NORM—RHET

London : The Educational Book Co., Ltd.

Normal School OR COLLEGE. Institution for the training of teachers for the work of education. The term, which is a translation of the French *école normale*, is more commonly used in the U.S.A. than in Great Britain, where the usual name for such institutions is training college. See Education: Training College.

Normal Temperature and Pressure. Conception in physics. Since the volume of a given mass of gas varies with the temperature and pressure, it is essential to define conditions of measurement when the density of the gas is quoted. It is usual to express this density as the value, termed normal density, which the gas would possess if the temperature and pressure were 0° C. and 76 cm. of mercury. These conditions are standard or normal temperature and pressure (S.T.P. or N.T.P.).

If V is the volume of gas measured at p cm. Hg pressure and t° C., then the volume V_0 occupied by the same mass of gas at N.T.P. is given by

$$\frac{pV}{273 + t} = \frac{76 \times V_0}{273}, \text{ or}$$

$$V_0 = \frac{pV}{76} \times \frac{273}{273 + t} \text{ c.c.,}$$

if V is expressed in c.c. Hence, to calculate the mass of a given volume of gas under particular conditions, it is necessary to reduce the volume to N.T.P. by the above formula, and then multiply by the density at N.T.P.

Norman. Name given to the people of Normandy and their descendants in countries which were conquered by them. The word Norman, Fr. *Normand*, is identical with Northman, but is generally restricted to the mixed race which arose after the conversion of the heathen settlers and their adoption of French culture. This race displayed extraordinary energy and love of adventure; military, legal, and organizing powers; and great adaptability. Itself the product of one of the latest of the great European migrations, it spread Latin order and discipline through many regions, posed as the champion of the papacy, and initiated the movement which culminated in the Crusades. The conquest of England was followed by the permeation of the Scottish Lowlands by Norman chivalry, while S. Wales and the Irish Pale were being conquered.

About 1017 Norman adventurers intervened in the struggles in S. Italy between Greeks and

Volume 8

Muslims, and by craft and force established a dominion under Robert Guiscard, who became duke of Apulia and Calabria in 1059. His nine brothers aided in the conquest, Roger I overthrowing the Arabs of Sicily, 1060-91. Roger II, crowned king of Sicily

in 1130, united the Norman possessions on the mainland, including Naples, with his own, and conquered Corfu and Mahedia in N. Africa. William II conquered Epirus and sacked Salonica, 1185. The Norman dynasty died out in 1194, having established one of the best organized kingdoms in Europe.

Norman, MONTAGU COLLET NORMAN, BARON (1871-1950). British banker. Born in London, Sept. 6, 1871, he was educated at Eton and King's College, Cambridge, and served in the S. African War. A director of the Bank of England from 1917, he was made deputy governor

in 1918, and governor in 1920, holding the post until his retirement in 1944. He had a large

share in framing and guiding the financial policy of Great Britain; he advised a return to the gold standard in 1925, and after its abandonment in 1931

Lord Norman, British banker

followed a policy of controlled inflation. His actions aroused criticism, but he never ceased to enjoy the confidence of the government, whatever its party. In 1923 he was made a privy councillor and on retirement he was given a peerage. He died Feb. 4, 1950.

Norman Architecture. Name applied to a style of building in England and Normandy during the 11th and 12th centuries. It is said to have been introduced into England by Edward the Confessor, who built the choir and transepts of the old abbey of Westminster, but was not fully developed until after the Conquest. Historically, it is a local variety of Romanesque.

The main characteristics of Norman, as of Romanesque, architecture are the round arch and the plain round or rectangular column. Little is made of the base of a column; the bell capital (*q.v.*) is much the same as the Saxon in design and workmanship; vaults are of the barrel variety, roofs gen-

Norman Architecture. The rounded arches and columns in St. John's chapel in the Tower of London. Top, the West door of Iffley church, near Oxford, a fine example of a Norman rounded arch and mouldings

erally of wood, and masonry thick-jointed and rough. In the reigns of William I and William II the principal building was the castle.

In the 12th century the style grew more ornamental. Heavy barrel vaults were groined; the angles of rectangular piers softened by recessed columns; doorways became more highly decorated, and enrichment more general in the direction of mouldings. The employment of the square and hatched billet, chevron, scallop, and other typical Norman ornaments was extended. Buttresses, at first wide and of slight projection, became much bolder. One of the best examples of a 12th century church in London is S. Bartholomew's, Smithfield. See Arch; Architecture; Castle; Door; Romanesque; consult Norman Architecture, E. G. Browne, 1907.

Normanby. Place in the N. Riding of Yorkshire, England. It lies 4 m. S.E. of Middlesbrough, in the urban district of Eston. A different Normanby, also in the N. Riding, is the village 5 m. S.W. of Pickering, from which the family of Phipps takes its title (*v.i.*).

Normanby, MARQUESS OF. British title borne since 1838 by the family of Phipps. In 1767, Constantine Phipps (1722-75), a grandson of Sir Constantine Phipps (1656-1723), lord chancellor of Ireland, was created an Irish baron, and in 1790 his son, Constantine John, was made an English one. On his death in 1792 the Irish title of Baron Mulgrave passed to his brother Henry (1755-1831), who was foreign secretary 1805, and first lord of the admiralty 1807. In 1812 he was made earl of Mulgrave. His son, Constantine Henry (1797-1863), 2nd earl, was made marquess of Normanby in 1838. George Augustus, 2nd marquess (1819-90), was a Liberal M.P. and in turn governor of Nova Scotia, Queensland, New Zealand, and Victoria. In 1932 Oswald (b. 1912) became 4th marquess. An eldest son is called the earl of Mulgrave, from the family seat near Whitby.

1st Marquess of Normanby, British politician after H. P. Briggs, R.A.

Normanby, CONSTANTINE HENRY PHIPPS, 1ST MARQUESS OF (1797-1863). British politician. The son of Henry Phipps, 1st earl of Mulgrave, he was born May 15, 1797. Educated at Harrow and Trinity College, Cambridge, he

entered parliament in 1818. Earl of Mulgrave in 1831, in 1832 he became governor of Jamaica. In 1834 he was appointed lord privy seal, and during 1835-39 was lord-lieutenant of Ireland. He was home secretary under Melbourne, 1839-41; ambassador in Paris, 1846-52 and at Florence 1854-58. He died July 28, 1863. He wrote *A Year of Revolution* (1848), 1857.

Norman Conquest. Name given to the conquest of England by William I in 1066 and the succeeding years. It began with his victory at Hastings, and may be said to have ended with the march to Chester in 1070. Formerly it was regarded as introducing a completely new system into England, but the present view is that Norman influence, although considerable, was far from destroying all traces of English law and customs. See Armour; Bayeux Tapestry; England: History; Feudalism; William I. Consult *The Norman Conquest*, Freeman, 1867-79; *Anglo-Saxon England*, F. M. Stenton, 1943.

Normandie. French luxury liner. First put into service on the Havre-New York route in 1935, this 83,423-ton ship captured the blue riband of the Atlantic on her maiden voyage, breaking all records for passenger ships. At the outbreak of the Second Great War in 1939 the Normandie was lying in New York harbour; taken into protective custody, and seized in Dec., 1941, by U.S. coastguards, she was converted into an auxiliary ship and renamed the Lafayette. On Feb. 9, 1942, when 2,200 workmen were on board, a fire started on the promenade deck; the men made dramatic escapes, but many were injured. After burning for 13 hours the Normandie capsized, and was later disposed of for scrap.

Normandy. Old province of France. It was one of the largest of those into which France was divided before the Revolution, and takes its name from the Normans or Northmen. The name is still used to describe the district. Normandy lies along the English Channel between Picardy and Brittany, and on the S. touches Maine, and in the S.E. the Île de France. Its departments are Seine-Inférieure, Eure, Orne, Calvados, and Manche. Its capital is Rouen; Caen, Bayeux, Lisieux, and Évreux, much damaged during the Second Great War, were interesting Norman towns. For many years the Channel Islands belonged to the duchy, and it was owing to this connexion that they became English.

Having been included in the Roman and the Frankish empires, Normandy was ravaged by the Danes or Northmen, who found an easy way for their boats along the Seine. Some of them settled on its banks, and in 912 King Charles the Simple made a treaty with their leader, Rollo, to whom he gave some land around Rouen. Thus Rollo founded the duchy of Normandy, which grew in size under his successors. They assimilated the French language and culture, and were often at war with their neighbours, the counts of Anjou. William the Conqueror, who became duke in 1035, added Maine to his possessions. In 1066 he was crowned king of England, and when he died in 1087 he left Normandy to his eldest son Robert, thus separating it from England. In 1106, however, Robert was beaten at Tinchebrai and captured by his younger brother, Henry I, and the two countries were again united. After Henry's death in 1135, his grandson, Henry II, had to fight for Normandy as for England, but when he became king in 1154 he was already duke.

Normandy, although ruled by the English king, had the king of France as its overlord, and the relationship naturally led to trouble. Both Louis VII and Philip Augustus coveted the great possessions acquired by Henry II, but were unable to take any of them from him, although they helped his sons to harass his life. The warfare continued during the reign of Richard I, and came to a climax in that of John. In 1202 Philip Augustus invaded Normandy, and when Rouen surrendered to him in 1204, it was all in his possession. The duchy was formally surrendered by Henry III (1259).

After John had been deprived of Normandy the land was without a duke, but in 1329 Philip VI appointed his son John to that office. During the Hundred Years War the duchy was a battleground, and in 1359, after the English successes, the French king promised to cede it. This arrangement fell through, and after Agincourt the English overran it and established an administration. But the Normans steadily resisted, and gradually the duchy was recovered by France.

For many years Normandy had its own assembly of estates, and there was a *parlement* at Rouen from 1499 until the Revolution. Before that time, however, the land was completely at one with the rest of France. In 1791 it was

Normandy. Map of the old French province and battleground of several historic wars

divided into departments. For the campaign in Normandy in 1944, see Caen; D-day; Europe, Liberation of; Falaise, etc. See also Channel Islands; Distaff; Northmen; William I.

Norman-French. Dialect of Old French spoken in Normandy and England. The Scandinavian settlers in Normandy adopted the French tongue in the 10th century, and the dialect which thus arose contained many words of Danish origin, and many phonetic peculiarities. It played an important part in the development of Old French literature, and was the dialect of many of the trouvères, including, perhaps, the author of the original Song of Roland. The metrical chronicles of Wace are 12th century monuments of Norman-French. Modern Norman speech preserves traces of the old dialect, especially in the Channel Islands, where an archaic form is used on ceremonial occasions.

Anglo-Norman is the name of the dialect spoken by the dominant class in England for about two centuries after the Conquest. Spoken by a small and scattered minority, it is remarkable for its irregularity and its tendency to

simplification. Its influence on English was much less than that of the Parisian-French which became current in official and noble circles in Henry III's reign, when Anglo-Norman was dying out.

Norman Lockyer Observatory. British observatory. With a site of 44 acres on Salcombe Hill, Devon, 565 ft. above Sidmouth, it is part of the University College of the S.W. of England.

Normanton. Urban dist. of the W. Riding of Yorkshire, England. It stands on the Calder, 10 m. S.E. of Leeds, and is an important rly. junction. The principal building is the church of All Saints, partly Perpendicular. There is a 16th century grammar school. Industries include coal mining and rly. work. Pop. 19,200.

South Normanton is a village near Alfreton, in Derbyshire, also a coal-mining centre. Another Normanton is near Derby, and there are places of this name in Rutland and Lincolnshire. Normanton-on-Soar and Normanton-on-Trent are villages in Notts.

Norrmanton. Town of Queensland, ranking as the chief place on the Gulf of Carpentaria, though it is 50 m. from the mouth of the

Norman river. There is steamer and air communication with Brisbane. Normanton is a port for mining and pastoral areas. Pop. 386.

Norn. In Scandinavian mythology, the name of the three goddesses of fate. Of the race of the giants, they ended the golden age of the gods. They cast lots over every infant and lay gifts in his cradle. One is malignant, the others are beneficent. They are akin to the Valkyries, the fairies, and the classical Parcae. Late literary myths represent them as Past, Present, and Future, and as daily watering the root of the world-ash Yggdrasil from the well of Weird or Fate.

Norrbotten. Län or co. of Sweden. It is the largest and northernmost co., being bordered by Finland, Norway, and the Gulf of Bothnia, and includes part of Lapland. The extensive forests and the iron mines of Gellivare are exploited, the numerous rivers and lakes transporting the lumber. Area, 40,754 sq. m. Pop. 229,661.

Norris, Sir John (c. 1547-97). English soldier. Younger son of Henry, Lord Norris, and known as Black Norris, he served with the Huguenots in France, under Essex

in Ireland, and in the Netherlands against Spain. After being lord president of Munster, he

Sir John Norris,
English soldier
After Zuccheri

returned to the Netherlands in 1585 at the head of an English army, was knighted by Leicester for relieving Grave in 1586, and fought at Zutphen. He was marshal of the camp at Tilbury in 1588, ambassador to the Netherlands, and leader with Drake of an expedition to Spain. He died at Mallow, July 3, 1597.

Norris's father belonged to an old Berkshire family prominent at court in Tudor times. His brothers were famous soldiers, and their figures are on the Norris monument in S. Andrew's Chapel, Westminster Abbey.

Norris, KATHLEEN (b. 1880). American novelist. Born July 16, 1880, at San Francisco, her surname being Thompson, she spent her childhood in Mill Valley in the Californian mts., and became a librarian and then a journalist, marrying C. G. Norris in 1909. Her first novel, *Mother*, was published in 1911, and she achieved a best-seller with *Saturday's Child*, 1914. Of some 80 novels, her later ones included *Burned Fingers*, 1945; *Over at the Crowleys*, 1946.

Norris Dam. Storage dam across the Clinch river, Tennessee, U.S.A. Part of the T.V.A., it was completed in 1937. 1,860 ft. long, 265 ft. high, it controls the flood waters of the river, the overflow being used to generate electricity.

Norristown. Borough of Pennsylvania, U.S.A., the co. seat of Montgomery co. It stands on the Schuylkill, 18 m. N.W. of Philadelphia, and is served by rlys. and the Schuylkill canal. Industrial prosperity is based on granite and marble quarries and iron deposits. Norristown was founded in 1785 and, never incorporated as a city, is the most populous borough in the U.S.A.: pop. 38,181.

Norrköping. Town of Sweden, in the län or co. of Östergötland. It stands at the head of the Bravik Fjord, an inlet of the Baltic, and is a junction 113 m. by rly. S.W. of Stockholm, with which it is also connected by steamer. It has a good harbour and ship-building yards, and trades in timber, granite, iron, and grain. The river Motåla affords power for

numerous factories. Norrköping was founded in 1384, is governed by municipal council, and is the fourth biggest place in Sweden. Pop. 78,344.

Norroy King of Arms. Officer of the Heralds' College, England. He was first heard of in the reign of Edward II, and, as the title indicates, had jurisdiction over England N. of the Trent. See *Heraldry: Heralds' College*.

Norsabite. Explosive of the non-nitroglycerine powder type. It is based on ammonium nitrate sensitised by T.N.T. Permitted for use in coal mines, it expedites drift cutting and ripping operations.

Norse. Adjective properly signifying Norwegian, the native form being Norsk, i.e. Nord-isk. It is applied usually to the older period of Norwegian history, including the age of the great migrations, often in a sense which includes the whole Scandinavian race. The Norse language, the old tongue of Norway, where it is now virtually extinct, was carried to Iceland, Greenland, the Orkneys, Shetlands, Hebrides, Isle of Man, and parts of the Scottish mainland, especially Caithness. It was ousted from Norway by Danish, and from Scotland by Gaelic and English, but lingered in the Orkneys and Shetlands until the 18th century.

Old Norse, one of the North Germanic group of languages, is the name given to the form of the language current before the 15th century, another name being Old Icelandic. While Iceland was the chief seat of Old Norse literature, some of the extant works were written in Norway, Greenland, and perhaps in the Hebrides. See *Iceland*; *Northmen*; *Norway*.

North. One of the cardinal points, one end of the earth's axis. The central point of the Arctic basin is the north terrestrial pole, directly above which the north celestial pole is marked approximately by the pole star. The north magnetic pole to which compasses point is more than 800 m. to the S. of the N. pole, somewhat N.W. of Boothia Peninsula, Canada.

North, BARON. English title borne since 1554 by the family of North. Sir Edward North was made a baron in 1554. His son Roger, the 2nd baron, was ambassador to France. Charles, the 5th baron, was made Baron Grey; but this title expired with his son, the 6th baron, in 1734. The 7th baron was a cousin, who was already Baron Guilford, and in 1752 was made earl of Guilford. The two titles were held together

until 1802, when the 3rd earl died. The barony then fell into abeyance, remaining so until 1841. It was then granted to Susan, daughter of the earl of Guilford. She and her husband, J. S. Doyle, took the name of North. The title again became extinct when the 13th baron, John Dudley, was lost with H.M.S. Neptune, as announced Jan. 3, 1942.

North, FREDERICK NORTH, LORD (1732-92). English statesman. Born April 13, 1732, son of

Frederick, Lord North,
English statesman
After Dance

Francis, 1st earl of Guilford, whom he succeeded in 1790, he was educated at Eton and Trinity College, Oxford. Entering parliament 1754, he was chancellor of the exchequer, 1767. Prime minister from 1770, his "King's Friends" were fiercely attacked but held office until 1782; this period saw the American War of Independence. In 1783 North formed a coalition with Fox, and held office April-Dec. He died Aug. 5, 1792. *Consult* Life, W. B. Pemberton, 1938.

North, CHRISTOPHER. Pseudonym of John Wilson (*q.v.*), professor of moral philosophy, Edinburgh, and contributor to *Blackwood's Magazine*.

North, SIR DUDLEY (1641-91). British economist. Son of Dudley, 4th baron North, he was born at Westminster, May 16, 1641, and educated at Bury St. Edmunds. He amassed a fortune in Turkey as treasurer of the Turkey Company. He returned to England in 1680, and became a well-known figure in London, being a sheriff of the City, and M.P. for Banbury. North was one of the earliest economists who advocated the doctrine of free trade. His *Discourses upon Trade*, published in 1691, foreshadowed the views of Locke and Adam Smith. He died, Dec. 31, 1691.

North, SIR THOMAS (c. 1535-c. 1601). An English translator. Younger son of Edward, Baron North, his fame rests almost entirely upon his translation of Plutarch's *Lives*, made from the French version of Amyot. The book was Shakespeare's chief source for Julius Caesar, Antony and Cleopatra, and other classical plays. North wrote in a vivid and powerful style, and was one of the makers of English prose.

NORTH AFRICA CAMPAIGNS, 1940-43

Lt.-Gen. Sir Giffard Martel, K.O.B.

The story of the fighting in North Africa during the Second Great War is here told from Gen. Graziani's advance into Egypt in Sept., 1940, until the surrender of the last Axis forces in Tunisia in May, 1943. See also Alamein; Eighth Army; Mareth Line; Montgomery; Tobruk; Tunisia, Battle of, etc.

So long as Great Britain had France as an active ally her position in the Mediterranean was reasonably secure; but when France was defeated in June, 1940, Wavell, British c.-in-c. in the Middle East, found himself unsupported, and outnumbered by the strong forces Italy had built up in Libya, estimated when Italy declared war on June 10 at over 215,000 men, while the British in Egypt totalled 36,000 men, under Gen. Sir H. Maitland Wilson. The foremost defended position in Egypt was at Mersa Matruh, 120 m. from the frontier with Libya, on which a small covering force was placed with orders to attack Italian frontier posts immediately on the outbreak of war.

A number of patrol engagements were fought during the summer, but the Italian commander Gen. Graziani decided not to launch his offensive until the heat had abated. On Sept. 13, the Italians advanced across the border near the coast. British mobile troops withdrew before the Italians, who took Sidi Barrani, Sept. 16, and proceeded to construct a series of fortified camps from Maktila, some 12 m. E. of Sidi Barrani, through Tummar E. and W., about 10 m. S.E. and S. respectively of Sidi Barrani, and Nibeiwa, about 5 m. S. of Tummar. To protect their communications the Italians constructed a group of camps at Sofafi and El Rabia some 25 m. S. of the coast and the same distance S.W. of Nibeiwa. Wavell had decided not to offer strong opposition until they reached the prepared defences of Mersa Matruh; but two months went by without further enemy activity.

WAVELL'S ADVANCE. In the meantime Wavell had been making preparations. Small reinforcements were sent out to him, but on the other hand he had, after the Italian invasion of Greece, Oct. 28, to send forces to that country. However, in Nov. he decided that the time had come to assume the offensive, in spite of his great inferiority in strength. He considered the enemy's defensive arrangements to be "thoroughly faulty," with camps not mutually supported spread out over a wide area; and his plan was to attack

round the S. flank, capture the enemy camps at Nibeiwa and Tummar, and then push on towards Sidi Barrani and cut off the enemy while a small force attacked Maktila from the E. As this was a difficult operation Wavell decided to carry out a rehearsal in the back areas. Ground was marked out showing the positions of the camps and defences. His plan of attack was then gone through on Nov. 25 and 26 as an exercise complete with umpires. No one but the two divisional commanders had any idea that this was a rehearsal for their attack on the enemy. Certain mistakes came to light and were to be corrected in the "next exercise," i.e. the actual attack.

Opposing Forces

For these operations the R.A.F. had two army cooperation squadrons, a squadron of Hurricanes and Lysanders for tactical reconnaissance, and a squadron of Gladiators for attacking opportunity targets. The Italians had a rather stronger air force. The British Western Desert force, commanded by Lt.-General Sir Richard O'Connor, consisted of the 7th armoured div., the 4th Indian div., and the 7th tank battalion; its total strength was 31,000 men, 120 guns, 225 tanks (mostly light), and 50 heavy infantry tanks (Matildas). The Italian force E. of the Egyptian frontier consisted of three Libyan divs., two Blackshirt and two Metropolitan divs., and an armoured group; total strength 80,000 men (63,000 Italians), 250 guns, and 120 tanks (mostly light).

The British approach, which began on the night of Dec. 7-8, was made in two night marches, the heavy infantry tanks starting two days earlier on account of their slowness. There was great danger that the movement would be seen from the air, but all went well. The approach on the last night was made in full moon and by the early hours of Dec. 9 the troops were in position. The guns opened at 7.15 a.m. The 7th tank battalion with the heavy infantry tanks advanced from the N.W. followed by infantry of the 11th brigade of the 4th Indian div. At 7.35 a.m. Matildas entered

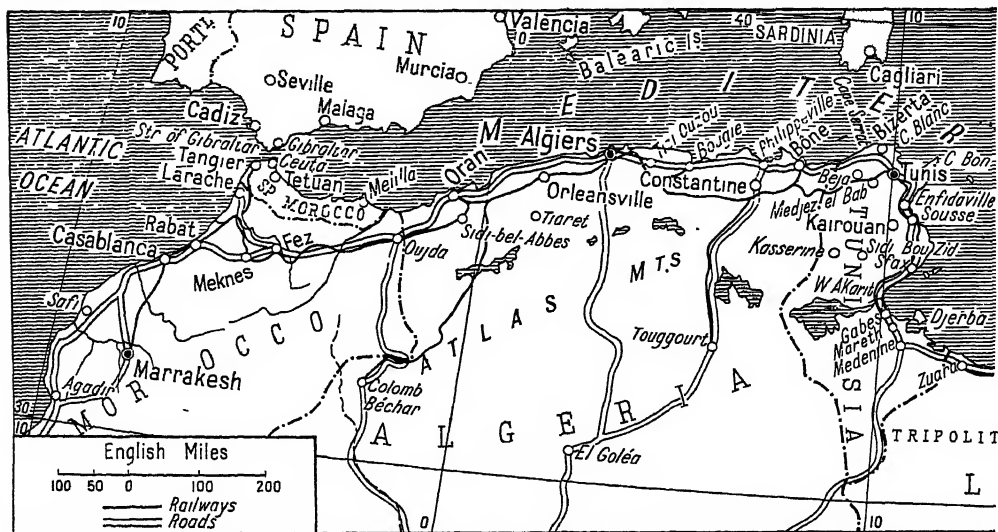

Nibeiwa and met some enemy tanks which they destroyed with ease. As they advanced they came under heavy fire, but the Matilda was at that time the most heavily armoured tank in the world, and the enemy anti-tank shells bounced off the armour. By 8.30 a.m. Nibeiwa was in British hands. The commander of the 4th div. now turned to attack the camps at Tummar E. and W., both subdued by dark in much the same way and with few casualties. Seeing the success of these operations, he also sent the 16th infantry bde., in reserve, to move N. to cut off Sidi Barrani.

During this day the 7th armoured div. had sent the support group to pin the enemy at Sofafi and one of the two armoured brigades (the 4th) was sent N. to cut the road just W. of Sidi Barrani. They reached their objective; but the 16th infantry bde. came under rifle fire and was seriously delayed. On Dec. 10 the 11th infantry bde. came up on their flank with some infantry tanks. At 1.30 p.m. the commander 4th div. decided to attack Sidi Barrani. This was an ambitious plan in view of the great distances the troops had already moved, but they were highly trained and elated with their successes. The attack started at 4.15 p.m. and the town was captured before dark. Dec. 11 was spent in mopping up the battlefield. The Sidi Barrani area was soon cleared; and Brig. Selby's force dealt with the Italians round Maktila. The enemy was withdrawing in many places towards the frontier, and the 7th armoured div. was much occupied sending out forces to cut them off. By Dec. 15 all enemy troops had been driven out of Egypt, and the battle of Sidi Barrani was over.

Italian Losses

The enemy forces, now concentrating in the area Bardia-Sollum-Capuzzo, consisted of four divs., with another at Tobruk. By Dec. 17 the greater part of them was behind the defences of Bardia, and the 7th armoured div. was already holding the exits to the W. Five enemy divisions had suffered heavy casualties or been broken up. Italian prisoners numbered 38,000, while British casualties were 133 killed, 387 wounded, and 8 missing.

The British supply system became increasingly difficult. The nearest railhead was at Mersa Matruh, and there was a shortage of mechanical transport. Gen.

North Africa Campaigns. Map of the N. African coast from French N. Africa in the West to Cairo and—

Wavell, however, gave the Italians no rest. The Western Desert force now became 13th corps. The 4th Indian div., sent to the Sudan, was replaced by 6th Australian div.

Bardia perimeter defences were 17 m. in length and consisted of a chain of concrete posts each of which was protected by wire and an anti-tank ditch. Infantry tanks were required for the attack; but the tank battalion was much under strength owing to casualties and breakdowns. A strong artillery bombardment was therefore essential, and it took 16 days to build up the ammunition dumps. The attack began at 5.30 a.m. on Jan. 3, 1941. The Australians broke through on the left on a narrow front after an intense bombardment. Tanks and fresh infantry units passed through and attacked the defences from the rear. The Italians fought stubbornly in places, but by the afternoon of the 4th the defences had fallen and the Australians were entering the town. On the 5th the last defenders surrendered. 45,000 prisoners, 462 guns, and 129 tanks were taken. Close support was received from the R.A.F., and the R.N. cooperated by a bombardment from the sea.

Tobruk, 75 m. away, was the next fortified place. The perimeter defences, similar to those at Bardia, were 27 m. long, and the 7th armoured div. very quickly passed round them to hold the exits on the W. The defences were strong, and full preparations for the attack had to be made, including bringing up ammunition, which

took 13 days. The attack began at 5.30 a.m. on Jan. 21 in much the same manner as against Bardia. The Australians advanced under a strong artillery bombardment. The heavy tanks were again of great value, though only 16 were now available. The R.N. and the R.A.F. again cooperated. Organized resistance ceased on Jan. 22; O'Connor's forces had taken 30,000 prisoners, 236 guns, and 87 tanks, and secured the use of a valuable seaport, although the Italians had done considerable damage to the installations.

After a short interval, the Australians were advancing again on the coastal road towards Benghazi behind the retreating Italians. The enemy had left some armoured forces at Mekili to guard his flank, but withdrew them on Jan. 27, and the 7th armoured div. advanced by the route thus left open. It had been instructed to wait for reinforcements and supplies at Mekili, but by Feb. 3 it was clear that the enemy was withdrawing from Benghazi, and the div., ordered to make for the coast without delay and intercept him, advanced straight on Msus, the first elements arriving there on Feb. 4, having covered 150 m. in 24 hrs. The going was exceptionally heavy and this move was a wonderful feat in the conditions. A detachment was sent on the 5th towards the coast near Antelat to form a road block. Another detachment was sent to Soluch; while the 4th armoured bde. went to Bada Fomm to take the enemy in flank. The

Italians began to appear next day, and at first tried to break through frontally; but the Rifle bde. and some artillery fought magnificently. The Italians then launched their tanks to try to clear a way round and met the 4th armoured bde. In the very exciting and critical battle of Bada Fomm reinforcements from the 7th armoured bde. arrived just in time to save the situation. On the morning of Feb. 7 the Italians surrendered unconditionally. Benghazi, meanwhile, had surrendered, Feb. 7, to the Australians advancing along the coast road. In two months the army of the Nile had advanced 500 m., destroyed an Italian army, and captured 130,000 prisoners, 400 tanks, and 1,290 guns for the loss of 500 dead, 1,373 wounded, and 55 missing.

While British troops had been driving the Italians out of Cyrenaica the Germans had been collecting powerful forces to attack Yugoslavia and Greece; and immediately after the fall of Benghazi Wavell was directed to undertake no operations beyond the W. frontier of Cyrenaica. On March 5 transfer to Greece of a large part of the forces in N. Africa began, leaving the British position in Cyrenaica very insecure.

During February and March it became evident that the Germans were also in N. Africa. Heavy German air attacks on Benghazi led to the decision in late Feb. to cease using it as a supply port, and all supplies had then to be brought from Tobruk, although shortage of transport was one of

—Alexandria in the east, the scene of Axis and Allied advances and retreats in the Second Great War

the chief difficulties in the Middle East. British forces lying just E. of Agheila at the end of March comprised the 2nd armoured div. (less one bde., in Greece), much of it inexperienced and all of it poorly equipped, and a support group. Two bdes. of the 9th Australian div. were also forward, the third bde. being in Tobruk owing to lack of transport.

ROMMEL'S FIRST ADVANCE. Lt.-Gen. Neame was now commanding the British forces in Cyrenaica and his orders were, if attacked, to fight a delaying action and withdraw if necessary. On March 31 the enemy (now with Rommel as c.-in-c.) began his counter offensive with a German light armoured div. and two Italian divs. By April 3 they were advancing on Msus, and on the 4th Neame decided to withdraw to the line Derna-Mekili. The enemy followed closely. On the 7th the 9th Australian div. withdrew in good order to Tobruk. An Indian motor bde. and certain other elements holding Mekili fought off a series of small attacks, but, also on the 7th, were ordered to withdraw to El Adem. Part of the force withdrew, but the remainder, including the H.Q. of 2nd armoured div., was captured on the 8th. During the night of April 6-7, Gens. Neame and O'Connor, in consultation at Barce, were surprised and taken prisoner.

Wavell decided that Tobruk must be held, and a bde. of the 7th Australian div. was sent by sea to reinforce the defence. The remainder of the British forces

were driven back on Sollum in Egypt, and from April 11 Tobruk was invested.

There was no major activity on either side until June. The British forces now again included the 4th Indian div. and a reformed 7th armoured div. which was much under strength in tanks and not fully trained to the use of those that had recently arrived. On June 15 the British attacked and captured Capuzzo, but could not hold it. Useful information was, however, obtained. It was discovered that the Germans had mounted 50 mm. guns in all their tanks, in place of 37 mm. guns. The 50 mm. gun fired a 4½-pr. shell which could penetrate British tanks at 1,500 yds., whereas the British tanks with 3-pr. guns had to close to 800 yds. to penetrate the German tanks.

AUCHINLECK'S CAMPAIGN. On July 5 Gen. Sir Claude Auchinleck took over command of the Middle East, Wavell relieving him as c.-in-c. in India. Both sides in Cyrenaica were preparing for a renewal of operations in the autumn, the only important operation undertaken meanwhile by the British being the complete relief by sea of the Tobruk garrison with new units during the moonless periods of Aug., Sept., and Oct. The British forces, grouped in three corps, were formed into the 8th army under Gen. Sir Alan Cunningham. The 13th corps under Gen. Godwin Austen had the 4th Indian and the New Zealand divs., and the 1st army tank bde. The 30th corps under Lt.-Gen. Norrie

was an armoured corps with the 7th armoured div., the 4th armoured bde., 1st S. African div., and Guards bde. The garrison of Tobruk was the 70th div., the 32nd army tank bde., and a Polish infantry group. The 2nd S. African div., in reserve, was not yet fully trained. The British air forces now consisted of 11 squadrons of light bombers, 17 of fighters, and 6 of medium bombers.

The enemy forces holding the frontier defences were an Italian div. and some German troops. Concrete pill boxes behind strong wire obstacles ran along the whole frontier, with field defences from the sea to Sidi Omar, a front of 25 m. On the frontier 40 m. S. of Sidi Omar lay Maddalena. Bardia was held by Italian forces.

The ground is very broken between Bardia and Tobruk, and a high ridge with a double escarpment runs all the way along about 10 m. inland. S. of this ridge there is nothing but open flat desert with very few features. Between this ridge and the sea Rommel had placed the 15th and 21st panzer divs. Four Italian divs. and one German surrounded the outer defences of Tobruk. The Italian Ariete armoured div., stiffened with German officers, was at Bir el Gobi. There was an important feature of high ground running from El Adem to Sidi Rezegh about 15 m. S. of Tobruk, the W. end of the high ridge parallel to the coast. Gabr Saleh was an important point between Sidi Omar and Bir el Gobi. The Axis forces outnumbered the

British considerably; but the Italians among them were of doubtful fighting quality. In tanks the British had a small superiority in numbers, but the German tanks all had 50-mm. guns while the British still had only 3-prs. The German armoured forces were greatly superior in strength of personnel and weapons—particularly in anti-tank guns. It was a bold but correct action to assume the offensive.

British Advance into Libya

At dawn on Nov. 18 the 30th corps crossed the frontier near Maddalena, behind a screen formed by three armoured car regiments. The 7th armoured div. reached Gabr Saleh that evening, having covered 100 m. The 4th armoured bde., however, had been drawn away 25 m. to the E. in a protective rôle, and was already out of supporting distance of the div. The 1st S.A. div. was following in support of the 7th armoured div.

In preparation for the battle, British air forces had been fighting for air superiority, which they had gained to a large degree. As a result the advance came as a tactical surprise, and there was little interference from enemy air forces. On Nov. 19 the 30th corps was instructed to advance towards Tobruk. One brigade of the 7th armoured div., diverted to attack the Italians at Bir el Gobi, fought an indecisive action there. The remainder of 7th armoured div. advanced and seized Sidi Rezegh.

On Nov. 20 the German armoured forces debouched from the N. and a strong column was seen to be advancing on the 4th armoured bde., which was isolated. The bde. which had been fighting at Bir el Gobi was moved to reinforce the 4th armoured bde. A small action resulted; but next day the Germans diverted their forces to Sidi Rezegh, held by the British with one armoured bde., the S. Africans having not yet arrived. Lack of concentration at the decisive point found the British in a serious situation. On Nov. 22 all their forces were concentrating on Sidi Rezegh, but too late. The initiative had passed to the Germans who, on the 23rd, attacked Sidi Rezegh in very superior strength, and also the S. Africans, who had not yet reached the high ground. Fierce fighting occurred in which acts of great gallantry were performed by the armoured forces. German tanks broke into the lines of the S. African troops, who knocked many of them out at the muzzles

of their guns. But in the end the S. Africans were overrun, and the Germans were left in possession of the battlefield and of the high ground round Sidi Rezegh.

At this stage Rommel made a mistake. He was in considerable strength at Sidi Rezegh, with his 15th and 21st panzer divs. in hand. The British armoured forces were lying on the desert collecting themselves after their ordeal. The S. Africans were re-forming near Gabr Saleh. Rommel could undoubtedly have attacked and defeated the British armoured bdes. in detail before they could re-form and prepare themselves for battle. Instead, he chose to march straight through with both his armoured divs. and move on Shefferzen, just S. of Sidi Omar. This caused considerable confusion. Various headquarters had to scatter and clear out of his way, but the Germans made no attempt to mop up the troops. Heavily attacked from the air, at Shefferzen they met the 4th Indian div. There was nothing else between them and Cairo. Gen. Auchinleck came up to the front to restore confidence. The panzers attacked. The Indians held their ground. Fierce fighting ensued, and the Germans were repulsed with heavy losses.

Battle for Sidi Rezegh

While these events were happening the 13th corps had been advancing round Sidi Omar. The N.Z. div. had been making for Sidi Rezegh to support the armoured forces. It did not arrive in time to do so, but when Rommel advanced with his panzer divs. the New Zealanders took Sidi Rezegh, Nov. 26, and next day met a party which made a sortie from Tobruk.

After his failure against the Indian div. Rommel ordered the 15th and 21st panzer divs. to return to their bases on the coast and reft. By this time the British armoured forces had recovered. Every available man, gun, and tank was used to pursue these defeated German forces as they withdrew; heavy casualties were inflicted. The Germans were now concentrating normal formations to attack Gen. Freyberg and his small force of New Zealanders at Sidi Rezegh. An attempt was made by the 30th corps to reinforce them with the S.A. div., but before they could arrive Sidi Rezegh was again lost.

Cunningham was replaced in command of the 8th army on Nov. 26 by Lt.-Gen. Ritchie, who added the 4th Indian div. to the 30th

corps and instructed it to retake Sidi Rezegh from the S. with the help of the armoured forces, now reinforced. About this time Rommel decided to pull out, in order to save the highly skilled personnel of his armoured forces. His withdrawal meant deserting the garrisons of Bardia, Sollum, and Halfaya, but these were for the most part Italians. He established strong rearguards on his S. flank which were overcome by the 30th corps, while the 13th corps followed up his retreating forces in the N. Tobruk was cleared on Dec. 7, Benghazi was recaptured Dec. 24, and the pursuit went on to Agheila near the Tripolitania border. Of the garrisons, that at Bardia fell on Jan. 2, 1942; Sollum was captured on Jan. 12, Halfaya on the 17th.

Rommel had saved fewer than 50 tanks out of his original 400. He lost 10,500 German and 26,000 Italian prisoners, and also some 24,000 dead and wounded. British casualties were c. 18,000.

ROMMEL'S SECOND ADVANCE.

Driving the Axis powers out of Cyrenaica for a second time had again opened the way for an advance along the N. African coast. The rly. was extended to Tobruk with great speed. Administrative preparations were in hand. But events in another field again upset plans in N. Africa. Japan had attacked the U.S.A. at Pearl Harbour, and the whole situation in the Pacific was critical. Burma was threatened. Australia was in danger. Two Australian divs. and the 7th armoured bde. were sent to the Far East. Rommel meanwhile was being reinforced. In Jan., 1942, he advanced from Agheila. Benghazi was evacuated on the 29th and the British should have withdrawn farther; but they were anxious to retain airfields near Derna for the protection of Malta. In Feb., however, they were back to the Gazala-Bir Hacheim line. The 13th corps under Gott had the 1st and 2nd S.A. divs. and the 50th div. with the 1st army tank bde. and the 9th Indian infantry bde. Norrie had the 1st and 7th armoured divs. and some independent motor and infantry bdes., including the 1st Free French bde. at Bir Hacheim.

On May 26 Rommel attacked, advancing with his armour round the S. flank of the British line. When this outflanking move was held Rommel pierced the line farther N. On May 30 Norrie was fighting a fast moving battle in the S. with his armour still outgunned

against superior enemy forces, and had to withdraw at many points. At Bir Hacheim the Free French were holding their ground against heavy attacks, but immediately to their N. the Germans and Italians were making headway. In about the centre of the whole battlefield and just N. of the Capuzzo track there was a piece of ground which came to be called Knightsbridge. The 201st Guards bde. was well established at this place. Intense fighting was taking place to the S. of this locality and E. of Bir Hacheim, and this area was called the "cauldron." The 150th infantry bde. (50th div.), which was holding an isolated position in the forward area, was overwhelmed on June 1, and the enemy thus secured a salient in the British line. On the 4th-5th an assault was made on this salient, but repulsed: the full strength of the Germans in this area had not been appreciated. But the Gazala line still held, though the French at Bir Hacheim were isolated. On June 6 an armoured battle began round Knightsbridge, and enemy assaults on Bir Hacheim were renewed. On the 10th Ritchie ordered the French to evacuate Bir Hacheim, and the additional pressure then brought upon Knightsbridge forced the British to withdraw from there on the 14th. British armour in the Acroma area had been reduced to 30 cruiser and 20 infantry tanks, while the enemy probably had twice as many. The security of the British line had depended on a strong armoured backing, the loss of which made a withdrawal on the whole front inevitable.

Surrender of Tobruk

An attempt to hold a line Tobruk - El Adem southward failed, and Tobruk was again invested. Maj.-Gen. Klopfer, commanding the 2nd S.A. div. since May 15, and appointed to command the fortress, was told to defend it at all costs. The enemy attacked on June 20, and next day Tobruk capitulated, some of the units fighting on, however, and a few succeeding in breaking out to rejoin the 8th army. Rommel was able to take up the pursuit immediately. Auchinleck favoured an attempt to hold the frontier, but without armour Ritchie felt this could not be done, and his decision that he must withdraw on Mersa Matruh, where he proposed to fight a decisive battle while sending on H.Q. 30th corps to control the completion of the Alamein position, was endorsed by the Middle East defence committee.

However, Auchinleck, who took over control of the 8th army from Ritchie on June 25, abandoned the intention to fight at Mersa Matruh and withdrew the whole of the British forces to Alamein. There on Aug. 12 Auchinleck handed over command of the 8th army to Lt.-Gen. B. L. Montgomery; while on Aug. 15 Gen. Harold Alexander assumed command in the Middle East. On Aug. 10 Churchill, on his way to Moscow, met Alexander in Cairo. He gave him a directive: "Your prime and main duty will be to take or destroy at the earliest opportunity the German-Italian army commanded by Field Marshal Rommel together with all its supplies and establishments in Egypt and Libya."

ALEXANDER'S CAMPAIGN. Montgomery made himself familiar with the desert, and soon inspired all ranks of the "brave but baffled" 8th army with his own enthusiasm and confidence. At the beginning of Aug. it consisted of the 30th corps (now made up of the 9th Australian, 1st S.A., and 5th Indian divs., reinforced by the 23rd armoured bde. in an infantry support rôle) and 13th corps (2nd N.Z. div. of two bdes. and the 7th armoured div.). The line it held lay from Alamein (meaning the twin cairns), a halt on the desert rly. to Mersa Matruh, to the E. end of the Ruweisat ridge and then S. by W. over flat ground, interrupted by steep-sided depressions, of which Deir el Munassib was the chief, to the Qattara depression. Behind this part of the front lay the strongly defended Alam el Halfa ridge which, reaching a height of 430 ft. and commanding the country to the S., was held by an infantry bde.; a second bde. occupied reserve positions on Ruweisat ridge. For the defence of the Delta there were three armoured and three infantry divs., and of these Alexander brought forward on Aug. 15 the 44th infantry and the 10th armoured divs.

Axis forces in Egypt, under the nominal command of Mussolini, but the actual command of Rommel, were the German Afrika Korps (15th and 21st panzer divs.), the Italian 10th, 20th, and 21st corps.

On the night of Aug. 30 Rommel launched his offensive. A position on Ruweisat ridge was captured by parachute troops and lost again to the 5th Indian div. by dawn. A feint to the N. against the Australians failed. At 1 a.m. on Aug. 31 Rommel began a drive in the S. with his armoured forces. By a

ruce, a false map had been allowed to fall into the enemy's hands, and acting on it, as Gen. von Thoma (commander of the Afrika Korps, who was taken prisoner in Nov.) later admitted, Rommel did not bypass the British defences and drive N.E. on to Cairo, which was what he had been expected to do. Instead he launched a heavy attack upon them. They were well organized; and the German tanks now had to meet the fire of 6-pr. guns. They were severely defeated, and withdrew slowly and stubbornly until on Sept. 7 the battle was called off with Rommel's front slightly advanced in the S. to a line running from the E. end of Deir el Munassib to include the peak of Himeimat. During Sept. Rommel returned to Germany a sick man, and his place was taken by Gen. Stumme.

Montgomery's Preparations

Montgomery now prepared to assume the offensive. For this purpose 13th and 30th corps were to be used as infantry with some armour; a third corps, 10th, was to be an armoured *corps de chasse*, and to include 1st, 8th, and 10th armoured divs., and the N.Z. div. as motorised infantry. On Sept. 3, 300 Sherman tanks had arrived at Suez from the U.S.A. and 10th corps was assembled some 50 m. in the rear to undergo training and re-equipment, while the remaining troops from the Delta were brought forward to acclimatise them to the desert in which they would now have to fight. The R.N. and the R.A.F. raided the enemy's shipping, and sea and overland raids, troublesome to the enemy though abortive in effect, were made on Tobruk, Benghazi, and Barce.

The supply services that would be needed when the enemy was in flight were fully prepared; and elaborate measures were taken to conceal the actual plan of attack and lead the enemy to believe that its main feature would be an out-flanking movement in the S. instead of the intended direct attack in the N. The date selected as D-day was Oct. 23: full moon was on the 24th and good light was needed for the work the infantry had to do in clearing a passage through the enemy minefields for the armour. By this time also the Allies were about to assume a wider offensive. Invasion of the N. shore of Africa from the W. had been planned for Nov. 8, and it was considered that, if the attack at Alamein were made a fortnight ahead of that date, the enemy's forces in Egypt should by then

have been for the most part destroyed and he would have had insufficient time to bring in any significant reinforcements.

The Axis troops were spread fairly evenly along their whole front when nearly a thousand British guns opened up a 15-min. barrage at 9.40 p.m. on Oct. 23. Twenty mins. later 13th and 30th corps advanced to the attack. 30th corps cleared two corridors through the enemy defences as planned, though somewhat behind schedule owing to the density of the minefields; and the armoured brigades went through. The 13th corps to the S. was not so successful; but it was containing the southern group of enemy armour and was ordered by Montgomery not to press the attack, but to continue creating a diversion.

Rommel's Return

Stumme died of a heart attack on Oct. 23, and during a pause which Montgomery made for reorganization and regrouping on Oct. 26, Rommel arrived back. He endeavoured at once to carry out a manoeuvre he had often used successfully before—a mass tank attack in the afternoon out of the sun. But continuous bombardment by the R.A.F. and artillery fire disrupted his concentrations of armour. At 1.05 a.m. on Nov. 2 Montgomery launched a new attack, and at Tel el Aqqaqir occurred the biggest clash of armoured formations in the 11-day battle of Egypt. The British losses were heavy, but the enemy's losses were crippling. Then followed a German retreat and a British pursuit. Mersa Matruh, evacuated by the enemy, was re-entered on Nov. 8. At the same moment, the first Allied troops were coming ashore 2,000 m. to the W. in French N. Africa (*v.i.*).

The whole of Cyrenaica was in British hands by Nov. 25, and all the way the retreating enemy had been relentlessly attacked from the air, his fighters and his transport planes shot down. The next enemy position was at Agheila, the strongest in Libya. But by this time Rommel had under his command only some 25,000 Italians and 10,000 Germans, with 60-70 tanks; and the success of the Allies in establishing themselves in French N. Africa made it impossible to send him reinforcements from overseas.

Preparations to attack Agheila, Montgomery estimated, would take until Dec. 16. Heavy enemy demolitions and the effect of R.A.F. bombing were rapidly overcome :

by Dec. 1 the railhead had been brought forward to Tobruk, and 3,000 tons of Nile water were being delivered daily 25 m. W. of Mersa Matruh; the first ships entered Tobruk and Benghazi four days after their recapture, on Nov. 13 and 20. But Agheila is 150 m. from Benghazi and 300 m. from Tobruk, and motor transport remained a limiting factor.

When Dec. began, however, there were clear indications that the enemy meant to draw out. On Dec. 12 the N.Z. div. was sent off on a desert track to pass the enemy's landward flank and strike N. to cut the road at the Wadi Matratin some 60 m. W. of Agheila; and on that night the enemy began to withdraw, leaving mines, booby traps, and demolitions in such profusion that the troops making the frontal attack on the 14th took until the evening of the next day to cover the 30 m. from Mersa Brega to Agheila. Later on the 15th the N. Zealanders reached the wadi, but their difficulties in deploying by night in unknown country gave a large part of the enemy's rearguard still to the E. the chance to break up into small sections and race through breaks in the N.Z. deployment so that, despite losses, he got away the bulk of his forces. Pursuit continued, held up by demolished bridges and culverts over the numerous minestrewn wadis. There were skirmishes round Noflia on Dec. 18 and 19, when the enemy began to retire on Buerat. The 15th panzer div., left to cover Sirte, withdrew when an armoured car regt. was sent forward to work round the S. of Sirte, taken without opposition on Christmas day. Similar outflanking movements by armoured cars forced the enemy back to Buerat by Dec. 30.

8th Army's Dash for Tripoli

By this time the Axis had decided to evacuate Tripolitania and put all its forces into holding Tunisia; but Alexander was unaware of this, and it was decided that a two weeks' delay was necessary to bring up sufficient supplies, especially of petrol, from Benghazi, now 600 m. away, before the dash on Tripoli could be made, a delay during which Montgomery employed his Long Range Desert Group in reconnoitring in what was totally unknown country.

The attack began on Jan. 15, 1943; but the enemy was already moving W. and by the evening, in spite of some opposition, the 8th army had seized the main crossing of the Wadi Zem Zem. By the 19th

Rommel was standing on the line Homs-Tahuna, and in the evening of that day the 51st div. reached Homs. Again an outflanking armoured movement was made: it called off the enemy armour to the S.W. of Tahuna while a parachute bde. was moved to the Homs area, on which another British armoured bde. was moving. But the road W. of Homs winds for 35 m. through ravines and had been so thoroughly demolished that a rapid advance was impossible. Sharp rearguard actions had to be fought also. The outflanking column encountered stiff resistance; but at 5 a.m. on Jan. 23, three months exactly since the offensive opened 1,400 m. to the E., the 11th Hussars (the "desert rats") from the S., the 1st Gordons from the E., entered Tripoli. At 9 a.m. Montgomery received the formal surrender of the Italian authorities. The city had been little damaged, and the British military administration assumed the govt. of the city and prov. in an atmosphere of calm. By the end of the month, aided by a column of Fighting French under Gen. Leclerc which had invaded the country from the Chad territory, and conquered the Saharan prov. of the Fezzan between Jan. 4 and 29, Tripolitania was cleared.

TUNISIAN CAMPAIGN. The Allied expeditionary force which landed on Nov. 8, 1942, near Casablanca, at Oran, and at Algiers, was brought in two convoys, one from the U.S.A. and one from Great Britain, totalling some 500 transports and more than 350 escorting warships—at that time the largest armada ever assembled. Yet secrecy had been maintained down to the actual landing. The force was under U.S. command. Reports made after a secret landing in N. Africa from a British submarine by Maj.-Gen. Mark Clark (U.S. army) and six other British and U.S. officers had led to the belief that this would be less likely to lead to resistance by the Vichy French officials who controlled French N. Africa. The force which landed at Algiers, however, included a British bde. group which was to be the nucleus of the British 1st army.

The French army did oppose the landings; but on Nov. 10 Admiral Darlan, Vichy defence minister, who happened to be on a tour of inspection in N. Africa, agreed to an armistice and ordered all resistance to cease.

Gen. Eisenhower, the c.-in-c., decided to make a dash for Tunis, but by Nov. 10 already German troops were beginning to arrive in

Tunisia, at first by air, without resistance from the Vichy authorities; and after reaching Djedeida, only 12 m. from Tunis, on Nov. 28, the Allies were driven back by enemy tanks and dive bombers to Medjez el Bab (the ford of the pass). Axis forces were being reinforced much more rapidly than Allied, and with their S. flank at Sidi Bou Zid, the Allies now spent two months in consolidating the N. position and beating off German attempts to get round the S.

In accordance with decisions taken at a conference of the combined staffs with Churchill, Roosevelt, and Eisenhower held at Anfa near Casablanca on Jan. 14, and attended by Alexander, the 8th army came under Eisenhower's command when it entered Tunisia, and an army group H.Q. under Alexander's command (known as 18th army group—1st under Gen. Kenneth Anderson, 8th under Montgomery) was set up to co-ordinate the British, French, and U.S. forces in Tunisia. Alexander also became deputy commander of the Allied expeditionary force. At about the same time the Axis created "army group Africa," under Rommel, with the 5th panzer army commanded by Gen. von Arnim, and the 1st (Italian) army (German Afrika Korps, Italian 20th and 21st corps, which had been driven out of Libya) commanded by the Italian Gen. Messe.

Alexander assumed command in Tunisia on Feb. 19. At that time the battle of the Kasserine pass was raging in the S., but by the end of the month the pass, Sbeitla, Kasserine village, and Feriana had been reoccupied. In the last days of Feb. Rommel attacked in the N. towards Medjez el Bab, Béja, and the Gebel Abiud ("Longstop Ridge"). He achieved some success; but all the thrusts were held. Eighth army meanwhile had occupied Medenine on Feb. 18, and by the 24th was in contact with outposts of the Mareth line. On March 6 Rommel attempted to recover Medenine. It was his last battle in Africa, and he lost it. About the 19th he handed over his command to von Arnim, and returned to Germany. Then followed Montgomery's successful attack on the Mareth line, March 20-28, his capture of Gabes March 29, and the battle of the Wadi Akarit April 6, which forced Messe to retire to Enfidaville. On April 7 a U.S. patrol from a force which had advanced from Feriana to capture Gafsa on March 17 and El Guetar

on the 18th, met a British patrol of 8th army: the Allies had driven right across Africa.

By April 13 leading Allied troops were in touch with the enemy defences N. of Enfidaville, and the whole coastal plain was in Allied possession. As Alexander prepared for the final assault the enemy, some 250,000 strong, was now contained within a line running from the coast E. of Cape Serrat through Sidi Nsir, Medjez el Bab, due S. and then due E. to just N. of Enfidaville. By this time, the Allies had established complete air superiority. Eighth army attacked at 9.30 p.m. on April 19, capturing Enfidaville next day; this was the culmination of an 1,800 m. advance in six months, during which it had fought numerous and always successful battles.

On the night of April 20-21 the enemy made his last attack—between Medjez el Bab and Goubellat. It was a failure; and on the 22nd the 1st army attacked in its turn and slowly forced its way forward in heavy fighting. On May 7 British troops entered Tunis, U.S. troops Bizerta. Some thousands of the enemy retired into Cap Bon (*q.v.*) pen. in the hope of escaping by sea and air; after severe fighting during May 8-10 for the Hammam Lif defile they were rounded up. Mass unconditional surrenders began on the 12th. That day von Arnim surrendered; next day Messe did. A quarter of a million men, more than half Germans, laid down their arms; 663 escaped. On May 13 Alexander sent a signal to Churchill, "Sir, it is my duty to report that the Tunisian campaign is over. All enemy resistance has ceased. We are masters of the North African shore."

Northallerton. Market town and urban dist. of the N. Riding of Yorkshire, England. It is 30 m.

Northallerton arms

N.N.W. of York by rly. and is a junction, being the capital of the N. Riding. The chief building is the cruciform church of All Saints, mainly of the 12th century, with a fine Perpendicular tower. There are a hospital founded in the 15th century and a grammar school, while near are the remains of a Carthusian priory, Mount Grace (*q.v.*). The industries include tanning, brewing, malting, and engineering works; also the making of saddlery and other

leather goods. Standard Hill, 3 m. to the N., was the scene of the battle of the Standard (*q.v.*), 1138. Northallerton was the property, in the Middle Ages, of the bishops of Durham, and they held the manorial rights until 1865. They had a palace here, and there were at least two religious houses in the town. It was represented in parliament by two members until 1832, and by one until 1885, when it was disfranchised. Market day, Wed. Pop. 4,800.

Northam. An urban dist. of Devon, England. The dist., which takes in Westward Ho, Appledore, and Orchard Hill, stands near the left bank of the Torridge, 1½ m. N. of Bideford. Pop. 5,500. Another Northam is in Hampshire, part of the co. bor. of Southampton.

North America. The N. American continent, stretching from longitude 170° W. to 52½° W. and from latitude 80° N. to 15° N. It covers an area of approximately 8,350,000 sq. m. and has a pop. estimated at 163,000,000. Politically it is divided from E. to W. N. of 49° and the Great Lakes is (except for Alaska and Newfoundland) the dominion of Canada. Alaska is a dependency of the U.S.A., while the U.S.A. proper stretches from the 49th parallel to the borders of Mexico. The republic of Mexico, occupying the S. portion of the continent, extends from the boundary of the U.S.A. to Guatemala. For details of physical, geographical, and political features, see Alaska; America; Canada; Mexico; United States of America.

Northampton. County borough of Northamptonshire, England, also the county town. It stands on the left bank

Northampton arms

of the Nene, 66 m. N.N.W. of London, and is served by rly. The chief buildings in the borough are four parish churches: S. Peter's, a fine building, mainly Norman; S. Giles, varied in style and of somewhat later date; All Saints, rebuilt in Wren style after the fire of 1675; and the round church of S. Sepulchre, built by crusaders. There is a modern R.C. cathedral, by Pugin, but incomplete. S. John's hospital, founded 1137, is an interesting medieval building. The county hall dates from the 17th century, and the grammar school from the 16th. The town hall is 19th century Gothic, and the municipal buildings, museums, and

corn exchange are modern. The town has one of Europe's biggest market squares, and its public parks include the race-course and Abington Park. It has a service of motor buses, two theatres, and several cinemas. The chief industry since the 13th century has been the manufacture of boots and shoes. Others include tanning, brewing, iron founding, brick-making, colour printing, plastics, and light engineering.

Northampton began as an English settlement. After the Norman Conquest a castle was built here, and later the kings held parliaments therein. It was made a corporate town in the 12th century, and sent two members to parliament until 1918, when the representation was reduced to one. It was made a co. bor. in 1888. In 1675 much of the town was destroyed by fire. At Hardingstone, 1 m. S., is one of the Eleanor crosses, and near the town were several religious houses. Market days, Wed. and Sat. Pop. est. 104,700.

Northampton. City of Massachusetts, U.S.A., the co. seat of Hampshire co. It stands on the Connecticut R., 17 m. N.N.W. of Springfield, and is served by two rlys. Now a pleasant, cultivated New England town with wide streets, it was celebrated early in the 18th century as the home of Jonathan Edwards, the Puritan divine who led America's first revival movement. Smith College for women, opened 1875, is one of the largest resident women's colleges in the world. Pop. 24,525.

Northampton, ASSIZE OF. Body of instructions amounting in practice to laws, issued by Henry II and his advisers, at Northampton, in 1176. It was an expansion of the Assize of Clarendon (*q.v.*), and was in the form of directions to the judges about to go on circuit throughout England. The punishments to be inflicted on criminals were made more severe, and the powers of the sheriffs curtailed, while other articles dealt with questions of land tenure and dower.

Northampton, BATTLE OF. Fought July 10, 1460, during the Wars of the Roses. The Lancastrian host, with which was Henry VI, was encamped in a protected

Northampton. The Town Hall, built in 1364

position in some fields outside Northampton, when the Yorkists, under Warwick and the future Edward IV, who had just returned from exile, found and attacked it. The fight was soon over, for Lord Grey de Ruthyn turned traitor, and with his help the Yorkists got within the entrenchments of their foes, inferior in every way. The duke of Buckingham and about 300 other Lancastrians were slain.

Northampton, EARL AND MARQUESS OF. English titles borne by the family of Compton since 1618 and 1812.

There was an earl of Northampton in the time of William the Conqueror, and later the earldom became hereditary in the family of Bohun, whose male line came to an end in 1373. In 1547 William Parr was made marquess of Northampton. A brother of Catherine Parr, he was made a baron in 1539, and was also earl of Essex and a leading man under Edward VI. A supporter of Lady Jane Grey, he was sentenced to death under Mary, but the sentence was not carried out, and he died Oct. 28, 1571.

The title of earl of Northampton was revived in 1604 for Henry Howard, on whose death in 1614 it became extinct. In 1618 William Compton was made earl. He was

Spencer Compton, 2nd Marquess of Northampton

the son of Sir Henry Compton, who was created Baron Compton and was lord president of the marches of Wales. From James, the 3rd earl (d. 1681), who fought for Charles I, the earldom passed to Charles, the 9th earl. In 1812 he was made a marquess and his descendant still holds the titles. Spencer, the 2nd marquess (1790-1851), was president of the Royal Society; William, the 5th marquess

William Parr, Marquess of Northampton

(1851-1913), was a philanthropist and, before succeeding to the title, a Liberal M.P. During 1880-82 he was lord-lieutenant of Ireland. In 1913 the title descended to William Bingham Compton, the 6th marquess (b. Aug. 6, 1885). The family seats are Castle Ashby, Northampton, and Compton Wynnyates (*q.v.*), Warwickshire. The marquess's eldest son is called Earl Compton.

Northamptonshire. County of England. An inland and eastern co., its area is 998 sq. m. The surface is undulating except in the soke of Peterborough, which is in the fen country. The highest point is Arbury Hill, near Daventry.

The principal rivers are the Welland, dividing the county from Leics., Rutland, and Lincolnshire, and the Nene. The Avon, Cherwell, Leam, and Ouse rise in the county, which has rly. service and is also served by the Grand Union canal.

Northampton is the co. town; other large places are Peterborough, Kettering, and Wellingborough. Higham Ferrers, Towcester, Oundle, Daventry, and Brackley are small boroughs, and there are a number of urban districts. The county has much fertile soil, wheat and barley being grown and cattle and sheep reared on a considerable scale. Boots and shoes are made in the towns and villages. It is famous as a hunting county. For the purposes of administration Northamptonshire is divided into two counties, each having a county council. One is Northampton proper and the other the Soke of Peterborough. Together they elect 4 M.P.s, and 1 for Northampton.

In addition to the cathedral at Peterborough the county has many fine churches, and contains Fotheringhay, Holdenby House, Burghley House, Althorp, Castle Ashby, and Sulgrave Manor, ancestral home of the Washington family. There are remains of castles at Barnwell and Rockingham, earthworks at Arbury and elsewhere, Roman remains at Irchester, and monastic ruins at Irthlingborough and Higham Ferrers. There are some remains of Rockingham, Whittlebury, and Salcey Forests. Pop. 361,313.

LITERARY ASSOCIATIONS. Thomas Fuller was born at Aldwinkle St. Peters and there received his early education; while at the neighbouring Aldwinkle All Saints was born John Dryden. A later poet was John Clare, the peasant-poet, born at Helpston. William Law was born at King's Cliffe, William Paley at Peterborough, John Hervey, the

Northamptonshire. Map of this eastern inland county of England, famous for the manufacture of boots and shoes

author of *Meditations among the Tombs*, at Hardingstone, and James Harington, author of *Oceana*, at Upton. Rockingham Castle was partly described by Charles Dickens as the Chesney Wold of *Bleak House*.

Bibliography. *Victoria History of the Counties of England, Northamptonshire*, W. R. D. Adkins and R. M. Sergeantson, ed. H. A. Doubleday, 1902; *N. in the 20th Century*, W. T. Northamptonshire Regiment. Regiment of the British army. Raised in 1741 as the 48th Foot, it saw its first active service in Flanders in 1744, and earned distinction at Tournai and Fontenoy. The regiment was present at Louisburg, 1758, fought under Wolfe at Quebec in 1759, and for its share in the defence of Gibraltar, 1779-83, gained the castle and key on its badge; the sphinx on its colours commemorates its gallantry in Egypt in 1801. Eleven honours

Northamptonshire Regiment badge

were gained in the Peninsular campaigns. After taking part in the Maori war in New Zealand, it fought in the Crimea, and from 1879 to 1881 took part in the campaigns in S. Africa.

In 1881 the 58th Foot was incorporated into the 48th Foot and the regt. given its present designation. Like the 48th, the 58th, raised in 1750, saw its first active service in Canada in 1758, and then moved to the W.

Indies, gaining the honours Martinique, 1762 and 1794. It spent many years in garrison in India, and in the S. African War won a V.C. at Laings Nek. Thirteen battalions were raised in the First Great War, and earned the following honours: Mons; Marne, 1914; Aisne, 1914, '18; Ypres, 1914, '17; Neuve Chapelle; Loos; Somme, 1916, '18; Arras, 1917, '18; Epéhy; and Gaza. In the Second Great War, battalions of the regt. fought in Burma, Italy, and Madagascar, and in the liberation of Europe. The regimental depot is at Northampton.

Northanger Abbey. Novel by Jane Austen. It was first published posthumously in 1818,

though it had been completed in 1803. Notable for its entertaining descriptions of social life at Bath, and its easy dialogue, the story was designed as a skit on the romantic "Gothic" fiction of the day.

North Atlantic Treaty. See N.V. section, at end of Vol. 10.

North Bay. Town of Ontario, Canada. The capital of the Nipissing district, it stands on the N.E. side of Lake Nipissing. It is served by the main line of the C.P.R. and the C.N.R., and is a terminus of the Temiskaming and Northern Ontario rly. Pop. 16,500.

North Berwick. Royal burgh and watering-place of East Lothian, Scotland. It stands at the entrance

North Berwick arms

to the Firth of Forth, 23 m. by rly. from Edinburgh. With fine sands, it is famous for its golf courses. Behind the town is Berwick Law, a conical hill, 610 ft. high, and near by are the Bass Rock, Tantallon Castle and Dirlton Castle. North Berwick was made a royal burgh about 1400, and was at that time flourishing as a port. Pop. 4,083.

North Berwick, East Lothian. Ruins of Tantallon Castle, formerly a stronghold of the Douglas family

Firth

Northbrook. THOMAS GEORGE BARING, 1st EARL OF (1826-1904). British politician. Born Jan. 22, 1826, he was the eldest son of Sir Francis Baring, who, in 1866, was created Baron Northbrook. Educated at Christ Church, Oxford, he entered parliament in 1857 as a Liberal for Penryn and Falmouth, and the same year was made a lord of the admiralty. In 1866 he succeeded to the peerage. Northbrook

Thomas Baring, 1st Earl of Northbrook

Stereoscopic Co.

was under-secretary for war 1868-72, and during 1872-76 viceroy of India. In 1876 he was made an earl, and during 1880-85 he was first lord of the admiralty. In 1885 he parted from Gladstone, being opposed to Home Rule. He died Nov. 15, 1904. *See Baring; consult also Memoir, B. Mallet, 1908.*

North Cape. Promontory on Magerö Island, N. Norway. Generally accepted as the northernmost point of Europe, its lat. is $71^{\circ} 10' 40''$ N. The most northerly continental point is Nordkyn. It reaches an elevation of 968 ft.

North Carolina. An Atlantic state of the U.S.A., one of the 13 original states of the Union. Its area of 52,712 sq. m. is a little more than that of England. The W. portion, traversed by the Appalachian system, contains many summits above 6,000 ft., a number of which are forest-clad; they are geologically the oldest mts. on the N. American continent. Mt. Mitchell, 6,711 ft., is the highest peak E. of the Mississippi. On the border of Tennessee is the Great Smoky Mt. park. In the centre the surface is undulating, and the coast region is low and often swampy.

The mainland is separated by Pamlico, Albemarle, and Currituck Sounds, and numerous lagoons and inlets form a chain of long and narrow sandy islands or beaches, which throw out three prominent capes, Fear, Lookout, and Hatteras; between these projections lie Onslow and Raleigh Bays. The principal rivers, all flowing to the E., are the Roanoke, Catawba, French Broad, Neuse, Cape Fear, and Great Pedee.

The state grows 70 p.c. of the valuable bright-leaf cigarette tobacco in the U.S.A. It ranks third for value of farm crops, producing cotton and cotton seed, maize, peanuts, sweet potatoes, and peaches. It is the nation's chief source of mica, feldspar, and residual kaolin clay. There are 200,000 acres of virgin hardwoods. Manufactures include cotton and knitted goods, lumber products, tar, resin, flour. Shad and oyster fisheries are important.

There are 17 institutions of higher learning, including the oldest state university in the U.S.A., at Chapel Hill (1795). Two senators and 12 representatives are returned to congress. Raleigh is the capital. Roanoke Island was the site of the first English colony in America, 1585. Pop. 3,571,623, of whom 981,298 are negroes.

Northcliffe, ALFRED CHARLES WILLIAM HARMSWORTH, VISCOUNT (1865-1922). British newspaper

proprietor and pioneer of modern journalism. He was born at Chapelizod, Dublin, July 15, 1865, eldest of seven sons of a barrister-at-law, and was educated at Hampstead. In 1881 he began to practise with success as a free-lance journalist, and at the age of 17

Lord Northcliffe, British newspaper proprietor

was appointed assistant editor of Youth. Moving to Coventry in 1885, he worked for Iliffe & Sons. In 1887, declining the offer of a partnership, he returned to London, where in 1888 he established the weekly journal Answers, forerunner of many other successful periodicals which developed into the gigantic business of The Amalgamated Press (*q.v.*). In 1894 he and his brother Harold, later Viscount Rothermere (*q.v.*), acquired the London Evening News. In the same year he financed the Jackson-Harmsworth Arctic expedition (*see Arctic Exploration*).

Probably the greatest step in his career was the founding of the Daily Mail (*q.v.*), the first number of which appeared May 4, 1896. The bold original lines on which this, the first halfpenny morning newspaper, was organized quickly revolutionised British journalism, over which Harmsworth's influence was vigorously felt during the rest of his life. In 1903 he founded the Daily Mirror, disposing of it to his brother in 1914.

Created a baronet 1904, Harmsworth received a barony the following year, becoming Lord Northcliffe. In 1908 he became chief proprietor of The Times. The "Northcliffe press," which now included the Weekly Dispatch and the Overseas Daily Mail, was the medium by which he constantly endeavoured to exert an influence over public affairs, especially in directing the thoughts of his readers to patriotic and imperial causes.

In the first year of the First Great War both The Times and the Daily Mail played a leading part in the controversy over the supply of munitions (*see Munitions*). Northcliffe was singled out by the German press for particular malignity as the incarnation of the British will to win, and a bronze "hate-medal" of him was struck in 1916. In 1917 he served as chairman of the British war mission in the

U.S.A., being made a viscount on his return. Declining the office of air minister, he became in Feb., 1918, director of propaganda in enemy countries, and his work in this capacity undoubtedly contributed greatly to the rapid collapse of Germany and Austria. In 1921 he undertook a world tour, but serious illness necessitated its curtailment, and he returned to London in 1922, dying there Aug. 14, 1922. He had no children, and the title became extinct.

He stood unsuccessfully for parliament in 1895 as a conservative candidate for Portsmouth. *Consult Northcliffe, H. Fyfe, 1930; My Northcliffe Diary, T. Clarke, 1931; With Northcliffe in Fleet Street, Sir J. A. Hammerton, 1932.*

Northcliffe Glacier. Huge ice mass on the coast of Queen Mary Land (*q.v.*), Antarctica, falling into Robinson Bay. It was discovered and named by Sir Douglas Mawson (*q.v.*); Dec. 25, 1912.

Northcote, HENRY STAFFORD NORTHOTE, 1ST BARON (1846-1911). British administrator. Son of the first earl of Iddesleigh, he was born in London, Nov. 18, 1846, and educated at Eton and Merton College, Oxford. Secretary to his father, then chancellor of the exchequer, 1877-80, he was M.P. for Exeter, 1880-99. He was appointed governor of Bombay, 1899, and created a peer in 1900. During 1904-08 Northcote was gov.-gen. of the Commonwealth of Australia. He died Sept. 29, 1911.

Northcote, JAMES (1746-1831). British painter. Born at Plymouth, Oct. 22, 1746, he moved to London, where the help of Reynolds enabled him to study at the R.A. schools. He was elected A.R.A. in 1786, and R.A. in 1787; he published his Life of Sir Joshua Reynolds in 1813, One Hundred Fables, illustrated by himself, in 1828, and A Life of Titian in 1830. He died in London, July 13, 1831.

James Northcote, British painter

North Dakota. North-central state of the U.S.A.; area, 70,655 sq. m. It is bounded N. by Canada, E. by Minnesota, S. by S. Dakota, W. by Montana. The geographical centre of N. America is in Pierce co., 50 m. W. of Devil's Lake. A Peace Garden of 3,000 acres on the border marks the long peace between the U.S.A. and Canada.

North Downs. The view from Reigate Hill, Surrey, looking westward along the chalk ridge
Wulf F. Taylor

The surface is chiefly undulating prairie, relieved in the N. by the Turtle Mts. and S.W. by isolated "buttes." In the E. is the Coteau des Prairies, a plateau from 1,000 ft. to 2,000 ft. high, and between the Missouri and James rivers is the Coteau du Missouri from 2,000 ft. to 2,750 ft. high; W. of the Missouri intrude the Bad Lands, areas virtually devoid of vegetation, which are now accessible over all-weather highways. The Red River of the North, tracing the "Sioux state's" E. frontier with Minnesota, has a fertile valley forming part of the nation's N.W. granary. The state leads in the production of spring and durum wheat, rye, flax seed, oats, barley, and maize, and does much cattle rearing and dairy farming. In the W. are 32,000 sq. m. of lignite annually producing 2,000,000 tons. Chief educational centres include the university of N. Dakota Agricultural College, and Jamestown College. The capital is Bismarck. Settled c. 1800, it was part of Dakota Territory, formed in 1861, but joined the union as a separate state, Nov. 2, 1889. Two senators and two representatives-at-large are returned to congress. Pop. 641,935. Consult History of N. Dakota, L. F. Crawford, 1931.

North Devon. Island of British N. America, better known as Devon (*q.v.*).

North Downs. Range of broad chalk ridges which traverses the counties of Surrey and Kent, England, from W. to E. and extends 95 m. from Farnham to the English Channel between Dover and Folkestone. The hills are breached by deep gaps, and separate the London Basin (*q.v.*) from the Kent and Sussex wealds. The western end is a narrow ridge, the Hog's

Back, alt. 489 ft. and a quarter of a mile broad at the top. The Wey, flowing S. of the Hog's Back, breaches the Downs at the Guildford gap. Leith Hill, 965 ft., marks the highest point of the range, and a height of 868 ft. is reached E. of Caterham. Box Hill, 569 ft. above Dorking, is a well-known beauty spot. The ridges are followed in several places by the Pilgrims' Way, traditional route of pilgrims from Winchester to Canterbury.

NORTHERN IRELAND: PART OF THE U.K.

Hugh Shearman Ph.D., author of several books on N Ireland

The physical features, industry, and history since 1920 of the N.E. corner of Ireland are here described. For the earlier history of this region see Ireland. See also Eire; articles on Belfast, Londonderry, and other towns: and the colour map facing p. 4564

Northern Ireland is part of the U.K. of Great Britain and Northern Ireland. It is frequently called Ulster, an ancient name applied to a prov. in the N. of Ireland which was at different historical periods rather larger or smaller than the present Northern Ireland.

Northern Ireland consists of the cos. of Antrim, Armagh, Down, Fermanagh, Londonderry, and Tyrone, and the co. bors. of Belfast and Londonderry. It has a total land area of 5,238 sq. m., roughly one-sixth of the whole island of Ireland, and includes much beautiful hill country, glens, and valleys. There is also a considerable area of inland water, including Lough Neagh, the largest lake in the British Isles, drained by the Bann, Northern Ireland's longest river; and the beautiful lake district of Upper and Lower Lough Erne in co. Fermanagh. On the N. and E., Northern Ireland has a seaboard of 245 m., including some splendid strands and lines of lofty cliffs, and is bounded by the Atlantic

North-Eastern Provinces. The official name for the nine provinces of China usually known as Manchuria (*q.v.*).

North-East Passage. Name of a route round the N. of Eurasia to China (Cathay). Attempts to make it, undertaken mainly by Englishmen and Dutchmen, Wiloughby and Chancellor, 1553, and Barents, the Dutch navigator, 1594-95, failed in their main purpose, but succeeded in opening up a trade with Russia in furs, oil, etc. The North-East Passage was eventually accomplished in 1878-79 by N. A. E. Nordenskiöld (*q.v.*). Since 1932, a number of Russian expeditions have made the N.E. passage, and it has now been developed by the U.S.S.R. as a commercial route. See Arctic Exploration.

Norther. Name for the bitterly cold, often snow-filled, N. and N.W. winter winds experienced in Texas and the Gulf of Mexico region. They are caused by the movement of air from an intense anticyclone towards the rear of a vigorous depression over the W. Caribbean Sea, their strength being due to the marked progressive gradients. The norther sometimes results in temperatures falling 30° F. in an hour.

ocean, the North channel, and the Irish sea. There are several large estuaries and tidal inlets along the coast, the Foyle, Larne Lough, Belfast Lough, Strangford Lough, and Carlingford Lough. On the S. and W. there is a land frontier of 200 m. with Eire.

The pop. in Jan., 1947, was 1,348,000. The average density of pop. was 257 to the sq. m. More than half the pop. of Northern Ireland lives in urban areas, a third being in the Belfast area. Northern Ireland has, over many years, had the highest birth rate in the British Isles.

The capital of Northern Ireland is Belfast; with about half a million inhabitants. It is the seat of the government of Northern Ireland. The next largest centre of pop. is Londonderry, with 49,000. Next in size is the popular seaside resort of Bangor, in co. Down, with 20,000. Other towns of over 10,000 are, in order of size, Lurgan, Lisburn, Ballymena, Portadown, and Newry, all inland

market and industrial towns, Larne, a port town, and Newtownards. Other still smaller towns, however, have an important place in the life of the prov. and include the historic little cathedral city of Armagh, the ancient port of Carrickfergus on Belfast Lough, Coleraine, a river port on the Bann, Enniskillen and Omagh, the co. towns of Fermanagh and Tyrone, and the seaside resorts of Portrush, Donaghadee, Portstewart, and Newcastle.

Belfast is the main transport junction of the prov. and the principal port. Thus, of 11,043 vessels arriving in Northern Ireland in 1945, 8,940 arrived at Belfast harbour or the small adjacent ports of Belfast Lough. Belfast is linked by passenger steamship services to Heysham, Liverpool, and Glasgow. There is also a regular passenger service between Larne and Stranraer in Scotland. Londonderry, too, is a port of importance. There is an airport at Nutti's Corner, co. Antrim, several miles from Belfast, and a smaller airport beside Belfast harbour. There is no customs barrier between Northern Ireland and the rest of the U.K., but there is one between Northern Ireland and Eire.

Internal Transport

Much of the internal traffic is by road, several light rlys. having been superseded by road transport. Most of the road transport services are nationalised and are operated by the Ulster transport authority, set up in 1948. Public transport in Belfast, however, is under the city corporation, and private carrying firms are allowed in Belfast and Londonderry. Motor hackney carriages and transport for particular trades also remain in private control.

There are three main rly. systems, also controlled by the Ulster transport authority. The Northern cos. line of the former L.M.S. system serves the cos. of Antrim and Londonderry and a part of Tyrone. The Great Northern line serves all the cos. to some extent. Its main line goes S. from Belfast to Portadown, where one main line branches E. and serves Armagh, Tyrone, Fermanagh, and Londonderry; another goes S. across the frontier to Dublin. The Belfast and co. Down line serves N. and E. Down. The parliament of Northern Ireland, which placed the rlys. and roads of the prov. under the control of the Ulster transport authority, purchased the Belfast and co. Down rly. in 1948. Of six

inland waterways in use, the Lower Bann navigation is controlled by the ministry of finance and the rest remain under the control of private companies. They do not carry much traffic.

CONSTITUTION AND ADMINISTRATION. The Government of Ireland Act, 1920, of the U.K. parliament set up two legislatures in Ireland, one of them in Belfast for Northern Ireland, to which was delegated control over certain local matters. At the same time, Northern Ireland had a federal status within the U.K., electing 13 members to the house of commons at Westminster. Various amending acts have not altered the fundamental principles of that settlement. The frontiers of Northern Ireland were guaranteed by a tripartite agreement made in 1925 between the govts. of the U.K., the Irish Free State, and Northern Ireland. A considerable part of the public affairs and public services is under the direct control of the U.K. parliament, and the local parliament of Northern Ireland may not legislate with regard to them. Subjects thus reserved include: the crown and the succession, peace, war or neutrality, the armed services, relations with foreign powers or with other parts of the British Commonwealth, titles of honour, treason, extradition of fugitive offenders, naturalisation, aliens, foreign trade, navigation by sea or air, the post office, submarine cables, radio, lighthouses, coinage, weights and measures, trade marks, copyright, and patents. In these and other respects, Northern Ireland has exactly the same status as England, Wales, or Scotland.

Parliament and Finance

The parliament of Northern Ireland consists of a house of commons of 52 members elected by universal adult franchise, and a senate or upper house of 24 members elected by the house of commons, together with two ex officio members, the lord mayor of Belfast and the mayor of Londonderry. The house of commons has a maximum life of five years; an elected senator holds office for eight years. There is a prime minister of Northern Ireland, and ministries have been established dealing with finance, home affairs, labour, education, agriculture, commerce, public security, and health and local government. The head of the govt. and representative of the king is the governor. He summons, prorogues, and dissolves the parliament and gives assent in the name of the king to its legislation

Broadly speaking, the taxation of Northern Ireland is the same as that in other parts of the U.K. Taxation revenue of the prov. goes into the U.K. exchequer, and the imperial contribution is retained by it to pay for Northern Ireland's share of general national expenditure. Then a sum, c. £9,000,000, is handed back to the N.I. govt. to pay for those services delegated to it. The sum thus handed back is decided each year, by a joint exchequer board consisting of a chairman appointed by the crown and a representative each from the U.K. Treasury and the Northern Ireland ministry of Finance, on the principle that Northern Ireland shall have equality in social services with other parts of the U.K. and a position of relative equality in all other services, taking into account local conditions. The imperial contribution in the first 25 yrs. of the existence of the govt. of Northern Ireland was c. £250,000,000. The U.K. exchequer also deducts from Northern Ireland taxation about £3,000,000 a year, the cost of certain administrative expenses, loan charges, etc.; and the govt. of Northern Ireland may impose a small range of taxes, e.g. death duties, stamp duties, motor vehicle duties, and entertainments duty.

Local Government

There are five main types of local govt. authority, all elected: the corporations of the two co. bors. of Belfast and Londonderry; the bor. councils of the various towns which have been given bor. status, such as Ballymena, Bangor, Coleraine, Larne, and Newtownards; the urban dist. councils serving other towns; the six C.C.s; and more than 30 rural dist. councils. Other public bodies, e.g. water and harbour commissioners, fulfil special functions. Local govt. bodies work under the general supervision of the ministry of Health and Local Government. The annual expenditure of local govt. bodies is more than £12,000,000, about a quarter from rates, another quarter from govt. grants, the remainder earned by public utility depts., transport, housing, etc. Capital indebtedness of local govt. bodies is c. £20,000,000. Northern Ireland has its own judicial system, modelled on the English pattern, with an ultimate appeal to the house of lords. The petty sessions courts are presided over by paid professional resident magistrates sitting alone; the judicial powers of J.P.s have been abolished

RELIGION AND EDUCATION. One third of the pop. is R.C. Among the Protestants the largest denomination is Presbyterian, the second largest church of Ireland, a Protestant episcopal body in the Anglican communion. Schools are run by local govt. bodies, and by private and religious bodies, under the supervision of the ministry of Education; attendance at a place of education is to be compulsory up to 16. The ministry has its own training college for elementary teachers. Belfast is the seat of Queen's University; Londonderry has an arts school at Magee College, where students are prepared for the examinations of Trinity College, Dublin. There are many technical schools throughout the province; and a number of organizations encourage cultural interests and activities.

INDUSTRY AND TRADE. Farming is the largest industry, providing before 1939 about a third of Northern Ireland's total exports. Manufactured exports increased during the Second Great War, but the produce of the land remained a large part of the total. There are over 90,000 agricultural holdings larger than one acre, 70 p.c. of the agricultural area being farms of 15 to 100 acres. Mixed farming is usual, and much of the crops grown is used to feed livestock and poultry. Chief crops are oats and potatoes, with smaller areas of roots and kale, flax and seed hay. Fruit farming is carried on, particularly in co. Armagh; canned foods and milk products are exported. Most important agricultural exports are fat and store cattle, fat lambs, bacon, eggs, butter, grass seed, seed potatoes, and apples. From 1924 the ministry of Agriculture has enforced a sound system of collection, marketing, grading, packing, and inspection. The ministry has also done much to extend agricultural education. Mechanisation has made rapid progress even on very small farms.

Fisheries are carried on, for eel and pollan on Lough Neagh and for salmon on the N. coast. White fish is landed at Portavogie, Kilkeel, and Annalong in co. Down, and a herring fleet operates from Ardglass, also in Down.

Ulster linen is one of the most important exports of the U.K. as a whole. Other textile manufactures are cotton and rayon. There is a considerable clothing industry. At Belfast there is a large ship-building industry; and a great succession of record-breaking liners,

warships, and vessels of every kind has earned Belfast shipyards a world-wide reputation. Much marine engineering and repair work is done. There is large scale manufacture of ropes and cables, foundry work, and the making of small mechanical devices and equipment. Aircraft, paper, whisky, jam, soap, boots and shoes, furniture, artificial limbs, metal boxes, and plastics are other types of goods made.

In 1946 Northern Ireland's exports amounted to £127,666,000, nearly £100 per head of the pop., while imports were £125,141,000. Exports of food and drink were £17,015,000; articles wholly or mainly manufactured £63,427,000; tobacco, ropes, aircraft, ships, and shipping repair work £34,878,000; livestock £8,445,000.

HISTORY. The govt. of Northern Ireland, led by Sir James Craig (later Viscount Craigavon), was established in 1920; its depts. were set up and powers handed over during 1921. Northern Ireland suffered as the result of the stormy conditions under which the Irish Free State was established in 1922. When a civil war broke out in the Free State in 1922, it overflowed into Northern Ireland, and the prov. was disturbed by many episodes of bomb throwing, shooting, and incendiarism. These troubles died down, but they left a legacy of bitterness.

The Unionist govt. of Sir James Craig remained in office until his death in 1940. The Unionist party (in favour of the union with Britain) continued to have strong majorities at all general elections. Lord Craigavon was succeeded as prime minister by J. M. Andrews, and he in turn in 1942 by Sir Basil Brooke, Bt. As those who support the union do not necessarily agree on other subjects, groups and movements inside the Unionist party had much importance. The policy of the govt. might be described as a progressive conservative policy, going somewhat "left" of English Conservatives in its application of principles of public control to many undertakings, but repudiating any specific Socialist doctrine. The parl. opposition has consisted of several groups of Irish nationalists and three competing labour parties.

The economic depression from 1930 afflicted Northern Ireland with particular severity on account of the province's dependence upon export trade. But with the outbreak of war in 1939, Northern Ireland came to have increasing

importance, particularly in view of Eire's neutrality. Northern Ireland contributed many able men and women to the forces, among them officers of high rank, e.g. Sir John Dill, Lord Alanbrooke, Lord Alexander, and Sir Claude Auchinleck. Her agricultural and industrial capacities were of major importance. The farmers of Northern Ireland made a large proportionate contribution to the home-produced food supply than the agriculturists of any other part of the British Isles. The Belfast shipyards contributed 140 warships and 10 p.c. of the whole merchant shipping tonnage built in the British Isles. There was a large output of tanks, guns, and ammunition, aircraft, including 1,500 heavy bombers, accessories, including some 2,000,000 parachutes and a third of the ropes produced in the U.K. for the War office. The textile industry produced 90 p.c. of the shirts used by the British forces. Northern Ireland was also of very great strategic importance, providing vital bases from which the Atlantic could be patrolled, and it received the first U.S. troops sent to train in the U.K. for the invasion of Europe. During the Second Great War the Ulster cabinet became a coalition of Unionist, Labour Unionist, and Commonwealth Labour members. The general election of 1945 again gave the Unionists a strong majority.

NORTHERN IRELAND TALENT. The community which inhabits Northern Ireland is chiefly English and lowland Scot in its tradition and ancestry. Few areas in the world have produced so many talented men and women proportionately. Besides field marshals, Northern Ireland has produced administrators such as Sir Robert Hart, scientists such as Lord Kelvin, inventors such as J. B. Dunlop, pioneers in medicine such as Sir Robert McCarrison. Skill and mechanical ability are widely diffused. Northern Ireland artists of note include Lavery, William Conor, and Paul Henry; among writers are Forrest Reid, Robert Lynd, St. John Ervine, and Louis MacNeice. Belfast is increasingly a cultural centre.

Northern Lights. Name popularly given to the phenomenon of the Aurora Borealis (*q.v.*).

Northern Line. London railway. The first section was opened in 1890 as the City and S. London tube, and ran from King William Street to Stockwell, a distance of $3\frac{1}{4}$ m. It was subsequently joined to the Hampstead and Highgate tube rly., and extended in both directions, and by 1941 had N. termini at High Barnet and Edgware and S. terminus at Morden, a distance of $40\frac{1}{2}$ m., most of which is underground. Taken over with the other underground railways by the London Passenger Transport Board in 1933, it was nationalised in 1948 and operated by the London Transport Executive.

Northern Rhodesia. British protectorate in S. Africa. It lies between long. 22° and 33° E. and between lat. $8^{\circ}15'$ and 18° S. It is completely surrounded by neighbouring territories, Angola, Belgian Congo, Tanganyika, Mozambique, Southern Rhodesia, and South-West Africa. It has an est. area of 290,320 sq. m., consisting for the most part of a vast tableland 3,000-5,000 ft. in height. Around the Zambesi R., which forms the greater part of the southern boundary, there is magnificent scenery, including the Victoria Falls, one of the natural wonders of the world. The country has luxuriant forests and is well watered owing to the vast swamps.

The European pop. (1946) is close on 22,000; est. African pop. 1,400,000; Asiatic pop., mostly British Indians, about 1,100. The Europeans are settled mostly near the rly. running from Southern Rhodesia to the Belgian Congo via the Victoria Falls, or in the copper belt in the neighbourhood of the Belgian Congo.

It was not until 1851, when Livingstone began his great missionary journeys, that authentic information was obtained about this territory. Before 1899 it was included in the charter of the British South Africa Co. In 1924 the British government assumed control and appointed a governor, assisted by an executive council (officials only) and a legislative council (partly elected non-officials).

In its earlier stages the territory was mainly agricultural, the chief products being maize, live-

stock, and tobacco, but rich copper deposits have been discovered and developed into an extensive industrial area employing many Europeans and natives, and it is now one of the world's chief copper-producing areas. Other minerals developed include zinc, which ranks next to copper in importance. Consult An African Survey, Lord Hailey, 1938. For map, see Southern Rhodesia.

Northern Territories. A British protectorate of W. Africa, attached to Gold Coast colony. It is bounded N. and W. by Ivory Coast, E. by Togoland, and S. by Ashanti. Placed under British protection in 1901, it is peopled by Muslim Hausas and negroes, engaged in agriculture and stock rearing. The cap. and chief tn. is Tamale. Area 30,486 sq. m.; pop. (1948) 1,077,138.

Northern Territory. Part of Australia directly administered by the Commonwealth itself. It lies between meridians 129° and 138° E., N. of 26° S., with a coast-line on the Arafura Sea and the Gulf of Carpentaria. From 1863 it formed the N. part of South Australia, and with this status joined the Commonwealth in 1900, but in 1911 it passed under the control of the central authority. The S. comprises a highland area, Macdonnell Ranges, part of the Central Australian desert, although water is found in the valleys and can be reached by artesian bores; northwards lies the plateau with extensive pastoral areas suitable for cattle runs.

The people live mainly in the N. Gold, copper, tin, and wolfram are mined. Darwin is the chief port, and the terminus of the overland telegraph and of the N. section of the Transcontinental Rly. Area 523,620 sq. m. Pop. 20,000 (14,500 aborigines). From 1927 to 1931 the territory was divided into North Australia, with 287,220 sq. m., and Central Australia, with 236,400. Newcastle Waters is the capital of North and Alice Springs of Central Australia. Consult N. Australia, C. P. Conigrave, 1936.

Northern Union. The professional British Rugby football organization from 1895 to 1922, renamed Rugby League in the latter year. See Football.

Northfield. Dist. of Worcestershire, England, now a suburb of Birmingham. It has a rly. station, and the principal industries are the manufacture of nails and other forms of hardware. Pop. 46,000.

Northfleet. Urban dist. of Kent, England, adjoining Gravesend. It is on the Thames, 22 m.

from London, with a rly. station. The church of S. Botolph is a fine building, partly Perpendicular. The industries include the manufacture of cement, paper, and chemicals. Pop. 18,785.

North Foreland. Headland of Kent, England. Off here three actions were fought in the wars with Holland. The first battle opened June 2, 1653, with an attack by the English admirals, Monk, Deane, and Lawson, on the Dutch fleet of Tromp. With the arrival of Blake on the following morning the Dutch made a hasty retreat, having lost heavily.

The second battle was begun June 1, 1666, by Monk's attack on the Dutch under de Ruyter, and lasted for four days. On the 2nd the battle opened early, and went against the English. The next morning Prince Rupert hastened to Monk's assistance, but after heavy fighting on the 3rd and 4th, the English were obliged to make the Thames, having lost 20 vessels and 6,000 men. A third battle, fought July 25 and 26, 1666, resulted in the flight of the Dutch. See Foreland, N. and S.

North German Confederation. Alliance formed in 1866 by 22 sovereign German states. The German Confederation of 1815 was broken up by Prussia's attack on her fellow-member Austria in 1866. After the defeat of Austria, a new alliance, the North German Confederation, was formed, Aug. 18, 1866, consisting of Prussia and the remaining states of the old Bñd N. of the Main, except Luxemburg, which was divided between Holland and Belgium. On April 16, 1867, a constituent assembly ratified the constitution, which was proclaimed on July 1. The Bund had an area of 160,000 sq. m. and a pop. of 30,000,000. See Bismarck; Bund; Germany; Prussia.

North Holland. Province of the Netherlands, described under Holland.

North Island. The smaller and more northerly of the two main islands of the dominion of New Zealand. It has a lat. corresponding to that of S. Spain, a more equable temperature and more evenly distributed rainfall than S. Island, and is more definitely suited to the pastoral industry. The E. and S.E. contain probably the finest sheep country in the world, and the S.W. is ideal for dairy cattle. The N. is steadily developing a fruit industry. North Island comprises four provincial districts: Auckland, Hawke's Bay,

Wellington, and Taranaki; and contains in Auckland and Wellington the two largest cities of the dominion. Rlys. connect Wellington with Auckland, Napier, and New Plymouth. Area, 44,280 sq. m. Pop. 1,146,292. See New Zealand.

Northmen. Name given to Scandinavian sea-rovers who began their incursions upon the coasts of W. Europe late in the 8th century. The names Northmen and Viking cover four groups: the Swedes and the Goths, who confined their attentions mainly to the Baltic shores; the Danes from Jutland and Slesvig; and the Norsemen from Norway; though both Danes and Norsemen were names sometimes applied to the whole. In England, the name of Ostmen, the men from the East, was sometimes applied.

The first recorded raids on English, Irish, and French soil respectively are dated in 787, 795, and 799. In the first instance the raids of the Northmen were mere landings in search of booty by pirate crews composed of free warriors who followed some captain of repute. During the early part of the 9th century they were still for the most part ravaging in small bands. Then the small bands began to grow into confederate fleets, Danes and Norsemen acting together.

In the second half of the 9th century supreme kings were establishing themselves in both Denmark and Norway; and this process encouraged minor chiefs to seek other lands and to settle. Danish hosts established themselves in England and made themselves masters of the whole district known as the Danelagh; though Alfred drove them out of Wessex, and in the next century his son and grandson forced them to own the overlordship of the king of England. In France the Viking hosts met with a check when they laid siege to Paris in 885.

After the permanent establishment of the Danelagh in England, and the dukedom of Normandy in France in 912, raiding France and England ceased to be a profitable employment for Danes and Norsemen, though the latter acquired a supremacy in the extreme N. of Scotland, over the islands of the Hebrides, and on the E. coast of Ireland, until their efforts at further conquest in Ireland were finally checked by a crushing defeat at Clontarf at the hands of Brian Boru in 1014. In the days of Ethelred II, at the close of the 10th century, Danish and Norse raids upon England revived; but

the Danish leader Sweyn became king first of Denmark, and then in 1013 of England as well, and in the reign of Canute Denmark finally lost the characteristics of a pirate state. See Danelagh; England: History; Goths; Norman; Norse; Russia; Viking.

Northolt. Village of Middlesex, England. It is 2½ m. S.S.W. of Harrow. The aerodrome, a terminus for flights to Europe, was used by the R.A.F. as a fighter station in the battle of Britain. In 1946 the adjacent racecourse was acquired as a housing site.

North Pole. Lat. 90° N., one terminus of the earth's axis. The pole itself is the central point of the shallow Arctic basin wherein lies the Arctic Ocean. The geographical N. pole must not be confused with the N. magnetic pole which is (1950) some 1,000 m. distant, i.e. approx. 74° N., 100° W. See Arctic Exploration.

North Rhine-Westphalia. A Land of W. Germany, in the British zone of occupation, formed 1946 from the N. half of the former Rhine (q.v.) prov. and the former Westphalia (q.v.) prov. In 1949, 10 p.c. (1,200,000) of its pop. were refugees and expelled persons.

North Riding. One of the three administrative divisions (A.S. *thriding*, third part) of Yorkshire, England, and for many purposes a co. of itself, with its own admin. centre, Northallerton. The North Riding is mainly agricultural, but there are rich iron deposits in the Cleveland district. Middlesbrough is the largest place, Scarborough and Whitby are seaside resorts, and other towns are Pickering, Malton, Thirsk, Richmond, Hawes, and Bowes. The Derwent marks the boundary with the E. Riding, and the Ure part of that with the W. Riding. In the extreme W. the fells rise over 2,300 ft. Area, 2,128 sq. m. Pop. 469,375. See Yorkshire.

Northrop, JOHN HOWARD (b. 1891). American biochemist and biologist. Born in New York, July 5, 1891, he was educated at Columbia university and in 1915 was appointed an assistant at the Rockefeller Institute for Medical Research. He was in the U.S. chemical warfare department in the First Great War, and later held various research posts, becoming a lecturer at Johns Hopkins university in 1940. In the Second Great War he was a consultant to the national defence research committee. For his researches into the purified production of enzymes and virus proteins he shared with Prof. W.

M. Stanley (q.v.) half the 1946 Nobel prize for chemistry. In 1939 he published *Crystalline Enzymes*.

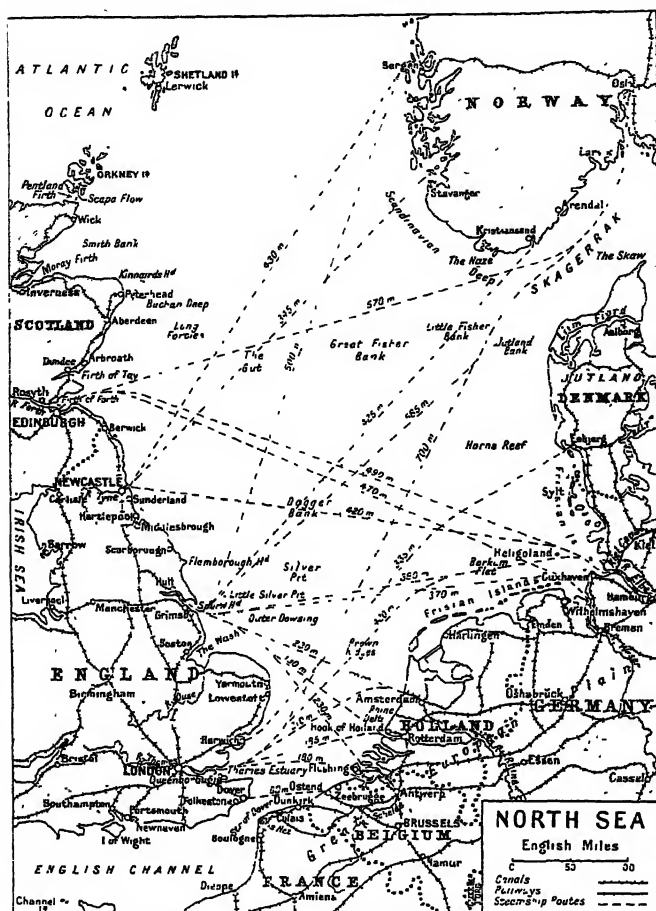

North Sea. Arm of the Atlantic Ocean, and the most easterly of the British seas. It covers part of the continental shelf of W. Europe, and except for the Scandinavian deep, over 2,400 ft., off the S. of Norway, it is relatively shallow, with an average depth of 120 ft. in the S. and 350 ft. in the N.

This sea being physically a connexion between the lowlands of E. Britain and the great European plain, its coast-line is not a permanent feature; the former Zuyder Zee was an accidental enlargement, and English coastal areas are being slowly removed, while the great rivers tend to fill it with their loads of sediment, so that the Rhine delta and the Thames estuary experience encroachments of the land on the sea. Structurally the North Sea is part of the lowland between the old mountains of Scandinavia and Scotland and the middle-aged mountains of S. England, Belgium, and N. Germany. The S. outlet by the Strait of Dover is not inherent to the structure, and occurred in a comparatively recent geological epoch. Between these ranges the rivers form one system which, in the days before the area was drowned, when the plains were connected by dry land, may have all—Thames, Ouse, Lower Rhine, Elbe, etc.—joined to make one great N.-flowing river.

The submarine surface is marked by inequalities; the Dogger, Jutland, and Great Fisher banks are submarine ridges, the Silver and other pits are submarine hollows. The waters slowly circulate, a S.-flowing current along the British coast becoming a N.-flowing current on the Eastern shore; the tides are unusually complicated; they enter by the Strait of Dover and round Scotland, flowing S. along the British coast and N. along the E. shore, scouring the great estuaries on both sides.

Owing to these movements the floating eggs of the food fishes are widely distributed, and the shoals of fish, such as the herring, appear to follow regular movements which control the work of the trawlers. These fish feed on the large quantities of the lower forms of animal and vegetable life in which the North Sea abounds, and thus this marine area is one of the chief of the world's fisheries.

Commercially the North Sea is the most important water area in the world, and historically, with

North Sea. Chart showing the fishing banks and steamship routes between Great Britain and the principal Continental North Sea ports

the English Channel, it is a predominant physical feature of W. Europe. Its area is 190,000 sq. m.; maximum breadth 420 m., and length 700 m.

From the earliest times Great Britain's security has depended upon her control of the North Sea, without which she would be open to invasion. It was across the North Sea that the Vikings sailed, and the same route was taken by the Saxon invaders. It was not until Alfred the Great established English naval power that the coasts of Great Britain became comparatively secure.

By the beginning of the 15th century England had gained virtual control of the North Sea, which became the route for trade with the Low Countries. The only interference was from the attacks of pirates. English security in the North Sea was due greatly to the fact that countries with North

Sea coastlines were constantly at war, and, except Holland, none became sufficiently strong to dispute English supremacy. Even the Dutch avoided fighting general naval engagements in the North Sea, and their warlike activities were generally confined to demonstrations or forays. Similarly, the French and Spanish fleets avoided the North Sea, where Great Britain was always in a position to concentrate overwhelming naval strength; moreover, in order to reach the North Sea, Spanish or French ships had to pass through the English Channel. The only hostile Spanish warships which entered the North Sea were the storm-battered remnants of the defeated Armada in 1588.

On the other hand, the North Sea was open to British warships and transports taking troops to the Continent, and it was command of the North Sea that made

it possible to maintain large continental British armies in the 16th, 17th, and 18th centuries. When these armies met with disaster it was always after they had landed, and was never due to inability to transport and maintain them by sea.

It was not until the development of the German empire in the last decades of the 19th century that any nation became strong enough to dispute British supremacy in the area. Germany set out to achieve naval parity with Great Britain; these ambitions were openly declared when Kaiser William II rechristened the sea the German Ocean.

North Sea in the Two Wars

Nevertheless, from the outbreak of the First Great War, Great Britain retained virtual control of the North Sea and was able to maintain a strict blockade, and virtually to close its waters to enemy surface vessels. The Royal Navy laid vast minefields to block its approaches; cruisers and destroyers patrolled unopposed; and battle cruisers operated as far afield as the Skagerrak. German warships were unable to patrol even their own coastline, and when they did venture far into the North Sea they met with disaster, as at the Dogger Bank, Jan. 24, 1915. It was only by sailing in the territorial waters of neutrals that they were able to maintain merchant traffic.

In the Second Great War, Germany repeated her 1914-18 policy of keeping her main surface fleet intact. On the other hand, Great Britain was in a less advantageous position than in the First Great War, primarily because she was unable to hem in the enemy with a great minefield. One was laid parallel to the east coast of Great Britain shortly after the outbreak of war in 1939, and this successfully prevented any German warships except shallow-draft E-boats attacking North Sea shipping. With her occupation of the European coast from Norway to Ushant, Germany had innumerable bases for air operations over the North Sea, and throughout most of the war British warships and merchantmen required heavy anti-aircraft protection. Except when a definite object was in view, major units of the Royal Navy used the North Sea little in the early years of the war and most of the British patrolling was confined to cruisers, destroyers, and motor-torpedo boats working in close cooperation with shore-based aircraft. Gradually the Royal

Navy and R.A.F. regained control, and by 1941 were in a position to ensure the safe passage of a number of expeditions against occupied Norway, besides carrying out attacks on supply convoys.

In the summer of 1942 the initiative in the North Sea clearly passed to the Allies. E-boats, no longer offensive, took up the defensive duty of protecting German convoys from attack. From 1943 onwards the British Home Fleet made periodical sweeps right up to the Norwegian coast. Virtually the only damage was by air-laid mines. After the Allied invasion of Europe in June, 1944, operations to check enemy forces coming down from Norway were almost unopposed, while U-boats suffered heavy losses. The clearing of the minefields occupied large fleets of British and German sweepers for nearly a year after hostilities ceased. See *Dogger Bank*; *Jutland*; *Skagerrak*. Consult *The Battle of the Narrow Seas*, P. Scott, 1945.

North Sea Fisheries Convention. Agreement made at The Hague in May, 1882, between Great Britain, Germany, Belgium, Denmark, France, and Holland, with power reserved to Sweden and Norway to come in on giving notice. This convention declared that the fishermen of each country should have the exclusive right of fishing within a distance of 3 m. from low-water mark along the whole extent of their respective countries, as well as of dependent islands and banks. As regards bays and inlets the 3 m. were to be calculated from a line drawn across the bay in the part nearest the entrance where the bay did not exceed 10 m. in width.

Other clauses stated that fishing boats were to be registered, and to bear their registration marks and numbers distinctly marked, and to carry official papers showing their nationality. Minute rules and regulations governed the manner of fishing and the behaviour of fishing boats to each other, e.g. the right to cut entangling lines. The regulations were to be enforced by means of special cruisers having the right of visit, search, and arrest. The arrested boat was to be handed over to its own country to be dealt with and punished.

North Somerset. This island of British N. America is noted as Somerset.

North Staffordshire Regiment. Regiment of the British army. Raised in 1756 as the 64th Foot, the regiment earned its

first battle honour at Guadaloupe and fought in the

North Staffordshire Regiment badge

the Sikh War, the 64th Foot went to the Persian Gulf in 1856 to assist in suppressing piracy, one of the few British units to carry the battle-honours *Reshire*, *Bushire*, and *Koosh-ab*. It fought in the Crimea, and in 1876 was in garrison at Malta, when it received its alternative title, *The Prince of Wales's*, and was granted the prince of Wales plume, which now forms part of its badge.

In 1881 the 64th Foot absorbed the 98th Foot, which had been raised in 1824. The amalgamation is commemorated in the Stafford knot incorporated in the regimental badge. The 98th had distinguished service in the China War, 1840-42, and later fought in the Crimea. The combined regiment served in the Sudan in 1896 and earned much distinction in the S. African war. Seventeen battalions of the regt. were raised in the First Great War, winning six V.C.s and the battle honours *Armentières*, 1914; *Somme*, 1916, '18; *Arras*, 1917; *Messines*, 1917, '18; *Ypres*, 1917, '18; *St. Quentin Canal*; *Sari Bair*; *Kut-el-Amara*, 1917; and *N.W. Frontier*, 1915. The regiment served in France, N. Africa, Italy, and Burma in the Second Great War. The regimental depot is at Lichfield, Staffordshire.

North Star. Another name for the Pole Star (*g.v.*).

Northstead, MANOR OF. The stewardship of this Yorkshire manor is an office of profit under the crown, and acceptance of it will enable an M.P. to resign his seat, which he cannot do directly. See *Chiltern Hundreds*; *Member of Parliament*.

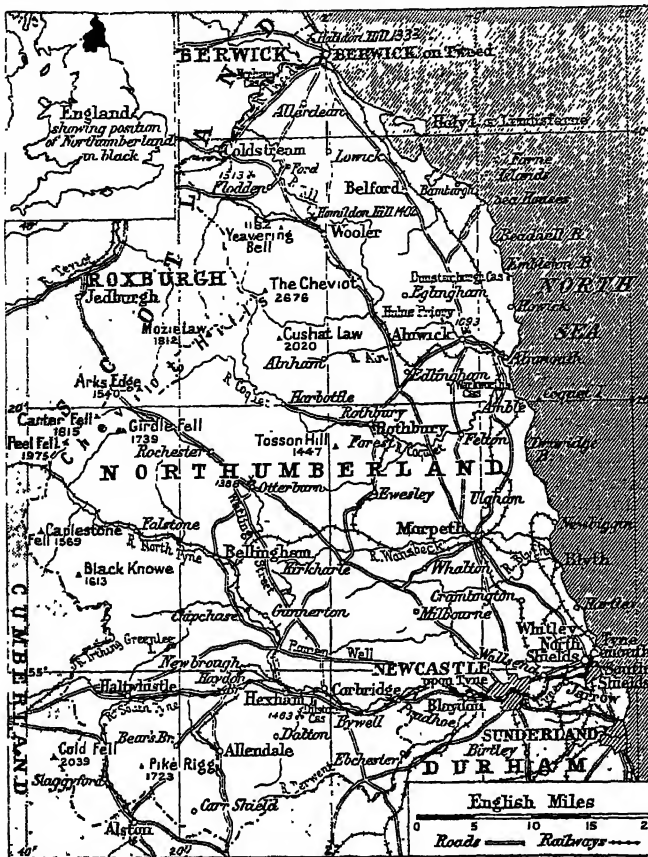

Northumberland. County of England. The most northerly of all, it is separated from Scotland by the Cheviot Hills and the Tweed. Its area is 2,018 sq. m. and it has a long coast-line on the North Sea. From there the surface rises to the Cheviots, the highest point of which is 2,676 ft., and it varies between moorland and verdant undulations, intersected by fertile and wooded valleys. A geological feature is the

Great Whin Sill, a sheet of basalt forming a succession of crags stretching with intervals from the N.E. into Cumberland.

The chief rivers are the Tyne, Tweed, Till, Wansbeck, Aln, and Coquet, and there are several small lakes, Greenlee Lough being the largest. Off the coast are Coquet and Holy Islands, and the Farne Islands. Agriculture flourishes along the coast and in the valley districts, and the rearing of Cheviot sheep and Durham short-horns is actively pursued. There is a coalfield in the S. part of the county, and the urban industries are mainly associated with this. Newcastle-upon-Tyne is a co. of itself, and Alnwick is the co. town; other places are Tyne-mouth, Berwick-on-Tweed, Wallsend, Morpeth, and Hexham. Blyth is a fishing port, and there are several populous urban districts in the mining area. There are 3 co. and 7 bor. constituencies. Northumberland forms the diocese of Newcastle.

In Anglo-Saxon times Northumberland formed part of the kingdom of Bernicia, and then of Northumbria. Its history is dominated by the fact that it was on the border between England and Scotland, and was the scene of centuries of constant warfare. It was protected by fortresses, and herein are Flodden, Otterburn, Homildon Hill, and other battlefields. The county contains also Bamburgh, Lindisfarne, and the castles, now mainly ruins, at Norham, Dilston, Warkworth, Dunstanburgh, Bamburgh, and Prudhoe. Alnwick has been largely rebuilt; Ford and Chipchase are also mainly modern. The Roman Wall passes through the county. Pop. 756,782.

LITERARY ASSOCIATIONS. From its position as a border county Northumberland has rich association with the old ballad literature of the border district. Among these ballads may be named *The Brave Earl Brand*, *Jack and Tom*, *The Baillie of Berwick*, *Sir Arthur and Charming Mollee*. Bamburgh is reputed by some to be the Joyous Gard of Arthurian legend; it is the scene of much prose and verse concerning *Grace Darling*, and of *Bessant's Dorothy Forster*. Much of the action of *Scott's Marmion* takes place in the county (Flodden, Holy Isle, Norham). *Swinburne* wrote of the county. At Warkworth was born the 17th century historian, *John Rushworth*, and the hermitage there afforded the subject of *Bishop*

Northumberland. Map of the north-eastern county of England, famous for its historical associations with the Scottish border

Percy's The Hermit of Warkworth. At Newcastle was born Mark Aken-side. Thomas Bewick came from Cherryburn, near Newcastle.

A history of the co. in 9 vols. was issued by its historical committee, 1893-1909.

Northumberland, DUKE OF. Title held since 1766 by the family of Percy. There was an earl of Northumberland at the time of the Norman Conquest and afterwards, but as an hereditary title it dates from 1377, when Henry Percy, Baron Percy, was made earl. He was killed at Bramham Moor in 1408 and the title was forfeited, but it was restored to his grandson and stayed with his descendants until the 11th earl died in 1670. During 1551-53 there had been a duke of Northumberland, John Dudley (v.f.). From 1683 to 1716 George Fitzroy, a natural son of Charles II, was duke of Northumberland, but he died without sons.

The 11th earl's daughter married Charles Seymour, duke of Somers-

set (1662-1748), and their son Algernon, the 7th duke, was made earl of Northumberland in 1749. He had no sons, and the earldom passed to his son-in-law, Sir Hugh Smithson, who took the name of Percy. In 1766 he was made duke of Northumberland. In 1875, when the 4th duke died, the title passed to a grand-nephew, George, earl of Beverley, and from him the later dukes are descended. Henry George Alan, 9th duke (1912-40), was parliamentary private secretary to the lord privy seal, 1935, and to the secretary for Air, 1936. Killed in action with the B.E.F., May 21, 1940, he was succeeded as 10th duke by his brother, Hugh Algernon (b. April 6, 1914), who became in 1945 a lord in waiting. The duke's chief seat is Alnwick Castle, and he owns Syon House, Brentford, and Albury Park, Guildford. An eldest son is called Earl Percy. See Percy.

Northumberland, JOHN DUDLEY, DUKE OF (c. 1502-53). English soldier and politician.

The attainer of his father, Edmund Dudley (c. 1462-1510), was reversed by Henry VIII, and as Viscount Lisle, John proved himself a soldier and administrator of ability. In 1547 he was made earl of Warwick and defeated the Scots at Pinkie. He became earl marshal and duke of Northumberland in 1551. He sought to consolidate his position by the marriage of his son Guildford to Lady Jane Grey, May, 1553, but his plan to make himself the power behind the throne collapsed with the accession of Mary, and on Aug. 22 he was executed for treason. He was the father of Elizabeth's earl of Leicester.

John Dudley,
Duke of
Northumberland
After Holbein

Northumberland Avenue. A London thoroughfare. Connecting Trafalgar Square with the Victoria Embankment, it derives its name, like the neighbouring Northumberland Street, once Hartshorn Lane, from the former Northumberland House, which stood on the S. side of Charing Cross, 1605-1874. Opened in 1876, it contains the buildings of the Royal Empire Society, the Constitutional Club, offices of the S.P.C.K. and the Standard Bank of S. Africa, the Playhouse Theatre, and the former Victoria and Metropole hotels, which were taken over by the War office in the Second Great War.

Northumberland Fusiliers. ROYAL. Regiment of the British army. Raised privately in Holland in 1674 for service with the Dutch in their war against France, the regiment came to England in 1685 and was taken on the establishment as the 5th Foot. It served in Ireland with William III and then went to Flanders. At the battle of Wilhelmstahl in 1702 it defeated a French grenadier regiment, whose badge it adopted, though it was not designated a fusilier unit until 1836. It also captured the French colour which is still trooped every S. George's day. Service in the W. Indies earned the honour St. Lucia, 1778, and twelve honours and the regimental nickname,

Northumberland

Ireland with William III and then went to Flanders. At the battle of Wilhelmstahl in 1702 it defeated a French grenadier regiment, whose badge it adopted, though it was not designated a fusilier unit until 1836. It also captured the French colour which is still trooped every S. George's day. Service in the W. Indies earned the honour St. Lucia, 1778, and twelve honours and the regimental nickname,

The Fighting Fifth, were gained under Wellington in the Peninsula.

The regiment was at the relief of Lucknow, with Roberts in Afghanistan, and with Gordon at Khartum. In the S. African War it distinguished itself at the Modder river. Fifty-two battalions were raised in the First Great War and won 67 honours, including Mons; Marne, 1914; Ypres, 1914, '15, '17, '18; St. Julien; Somme, 1916, '18; Scarpe, 1917, '18; Selle; Piave; Struma; Suvla. It was one of the first regiments in France in the Second Great War, and in 1940 formed part of the force defending Arras. The regimental depot is at Newcastle-upon-Tyne.

Northumbria. Kingdom of Anglo-Saxon Britain. It stretched from the Humber to the Forth, and from the Pennines and Ettrick Forest to the sea, and was formed about 600 by the union of the smaller kingdoms of Bernicia and Deira. Edwin, king of Northumbria until 633, was the most powerful ruler in the whole of England.

After 670 Northumbria declined in importance, and most of its later kings were subject to the rulers of Mercia or Wessex. See England: History.

North Walsham. Urban dist. and market town of Norfolk, England. It stands on the river Ant, 14 m. N. of Norwich and 131 from London, and has two rly. stations. The principal building is the Perpendicular church of S. Nicholas. At the Paston grammar school, founded 1606, Nelson was educated. The village of Paston is 3½ m. away. Market day, Thurs. Pop. 4,500.

North-West Europe Expeditionary Force. British troops sent to assist Norway after the German invasion. Commanded by Gen. B. Paget, the force landed April 15, 1940. The bulk were withdrawn from Namsos, May 1-2, and the last elements by June 10. See Narvik; Norway.

North-West Frontier Province. One of the four governor's provinces of the dominion of Pakistan. The river Indus is the E. boundary, except where the Punjab extends across it to the W. near the Kurram river, and where the prov. crosses the Indus to the E. in Hazara. Baluchistan and Afghanistan lie W., and Kashmir N.E. The Kabul, Kurram, and Gomal rivers cross the prov. from Afghanistan to join the Indus. The mts. are the Hindu Kush, Safed Koh, and Suleiman ranges.

The province was formed in 1901 and became autonomous with a single chamber legislature in 1937.

North-West Frontier Province of Pakistan. Map of the province on the border of Afghanistan

N.W.F.P. states, the prov. has area 14,263 sq. m.; pop. (1948 est.) 3,537,000. Area of the N.W.F.P. states, 24,985 sq. m.; pop. 2,464,000. Almost all the pop. are M. hms.

North-West Highway System. Name given to the Canadian section (1,257 m.) of the Alaska or Alcan Highway (q.v.).

North-West Mounted Police, ROYAL. Name formerly held by the special force of police keeping order in the sparsely populated parts of Canada. In 1919 it was merged in the new Canadian Mounted Police (q.v.).

North-West Passage. Name for a sea route N. of America once believed to afford a short cut to China. The search for it over four centuries belongs to the romance of exploration, and has supplied stirring stories of endeavour. Pioneers in the quest, which began with the rediscovery of America by John Cabot in 1497, were John Rut (1527), Willoughby and Chancellor (1553), Frobisher (1576), Davis (1585), Barents (1594-96), Hudson (1607-10), Baffin (1612). In the 19th century the search was renewed by the Royal Navy with the expeditions of Parry (1819-

Under British rule it comprised six districts and five political agencies. The districts were Dera Ismail Khan, Bannu, Kohat, Peshawar, Mardan, and Hazara; all of these are now included in the province. The agencies were N. Waziristan, S. Waziristan, Kurram, Khyber, and Malakand (Chitral, Swat, and Dir); these, with the tribal areas adjoining Hazara and including the states of Amband Phulera, are called the N.W. Frontier Province States.

The prov. is mountainous, but about one-quarter of the area is under cultivation, wheat being the largest crop. Maize, sugar cane, fruit, and nuts are also grown. Sheep-rearing is important, the wool being woven into carpets. Goats are reared. Hydro-electric and irrigation projects in being and under construction are expected to make the prov. self-sufficient in food. The capital is Peshawar, dominating the Khyber Pass into Afghanistan. Excluding the

21), Beechey (1826), Ross (1829), and Franklin (1845). The passage was finally discovered by M'Clure 1850-53, though not traversed by him entirely by water; this was accomplished in 1903-05 by Amundsen, the Norwegian Arctic explorer. His record has since been twice broken by Capt. Larsen in the Royal Canadian Mounted Police schooner *St. Roch* which, on Arctic patrol duty, made the passage from W. to E. in 1940-42 and E. to W. in 86 days in 1944.

North-West Territories. Dist. of the dominion of Canada. Its total area is 1,309,682 sq. m., and

Northwich. Urban district and market town of Cheshire, England.

It stands at the junction of the rivers Dane and Weaver, and is connected by rly. with Chester, 18 m. to W.S.W. There are narrow cobbled streets and old houses, many of which have suffered from subsidence by the working of rock salt mines. These and its brine springs have long given fame to Northwich—its

Northwich arms

northerly salt town—but a chemical industry has supplanted the older trades. The history of the manor begins in 1483; the present urban district dates from 1875. It has had an M.P. since 1885. Interesting buildings are S. Helen's church (c. 1400), the salt museum, Brunner library, Victoria infirmary, and brine

Northwich. Old half-timbered houses and shops in this former salt-mining centre of Cheshire

it includes, save for Yukon and a section of Quebec, all that part of Canada lying above 60° N. which was formerly divided between Keewatin, Rupert's Land, and the North-Western Territory. It has three divisions, Franklin, Keewatin, and Mackenzie. The chief rivers are the Mackenzie, Slave, Great Fish, and Coppermine, and there are a number of lakes, Great Bear and Great Slave being the largest. Fur-bearing animals abound, and in parts the musk ox and the caribou are found.

The territories are now governed by a commissioner, his deputy, and a council of five members, and are watched over by the Royal Canadian Mounted Police. There is no capital, affairs being directed from Ottawa. Gold, silver, radium, uranium, and petroleum are worked, and some of the better land is under wheat, oats, and barley. Elsewhere only small trees, mosses, lichens, etc., are found. The territories are the remains of the vast area purchased from the Hudson Bay co. by the dominion in 1869. Various parts were subsequently taken away to form the new provinces of Alberta and Saskatchewan and to increase the area of the older ones, chiefly Ontario and Quebec. Pop. 12,028. See Canada.

paths. The Weaver is here navigable. Market day, Fri. Pop. 20,827.

Northwood. Residential dist. of Middlesex, England. It is 14 m. N.W. of London by rly., pleasantly situated in wooded country between Pinner and Rickmansworth. With Eastcote, Ruislip, and S. Ruislip it forms part of the urban dist. of Ruislip-Northwood. The parish church of Holy Trinity, 1854, is of flint, with a red tiled roof; in the churchyard are the graves of Sir R. Morier and the 1st Lord Ebury. The church of Emmanuel is modern. On Kewferry Hill is Mount Vernon hospital and Cancer research institute. There is also a war memorial hospital. Golf courses lie near. The urban dist. was the first in the country to be governed by an operative town-planning scheme. Pop. 65,710

Norton, CHARLES BOWYER ADDERLEY, 1st BARON (1814-1905). Born Aug. 2, 1814, and educated at Christ Church, Oxford, he inherited large estates in Warwickshire and Staffordshire from a great-uncle in 1826. Adderley was M.P. for Staffs from 1841 until in 1878 he was created Baron Norton. He was under-secretary for the colonies, 1866-68, and president of the board of trade, 1874-78.

He died March 28, 1905. He took a keen interest in educational and colonial questions, and was a pioneer of town planning. The title, remaining in the family, came in 1945 to Hubert, 6th baron (b. Feb. 21, 1886).

Norton, CAROLINE ELIZABETH SARAH (1808-77). A British poet and novelist. Born in London, grand-daughter of R. B. Sheridan, she was one of three beautiful sisters. Her husband, George Chapple Norton, whom she married in 1827, brought, and lost, an action against Lord Melbourne, 1836, alleging alienation of her affections. She left him; and further proceedings arising out of disputes on pecuniary matters instituted by her husband in 1853 moved Mrs. Norton to write a pamphlet, *English Laws for Women*. Of her earlier pamphlets, *A Voice from the Factories*, 1836, condemned child labour; *A Plain Letter to the Lord Chancellor* helped in the passing of an act, 1839, giving a woman separated from her husband the right to apply for access to her children. Her husband died in 1875, and in 1877 she married Sir William Stirling-Maxwell, but died June 15. Among her novels are *Stuart of Dunleath*, 1851; *Old Sir Douglas*, 1868. A well-known poem is that beginning *I do not love thee*. See *Diana of the Crossways*.

Caroline Norton, British writer After J. Hayter

Norton, CHARLES ELIOT (1827-1908). American scholar. Born at Cambridge, Mass., Nov. 16, 1827, he was educated at Harvard, and engaged for a time in business, voyaging to the East Indies in 1849. In 1853 he published an attack on experimental Socialism. During 1864-68 he was joint editor with Lowell of *The North American Review*. He was professor of fine arts at Harvard, 1875-1900. A powerful cultural influence was exerted by his *New Life of Dante*, 1859; *Notes of Travel and Study in Italy*, 1860; *History of Ancient Art*, 1891. He died Oct. 21, 1908.

Norton-Radstock. Urban district of Somerset, England. See Midsomer Norton; Radstock.

Norton Sound. Inlet of Bering Sea, Alaska. It lies S. of Seward Peninsula and is 100 m. across and 150 m. long. On the N. shore are Norton Bay and Godolphin Bay.

NORWAY AND ITS HISTORY

William Warbey, Chief English Press Officer to the Royal Norwegian Government, 1941-45

The physical features, constitution, and history of the old Viking country of Scandinavia are here described. An account of the Second Great War in Norway follows. See also Denmark; Narvik; Oslo; Sweden, etc.

Norway occupies the W. and N. parts of the Scandinavian pen. It extends from lat. 57° 17' N. to lat. 71° 11' N., and is bounded S. by the Skagerak, W. by the North Sea and Atlantic Ocean, N. by the Arctic Ocean, and E. by the U.S.S.R., Finland, and Sweden. The land area of Norway is 124,556 sq. m., and the country has a total length of 1,100 m., and a width varying from 8 to 250 m. The coast-line, measured as an unbroken line, is 1,700 m., but including every inlet, fjord, and larger island is 12,000 m. Spitsbergen, Bear I., and Jan Mayen Is. in the Arctic, Bouvet I., Peter 1st I. in the Antarctic, and the Antarctic continent between the Falkland Is. dependency and the Australian dependency are Norwegian possessions.

The greater part of Norway consists of lofty mountain ranges and plateaux of ancient igneous rock, with an average height of 1,600 ft. The greatest range is Kjölén (the Keel), running N. and S. and forming the natural frontier with Sweden. Its highest peaks in Norway are Sulitelma (6,153 ft.) and Jaekkevarre (5,950 ft.). The main watersheds of S. Norway are the Dovre and Long Mountains, the highest peaks being Galdhøppigen (8,399 ft.) and Glittertind (8,350 ft.) in Jotunheimen, and Snöhetta (7,615 ft.) in Dovrefjeld. The only low-lying areas are around the Oslo and Trondhjem fjords and in the extreme S.E. The plateaux are, however, broken up by numerous valleys, such as the Gudbrandsdal and Østerdal, which offer means of communication by road and rail. The whole of the W. and N. coast from Stavanger to the Russian frontier is deeply indented by long branching fjords, and fringed with islands and rocks called the Skærgård (skerries), which provide a sheltered waterway for the coastal steamers that are the principal means of communication in the W.

The S. coast is less indented, but the great Oslo fjord leading

into the heart of S.E. Norway is the main means of access to the country. Long narrow lakes are numerous, the largest being Mjøsa, 140 sq. m. in area. The rivers, apart from the Glomma (375 m. long), are short and turbulent, with high waterfalls, up to 850 ft., which are an abundant source of hydro-electric power. The whole country was once heavily glaciated, but now the glaciers cover fewer than 2,000 sq. m. and are diminishing every year. The largest are Jostedalbreen (580 sq. m.), W. of Jotunheimen, and Svartisen, near the Arctic circle.

The climate, under the influence of the Gulf stream and the prevailing S.W. winds, is temperate

but stormy and wet in the W. and N., while the S.E. has short, hot summers and long, cold but calm winters. All ports are permanently ice-free,

Norwegian flag, white and blue cross on red

though ice-breakers sometimes have to be used in the Oslo fjord. Mean Jan. temps. are: Oslo 22.3° F., Vardø on the Arctic ocean 22.1° F., Bergen 34.5° F.; July temps.: Oslo 62.2° F., Vardø 47.7° F., Bergen 57.4° F. Rainfall is high in the W., Bergen averaging 73 ins. p.a., and low in the E. (Oslo 26 ins.)

One quarter of the area of Norway is covered by forests, mainly coniferous, but with a sprinkling of deciduous trees on the lower slopes. N. of the Arctic circle the only trees are birch and dwarf willows. On the high ground of the interior above 3,000 ft. in the S. and above 1,600 ft. in the N., and on the coasts of Finnmark, Alpine vegetation and tundra prevail. Bilberries and whortleberries are plentiful in the forest areas. The principal wild animals in S. Norway are the fox, beaver, badger, stoat, weasel, elk, and roe-deer. The wolf is found in the dist. between Røros and Finnmark, the reindeer, Arctic fox, ptarmigan, and lemming in the Arctic and high mt. regions. Bird life is abundant. Salmon

and trout are common in the rivers of the W. and N., trout in the high lakes, and perch, pike, and grayling sporadically. Herring and codfish abound off the W. coast and mackerel in the S. Seals and several kinds of finner whale are also found.

CONSTITUTION. Norway has a written constitution, enacted in 1814 (since amended). It has a limited hereditary monarchy. The executive power is nominally vested in the king, who exercises his authority through a state council composed of the prime minister and not less than seven other members. The legislative power is exercised by the *storting* of 150 members elected directly for four years by all Norwegian men and women over the age of 21. The *storting* automatically assembles each year on the first week-day after Jan. 10. The *storting* elects one quarter of its members to form the *lagting*, the remainder constituting the *odelsting*. The *odelsting* originates bills and passes them to the *lagting*, which may approve a bill or send it back with comments. A bill twice rejected by the *lagting* is submitted to a joint session of the two *tings*, when a two-thirds majority is required to pass it. Budgetary and administrative matters are dealt with by the *storting* as a whole. The king has a right of veto, rarely exercised.

Norway is divided into 67 urban and 695 rural municipalities with popularly elected councils. They are entitled to levy a municipal income tax and are responsible for over one-third of the total public expenditure. The chairmen of all the rural municipalities in a *fylke* (county), of which there are 18, meet to form a *fylkesting*, before which the *fylkesmann*, appointed by the crown, presents the views of the central govt.

POPULATION, RELIGION, EDUCATION. Norwegians are mostly of Nordic type, with an admixture of an aboriginal stock of Alpine type. The majority are tall, blonde, and blue-eyed. The Lapps, of whom there are about 20,000 in N. Norway, probably came from central Asia. The pop. in 1946 was 3,123,883, a million more than in 1890. During the 19th century and the early part of the 20th century there was extensive emigration to the U.S.A. and Canada, the peak being reached in 1882 when 28,804 persons emigrated. Since 1911 emigration has declined.

The established religion is Evangelical Lutheran; 97 p.c. of

the pop. adhere to it. There are about 80,000 dissenters, including 3,000 R.C.s. During the German occupation of Norway in the Second Great War the Germans expelled and killed most of the 1,400 Jews, but in 1947 the govt. offered facilities to Jews to enter the country up to their pre-war number. The king is the head of the church and appoints the seven bishops, the deans, and the lower clergy. Primary school education, compulsory and free from seven to 14 years of age, is of a high standard. This is followed by a comprehensive system of further education at very low fees, with generous maintenance grants. Private schools scarcely exist. There is a university at Oslo, founded 1811, a technical college of university rank at Trondheim, and technical high schools for agriculture, dentistry, and commerce. There are also people's colleges providing short-term courses for young people and adults. The Bergen meteorological research school has played a leading part in the development of current methods of observation and analysis. The press flourishes, and even small towns publish their own daily newspapers.

NATIONAL DEFENCE. A large part of Norway's small navy was sunk during the Second Great War; most of the post-war navy, consisting of seven destroyers, five torpedo boats, five submarines, three corvettes, and a number of smaller vessels, was purchased from the U.K. The complement in 1946 was 8,000 officers and men. The air force was equipped with Mosquitos, Catalinas, and Spitfires. Just over 23,000 men are called up each year for 12 months' military training; the total in the three services on Feb. 1, 1947, was 34,442.

INDUSTRY AND TRADE. Until the 1890s Norway was predominantly an agricultural country, but the adaptation of water power to the generation of electricity led to an industrial revolution. In 1930, 37 p.c. of the pop. were engaged in agriculture, forestry, and fishing, 31 p.c. in industry and crafts, 21 p.c. in trade, transport, and shipping.

Agriculture is rendered difficult by the geographical configuration of the country. Only 3 p.c. of the area, a smaller proportion than in any other country of W. Europe, is arable, although the area under cultivation has increased steadily in each year. Norway is self-

sufficient in potatoes and dairy products, but only two-fifths of her cereal requirements are grown at home, chiefly in the form of oats and barley. In 1945 livestock included 1½ million cattle, nearly a million sheep, 171,723 pigs, 141,628 goats (pre-war figures were 1½ million cattle, 1·7 million sheep, 362,000 pigs, 249,000 goats).

In N. Norway 130,000 reindeer provide the Lapps with draught animals and, in emergencies, food. Fur production, mostly from foxes, expanded between the two Great Wars. In 1939 Norway had 493,000 silver foxes, reduced in 1945 to 66,469. The Norwegian forests, which produce about 15·5 million cu. yds. of timber annually, provide the basis for important sawn timber, furniture, wood pulp, cellulose, and paper industries.

The Norwegian Fisheries

The Norwegian fisheries are the largest in Europe, with a catch in 1946 of 835,000 tons. The cod and herring fisheries are the most important, the centres of the former being the Lofoten Is. and Finnmark, while herring are caught along the W. coast of S. Norway. Most of the cod is exported, unsalted as stockfish, or salted and dried as klipfish. The annual yield of cod liver oil is more than three million gallons. The bulk of the herring catch is used to provide herring-oil for margarine, etc.

Sprats and brislings are canned for export at the canning factories in Stavanger. Whaling is no longer carried on in Norwegian waters, but Norwegian whaling expeditions were the first to exploit the Antarctic fields, and have maintained a leading position despite severe war losses. The 1938-39 season produced 735,000 barrels of oil, valued at £1,895,000; the 1946-47 season 937,319 barrels, valued at £13,500,000.

Norway has no coal, except in Spitsbergen, where the mines produced over 300,000 tons annually before the Second Great War. Low-grade iron ores are plentiful, and about a million tons a year are produced from the mines at Kirkenes in N. Norway and near Kragerø and Arendal in the S. Norway is the world's largest producer of sulphur pyrites, with an annual output of over a million tons. Copper ore is worked at Røros, Sulitelma, and silver is mined at Kongsberg. Other minerals are molybdenum, nickel, chromium, titanium, and graphite.

Output of hydro-electric power is 1·4 million "all the year" kW.,

but resources are sufficient to provide nearly seven times as much. In 1937 the power produced in Norway averaged 3,189 kWh. per inhabitant, compared with 622 kWh. in Great Britain. The most important manufactures are electro-chemical and electro-metallurgical. Nitrates, of which the annual output is 600,000 tons, are produced at Rjukan, Odda, and near other waterfalls. Other important chemical products are carbide and cyanamide. The production of aluminium was expanded during the Second Great War from 29,000 to over 40,000 tons p.a. Ferro-alloys are an important group, and electric iron-smelting has been developed. In 1947 the construction of electric steel furnaces was started at Mo in Rana. Pre-war output of mechanical and chemical pulp reached nearly 1·5 million tons. The textile and clothing industries developed considerably between the two wars, as did the processing of foodstuffs. Shipbuilding is carried on in Oslo and Bergen, but the yards are small and most of the larger Norwegian merchant ships are built in British, Swedish, or Danish yards.

Balance of Trade

The principal exports are fresh, dried, and canned fish, fish oil, paper and pulp, ores, nitrates, iron and other metal alloys, aluminium, zinc, copper, carbide, and furs. Swedish iron ore is exported through Narvik. Norway normally spends one-third of her national income on imports, chiefly foodstuffs and fodder, coal, machinery, and ships. A favourable balance of trade has normally been assured through the earnings of the Norwegian merchant fleet, which, at 4,835,000 gross tons in 1939, was the fourth largest in the world. More than half the ships were less than 10 years old, there were 675 motorships, and tankers of an aggregate tonnage of 2·1 million tons. Most of these vessels were engaged in the tramp trade, but there were lines to all parts of the world. Nearly one-half was lost in the Second Great War, but by July, 1947, it had been built up again to 3,663,000 g.r.t.

Except in the far N., roads are good and adequate. The Arctic Highway, from Narvik to Kirkenes, is kept open for most of the winter with the aid of snow-shields and snow-ploughs. The coast towns are linked by regular services of coastal steamers. Rly. lines, most of them electrified, link Oslo with Bergen, Stavanger,

Trondhjem, and Bodö, and four lines run into Sweden. A line links Narvik with the Swedish iron mines and there is a short local line at Kirkenes. Norway has airports at Sola, near Stavanger, and at Oslo; internal airlines connect the principal towns, and there are services to Sweden, Denmark, the Netherlands, France, and the U.K.

LANGUAGE, LITERATURE, ART. The Norwegian language, like Danish and Swedish, belongs to the Germanic language group. During the period of Danish rule, from 1397 to 1814, Danish, spoken with a distinctive accent, gained precedence over the Norwegian language amongst the official classes and in literature. In the 19th century ardent Norwegian patriots evolved a literary form from the Norwegian peasant dialects, to which they gave the name *landsmål* (later officially called neo-Norwegian), in opposition to the near-Danish *riksmål*. A violent language conflict developed, and official attempts to fuse the two languages by reforms in orthography, grammar, and pronunciation have not completely succeeded. A modified *riksmål* is used in the towns and in most of the press and official publications, but the *landsmål* is used by many writers and in the schools of W. Norway and the rural areas.

Norwegian Literature

Old Norse literature, which flourished from the 9th to the 13th century, found its richest expression in the Icelandic sagas. The Norwegian court was a centre of scaldic poetry. During the period of Danish rule there was little distinctive Norwegian literature, apart from the satirical comedies of Holberg, who lived in Denmark, and the nature poems of the 17th century clergyman Peter Dass. The early 19th century saw a great revival, headed by the champions of national independence: the poets H. Wergeland and J. Welhaven, the language reformer Ivar Aasen, and the numerous collectors of folk poetry and music. In the latter half of the 19th century there came the literary giants, Henrik Ibsen (1828–1906) who, after writing historical plays, founded the drama of social criticism, and Bjørnstjerne Bjørnson (1832–1910) who wrote novels and plays and championed the national independence movements of the Norwegians, the Czechs, and the Poles. Associated with these two were the poets

J. Lie (1833–1908) and A. Kielland (1849–1906). The 20th century has produced the novelists Knut Hamsun (b. 1859), Sigrid Undset (b. 1882), Olav Duun (b. 1876), and J. Bojer (b. 1872), the dramatists G. Heiberg (1857–1929) and Helge Krog (b. 1889), and the poets O. Bull (1883–1933), A. Överland (b. 1889), and Nordahl Grieg (1902–43).

Norwegian musicians include Edvard Grieg (1843–1907), who derived much of his inspiration from Norwegian folk-tunes, C. Sinding (b. 1856), and J. Svendsen (1840–1911). Besides many

N. America on one of his voyages c. 1000. Norway was brought under one king for the first time in 872 when Harald the Fair-haired defeated the other chieftains at the battle of Hafrsfjord. At his death in 930 strife ensued between his sons and grandsons, but the kingdom was consolidated by his descendants Olav Trygvasson and Olav Haraldson (1016–1030), who introduced Christianity and was canonised after his death.

During the 11th century the crown, the church, and the nobility became firmly established. Many of the freeholding peasants

Norway. Map of the kingdom in western Scandinavia. Inset, environs of Oslo, the most populous area of the country

competent minor painters, Norway produced the leading exponent of expressionism and social-minded realism, Edvard Munch (1863–1944). Her leading sculptor is Gustav Vigeland, whose vast Park of Sculpture in Oslo took nearly 40 years to complete.

HISTORY. Norway was settled by men of Nordic type before the second millennium B.C. and that stock has since remained undisturbed. During the Viking period (800–1050) Norwegians established settlements in N. France (Normandy), Ireland, W. Scotland, the Isle of Man, and Northumbria, and colonised Iceland, Greenland, and the Faroe Is. Leif Ericsson probably reached

became tenant-farmers, but serfdom was never established. In the 12th century Hanseatic merchants settled in Bergen and obtained a firm grip on Norwegian commerce. The 13th century saw the peak of Norwegian power as an Atlantic empire, with both Iceland and Greenland acknowledging Norwegian suzerainty. The first setback came, however, with the defeat of Haakon IV by Alexander III of Scotland at the battle of Largs in 1263. As a result Haakon's son, Magnus VI, who earned the title Lawmender by codifying the provincial laws into a national civil code, abandoned Norwegian claims to Caithness and the Hebrides.

During the 14th century Norway was successively united, in consequence of royal marriages, with Sweden and Denmark, and in 1397 the three kingdoms were brought together in the union of Kalmar by Queen Margareta. Sweden broke away in 1449, but Norway remained under the autocratic rule of Danish kings until 1814. In 1496 the Orkneys and Shetlands were lost to Norway, in 1536 the Reformation was introduced by decree of the Danish state council, and in 1658 Norway lost three E. provs. to Sweden.

During the 17th and 18th centuries there was a revival of economic prosperity, and towards the end of the 18th, particularly after the French Revolution, a strong movement for national independence and democratic institutions began to develop. In 1814 the Swedish crown prince, Charles John, formerly Marshal Bernadotte of France, was persuaded by Tsar Alexander I to join the allied coalition against Napoleon, and to abandon the Swedish claim to Finland in return for Russian and British support of his plan to take Norway from Denmark, which had been forced on to Napoleon's side. After the defeat of Napoleon at Leipzig, Frederick VI of Denmark signed the treaty of Kiel, by which he surrendered his sovereign rights over Norway to Charles XIII of Sweden, but retained Iceland, Greenland, and the Faroes. The Norwegians objected to being treated as chattels, however, and persuaded the Danish *stadtholder*, Christian Frederick, to convoke a constituent assembly at Eidsvold.

Struggle for Independence

Meeting here from April 10 to May 17, the delegates asserted the independence of Norway, offered the crown to Christian Frederick, and drew up an advanced democratic constitution. Sweden invaded Norway to assert her rights, the powers intervened in support of Sweden, and an armistice was signed after 17 days. The *storting* met again and sanctioned the union with Sweden, but managed to secure the Swedish king's acceptance of their new constitution. As the century advanced a struggle developed between the Norwegian parliament and the Swedish king, who reserved the right to appoint and dismiss ministers at his pleasure. In 1882 the Norwegian Liberals, under Johan Sverdrup (1816-1892), took up the fight for parl. govt., and in 1884 Oscar II consented

to the formation of a Liberal govt. based upon a parl. majority. In the last quarter of the 19th century the Norwegian merchant navy leapt to the fore, and Norway acquired world-wide commercial interests which, it was felt, could not be adequately represented by a Swedish consular service. This provided a new motive for complete independence, and on June 7, 1905, the Norwegian *storting* voted for severance from Sweden. A plebiscite resulted in an overwhelming vote for a monarchical form of government, and on Nov. 18, 1905, Prince Charles of Denmark was formally elected king of Norway. He took the title of Haakon VII.

Twentieth-Century Progress

The period from 1880 to 1914 was one of swift economic development, which brought thousands of peasants' sons to the towns, and led to the birth of a Labour party (1887) and a centralised trade union movement (1899). Social reform came under the Liberal govts. of 1905-20, including the first Health Insurance Acts (1909 and 1915), measures for maternity and child welfare, a new Factory Act and an Eight-hour Day Act (1919). During the First Great War Norway was neutral, but half her merchant fleet, which plied chiefly in the service of the Allies, was sunk by German U-boats. Economic depression followed that war, and increasing social tension. For a time the Norwegian Labour party was affiliated to the Communist International, but it seceded in 1923. At the 1933 elections it was returned as the largest party in the *storting* and in 1935 a Labour govt. was formed which relied for its parl. majority sometimes on the Liberals and sometimes on the Agrarians. Up to the German invasion in 1940 it introduced fresh social reforms, including measures for old age pensions (1936), unemployment insurance (1938), and improved housing.

SECOND GREAT WAR. Efforts to form a Scandinavian neutral bloc broke down when Denmark was compelled, in 1939, to sign a non-aggression pact with Germany. When Hitler invaded Poland Norway declared her neutrality and took measures to strengthen her defences and lay in stocks of food and petrol. In the autumn of 1939 the Norwegian ship-owners' association signed an agreement with the British govt. promising to keep on charter to

the Allies the same tonnage of shipping as was normally used by them in peace-time. German attacks on Norwegian shipping during the seven months of Norwegian neutrality caused the loss of 377 lives and 54 merchant ships. At the same time German use of Norwegian territorial waters to evade the British sea blockade led to many controversies with the western powers, and on Feb. 16, 1940, a British naval party boarded the German vessel *Altmark* (*q.v.*) while it lay in the Jøssing fjord. Further incidents led to a British announcement on April 8, 1940, that mines would be laid in Norwegian waters. A few days before, Hitler had given final orders for the invasion of Norway and Denmark. On April 5 a fleet of troopships left Stettin for Norway, and on April 6 nine German destroyers left Bremen for Narvik. At 11.30 p.m. that day German warships, led by the 10,000-ton cruiser *Blücher*, sailed up the Oslo fjord and engaged the fortifications. A whaling boat and a small minelayer, which engaged the invading fleet, were sunk. Fort Iskarsborg, defending the narrow entrance to the inner fjord, opened fire and sank the *Blücher*, which was carrying the nucleus of the German police and civil administration.

The Nazi Invasion of 1940

Early in the morning of April 9 German airborne troops were landed at the Oslo airport at Fornebu, and quickly surrounded the capital. Meanwhile, the Norwegian cabinet had met, had rejected a German ultimatum to surrender, and had made arrangements to evacuate from the capital the royal family, the govt., and the civil administration. The *storting* was summoned, and met at Hamar, 100 m. N. of Oslo, the same afternoon, later moving on to Elverum to evade the pursuit of German forces. At these sessions full powers to carry on the fight, if necessary from abroad, were given to a new govt., still predominantly Labour in composition, but including representatives of the other political parties. In the capital Major Vidkun Quisling, leader of the tiny fascist National Union party, entered the radio station, and broadcast a statement that he had formed a govt. and had cancelled the mobilisation orders issued by the Norwegian general staff. Quisling's broadcast created some confusion for a few days, but when it became known that

Haakon and the real govt. were continuing the fight, most Norwegians quickly rallied round their leaders. On April 10 the German minister in Oslo presented to Haakon a demand that he should appoint Quisling as prime minister. The king indignantly refused, and nothing more was heard of Quisling until after the fighting in Norway was over.

The Fighting in Norway

Norwegian military resistance lasted for 62 days, against hopeless odds. In the first day all the main ports—Oslo, Stavanger, Bergen, Kristiansand, Trondhjem, and Narvik—had been captured by German warships, in most cases after heroic but futile resistance by small Norwegian forces. Airfields and military depots were seized by airborne troops. Except around Narvik, there was no organized front and resistance was mainly of a guerrilla character. The Allies promised support, and British, French, and Polish troops were landed. The British forces suffered from lack of suitable equipment, and from the fact that the best ports were in German hands. An attempt to hold the line of the Gudbrandsdal, from Åndalsnes to Lillehammer, failed, as did a move round the Trondhjem fjord, via Namsos and Steinkjaer. Only in the far North were successes recorded. In two engagements, on April 10 and 13, British naval forces sank all the nine German destroyers lying in the Ofoten fjord off Narvik. On May 26 Narvik itself was recaptured after a combined assault by Norwegian, French, and Polish troops, aided by British warships. A few days later, however, the Allies, owing to the menacing developments in France, decided to evacuate their forces from Norway, and the Norwegian forces themselves capitulated on June 9. Two days before, Haakon and the govt. left Tromsø for the U.K., in the cruiser *Devonshire*, after issuing a proclamation stating that they intended to continue the fight from outside Norway's frontiers. Norwegian losses in the two months' campaign totalled 2,000 men, over 20 small warships, and the whole of the small fleet of battle planes. The Germans lost more than 60,000 men, mostly drowned in troopships, and 21 warships totalling more than 50,000 tons.

The exiled govt. established itself in London, remaining there until the end of the war. Through the Norwegian shipping and trade

mission it organized the participation of 4,000,000 tons of Norwegian merchant shipping in the Allied war effort. Forty per cent of the oil and a large part of the food and munitions brought to Great Britain during the period before the U.S.A. entered the war were carried in Norwegian vessels. A new Norwegian army, recruited from all over the world and from young men who made daring escapes from Norway, was trained in Scotland. British, and later U.S., vessels were lent to create a new Norwegian navy which saw active service in convoy and patrol work. Norwegian airmen were trained in Canada, and gradually a new air force, consisting of two fighter squadrons and one seaplane squadron, was built up. Norwegian pilots, soldiers, and sailors also served in British units. The Norwegian govt. covered its own war expenses, chiefly through the earnings of the merchant fleet, which it requisitioned on April 22, 1940. In May, 1942, a small Norwegian force reoccupied Spitsbergen (which had been evacuated by the Allies in Sept., 1941), and set up a meteorological station there. They were attacked by German naval and air forces, but were eventually relieved from the air. A small Norwegian force also maintained a meteorological station on Jan Mayen I., in the Arctic. From time to time Norwegian forces participated in daring raids on the Norwegian coast, including one on Lofoten Is., from which over 300 Norwegian civilians were evacuated to Britain.

The Quisling Government

These raids brought encouragement to the Norwegian home front, which was passively resisting the invaders and the "quislings." After the Norwegian capitulation in June, 1940, there was a period of confusion and despondency, rendered worse by the defeat of France and the threatening battle of Britain. The German Reichskommissar, Josef Terboven, used this period to press a few prominent Norwegians, including members of the *storting*, to call upon Haakon to abdicate, and the govt. in London to resign. The king and the govt. rejected the proposal as unworthy and unconstitutional, and Terboven, after a further period of fruitless negotiations with Norwegian political leaders, resolved the situation in Nazi fashion by issuing a series of decrees. On Sept. 25, 1940, he declared the king and the exiled govt. deposed, dissolved all politi-

cal parties except Quisling's National Union, and appointed 13 Norwegians, either members of Quisling's party or pro-Germans, as acting councillors of state. This sham govt., which could act only with the approval of Terboven's own German administration, remained in "office" until the German capitulation in May, 1945. Despite repeated requests from Quisling, however, the Germans refused to sign a peace treaty with him.

Resistance to the Tyranny

The shock of the Terboven *diktat* of Sept. 25, 1940, brought home the meaning of Nazism to all Norwegians except the two p.c. or less who supported Quisling. From then on a ding-dong moral and political struggle was waged, with all sections of Norwegian society playing their part in turn. First to act were the members of the supreme court who resigned in a body in Dec., in protest against the Reichskommissar's interference with the independence of the Norwegian judiciary. In the same month the Norwegian sporting associations, with 300,000 members, refused to agree to the introduction of the *Führerprinzip* into their organizations, and started a strike which lasted throughout the occupation. During the same winter school strikes took place in Oslo, Bergen, and elsewhere after Quisling's stormtroopers, known as the *Hird*, had broken into several schools and maltreated teachers and children for their opposition to the Nazi "new order." In Feb., 1941, the seven bishops of Norway issued a pastoral letter roundly condemning the lawlessness of the *Hird* and the arbitrary acts of the Quisling "govt." This was the beginning of a long struggle in the course of which the Norwegian church, despite the deposition and confinement of the bishops and many of the clergy, repeatedly denounced the Nazi regime and called upon all Christians to resist its encroachments on religious and civil liberty.

On April 3, 1941, 22 Norwegian organizations combined to send a letter of protest to Terboven, concerning political interference with civil service appointments.

On May 15 a further letter was signed by 43 organizations, including the powerful T.U.C. In June the T.U.C. took up the struggle for the independence of the unions, and after a temporary concession the Reichskommissar struck hard on Sept. 10, declaring

a state of emergency in Oslo, executing two of the union leaders, arresting many others, and placing the unions in the hands of quisling "commissars." Despite this action, the Norwegian workers, led by the underground "free trade union movement," retained sufficient cohesion to defeat by mass opposition an attempt in Sept., 1942, to form a fascist "national assembly." The Norwegian teachers had their greatest trial in the same year, when they resigned in a body from the Nazi "teachers' front" set up by the quislings in Feb., 1942. In March 1,300 of them were arrested, and of these 650 were transported, in an old cargo vessel, to forced labour at the Arctic port of Kirkenes. They refused to give way, and the Germans were eventually compelled to release them.

Meanwhile an underground Home Front with a Home Army was gradually built up under the president of the supreme court, Paal Berg. At great risk, illegal news bulletins were distributed, wireless contact was maintained with Great Britain, patriots were smuggled over the frontier into Sweden, and in the later years of the war a special sabotage organization was built up which did great damage to German military supplies and communications. A successful Allied raid on the heavy water plant at Rjukan in Feb., 1943, was carried out with the aid of this organization.

On Oct. 25, 1944, Russian troops, pursuing the retreating Germans across Finland, entered the Norwegian port of Kirkenes, and advanced as far as the River Tana. Here they were held, and no more Norwegian territory was liberated until the surrender of Germany on May 8, 1945. On the night of May 7 the Norwegian Home Army emerged and took charge of the streets and main public buildings in Oslo. Three days later a govt. delegation, headed by Crown Prince Olav, arrived in the capital, and the Home Front placed itself under its authority. On May 31 the Norwegian govt. returned, amidst great public rejoicing, and three weeks later a new coalition govt., including two Communists, was formed under the premiership of Einar Gerhardsen, a former Labour mayor of Oslo, who had spent three years in a German concentration camp.

In Oct., 1945, a general election gave the Labour party for the

first time a clear majority, with 76 seats out of 150. Gerhardsen then formed a Labour administration to carry out a programme of reconstruction under vigorous state direction. Food, which had been extremely short during the occupation, rapidly increased in quantity, and within two years production and foreign trade indices were nearly back to pre-war levels. Democratic institutions, destroyed by the Nazis, were fully restored, the leading quislings were tried, and Quisling himself was executed, Oct. 24, 1945. In Feb., 1946, the Norwegian foreign secretary, Trygve Lie, was elected secretary-general of the United Nations.

Warbey, 1946.

Nor'-Wester. Warm dry föhn wind which blows over the Canterbury Plains, E. of the mts. of the S. Island of New Zealand. It is the prevailing wind, which, having crossed the Southern Alps, to whose W. slopes it brings a heavy rainfall, descends to the E. plains, and in so doing is warmed by compression.

Norwich. City and county borough of Norfolk, England, also the county town. It stands on the Wensum, near its junction with the Yare, and is 114 m. N.E. of London. The city and environs are served by rly. and Eastern Counties buses. Its chief magistrate has been known since 1910 as the lord mayor.

The principal building is the cathedral of Holy Trinity, begun in Norman times, but not completed until about 1500. It displays several styles of architecture; features are the long and splendid nave, the lofty spire, and the two

Norwich, Norfolk. The City Hall in the Market Square; it was opened by King George VI in 1938. The ancient guildhall is seen on the right

Val Doonee

apsidal chapels. Two old gateways lead to it, and near are the cloisters, bishop's palace, deanery, and other buildings connected with the foundation. Of the other churches, the chief are S. Peter Mancroft, a large and noble building, S. Michael-at-Coslany, S. Giles, S. Andrew, and S. Lawrence. The fine R.C. cathedral is modern.

Of secular buildings the chief is S. Andrew's Hall. Originally the nave of a monastic church, built in the 15th century, its proportions make it a public hall of unusual magnificence. The guildhall was built in the 15th century. The grammar school was once a chapel. Other buildings include the shire hall, corn exchange, and a drill hall, and there are hospitals, libraries, a technical college, and a training school. Of the castle little more than the keep, dungeons, and battlements remain; it is now used as a museum and art gallery housing the most comprehensive collection in England of paintings of the Norwich school. Borrow's house is also a museum. The Maid's Head Hotel is a picturesque old building. Bishop Bridge of the 13th century is still used, and the Strangers' Hall dates from the 15th century. The charitable foundations include the old hospital of S. Giles. There is a theatre, and in 1921 a playhouse, near the site of one closed by Cromwell, was opened by the Norwich players as the Maddermarket Theatre; it is designed as were the theatres of Shakespeare's day, the only one of its kind in England.

The industries of Norwich include engineering works and the making of boots and shoes, crape,

Norwich arms

beer, starch, mustard, etc. There is a trade along the river, and the city is the business centre of a large district, being still in a sense the capital of E. Anglia. It is the headquarters of important insurance companies, but amalgamations have made its banks less prominent than formerly. Still an

staple for wool was fixed here, and Flemings settled. Made a county of itself in 1404, the city became, through the wool and worsted industry, one of the richest in England. Separately represented in parliament since 1298, it now has 2 M.P.s. Pop. est. 114,750. *Consult*

Records of the City of Norwich, W. Hudson and J. C. Tingey, 1904-10; Norwich Cathedral, C.H.B. Quennell, 1898; The Story of Norwich, E. Henderson, 1911; Autobiography with a Difference, R. H. Mottram 1938.

Norwich. City of Connecticut, U.S.A., and co. seat of New London co. It stands on the Thames river, at the head of navigation, 49 m. S.E. of Hartford, and is served by the New York, New Haven and Hartford, and the Central Vermont rlys., and by steamers plying to New York and other ports. Norwich was settled in 1659, and received a city charter in 1784. Pop. 23,652.

Norwood. Residential dist. of S.E. London. It forms the S. part and a bor. constituency of Lambeth, lying between Streatham to the W., Sydenham E., and Croydon S. At West Norwood is the S. Metropolitan cemetery of about 40 acres, founded in 1846. To the W. of it is the Jews' Hospital, built 1863; it was founded at Mile End in 1806. Near Norwood Park is the R.C. convent of Our Lady, with orphanage, founded in 1848. The Royal Normal College and Academy of Music for the Blind was established at Upper Norwood in 1874. In the 17th century Norwood was covered by an oak wood; a spa, called Beulah Spa, was opened here on a large scale in 1831, but had a brief existence. Gipsy Hill, part of Norwood, commemorates the fact that the district was once a favourite haunt of gipsies. Norwood Green covers about 10 acres, and Norwood Park about 33 acres. Population 85,580.

Norwood, Sir Cyril (b. 1875). British educationist. Born Sept. 15, 1875, and educated at Merchant Taylors' School and S. John's College, Oxford, he became a clerk in the Admiralty, but resigned in 1901 on appointment as a schoolmaster at Leeds. During 1906-16

he was headmaster of Bristol Grammar School, becoming master of Marlborough, 1916, and headmaster of Harrow, 1926.

In 1934 he resigned to become president of S. John's, Oxford, an appointment he held until his retirement in Dec., 1946. He was chairman

of the secondary schools examination council, 1921-46, and of the committee on curricula and examinations, 1946, which produced the Norwood report. He was elected chairman of the Modern Churchman's Union, 1937, and re-elected, 1942. He published several works on British education.

Norwood, Frederick William. Contemporary Australian churchman. He was educated at Ormond College, Melbourne, and became in turn pastor of the Congregational churches at Canterbury (Victoria), Brunswick (Victoria), and North Adelaide. He was appointed minister of the City Temple, High Holborn, London, in 1919, and remained there until 1936, when he became an evangelist under the auspices of the National Free Church Council. He was chairman of the Congregational Union of England and Wales, 1930-31. Crossing to Canada, he became a minister at Vancouver in 1939, and in 1943 became pastor of S. James' United Church, Montreal. He published several books, mostly on religious subjects, and including *Indiscretions of a Preacher*, 1932; *Beaten by the Divine*, 1933.

Nose. Organ of the sense of smell, also used in respiration. In human beings it forms a prominence, variable in size, situated in the middle line of the face. It ends below in the nostrils, which mark the entrance to the two nasal cavities between the base of the skull and the roof of the mouth.

The roof, sides, and floor of the cavities are formed of certain bones of the skull. The roof is composed of a bone perforated like a sieve to afford passage to the nerve of smell. The sides are each covered by three highly vascular bodies (the turbinals) which moisten and warm the air passing through. When swollen, these bodies give rise to a stuffiness of the nose experienced by everyone suffering

British educationist

Norwich. Cathedral of Holy Trinity, from the south-east. Parts date from Norman times
Frith

important agricultural centre, it has a large cattle market, and is known for canaries. The borough includes Carrow, where there was a Benedictine abbey in the Middle Ages, and Thorpe. Mousehold Heath, the subject of a famous painting by Crome, is public property. Norwich is remarkable as a centre of literature and art and for the eminent persons associated with it; they include Sir Thomas Browne, Borrow, and Crome; Coke and Nelson, who were educated in its grammar school; the Martineaus, the Gurneys, and Edith Cavell. It was subjected by the Germans to "Baedeker raids" on April 27 and 29, 1942.

Norwich was founded by the Anglo-Saxon invaders of Britain, and in the 10th century or earlier was an important town. In 1094 the E. Anglican bishopric was brought here from Thetford, and about the same time the castle was built. Attached to the cathedral was a monastery. The citizens, growing rich, bought various charters giving them liberties and privileges, and walls were built around the city. In the 14th century a

from a cold in the head. Several cavities are present in the bones adjoining the sides of the nose, and

Nose. Sectional diagram showing lateral wall and principal parts of the organ

open into it by small holes. These holes may become blocked by catarrh or infection, and severe headache can result. The pain is caused not by pressure resulting from blockage, but by the negative pressure caused by the absorption of the air normally present in the cavities, the sinuses, no more being able to enter. The condition is relieved by sprays and inhalations which shrink the mucous membrane. The floor runs straight back from the nostrils to the nasopharynx, parallel with the roof of the mouth. The two cavities are separated from one another by the septum, which is principally composed of cartilage.

The point of the nose is composed of cartilage covered by skin externally, and jointed to the bony framework of the rest of the nose, giving softness and mobility to the point. The nerve of smell breaks up into many branches, which end in the upper parts of the septum and sides of the nose. This region is therefore termed the olfactory region, or the part of the nose used for smelling. Often after acute diseases, especially influenza, this area may cease to function. The rest of the nose is supplied by nerves of common sensibility and is used for breathing. It is therefore termed the respiratory region of the nose.

The sense of smell varies much in different individuals, and in different animals. It is highly developed in herbivora and carnivora, the dog, for example, depending on the sense of smell almost as much as on sight. Taste and smell are intimately connected. Digestion is greatly assisted by the agreeable stimulation of both senses.

To avoid irritation of the throat and lungs all the air should be drawn through the nose in order

that it may be warmed and moistened and rendered harmless to these important organs. See Adenoids; Anatomy; Head; Man; Smell.

Nosean or **NOSFLITE**. Member of the feldspathoid group of minerals, composed of sodium aluminium silicate with calcium sulphate, $3(\text{Na}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2) \cdot 2\text{CaSO}_4$. It occurs as greyish or brownish cubic crystals and grains in certain igneous rocks, mostly of volcanic origin, that are low in silica and rich in alkali.

Nose-ornament. Object worn in or on the nose, usually by passing it or a subsidiary ring or hook through a perforation. Made of bone, shell, feather, quill, tooth, wood, pearl, or metal, sometimes engraved or jewelled, its purpose was originally amuletic.

Nose-pins, especially characteristic of Melanesia and Australia, are usually passed through the septum, the rite of piercing being sometimes completed by drawing a live snake through the perforation. Corpses with unpierced noses have the rite performed upon them, to avoid discomfort to the ghost in the afterworld.

Metal nose-rings, which may have antedated earrings in W. Asia, were adopted by the Hebrew people. Many O.T. references to rings concern nose-ornaments, as in Gen. 24. They were removed on the Sabbath. The khizam, worn by women in Cairo and among some Beduin tribes, is usually of brass, with red or blue glass beads. The practice drifted across Africa to Nyasaland and the Gambia; the Yorubaland Egba insert coral plugs in the left nostril. Nose-rings became especially developed in India, among both Hindu and Mahomedan women. Tattooing of the nose also occurs.

Nosology (Gr. *nosos*, disease; *logos*, science). A science which deals with the classification and nomenclature of diseases. No general system has been agreed upon by doctors for this classification, but Nomenclature of Diseases of the Royal College of Physicians, a compilation originally due to Dr. William Farr in 1837, has been adopted with amendments by various countries.

Nossi-Bé or **Nossy-Bé**. Island off the W. coast of Madagascar. Belonging to France, it is situated

at the entrance to the Bay of Passandava. It is mountainous and volcanic. Its chief town, Hellville, named after Governor Hell, who took possession of the island in 1841, has an excellent harbour. The neighbouring islands are Nossi-Mitsiou, Nossi-Comba, Nossi-Sakatra, and Nossi-Faly. Area of Nossi-Bé, 130 sq. m.

Nostalgia (Gr. *nostos*, return; *algos*, grief). Homesickness, and a common symptom of regression (*q.v.*). In periods of strain, when adjustment to adult life or a new environment is painful and difficult, a longing is felt to return to a phase in which the individual was sheltered and happy. In bad cases the desire will be for a return to a childish state when everything was provided and there was no need to face responsibilities. This feeling precludes any real attempt to cope with life. It is sometimes found to be an early symptom of melancholia (*q.v.*).

Nostoc. Mucilaginous plants of the family Nostocaceae, of the

Nose-ornament. Examples worn by different races of mankind. Left to right: Sudanese negress; Tamil girl; Papuan wearing tusks of a wild boar

division Protophyta, or simplest plants. They are exceedingly fine filaments, consisting of a large number of minute cells attached in a single series, which under the microscope presents the appearance of a necklace of pearls or beads. One or more of these filaments, coiled or twisted, are enclosed in hyaline jelly, and these masses, varying from 0.2 mm. to an inch in diam., float on bog-pools, appear on gravel paths, damp soil, or on rotting timber. They are often tinted green, violet, or blue. Sometimes they inhabit the cells of higher plants. *N. edule* is utilised by the Chinese as a soup ingredient. *N. commune*, the common species, is in some districts known as falling stars.

Nostradamus (1503-66). A French astrologer. Michel de Notredame was born of Jewish parents at St. Rémy, Provence, Dec. 13, 1503. After studying philosophy at Avignon, he became a doctor at Montpellier, and in 1544 established himself at Salon near Aix. He gained a reputation for cures during the plague which

ravaged the country, and in 1555 published at Lyons a book of prophecies (in rhymed quatrains) known as *Centuries*. In these he forecast the death of Henry II in a tournament and events of French history up to the Revolution. He became physician to Charles IX, and died July 2, 1566.

Nosu. Aboriginal people in S.W. China. Occupying the mountain region where Yunnan, Szechwan, and Kweichow meet, they represent a stock of Tibetan origin and primitive culture, who spread E. into the plains, driving before them the earlier Yao. They resisted the Manchu domination until early in the 18th century, when they were thrust back into the uplands above the 6,000 ft. level. They maintain feudal institutions and animistic practices.

Notables. Prominent personages formerly convoked in extraordinary council by kings of France. Dating from the 14th century, the council was called in times of national emergency, but had no powers, being purely consultative. The two most famous occasions of its being called were in 1787, when Louis XVI appealed to the notables for advice on the increasing difficulties of the monarchy, and was advised to convoke the states-general; and in 1788, when they were summoned to give advice on the representation of the Third Estate, and by their reactionary attitude deepened the public discontent and hastened the Revolution. See French Revolution; States-General.

Notary (Lat. *nota*, note). In England, originally an officer in the ecclesiastical courts. Notaries are still admitted by the archbishop of Canterbury through his representatives, but their duties are mainly secular. They serve an apprenticeship and pass an examination, and, in London, must belong to the Scriveners' Company. A notary attests or certifies documents, mainly in connexion with a failure to meet bills of exchange. There is a society of public notaries. In England a notary is usually a solicitor; in Scotland he must be a solicitor. Among the Romans the notary originally was a slave or freedman employed as a shorthand reporter of proceedings in the senate and law courts.

Notation. Musical term, meaning the use of signs to represent musical sounds. Its evolution has been slow, and no system is perfect for all purposes. Three chief methods have been employed: (1) representing scale relations, as

in the phonetic systems of the Hindus and Chinese, the old Greek systems, the modern Paris-Galin-Chev  figure notation, and the Tonic Sol-fa notation; (2) representing the fingering of certain instruments, known as *tablature*; (3) representing fixed pitch, as in the ordinary staff notation of modern W. Europe. Each of these methods of showing pitch is aided by time symbols of various kinds. See Musical Terms; Pitch; Stave; *Tablature*; Time; Tonic Sol-fa.

Notation. System of figures and signs used in arithmetic and algebra to denote numbers and operations. See Arithmetic.

Notes and Queries.

London weekly paper established Nov. 3, 1849, by W. J. Thoms, to form a medium for the exchange of knowledge between literary men and others. A monthly journal during the First Great War, it reverted to its weekly form in 1920, but became a fortnightly in July, 1942. It was purchased by *The Times* in 1920, and taken over by the Oxford University Press in 1939.

Notice. In English law, a term in frequent use, usually meaning knowledge of a fact. Sometimes, however, it merely means knowledge of some other fact, which ought to induce a careful and prudent man to make inquiry, from which inquiry he would probably have discovered the fact in question. In equity, a purchaser for value without notice of any defect in his vendor's title is always in a strong position. Thus if A has borrowed money from X on the deposit of his title deeds, and A, afterwards obtaining the deeds somehow from the lender, takes them and sells the property to B, as being unencumbered, B takes the property free from the charge. But if there was some fact or circumstance which ought to have put B on inquiry, and he did not choose to inquire, he may have to hold the property subject to X's loan. At common law, if the holder of a bill of exchange takes it with notice of any fraud in its inception or transfer, he will have no better title to it than his transferor had.

Notification. For notification of diseases, including list of notifiable diseases, see Disease.

Noto. Town of Sicily, in the prov. of Syracuse. It stands 2 m.

from the Mediterranean and 21 m. by rly. S.W. of Syracuse. It has some handsome palaces and an archaeological museum. There are prehistoric tombs, Greek cemeteries, and Christian catacombs. Trade is carried on in corn, oil, and wine. The present town was built in 1703, ten years after the destruction by earthquake of the medieval city, which occupied the site of Netum, a Sikel city 5 m. to the N. Pop. 32,000.

Notochord (Gr. *n tos*, back; *chord *, cord). In embryology, a cellular, cartilage-like rod, which appears in the embryo of vertebrates and forms the basis of the vertebral column. Except in the lowest forms of vertebrates it disappears after the embryo stage, and is replaced by the vertebral column. See Vertebrates.

Notornis. Very rare New Zealand bird. It belongs to the *Ralliformes*. The best known species has greenish plumage on the back, with head, neck, and under parts purple. Its wings are rudimentary and it cannot fly, but runs

Notornis. Very rare bird of New Zealand

fast. Living specimens were caught in 1849, 1851, 1879, and 1898. Then in 1948 three were seen and two captured, examined, photographed, and released, near lake Te Anau. Later that year an expedition to the area filmed 20 breeding pairs.

No Treating Order. Drink restriction in Great Britain during the First Great War. Early in the war complaints were made as to the excessive drinking in munition areas, and its harmful effect on the output of urgent supplies, also as to the injury to soldiers on leave by well-meaning persons treating them to alcoholic liquor. As part of the wider scheme to regulate the drink traffic, the central control board issued an order in Nov., 1915, prohibiting treating. No one could purchase in licensed premises or clubs an alcoholic drink for another person. Infringement of the order was punishable by a fine. The order was in force until 1919.

Notre Dame (Fr., Our Lady). In French ecclesiology, name for the Virgin Mary. Numerous churches are thus dedicated, in Paris and elsewhere, notably the cathedral, *Note Dame de Paris*. Situated in the  le de la Cit , this cathedral stands on the site of a 7th century church of S.  tienne and of a church of *Notre Dame* res

built in the 9th century. Begun in 1163, and completed early in the 14th century, the existing building was converted into a Temple of Reason, 1793-94.

The building was reopened in 1795 for divine worship, handed over to the R.C. Church in 1802, restored in 1845, and damaged by the Communards in 1871. A magnificent example of decorated Gothic architecture, its length is 390 ft. Two towers have quaint gargoyles on their balustrades and are 226 ft. high. The fine sculptured façade was completed in 1240. The aisles are prolonged round the choir, there are 37 chapels, and beautiful old glass in the rose windows of the transepts, between which rises the 315-ft. spire. See Apse; Paris.

Notre Dame Bay. Arm of the Atlantic Ocean, on the N. coast of Newfoundland. It lies between Cape St. John and Fogo Island, a distance of 45 m.; the E. end contains an extensive archipelago in the Bay of Exploits.

Notre Dame de Paris. Romance of medieval Paris by Victor Hugo, first published in 1831. Full of character, exciting incident, and vivid action, it ranks as one of its author's masterpieces of fiction. Quasimodo, the hunchback of Notre Dame, and Esmeralda, the gipsy girl with her goat, Djali, are numbered among the familiar figures of fiction.

Nottingham. City, parl. and co. borough, market town, and the co. town of Nottinghamshire, England. It stands on the N. or left bank of the Trent, 123 m. N.N.W. of London, and is served by rlys. and canals. Its area,

since the extension of the boundaries in 1932, is 16,166 acres. It was made a city in 1897, and in 1928 its chief magistrate became a lord mayor. Pop. est. 297,000.

Nottingham arms

The town probably originated in an Anglo-Saxon settlement. It was later a Danish burgh. It was soon recovered from the Danes, and Edward the Elder is said to have walled the town, built a bridge across the river, and erected a mint. A castle was built on a rock overlooking the Trent by a follower of William I soon after the Norman Conquest.

In the Middle Ages Nottingham was an important borough and its castle a regular royal residence. It received charters making it a corporate town and bestowing privileges upon its citizens; in 1448 it was made a county of itself, and at one time comprised two boroughs, one French and the other English, each with its own laws and customs. Here Isabella, queen of Edward II, was captured with her lover, Roger Mortimer. In 1642 Charles I set up the royal standard on a spot still known as Standard Hill, and the castle was held by Colonel Hutchinson throughout the Civil War.

The city's modern history is mainly that of its growth into a great manufacturing centre, although the Reform riots of 1831, when the castle was destroyed, must not be forgotten. Industrial development began early and the

town soon had ironworks and foundries, from which issued the bell, Great Tom, afterwards hung in Lincoln cathedral. Nottingham became a seat of the stocking trade in the 18th century.

Lace making, for which Nottingham is famous, is the direct natural descendant of the older stocking making trade, as the first lace was made here on a stocking frame in 1760. The lace is made in factories in the adjoining districts as well as in the city itself, being finished in the warehouses of the city. Connected with this industry are bleaching and dyeing establishments, and there are works for the manufacture of lace machines. An offshoot of the lace trade is the making of blouses, aprons, underwear, etc., and veilings and embroideries and men's and boys' clothing are made. Hosiery also employs many. There are engineering works, the output of cycles being great, large tanneries and tobacco factories, while soap and drugs are other products. Other industries are brewing and malting, cotton spinning, boxmaking, brickmaking, and colour printing. There is a transit trade along the river, and the city has cattle markets. Goose Fair, held annually in Oct., is an ancient institution.

A feature of Nottingham was the immense market place in the centre of the city. This has now been laid out as a magnificent square with processional way leading to the fine council house. The chief church is S. Mary's, a fine Perpendicular structure of the 15th century; S. Peter and S. Nicholas are old foundations. The R.C. church of S. Barnabas is a noble building.

Sir Jesse Boot (Lord Trent) gave £750,000 for the laying out of the University Boulevard and the beautiful buildings adjacent to it, opened 1928. (See N.V.)

The castle, acquired and rebuilt by the corporation after 1831, is now an art gallery. The old university college in Shakespeare St. is a fine pile. The Guildhall, a modern edifice, is the headquarters of the city's official business. The Albert, Victoria, and Mechanics' Halls are large public buildings. A new and spacious cattle market has replaced the older one. The city contains numerous open spaces including the Forest and the Arboretum. On Bulwell Forest and in Bulwell Hall Park are municipal golf links. Trent Bridge is famous as a centre of county and international cricket.

Nottingham. The Council House dominating the Square and processional way

The city is governed by a lord mayor, sheriff, and council, consisting of aldermen and councillors from its 16 wards. The city has a recorder, who holds here courts of quarter sessions, and it is an assize town. It sends four members to parliament, and has two daily papers, *The Guardian* and *The Journal*, and also two evening papers.

Nottingham, CHARLES HOWARD, EARL OF (1536-1624). English sailor. The eldest son of Lord Howard

of Effingham, lord high admiral of England, and first cousin to Anne Boleyn, he served at sea as a youth, and after Elizabeth's accession occupied several court appointments before he became lord high admiral in 1585. A gallant and able sailor. He was in command when the *Armada* (*q.v.*) appeared and was largely responsible for its defeat. In 1596 he and Essex sailed to Cadiz and sacked the town, and on his return he was created earl of Nottingham. In 1599 he was given command of all the sea and land forces. He died at Croydon, Dec. 14, 1624, and was buried at Reigate.

ments before he became lord high admiral in 1585. A gallant and able sailor. He was in command when the *Armada* (*q.v.*) appeared and was largely responsible for its defeat. In 1596 he and Essex sailed to Cadiz and sacked the town, and on his return he was created earl of Nottingham. In 1599 he was given command of all the sea and land forces. He died at Croydon, Dec. 14, 1624, and was buried at Reigate.

Nottingham, HENEGAGE FINCH, 1ST EARL OF (1621-82). English politician. Born Dec. 23, 1621, the son of Sir Henegage Finch, Speaker of the house of commons, he was educated at Westminster and Christ Church, Oxford, and called to the bar in 1645. Entering parliament in 1660, he was made solicitor-general, and in 1674 lord chancellor and a baron. Created an earl in 1681, he died Dec. 18, 1682.

public life, became a privy councillor and a lord of the admiralty, and was one of James II's warmest supporters until alienated by that monarch's ecclesiastical policy. He took no part in bringing about the Revolution, but in 1690 was one of the council chosen to assist Queen Mary during the king's absence in Ireland. At George I's accession Nottingham was made president of the council, but he lost favour in 1716. He died Jan. 1, 1730.

Nottinghamshire. County of England. Wholly inland, its area is 844 sq. m. It is in the main a level region, much of it being the valley of the Trent, but there are wolds in the S. and some hills in the W. The chief river is the Trent; others are its tributaries, the Idle and the Erewash, which

latter separates the county from Derbyshire.

Notts may be divided roughly into a coal-mining and industrial area in the S. and S.W., and an agricultural one in the N.E. and S.E. Barley and oats are grown; sheep and cattle are reared. A large quantity of coal is produced, mining having begun in the Middle Ages; lace manufacture is a traditional industry, and that of hosiery was introduced in the 16th century; also there are engineering works. Main rlys. to N. and canals pass through the co. In it are the remains of Sherwood Forest including the

Nottinghamshire
arms

district known as the Dukeries (*q.v.*). Other places of interest are Cresswell Crags, where traces of primitive man have been found, and the fine houses of Welbeck, Thoresby, Clumber, Newstead, and Wollaton. There are remains of monasteries at Newstead, Thurgarton, and elsewhere. Nottingham is the county town; other boroughs are Mansfield, Newark, Retford, and Worksop. Six co. members are returned to parliament. Notts is mainly in the diocese of Southwell. Before the Norman Conquest, it was part of Mercia. It passed under the control of the Danes, and there are traces of Danish settlements. Population 712,731.

LITERARY ASSOCIATIONS. The most prominent figure is Byron, who passed much of his early life at Southwell and Newstead, and is buried at Hucknall Torkard. Other poets of the county are H. K. White and P. J. Bailey, both born at Nottingham. D. H. Lawrence was born at Eastwood. Thomas Cranmer came from Aslockton, and Erasmus Darwin from Elston Hall. In the literature of legend the county has Gotham (*q.v.*), and Sherwood Forest, background to tales of Robin Hood, and also to the ballad of The King and the Miller of Mansfield.

Nottinghamshire and Derbyshire Regiment, THE. Official name of the regt. better known as The Sherwood Foresters (*q.v.*).

Nottingham University. See N.V. section, at end of Vol. 10.

Notting Hill. London district. Part of the bor. of Kensington, it is N. of Holland Park, with Bayswater to E. and Shepherd's Bush to W. At Notting Hill Gate was an old turnpike, removed in 1864; near the Met. rly. station is the Coronet Theatre, built 1898, later a cinema. On the rising ground of Ladbroke Grove, known in 1820 as Notting Hill Farm, is S. John's church, 1842-45. The farm was succeeded, 1837-41, by a racecourse, recalled by the name of Hippodrome Place. The district, built over 1828-48, was named from the manor of Knotting or Nutting Barnes, owned by John de Vere, earl of Oxford in the time of Edward IV.

Nouméa. Capital of the French island of New Caledonia. Situated on a bay in the extreme S., it engages in smelting and treatment of nickel ore. The Collège La Pérouse is one of the principal educational institutions in the Pacific. Nouméa is connected with Sydney, N.S.W., by monthly

steamer service. In the Second Great War, New Caledonia having declared for Gen. de Gaulle, British and U.S. aircraft carriers were based on Nouméa during operations against Japanese-held islands. Pop. 10,466.

Noumenon (Gr. *noumenon*, anything thought). Object of pure thought, opposed to phenomenon, the object of sensation. Kant further distinguishes the object known by the mind from the noumenon, which can be conceived but not known. The object is relative to intelligence generally; the noumenon is relative to nothing—it is the thing-in-itself, not the thing as we see it. *Pron.* No-oomenon.

Noun (Lat. *nomen*, name). In grammar, a word denoting a person or thing (noun substantive), or a quality (noun adjective). The term substantive (*substantivus*, self-existent) is due to the grammarians of the Middle Ages. Nouns substantive may be divided into abstract, expressing an attribute of a person or thing (virtue, beauty); concrete, designating real persons or things, to which such attributes belong; concrete nouns being further divided into proper, distinguishing any particular living being or inanimate object from others of the same kind (Henry, London); common, embracing all persons or things belonging to the same class (man, dog, house); collective, designating a collection of persons or things regarded as forming a whole (army, multitude, heap); partitive, indicating a part, variable in amount, of a collective whole. *See* Name.

Nova. (Lat. *novus*, new.) A temporary star noticed when a previously faint star blazes up in two or three days to a brightness usually between 10,000 and 1,000,000 times its value before the outburst. Since the star has usually been below visibility to the naked eye, it suddenly appears to the observer as a "new" star, hence the name. Its decline from maximum brightness is not so rapid as its rise, but within a few weeks the average nova has faded to about one hundredth of its maximum light and is probably again invisible to the unaided eye. A year or two afterwards the star has returned to insignificance, which suggests the outburst, though spectacular, is not deep-seated.

The brightest recorded novae are Nova Cassiopeiae, discovered by Tycho Brahe in 1572, which became brighter even than Venus and was visible in broad daylight; Nova Ophiuchi, discovered by

Kepler in 1604, which reached Jupiter's brightness; and Nova Aquilae, 1918, which exceeded in brightness all stars except Sirius. Nova Herculis in 1934 reached the first magnitude, and Nova Puppis in 1942 was as bright. Nearly 100 novae have been discovered since 1900, but most were invisible to the naked eye.

Novae generally appear in or near the Milky Way. This indicates that they are members of the galactic system which are so bright intrinsically that they can be seen at great distances. Study of novae appearing in other galaxies (*e.g.* the Andromeda nebula) suggests that they equal the brightest ordinary stars.

Some idea of the physical processes occurring during nova outbursts can be obtained from their spectra, which show at successive stages different features rarely matched by ordinary stars. The occurrence first of absorption lines and later of emission lines displaced (*see* Doppler's Principle) by amounts corresponding to velocities of approach of thousands of miles per second suggests that the outer envelope of the star is blown off by some catastrophic explosion as a succession of gaseous shells. Nebulous envelopes have been seen telescopically around some novae after the outburst. These rapidly attenuate as they expand, and give rise to a nebular spectrum (*see* Nebulium) typical of gases at low pressure illuminated by a central star at very high temperature. After months or years the gaseous envelope becomes too thin to radiate and the central star giving an ordinary stellar spectrum remains. A. Hunter, Ph.D., F.R.A.S.

Novaculite (Lat. *novacula*, razor). In geology, name given to a fine-grained rock consisting of small quartz particles. Several varieties are used as hones.

Novaia Zemlia or NOVAIA ZEMLYA. Archipelago of the Arctic Ocean, belonging to the U.S.S.R. It stretches N.N.E. between Barents Sea on the W. and Kara Sea on the E., and is separated from Waigats or Vaigach Island by Burroughs Strait. It is composed mainly of two large islands, divided by the Matochkin Shar or Matthew Strait; that to the S. is called Goose Land (*q.v.*), while the N. island is divided into Barents Land in the N., Lutkes Land in the centre, and Matthews Land in the S. Several small islands, mainly off the E. coast, combine to make the archipelago. The total land area is est. at 35,150 sq. m.

Novalis. Pseudonym of Friedrich Ludwig von Hardenberg (1772-1801), German writer. He was born May 2, 1772, at Wiederstedt, Prussia, and studied philosophy at Jena and law at Leipzig and Wittenberg, where he graduated in 1794. He fell in love with the beautiful Sophie von Kühn, whose death in 1797, at the age of 15, proved a great blow to him. In 1800 he was at Freiburg, studying mineralogy, when pulmonary consumption declared itself, and he died at Weissenfels, March 25, 1801.

His *Hymns to the Night*, 1800, written after he lost his betrothed, breathe a lofty spirituality. Apart from romantic philosophical fragments and those hymns, his chief work is a great unfinished romance, *Heinrich von Ofterdingen*, in which the symbolism of the pursuit of the blue flower by the hero is an interesting precursor of Maeterlinck's *Blue Bird*. His works were edited by L. Tieck and F. Schlegel, 1802, and his correspondence was published in 1880. *Consult Miscellaneous Essays*, T. Carlyle, vol. 2, 1829.

Novara. Frontier prov. of Italy, in Piedmont. It is bounded N. by Switzerland, W. by Vercelli prov., S. and E. by Lombardy. Its area is 2,548 sq. m.

Novara. City of Italy, capital of the prov. of Novara. Situated on an eminence between the rivers Terdoppio and Agogna, it is a junction 31 m. by rly. W. of Milan. Among its many handsome edifices are the Romanesque cathedral, dating from the 4th century, with a 10th century baptistery and old frescoes; the church of San Gaudenzio, founded in the 5th century and rebuilt in 1570; an ancient citadel, now used as a prison; and a museum with Roman antiquities. Rectangular streets recall the Roman occupation of Novara. Its old fortifications have been replaced by boulevards. The chief industry is the manufacture of textiles. Pop. (1936), 62,570.

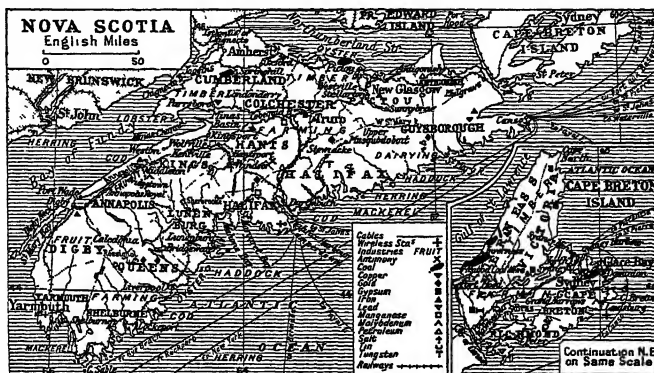

Novara, Italy. Dome of S. Gaudenzio, 397 ft. high, and part of the cathedral, right centre

Novara, BATTLE OF. Austrian victory over the Piedmontese, March 23, 1849. The armistice which followed the Austrian victory of Custoza, 1848, was succeeded by protracted and futile negotiations between England, France, Austria, and Piedmont. Wearied of a state of affairs in

lakes in Cape Breton. Many small islands lie off the coast.

Halifax is the capital, the chief port, and the largest city. Sydney, on Cape Breton, a mining centre, is the next in size, and third comes Glace Bay. The affairs of Nova Scotia are managed by a ministry responsible to the house

Nova Scotia. Map of this Canadian maritime province. Halifax is the winter port of entry from the Atlantic

which the only certainty was the daily strengthening of Austria, Charles Albert of Piedmont denounced the armistice, March 12, 1849, whereupon Radetzky made a rapid march and attacked him at Novara. Charles Albert's defeat was so overwhelming that he abdicated in favour of his son, Victor Emmanuel II.

Nova Scotia. One of the three maritime provinces of Canada. Its area is 21,068 sq. m., of which 325 sq. m. are water, and its pop. is est. at 612,000. The province consists of two parts. The larger is the peninsula of Nova Scotia, surrounded by the sea except where the isthmus of Chignecto, 11½ m. wide, unites it to New Brunswick. The smaller is the island of Cape Breton to the N., the strait of Canso lying between the two. The coast is very indented and has many openings, Minas Basin being the deepest. Halifax and Sydney have the finest harbours. There are a number of lakes, including Rossignol in Nova Scotia, and the Bras d'Or

of assembly, of 30 members, who are elected every five years. The province sends 10 members to the senate and 12 to the house of commons of the dominion. Its second chamber, or legislative council, was abolished in 1928.

Nova Scotia is mainly an agricultural area. Dairy produce, poultry, and fruit are the chief products, the apples of the fertile Annapolis valley being famous. Oats and potatoes are also largely grown. There is a good deal of forest land and much timber is felled. Cape Breton has a rich coal-field, and in Nova Scotia coal, iron, gold, salt, and gypsum are worked. The fisheries are valuable, chief among them being cod, lobster, and mackerel; trout and salmon are caught in the rivers. The rlys. converge on Halifax.

Nova Scotia was first taken possession of by the French, who named it Acadia. In 1613 the French settlers were ousted by the English, and in 1621 James I bestowed it upon a Scotsman, Sir William Alexander, to which fact it owes its name (New Scotland). It was given back to France in 1632, and again in 1667, after it had been taken by Cromwell. Port Royal, the later Annapolis, was then the capital of the colony.

The long struggle between England and France for the possession of America was partly fought out here; in 1710 Great Britain again seized Nova Scotia, keeping it by the treaty of 1713, but Cape Breton

Nova Scotia arms

remained French. At this time Nova Scotia included New Brunswick and Prince Edward Island, although its W. boundary was uncertain. On Cape Breton the French built the strong fortress of Louisbourg, which was twice captured by the British. In 1748 it was restored, but the second time it, and with it Cape Breton, was retained, and it formally became British in 1763.

From Nova Scotia itself the British in 1755 had expelled the French settlers, known as Acadians, and during the Seven Years' War the French vainly attempted to recover the region. After the British victory in 1763 New Brunswick and Prince Edward Island were separated from the colony.

In 1867 Nova Scotia was one of the four provs. composing the new dominion of Canada. It had had representative institutions since 1758, but their corollary, responsible government, was secured only about this time. The union once effected, there was soon a strong agitation for withdrawal, but financial concessions were made, the Inter-colonial rly., part of the bargain, was completed, and the movement gradually died away. Woman franchise was passed into law in 1918.

Novatianism. Schism which arose in the Christian Church in the 3rd century. It was named after Novatian, a presbyter of Rome, who was joined by Novatus of Carthage. Its adherents called themselves Cathari (*q.v.*) and separated from the Church as a protest against the laxity of the Roman clergy in receiving the lapsed to penance. Novatian is described as the first anti-pope, and he instituted a succession of schismatic bishops which existed for nearly 300 years. The Novatians denied that the Church could reconcile those who had fallen after baptism into deadly sin; they rebaptized those who joined them.

Novation (Lat. *novatio*, making new). In law, the substitution of one legal obligation for another. The situation constantly arises in the case of a change of partners in a firm. Thus if A and B are partners, under the title of A and Co., and have dealings with X, and B retires from the firm and C comes into it; and X, with knowledge of the change, goes on dealing with A and Co., he is deemed to accept A and C as his debtors (or creditors) instead of A and B.

Novaya Zemlya. Arctic archipelago of which the alternative spelling is Novaia Zemlia (*q.v.*).

THE NOVEL: ITS HISTORY AND RANGE

Frank Swinnerton, distinguished Novelist and Critic

The development of the art of reflecting life through imaginative fiction is here clearly presented, from the earliest travellers' tales to the contemporary excursions into unlimited subjectivity. See also English (Language and) Literature; Short Story; and under the sub-heading Literature in the articles on various countries, e.g. France, Germany, Hungary, Iceland, Russia, etc.

As soon as men began to narrate their adventures, and, for the better understanding of audiences, to arrange them in dramatic sequence, the novel was born. Only the types of adventures, and the degrees of emphasis in the narration, varied in the following centuries; and the earliest romances known to us are, in essence, travellers' tales. In these, love, magic, extraordinary accident, supposed death, and capture by and escape from pirates, are succeeded by eventful wanderings in strange countries, hardships, dangers, reunions, feasts, and happiness. Such stories mirrored the hopes and fears of listeners, excited their wondering curiosity, and pictured for them a wider, more enthralling world than the one they knew.

Adventures of "He" and "She"

In the early centuries of the Christian era, when the satiric Golden Ass, the charming pastoral Daphnis and Chloe, and the elegant and ingenious Theagenes and Chariclea of Heliodorus were composed, almost anything could happen in that unexplored world. Intercourse between communities was small, and credulity was eager. Story-tellers therefore enjoyed a freedom which modern authors cannot hope for, and gloried in the invention of all that seemed to them extraordinary. They discovered, however, one fact which later novelists have confirmed. It was that those who listened wanted to hear, not about great armies or undertakings, but about individuals, "he" or "she," who might be themselves or their idealised loves. Whether they were shepherds and shepherdesses, or distracted pilgrims, or, as the age of chivalry approached and was realized, knights and their ladies, they were henceforward "he" and "she," the prototypes of all later heroes and heroines of romance.

The whole of Europe gradually shared in such stories, which were carried from one land to another by minstrels and tale-tellers; and to this day, although students alone read the actual narratives sung or recited throughout the Middle Ages, we all know the

chivalric legends garnered by Geoffrey of Monmouth and, much later, Sir Thomas Malory. Daphnis, Chariclea, Hysmene, and Callirrhoe became Charlemagne, Arthur, Gawain, Galahad, and at length Tristram, Guinevere, Lancelot, and Yseult. In Scandinavia their ordeals were grimmer, in the Orient more ghastly; but, whatever names the heroes bore, all were splendid puppets, to be lauded to simple audiences, loving, feasting, fighting against men and magic, and wandering, sometimes upon mighty quests, in a largely unpopulated world.

What Saintsbury called "the pure novel" did not begin to be written until much later; yet it was on the way. By the 14th century narrative had been sharpened by the sly cruelties of Boccaccio and his imitators (Italy had no romances of chivalry), and by the 16th it had been enriched by the monstrous humorous extravagance of Rabelais. And although a largely bogus heroic romance reached immense popularity in Spain, and the *Arcadia* was written to universal admiration late in the 16th century by our own Sir Philip Sidney, this older type of romance lost its hold as the conditions in which it thrived yielded to the effects of the Renaissance. To the knight had succeeded the adventurer. The rogue appeared in Spanish literature. And at last came the greatest knight of all, in whose veins, for the first time in fiction, ran perceptible warmth. With Don Quixote we do indeed approach Saintsbury's "pure novel," a tale "confining itself to the incidents of ordinary life; advancing character to a position at least equal with plot; presenting the manners of its own day, but charging them with the essence of humanity in all days."

Progressing towards Realism

Henceforward, with hesitations and long periods of sterility, the story of the novel, as distinct from the romance, can be told as one of progress from the improbable to the real, from the flatly external to the limitlessly subjective. Don Quixote was the example from which English

masculine novelists of the 18th and 19th centuries learned to regard men and women as moral beings with an important relation to the society in which they lived. It thus had an influence which we still feel. Two French novels which similarly may be said to have created the feminine novel, or story of sensibility, were Mme. de La Fayette's brief study of motive and emotion, delicacy, and temperament, *La Princesse de Clèves*, which presented the now familiar "triangle," and the analytical *Vie de Marianne*, of Mariyvaux. These two books lead us directly to Samuel Richardson, whose close pictures of women were once called excursions into "imaginative ethics," and by way of Richardson to all those writers who have since specialised in the human heart.

Objective Realism

A third element now appeared in fiction: objective realism, the scrupulous imitation of fact. Defoe, its inventor, was an experienced journalist with a remarkable gift for detail; and after recording his observations as traveller and spy for nearly sixty years he brought the gift to fiction with overwhelming effect. Thus by 1719, when Robinson Crusoe was published, the novel had been granted humorous and critical humaneness, sensibility, and realism. It was largely dominated by these characteristics, in England, for a hundred years; and, allowing for inevitable changes in manners and literary style, one may find the same characteristics in the great Victorian novels and in books as late as *The Old Wives' Tale*, 1908, and *The Good Companions*, 1929. "A novel," said Smollett, halfway through the 18th century, "is a large diffused picture, comprehending the characters of life, disposed in different groups and exhibited in various attitudes, for the purposes of a uniform plan."

No such definition would have covered the French novel of the same period, although both Fielding and Smollett were certainly acquainted with *Gil Blas* and *Le Diable Boiteux*. On the whole the French novel of the 18th century, by comparison with what was being written in England, was dedicated. But wit, a first demonstration of psychological analysis, and at least some sense of truth and proportion are revealed, and Prévost in one tiny masterpiece, *Manon Lescaut*, and Rousseau in the first portion of *La*

Nouvelle Héloïse, allowed themselves something which their English contemporaries were denied. This was passion.

Nor were the large-scale realists unchallenged in England. Sterne caught inspiration flying and threw off a few dazzling characters; Horace Walpole and Mrs. Radcliffe, perhaps by reaction from the rationalism of their century, made magic of ruined castles, dungeons, and the supernatural in what they called "Gothic romance." And, while Sterne had a doubtful progeny of sentimentalists, sham Gothic, the favourite "horrid" reading of young ladies, led in time to, and was transcended by, the Scotch novels (as they were called) of Sir Walter Scott. Scott, an antiquary, is inexact called an historical novelist, and of late has been underrated. His greatest novels, which described almost contemporary life, brought to prose fiction, for the first time, an Elizabethan grandeur of comedy and tragedy. At his best he is comparable in creative power to Shakespeare; and his liberating influence upon all imaginative prose literature cannot be exaggerated.

By contrast with the Scotch novels, those of Jane Austen, written about country house and village life at the very end of the 18th century, are occasionally thought to be amusing parochial satires on snobs, schemers, and silly young women. The delight they give, however, is endless. They grow new delicious chapters, and the characters in them reveal new profundities of understanding, at every reading. As comedies of life and manners they are unique.

Zenith of the English Novel

The supreme days of the English novel had now been reached; and in the year of Queen Victoria's accession, Charles Dickens published *The Posthumous Papers of the Pickwick Club*, in which, to the roving manner of the traditional romance, he added uproarious merriment, satire, severe social criticism, and a greater capacity than Fielding's or Smollett's for the invention of droll minor personages. The book, with its sequels, made the novel universal family reading, and spread here and abroad, especially to France and Russia, such new inspiration as had been carried previously only by Cervantes, Richardson, and Scott.

Dickens loved melodrama; he could not resist his own comic

exuberance, and his pathos has lost its effect. But he had astounding creative energy. It far surpassed that of his distinguished contemporaries, who, shrinking appalled from his vulgarity, refined, deepened, and broadened the scope of good-humoured fiction until, with Thackeray, it embraced the genteel world, with Trollope the broad counties, with George Eliot the very spirit of altruistic rationalism, and with half a dozen others (not more effective than Dickens in arousing the moral sense of a people) the sufferings and social anomalies of an increasingly industrialised society. In England, for almost the whole of the 19th century, the novel was the most powerful instrument of ethics which had been invented by man. It was full of engrossing story and generously conceived characters; but except for the Brontë sisters, it was not impassioned, and, except for Jane Austen, it was not a precise and delicate work of art.

The French Masters

The English novelists, in fact, were instinctive novelists. They brought to their work genius, intellect, and inexhaustible love of humanity. They had hardly at all grasped the notion that there could be something classifiable as "the novel." This was partly true even of the two last great Victorians, Meredith and Hardy, who both, however, dramatised life; the one, after the manner of the Restoration playwrights, as comedy, the other, following the greatest Elizabethans, as tragedy. It was much less true of the majestic Frenchmen, Beyle and Balzac, of whom the former brought cold analysis of vice and virtue, action and emotion, to a degree previously unattempted, while the latter conceived the scheme of incorporating all life—spirit, flesh, work, wealth, and misery—in a series of novels which he afterwards called *La Comédie Humaine*. These two men were the first modern novelists. From what they wrote, almost the whole of French fiction arose. But where Balzac spun from within himself a fabulous France, Zola drew more precisely from observation and blue book, and still later Jules Romains and other social historians have taken what are called cross-sections of life. Where Stendhal (Beyle) coolly watched heartless lovers, Flaubert calmly portrayed wantons and romantics.

The differences were those of art, age, and environment; the resemblance was racial. The French are realists. In creative literature they love type and form. To the French above all, therefore, we owe the development of novel-writing as an art.

To say this is not to deny the creative supremacy of the Russian novelists, who had a power, breadth, and passion unknown in other literatures. They, more than the French, learned from Dickens; and the debt is apparent in both Gogol and Dostoevsky. But Dostoevsky, who was once scornfully described by George Moore as "Gaboriau with psychological sauce," learned from Dickens only a large looseness of construction. His temperament and his terrible experience as a man condemned to death and reprieved carried him to vehement heights and depths of emotion which Dickens could never have shared. His religious fervour, and the hyperaesthesia which gave him such insight into the minds and hearts of anguished people, could have had no place in English fiction, where the only writer to approach him for intensity of feeling was D. H. Lawrence, or even in American fiction, despite the apocalyptic splendours of Herman Melville. Moreover, the grand range of the Russian novel, sensational in Dostoevsky, but in Tolstoy's *War and Peace* impressively restrained, puts it beyond all comparison.

This question of size and conception does not arise in the case of Turgenyev, the third of the greatest Russian novelists, because Turgenyev has not the tumult of Dostoevsky nor the cosmic imposingness of Tolstoy's *War and Peace*. He was an artist in the French sense; his books are short, subdued, poignant in their revelations of sorrow and frustration. Although there are differences in quality as in theme, Turgenyev had as followers both Henry James and the early Galsworthy. Like them, he devoted himself to the drama of character, to the interaction of a small group of people of sensitive breeding; like them, he relied, as Joseph Conrad did, upon the significant word and gesture to convey every feeling and in particular every suffering of his very subtly seen characters.

James and Conrad did this, the one in delicate easel-dramas, the other in beautiful or dramatic pictures of failure and conflict. Proust, in France, expanded what

James refrained from expanding: he did not bring crisis to the easel, but with enchanting sensitiveness and taste he gave to the novel what James reserved for his autobiographical books, *A Small Boy*, and *Notes of a Son and Brother*. But Proust offered a lead—no more—to other writers who wove their reveries into a kind of novel known as "the stream of consciousness." At a time when realism was in eclipse, these writers brought fiction farthest from its beginnings. They looked within. For the external flatness of classical romance, and the humorous jog-trot of the popular chronicle, the world-changing improvisations of H. G. Wells, and the searching pateries of Arnold Bennett, they substituted poetic fantasy and what may be called the egotistic destructive. The novel had reached the subconscious. We do not yet know where it will go next. See English Language and Literature; Language and Literature subsections under the headings of Belgium, France, Germany, etc.; Dickens; Hardy; Meredith; Scott; Thackeray, etc.

Novello, IVOR (b. 1893). British actor, dramatist, and composer. Son of Clara Novello Davies, he was born at Cardiff, Jan. 15, 1893, and educated at Magdalen College school, Oxford, making his début on the stage in Deburau at the Ambassadors', 1921. He was already famous for his song of the First Great War, *Keep the Home Fires Burning*. As a romantic actor he had a great following in his own musical plays and light comedies. The first plays to achieve success, *The Rat*, 1924, and *The Truth Game*, 1928, were written in collaboration with Constance Collier; *Symphony in Two Flats* followed in 1929, and *Fresh Fields* in 1933. His series of musical plays began with *Glamorous Night*, 1935, followed by *Careless Rapture*, *Crest of the Wave*, *The Dancing Years* (filmed 1950), *Perchance to Dream*, and *King's Rhapsody*.

Novello, VINCENT (1781-1861). British composer. Born in London, Sept. 6, 1781, of mixed Italian and English parentage, he became a chorister in the Sardinian Chapel and later an organ-

ist. He died Aug. 11, 1861. He was a founder of the London Philharmonic Society, composed church music, masses, etc., and edited collections of sacred music. The publication of these by himself was the beginning of the business of Novello and Co., actually founded, 1861, by his son Joseph (1810-96).

V. Novello.

After Sir E. P. Novello

November. Eleventh month of the Christian calendar, the ninth in the old Roman calendar, whence its name from Lat. *novem*, nine. The Anglo-Saxons called it *Wind-monath*, and also *Blód-monath* (blood month), from the practice of slaughtering cattle during this month, to be salted for the winter. See Calendar.

Noverre, JEAN GEORGES (1727-1810). French choreographer. Born in Paris, March 29, 1727, he composed his first ballet for the Opéra Comique in 1747, and later devised the choreography for works by Gluck. He was invited to London by Garrick in 1755, though his influence was greatest at Stuttgart. Noverre's celebrated *Lettres sur la Danse*, 1758, did much to free the art of ballet from conventions. He was ballet master at the Paris Opéra, 1775-89. He died Nov. 19, 1810. See Ballet.

Novgorod. A town of the R.S.F.S.R. It is sometimes given the prefix *Veliki* (great), and is not to be confounded with the former *Nijni Novgorod*, now Gorky. It stands on the river Volkhov, N. of Lake Ilmen and 100 m. S.S.E. of Leningrad. Here are a kremlin or citadel, the cathedral of S. Sophia, the palace of Catherine II, and a monument commemorating the expulsion of the French in 1812. There are tanneries and candle works, and a trade in grain, timber, salt, and iron. In 862 Novgorod was the capital of the Scandinavian chief Rurik (*q.v.*), and it remained the Russian capital until replaced by Kiev. In the 12th century, when it was the centre of a great republic, the pop. grew to 400,000; but it came into the power of Moscow, and was almost destroyed by Ivan the Terrible in 1570. Standing on the main Leningrad-Moscow rly., it was a key city in German attacks on Leningrad during the Second Great War. Von Leeb's right

Ivor Novello,
British actor

wing took it on Aug. 21, 1941. It remained in German hands until on Jan. 20, 1944, the Red Army recaptured it by storm after an out-flanking movement. Pop. 31,120.

Novi or **Novi LIGURE**. Town of Italy, in the prov. of Alessandria, Piedmont. It is a junction 14 m. by rly. S.E. of Alessandria. Silk weaving is the chief industry. Here on Aug. 15, 1799, the combined Russians and Austrians defeated the French, who lost their general, Joubert, and 10,000 men. The French were victorious in the same locality on Nov. 6. Pop. 18,000.

Novi Pazar, **Novi Bazar**, or **YENIPASAR**. Town of Yugoslavia, in S.W. Serbia. Situated on the Rashka, a tributary of the Ibar, it is about 130 m. due S. of Belgrade, and is strategically important as a road junction. It frequently figured in Serbian history in the Middle Ages. Under the Turks it was fortified, and the chief town of the sanjak of Novi Pazar, part of the vilayet of Kossovo. After the treaty of Berlin, 1878, the sanjak was garrisoned by Austrian troops, and held until 1908, when Austria annexed Bosnia-Herzegovina, but retired from the sanjak. During the first Balkan War the town and sanjak were occupied by the Serbo-Montenegrins, and as the result of these two wars the sanjak was divided between Serbia and Montenegro in 1913.

Novi Sad (Ger. Neusatz; Mag. Ujvidem). Town of Yugoslavia, capital of the prov. of Dunavska. It is about 42 m. by rly. N.W. of Belgrade. Founded in the middle of the 18th century, it was almost completely destroyed during the revolution of 1848-49 but grew later into a prosperous town with a cathedral, the seat of a Greek Orthodox bishop. Pottery and cotton goods are produced, and there is a large airport. Novi Sad, occupied by Hungarian troops, 1941, was liberated by Tito's partisans, Oct. 25, 1944. Pop. 63,985.

Novocaine. Local anaesthetic. A para-aminobenzoylethyl-diethyl-amino-ethanol hydrochloride, it is included in the British Pharmacopoeia under the name of procaine hydrochloride. Novocaine is used in surgery in a similar manner to cocaine, but is more stable in solution, less toxic, and does not cause addiction. It is employed in the form of a 0.1 p.c. solution in infiltration anaesthesia, and as a 2 p.c. solution in conduction anaesthesia. See Anaesthesia.

Novocherkassk. Town of the R.S.F.S.R., in the Azov-Black Sea area, formerly the capital of Don

Cossack territory. On the rly. 25 m. N.E. of Rostov, it trades in anthracite, timber, corn, and wine. Pop., pre-war, 31,286.

Novorossiisk. Town and seaport of the R.S.F.S.R., in the Azov-Black Sea area. Standing on the Black Sea 60 m. W.S.W. of Krasnodar, it is connected by rly. with Rostov and Baku. Its formerly large export trade in grain has been mostly superseded by the shipping of petroleum and cement. During the Second Great War it became an important base for the Russian Black Sea fleet after the fall of Nikolayev, but was captured by the Germans, Sept. 5-11, 1942. Russian forces retook it after five days' violent street fighting, Sept. 16, 1943. Pop. 95,280.

Novosibirsk. Capital of the W. Siberian region of the R.S.F.S.R. This was a village of 5,000 people in 1900, and in 1939 an industrial city of 405,589. In the Ural area, it has light metal factories and trades in cereals and sugar beet from the steppe lying W. It is a rly. junction for Omsk, Tomsk, and Barnaul. The first theatre to be built for opera and ballet in W. Siberia seats 2,000.

Nowgong. Town and former cantonment of the Vindhya union, India. The town lies W. of Chhatarpur. Rajkumar College, for the education of the sons of Indian chiefs, founded by the chiefs of Bundelkhand in memory of Lord Mayo, was opened in 1875. Pop. 6,000.

Nowgong. Dist. and town of Assam. The dist. lies S. of the Brahmaputra. Although almost the whole area is cultivable, less than one-tenth is tilled, rice and oil seeds being the chief crops. The town is on the Kalang, a left-bank tributary of the Brahmaputra. The area of the dist. is 3,898 sq. m. Pop. dist., 710,800; town, 5,400.

Noya. Town of Spain, in the prov. of Corunna. It stands at the mouth of Tambre river at the head of Muros y Noya Bay, 21 m. W. of Santiago de Compostela. Ship-building and fishing are the leading occupations, and there are manufactures of lace, linen, soap, and paper. Pop. 11,800.

Noyau (Fr., kernel). Liqueur made from the kernels of peach-stones or bitter almonds, brandy, and sugar. Either white or pink, it is a cordial and used for flavouring in cookery. It is made in Martinique, and exported from Bordeaux.

Noyes, ALFRED (b. 1880). British poet. Born in Staffs., Sept. 16, 1880, he was educated at Exeter

College, Oxford, and published his first book of verse, *The Loom of Years*, in 1902. He wrote lyrics notable for their easy, flowing resonance, several being set to music by Elgar and other composers. His *Tale of Old Japan* was arranged as a cantata by Coleridge-Taylor. Early volumes included *Drake*, 1906; *Forty Singing Seamen*, 1907; *The Enchanted Isle*, 1909. A poetic drama, *Robin Hood*, was produced in 1927; *Ballads and Poems* appeared in 1928; an epic poem on science, *The Torchbearers*, was issued in one vol. in 1937. Noyes also wrote *The Return of the Scarecrow* (novel), 1929; *The Unknown God* (philosophy), 1934; a study of Voltaire, 1936; *The Edge of the Abyss*, 1944. He was visiting professor of English literature at Princeton university 1914-23.

Alfred Noyes,
British poet

Noyon. French town, in the Oise department. On the Brussels-Paris rly., it is 67 m. N.E. of the capital. It is famous as the birth-place of Calvin; for a treaty between Francis I and the future emperor Charles V in 1516; and for its cathedral destroyed in the First Great War. This had been founded by Pepin the Short c. 760, and in parts remained unfinished; rebuilt after 1920, it suffered minor damage in the Second Great War. In Roman times known as Noviomagus, Noyon was a bishopric from 531 to 1790, and for some time a royal residence of the Franks. Twice in German hands during 1914-18, it was the scene of fighting in 1940 and 1944. Important as an agricultural centre, Noyon is known to English readers from Stevenson's *An Inland Voyage*. Pop. 7,306.

Noyon arms

Nuba. Negro people, mostly in the Dar Nuba region of the Nuba Mountains prov., Sudan. Dark, woolly-haired, stoutly built, and muscular, they are an aboriginal stock, and have been driven into the hills by Baggara and other Sudanese "Arabs" of the plains. Mostly unclad, their personal ornamentation—lip-plugs, tooth-mutilation, and scar-tattooing—

attests cultural relationship with the Nilotic negroes. *See* Africa; Negro. *Consult* The Nuba, S. F. Nadel, 1947.

Nuba. Range of mountains in Kordofan. It contains the districts of Dilling, Sungkai, Kadugli, Rashad, Tagelle, Talodi, and Eleri. The capital is Talodi. Area, 32,200 sq. m. Nuba is also the name of a prov. in the Anglo-Egyptian Sudan.

Nubia. Name formerly applied to a large region of N. Africa extending on both sides of the Nile from Egypt to Abyssinia, now more generally called the Anglo-Egyptian Sudan. Nubia formed part of the ancient kingdom of Ethiopia, and was divided into Nubia Proper or Lower Nubia, extending from near Assuan to Dongola, and Upper Nubia, extending to and including parts of the Equatorial provs. *See* Africa; Ethiopia; Sudan.

Nuble. Inland prov. of Central Chile. Sloping from the Andes to Concepción, it is level and fertile in the W., and produces wheat, cattle, and timber. The vine is cultivated, and an excellent wine made. The capital is Chillán. Its area is 5,485 sq. m. Pop. 243,185.

Nucellus. Botanical term applied to the tissue which constitutes the main body of a young ovule. It is homologous with a megasporangium wall, for within it the nucleus of a specially prominent cell undergoes meiosis to initiate female gametophytic structures. Around it there grow up one or two tissue layers which become the integument(s) of the ovule. The nucellus may be a bulky tissue, as it is in most gymnosperms and some angiosperms, e.g. dock, caltha, tulip, or it may consist of a few cells—even of one cell layer only.

Nuclear Fission. Term in physics properly confined to those cases of "atom splitting" in which a heavy nucleus divides into two fragments of approximately equal size; each of these becomes the nucleus of a new atom occupying a mid position in the periodic table. It was produced by Hahn and Strassman in 1939 by the neutron bombardment of uranium, but it can be artificially induced by other kinds of bombardment, and it also occurs naturally. The process releases nuclear energy of the order of about 200 MeV, and is usually accompanied by the emission of several neutrons. In certain circumstances (e.g. with uranium 235 or plutonium, in sufficient quantity), these secondary neutrons can

produce fission in neighbouring nuclei, and the process can grow into an atomic explosion. In other cases (e.g. with uranium 238, thorium, or protactinium), where the energy of most of the secondary neutrons is not sufficient to provoke fission in neighbouring nuclei, the reaction rapidly dies out. *See* Atom. *Consult* Applied Atomic Power, Smith and Fox, 1947.

Nuclear Physics. Branch of physics concerned with the properties of the atomic nucleus. The subject of nuclear physics attracted much attention immediately after the Second Great War because of the advances made in the development of nuclear energy (usually termed, though not strictly correctly, atomic energy). The problem is, however, the contemporary aspect of one which has attracted investigators for centuries, i.e. the transmutation of the elements. The study of transmutation is obviously concerned with the structure of the atom and in particular the nucleus, but it was not until Rutherford's experiments in 1911 that direct experimental evidence of artificial transmutation was provided. Rutherford allowed fast-moving charged helium atoms, known as alpha (α) particles and emitted by certain radio-active materials, to fall on thin sheets of gold, aluminium, etc. From observations on the scattering of these α particles he deduced that the atoms of the metals comprised small but massive centres, i.e., nuclei, which were charged electrically. He further established that the gold nucleus carried a larger electric charge than that of aluminium (*see* Atom).

The liberation of the various radiations (α , β , and γ) from a naturally radio-active substance are due to the disintegration of the atoms of their own accord; energy is released at the same time, but the process is an uncontrollable one. Hence there arose the idea of producing an artificial source of bombarding particles to replace the natural radio-active one, and this led to the development of machines for producing high voltages. By such means charged particles can be accelerated to high velocities, so that they possess sufficient energy to disrupt atoms.

The detection of the various atomic particles is the other phase of nuclear physics which is of extreme importance. There are four main methods:

(a) The scintillation method (used by Rutherford in his early work) in which each particle gives

rise to a flash of light or scintillation on striking a zinc sulphide screen; (b) the electrical counting method, which depends upon the ionisation of a gas due to the collision of a gas molecule with a fast-moving charged particle which has entered the chamber containing the gas. Apparatus known as the Geiger counter contains two electrodes maintained at a sufficiently high electrical potential difference to produce a cumulative ionisation process, and the pulse of current thus produced by an incident particle can be suitably amplified to operate a counting mechanism; (c) the Wilson cloud chamber method which utilises a closed vessel containing air saturated with water-vapour so that the volume becomes supersaturated on the cooling produced by a sudden expansion of the volume of air by means of a piston. If an atomic particle has entered the chamber immediately before this expansion then its track will be made evident by the water drops formed on the ions which are produced in the path of the particle. By suitable synchronisation photographs can be taken which have often shown up sudden changes in the path direction, and so have enabled valuable deductions to be inferred regarding the nature of the collisions. Lastly, (d) the use of the photographic plate itself to detect the passage of atomic particles in their path through the emulsion.

R. W. B. Stephens, Ph.D

Nucleus (Lat., kernel). Biological term applied to that specially differentiated portion of the protoplasm of most animal and plant cells which contains a large proportion of the readily stainable material, chromatin. A nucleus is more or less rounded and is normally bounded by a delicate nuclear membrane, just within which is a net-like chromatin containing nuclear reticulum with one or more aggregations of chromatin called nucleoli attached. The residue of its volume is nuclear sap. The nucleus is essential for many of the cell's activities and bears many heritable characters. When cell division is pending the reticulum condenses to form rod-shaped chromosomes of which the number is constant for the type of organism.

Nucleus. In astronomy, the brightest part of the head of a comet. It usually appears only when the comet is near the sun.

Nucleus. In physics, term for the central core of the atom (*q.v.*), around which planetary electrons revolve. *See* Nuclear Physics.

Nudism. The practice of sunbathing, swimming, and playing outdoor games without clothes. Nudist clubs probably started in pre-Nazi Germany, and developed slowly in Great Britain, although the movement was given an impetus by warm summers in 1933-35 and showed signs of recruiting newcomers after the Second Great War. Those who practise nudism in clubs where both sexes and all ages mingle together out of doors claim that they derive, apart from the obvious physical benefit of sunlight, a mental freshening from the absence of restraint and pose in conversation and the abeyance of social and professional distinctions.

Nueces. River of Texas, U.S.A. Rising in Edwards co., in the S. of the state, it flows 315 m. S. and S.E. to Corpus Christi Bay, in the Gulf of Mexico. It drains an area of nearly 19,000 sq. m., and provides much water for irrigation.

Nuée Ardente (Fr., glowing cloud). Cloud caused by the explosion or sudden frothing of gas-charged lava escaping from a volcano while under great pressure. The mixture of burning and expanding gas and hot pumice fragments forms a great cauliflower type cloud which, because of the solid material it contains, is heavy and so avalanches down the side of the volcano. On May 8, 1902, the city of St. Pierre, capital of Martinique, was totally destroyed with 30,000 inhabitants by such a cloud from Mt. Pelée. They are not always glowing; some are black, as was observed at St. Vincent on May 6, 1902, when some 1,600 people were killed by a blast. Their temperature is high, sometimes over 700° C.; they move quickly; and the fact that the lava particles and fragments are emitting gas causes an internal air cushioning effect, and the cloud moves silently. See Pelée, Mont.; Volcano.

Nuer. Nilotic negro tribe, mostly in the Bahr-el-Ghazal prov., Sudan. Blue-black, 5 ft. 9 ins., located between the Shilluk and Dinka, they are flat-footed marsh-dwellers, using pile-houses, subsisting on fish and aquatic plants. The women pierce the upper lips.

Nueva Cáceres or NAGA. City of the Philippines, capital of the prov. of Ambos Camarines, Luzon. It is situated on the Naga river at the foot of Mt. Isarog, 145 m. in a straight line E.S.E. of Manila, and contains a cathedral, bishop's palace, and normal school.

Nueva Esparta. Insular state of N. Venezuela, on the Caribbean Sea. It includes Margarita and

adjacent islands, and its capital is La Asunción. There are important pearl fisheries. Area, 490 sq. m. Pop. 69,195. See Asunción, La; Margarita.

Nuevo Laredo. The main point of entry into N. Mexico from the U.S.A., connected by rly. and motor road with Mexico City (803 m.). Cattle and cotton are raised locally, and the town has several factories. Pop. 16,000.

Nuevo León. Interior northern state of Mexico. It lies partly on the slopes of the eastern Sierra Nevada and covers 25,134 sq. m. None of its many rivers is navigable for any distance. The soil yields sugar and cereals. Stock-raising is engaged in, and zinc, silver, and lead are mined. A rly. service radiates from Monterrey, the capital. Pop. 541,147.

Nuffield, WILLIAM RICHARD MORRIS, 1st VISCOUNT (b. 1877). British industrialist. Born at

Viscount Nuffield, British industrialist

Cowley, Oxfordshire, Oct. 10, 1877, he became an apprentice in a small cycle-shop in Oxford in 1894. He soon set up in business as a cycle manufacturer, and raced with machines of his own construction, winning seven county championships in 1900. From the manufacture of cycles he turned to that of motor-cycles, and in 1912 began the production of the Morris-Oxford light car, which achieved great popularity.

The business thrived during the First Great War, and after it Morris embarked on a large-scale scheme of mass production. His great organizing ability rapidly established Morris Motors, Ltd., as one of the largest car manufacturers in the U.K.; by 1926 the output had reached 100,000 cars a year. Morris widened his market by acquiring the Wolseley, M.G., Riley, and other companies. He was made a baronet in 1929, a baron in 1934, a viscount in 1938. His gifts to hospitals, to Oxford university, and to the Royal College of Surgeons, totalled several millions (see also Nuffield Foundation). During the Second Great War he organized Nuffield Centres for service men's welfare. In 1940 he was director-general of maintenance at the Air ministry.

Nuffield College. Graduate college of Oxford university, for the foundation of which Lord

Nuffield gave, in 1937, £1,000,000, including a site worth £100,000. The aim of the college is to promote cooperation between theoretical students and practical workers, to link research in social studies with the demands of everyday life. Its physical chemistry laboratory cost £100,000.

Nuffield Foundation. Trust fund set up by Lord Nuffield in Feb., 1943. Seven trustees were appointed, to whom Lord Nuffield handed over holdings in the Nuffield organization to the value of £10,000,000, directing that the interest be used for (1) medical research; (2) the organization and development of medical and health services; (3) scientific research and teaching in the interests of trade and industry; (4) the pursuit of social studies; and (5) the care and comfort of aged persons. The trust operates by grants to existing institutions.

Nuisance (Fr. *nuisance*, anything injurious). In English law, anything that does harm or causes inconvenience. Nuisances are classified as public and private. Public nuisances are of many kinds. There are nuisances which are injurious to the public health, such as having on one's property foul drains, sewers, and the like; these are dealt with under the Public Health Acts by the local authorities, who have power, in the last resort, to "abate" them at the expense of the owner or occupier of the property. Nuisances to highways consist of doing acts which cause obstruction to the roads. Nuisances to rivers and streams include polluting their waters or obstructing their flow.

Private nuisances are, or may be, somewhat different. A public nuisance may also be a private nuisance if it causes particular loss, damage, or inconvenience to one person more than it causes to the public generally. Thus, if a man next door to a shop erects an obstruction on the pathway, so that customers cannot enter the shop, it is a private nuisance to the owner as well as being a nuisance to the highway. The general principle of the law of nuisance is that a man shall not use his property so as to cause loss and damage to his neighbour. The remedy for private nuisance is by injunction and damages; and an action can be brought against anyone who continues the nuisance as well as against him who started it.

Nukualofa. Capital of the Friendly Islands. Situated on the N. coast of the island of Tongatabu.

it is connected by direct steamer service with New Zealand. There is a radio and cable station.

Nullity (Lat. *nullus*, none). The state of being null or void. In England the term is chiefly used in a legal sense. A nullity of marriage is a proceeding in the divorce court to declare a marriage null and void. See Divorce.

Numantia. Ancient stronghold of the Arevaci in N. Spain, on the Douro, near Soria. The centre of the struggle between the Romans and the Celtiberians from 154 to 133 B.C., it withstood several sieges and defeated a whole Roman army in 137. The garrison of some 6,000 to 8,000 Spaniards was eventually obliged to capitulate through starvation after a 15 months' siege (134-133 B.C.) by 60,000 men under Scipio Aemilianus. The Roman town of Numantia was afterwards built on the site.

Numa Pompilius. Second of the seven legendary kings of ancient Rome. He is reputed to have reigned from 715 to 673 B.C. A man of peace, instructed in sacred lore by the nymph Egeria (*q.v.*), he first established the priestly offices of the Roman state.

Number (Lat. *numerus*). In grammar, that attribute of a word which expresses unity or plurality. In addition to singular and plural, there was also a dual number, indicating that two persons or things were concerned. It survives in some Indo-European dialects and in the Semitic languages.

Number. The abstract ratio of one quantity to another of the same kind. The origin of numbers is lost in history, but the classification of numbers can be traced more definitely. An Egyptian papyrus dating from 1000 B.C. has a collection of problems dealing with fractional numbers. Pythagoras certainly understood polygonal numbers, factors, proportion, etc., and Euclid devoted four books to the subject. The names, etc., of numbers, such as trillion, are dealt with under Numeral.

Numbers may be classified under many heads, such as odd and even, prime and composite, rational and irrational. Odd numbers are 1, 3, 5, 7; even numbers 2, 4, 6; prime numbers those which have as factors themselves and unity; composite numbers those which admit of factorisation, *e.g.* 12 is $2 \times 2 \times 3$; rational numbers are those which can be expressed as the ratio of two integral numbers; irrational numbers those which cannot be so expressed, *e.g.* $\sqrt{2}$

The two most important irrational numbers are *e*, the base of the Napierian system of logarithms 2.7182818 . . , and π , the ratio of the circumference of a circle to its diameter, 3.14159 . . . The value of the latter has been calculated to over 700 places of decimals. There is a further class of numbers known as unreal or imaginary numbers, the roots of negative quantities. Such numbers are of great importance in many problems of physics. See Arithmetic; Fractions; Numbers, Theory of; Numeral.

Number of the Beast, THE, OR APOCALYPTIC NUMBER. A mystical or symbolical number occurring in the apocalyptic vision of the Beasts in the N.T. book of Revelation. The reference is in Rev. 13, v. 18: "He that hath understanding, let him count the number of the beast; for it is the number of a man: and his number is Six hundred and sixty and six." The Beast is here equivalent to the Antichrist who will for a time gain dominion over the whole world, but in the end will be overthrown by the angels of God (Rev. 14, vv. 14 ff.; 15, vv. 1 ff.). The number is supposed to represent the sum of the numerical values of some proper name, written in Hebrew or Greek letters, and attempts have been made to identify the Beast with various historical characters. Since 616 appears as a variant of 666 (Rev. 13, v. 18), a favourite identification is with the Roman emperor Nero (Neron Caesar—666; Nero Caesar—616: in Hebrew letters). Many other identifications have been suggested, *e.g.* Mahomet, Luther, Napoleon I, William II of Germany, Adolf Hitler. See Antichrist.

Numbers. Fourth book of the Pentateuch. It takes its title from the Septuagint, the book being so called because it contains accounts of two numberings of the children of Israel. The Hebrew title is *In the Wilderness*. Three divisions may be distinguished: (a) the first census and other events preparatory to the departure from Sinai, Num. 1-10, v. 28; (b) the journey from Sinai to Moab, Num. 10, v. 29 to 25, v. 18; (c) the second census, the appointment of Joshua as Moses' successor, and other events, Num. 26-36. Within these divisions there are a number of sections which form part of the so-called Priestly Code (Num. 1-10, 17-19, 25-31, 33-36). The poetic utterances of Balaam (Num. 23, 24) belong to the more ancient documents of the Hexateuch.

Numbers, THEORY OF. An extensive branch of mathematics,

concerned with the investigation of the nature of numbers, the characteristics of numbers, and the relations of numbers one with another. The subject has exercised the minds and occupied the time of famous mathematicians from the ancient Greeks (Pythagoras, 561-500 B.C.) to the present day. It has had a profound influence on mathematical ideas and methods, for some of the greatest mathematicians, including Gauss, have been strongly attracted to the study of numbers, and in their search for general solutions to various problems have made discoveries or evolved methods of great value. For example, the attempt to prove Fermat's Last Theorem of 1637 A.D. (it is impossible to separate a cube into two cubes, a fourth power into two fourth powers, or generally, anything above the second into two powers of the same degree; that is, $x^n + y^n = a^n$ cannot be solved in integers) has during the last 300 years underlain an immense amount of mathematical research.

Gauss's *Disquisitiones Arithmeticae* (Arithmetical Researches, 1801) is one of the masterpieces of mathematics, and inspired much of the discoveries of Jacobi, Eisenstein, Henry Smith, Kummer, Riemann, Kronecker, Hermite, Dedikind, and others. The book deals with the Theory of Congruences (the laws governing the divisibility of one number or set of numbers by others, and those governing the remainder from such division) and with the Theory of Forms (the various ways in which numbers can be expressed, particularly in equational forms, and the conditions for and the methods of securing the integral solution of equations).

Numeral. Figure or symbol used to represent number. Undoubtedly the earliest way of representing numbers was by means of notches on a stick and by perpendicular strokes. The system now in use in most civilized countries, employing the symbols 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, is partly Hindu and partly Arabic. The scale of tens is probably derived from the number of the human fingers. The value of a numeral under this system varies according to its position, *e.g.* the 7 in the numbers 7, 71, 716, 7,164 represents 7 units, 7 tens, 7 hundreds, and 7 thousands respectively, and this way of writing numbers gradually came into use in India about A.D. 500 and spread slowly through Europe. The use of the decimal point, with

corresponding results in the alteration of the value of the figure after it according to its position, is of uncertain origin.

The fundamental tens group, i.e. 10, 100, 1,000, 1,000,000, etc., are given distinctive names, e.g. ten, hundred, thousand, million, etc., and repetition of these names and those of the figures 0, 1-9 enable any particular number to be remembered, instead of a fresh name having to be remembered for every individual number. As an example, 2,408,924 is in full two million, four hundred and eight thousand, nine hundred and twenty four. The terms billion, trillion, etc., usually mean a million millions, a million million millions, etc., though in France and the U.S.A. a billion is taken to be a thousand millions only.

Though the above system has survived practically all others, the

Roman numerals are still used for certain purposes, e.g. dates. The symbols I, II, III, IIII explain themselves, but the origins of others in the system are not all certain. X for ten is probably I with a stroke across it, a symbol that must have come into very early use, and V for five is the upper half of the symbol X, as L and D for 50 and 500 are probably half the symbols once used for C and M, 100 and 1,000 respectively. The letters C and M are the initial letters of the Latin words for 100 and 1,000, *centum* and *mille* respectively. The use of IV and IX, etc., are later modifications of IIII and VIII.

The Greeks used a system of numerals in which the numbers 1 to 9 were represented by the first nine letters of the alphabet, the tens by the next nine letters, and the hundreds up to 1,000 by

another nine letters, two obsolete letters being revived for the purpose of the system. Like other ancient systems, apart from the Hindu-Arabic, it proved too cumbersome for mathematical use, and became obsolete. See Arithmetic; Decimal; Number.

Numidia. Roman prov. of N. Africa, between the provs. of Africa and Mauritania, corresponding to E. Algeria. The name means land of nomads. Masinissa (*q.v.*) united the country with Roman aid, 201 B.C. On the overthrow of Jugurtha (*q.v.*) the Romans conquered Numidia, but left it under its own kings. Juba I having sided with Pompey, Julius Caesar made Numidia a Roman province, 46 B.C., but in 25 B.C. Augustus gave the W. part to Juba II (*see* Juba). The Numidians provided light cavalry for the Carthaginian, and later for the Roman army

Numismatics. Specimens of ancient Greek and Roman coins. 1. Cyzicus, c. 560 B.C., electrum stater. 2. Croesus, c. 555 B.C., gold. 3. Athens, 560-480 B.C., silver. 4. Athens, c. 550 B.C., silver tetradrachm. 5. Corinth, c. 600 B.C., silver. 6. Philip II, c. 359-336 B.C., gold stater. 7. Philip II, silver. 8. Chalcidice, c. 392 B.C., silver stater. 9. Alexander the Great, c. 320 B.C., silver tetradrachm. 10. Alexander the Great, gold stater. 11. Thurium, c. 450 B.C., silver. 12. Syracuse, c. 413-400 B.C., silver. 13. Roman silver denarius, c. 269 B.C. 14. Roman bronze as. 15. Julius Caesar, c. 50 B.C., gold. 16. Octavian, c. A.D. 1, silver. See p. 6150.

From specimens in the British Museum

Numismatics (continued from p. 6149). English coins. 17. Edward III, gold noble. 18. Henry III, gold penny. 19. Henry VI, gold angel. 20. Henry VII, gold sovereign, the first issued. 21. Charles II, guinea. 22. William I, silver penny. 23. Alfred, offering penny. 24. Henry VI, silver groat. 25. Offa, earliest Anglo-Saxon gold coin. 26. Henry VII, silver, shilling. 27. Elizabeth, sixpence. 28. Charles I, half-crown

NUMISMATICS: THE STUDY OF COINS

Sir George Hill, formerly Keeper, Dept. of Coins, Br. Museum

Here is related the history of coins, companion articles being *Coinage*; *Mini.* See also *Gold*; *Medals*; and the articles on the various coins, e.g. *Franc*; *Mark*; *Napoleon*; *Peso*; *Shilling*, etc.

Numismatics (Gr. *nomisma*, a coin) is the science of coins and other similar objects, such as medals. Coins may be defined briefly as pieces of more or less precious metal (usually gold, silver, copper, bronze, or some other copper alloy), serving as a medium of exchange, and marked by the issuing authority with some device (type) or inscription as a guarantee of good quality and definite quantity; this is to ensure their currency as far as the authority extends. By its intrinsic value, corresponding more or less exactly to its face value, the coin is distinguished from the mere token or from paper money; it is distinguished from the medal by the fact that it serves as a medium of exchange.

The invention of coinage, by the Greeks in Asia Minor in the 7th century B.C., by the Chinese perhaps about the same time, was the first stage in the development of commerce. From the 7th century

onwards coinage also reflects, sometimes very closely, the general development of culture, throwing light on political and economic history, geography, religion, and art.

The earliest coins of the Greeks were of electrum, a natural mixture of gold and silver found in the river-sands of Asia Minor. In Greece Proper, where gold was not found, the earliest coins, such as those of Aegina, Athens, and Corinth, were of silver. Croesus, king of Lydia, 561 to 546 B.C., was the first ruler to issue coins of pure gold. Philip II of Macedon (359-336 B.C.) initiated a currency of gold and silver which, with the coinage of Alexander the Great, may be regarded as the chief international currency of the ancient world. Alexander's conquests led to the institution of coinage in lands which had hitherto used more primitive methods of exchange. The Jews had no coinage of their own before the middle of the 2nd century B.C.

In the Western world, the Greek colonies, especially in S. Italy and Sicily, had their coinages from the 6th century onwards. The Sicilian series, taken as a whole, ranks in artistic value above any other in the whole history of coinage, the 10-drachm pieces (so-called medalions) of Syracuse, first struck at the end of the 5th century, being perhaps the most famous example of the art. The Roman coinage, which from the first was under Greek influence, begins in the second half of the 4th century, with the *as* and its parts in bronze, at first, owing to its large size, cast, not struck from dies as is the rule for coins; the silver *denarius*, for long the standard denomination in the ancient world, was instituted in the 2nd. cent., weighing 4.55 grammes. The Roman coinage of gold, normally restricted to the sovereign power, did not become regular until the Imperial period. The Byzantine Empire continued the traditions of the Roman coinage, its gold coin or *besant* being an international unit of currency.

The decay of the Roman Empire, and the rise of the modern nationalities, are faithfully reflected in the style of their coinages. In the

7th century the first Mahomedan coins made their appearance; although, as the representation of living objects was forbidden, they had little influence on the artistic side, they were soon serious rivals to the Byzantine gold in international currency. It was, however, not until the 13th century that the nations of western Europe began to possess a regular gold currency, and this began with the florin of Florence, first coined in 1252, and the ducat of Venice, first coined in 1280. The English silver penny sterling, for its good quality, was largely imitated on the European Continent, especially in the Low Countries, during the 13th and 14th centuries.

The institution of the larger denomination of the *gros* by Louis IX in France, an example soon followed by other countries, robbed the smaller denomination of some of its prestige. The first English regular currency of gold, the noble, was begun in 1344.

From this time onwards the development of European coinage becomes extremely complicated. Among the northern nations, the best period of the coinage is the 14th century, although the practical absence of portraiture robs it of one source of interest. The coinage of the Renaissance in Germany was racially characteristic in its combination of vigour of portraiture with lack of refinement.

In Italy the highest level is reached in the portrait coins of the end of the 15th century, but the noblest contribution of Italy to numismatic art is in the cast medal. Antonio Pisano of Verona (first half of the 15th century), the founder of modern medallic art, and also by far its greatest exponent, is surpassed by few artists of any kind as a master of dignified portraiture and fine design. No other country produced medallists of the same quality as the best Italians, although Germany in the 16th century developed a characteristically vigorous but unimaginative school of portraiture; and in the 17th century, France in Guillaume Dupré and England in Thomas Simon could boast of portrait medallists of very high rank.

Development of Striking

During the 16th century the technique of striking, as distinct from casting, medals was rapidly developed, by no means to the advantage of the art, which lost in significance what it gained in skill. The old method of striking the metal between dies with a sledgehammer was gradually replaced by a press worked with a screw, which was firmly established in most

countries in the second half of the 16th century, and by the second half of the 17th century superseded the primitive method. Technically speaking, perhaps the most remarkable examples of the art of striking coins were produced during this last period; Thomas Simon's *Petition Crown* (1663), with an inscription struck on its edge begging Charles II to give him employment, has scarcely any technical rival.

The 18th and 19th centuries show for the most part a deplorable falling off in the art of coinage, which is hardly redeemed by 20th century attempts at revival which have been made, chiefly in France.

Colonial Minting

The history of the colonies outside Europe is illustrated from the 16th century by a coinage often very primitive in kind; among the most interesting being the issues of the early Spanish and English colonies in America, and the

Nummulite. Diagrams illustrating formation of fossil shell. A. Highly magnified vertical section of part of shell showing construction of air chambers. B. Horizontal bisection, showing spiral of chambers. C. Vertical bisection. D. Shell viewed from above

adaptations in the West Indies of Spanish coins to local use by counter-marking, etc. In Asia, important series of coins were issued by some of the Portuguese and Dutch colonies.

India had possessed a coinage quite as early as the time of Alexander the Great, in the shape of small punch-marked pieces of silver. Greek influence, beginning with the purely Greek coins of the kings of Bactria in the 3rd century, is continued through the coinage of the Indo-Scythic rulers, and still traceable in the extraordinarily rich gold coinage of the Gupta dynasty, contemporary with the earlier centuries of the Roman Empire. The medieval coinage of India, both under native rulers and under the Mahomedan dynasties, was enormous, and fills innumerable gaps in the scanty historical records of the country.

China is thought to have begun to use coins as early as the 6th or

7th century B.C.; these were cast in bronze in the shape of knives and other primitive media of exchange; the hole at the end of the handle, by which they were strung together, was probably the origin of the hole in the later Chinese copper cash. Japan derived the style of its coinage from China. The S.E. portion of Asia has used some remarkable examples of primitive currency, the metal being cast in the shape of snail-shells or in ingots of other primitive forms.

Bibliography. British Museum Catalogue of Coins, 1873; Currency of the Farther East, J. H. S. Lockhart, 1895-98; Manual of Musalman Numismatics, O. Codrington, 1904; Historia Numorum, B. V. Kead, 2nd ed., 1911; Evolution of Coinage, G. Macdonald, 1916; History of Ancient Coinage, P. Gardner, 1918; Coins of India, C. J. Brown, 1922; Handbook of Roman Coins, H. Mattingly, 1927; Corpus of Italian Medals of the Renaissance, G. F. Hill, 1930; Handbook of English Coins, G. C. Brooke, 1932; Handbook of Greek Coins, C. T. Seltman, 1933; Coins of the Modern World, M. Comencini, 1937.

Nummulite (Lat. *nummus*, coin). Genus of fossil foraminifera. The shells are remarkable for being flattened and circular, resembling coins, and yet containing a large number of chambers arranged in a spiral. The genus was abundant during the Eocene. Limestones of that period composed chiefly of nummulites are sometimes several hundred ft. in thickness, and are particularly noticeable in the Alps, N. Africa, Asia, and Cen. America.

Nun (Lat. *nonna*, an elderly woman, mother, or nurse). Word adopted by the early Church for a woman consecrated to a life of devotion. By the beginning of the 4th century there were communities of consecrated virgins in Egypt, and a little later in Italy also. The Council of Saragossa forbade the veil to be assumed before the age of 40. The Council of Carthage prescribed 25 as the earliest age; S. Basil suggested 17.

It was understood almost from the first that the dedication of a nun was for life; but it was not regarded as absolutely irrevocable until the establishment of the Benedictine Rule. Nuns were consecrated or professed by the bishop of the diocese or his representative; and all convents of women were under his jurisdiction and general supervision. The habit, veil, etc., forming the characteristic garb of a nun, are of early date and a modification of the ordinary dress of women in ancient times.

The term nun is only correctly applied to a female member of the

Benedictine Order, or of one of the orders springing from it. Women belonging to the orders of friars—Carmelite, Franciscan, Dominican—are known as Sisters, as are the members of many modern congregations of women, whether contemplative or active. Most recent congregations follow some modification of the Augustinian Rule. See Benedictines; Mercy, Sisters of; Monasticism; Poor Clares.

Nunatak. Isolated piece of rock, possibly the peak of a buried mt., projecting through a continental ice-sheet. These have been observed near the edge of the Greenland ice-cap.

Nunc Dimittis. Opening words used as the title of a Latin canticle or hymn (Lord, now lettest Thou Thy servant depart in peace) in the Book of Common Prayer. It is the song of Simeon (Luke 2, vv. 29-32), his hymn of praise and thanksgiving on being permitted to see the infant Saviour. From early times the Christian Church has used the hymn at vespers or at compline. In the Anglican Church it is sung after the second lesson at evensong.

Nuncio (Lat. *nuntius*, a messenger). General term for a diplomatic representative of the pope, acting with powers restricted by his instructions. The members of the Polish diet were called nuncios. See Ambassador; Diplomacy; Legate.

Nuncomar OR NANDA KUMAR (ex. 1775). Indian official. Governor of Hooghli in 1756, he was deputy to the nawab of Murshidabad when Warren Hastings was appointed resident there in 1758. Discovered in treasonable correspondence against the East India Company, he was sent to Calcutta in 1770, and there implicated in charges of corruption brought against the diwans of Bengal and Bihar. In 1775 he accused Hastings, then governor, of peculation. Before the matter had been gone into by the council, Nuncomar was arrested on a charge of forgery, tried before Sir E. Impey, found guilty, and executed. Impey and Hastings were impeached, but exonerated. See Hastings, Warren; India.

Nuneaton. Mun. bor. and market town of Warwickshire, England. It is on the little river Anker, 97 m. N.W. of London and 9 m. N. of Coventry, and is served by rly. and canal. The chief buildings are the churches of S. Nicolas, S. Mary, and Chilvers Coton; the council house and law courts; Arbury Hall; and

a grammar school dating from the 16th century and a college for the poor, 1712. Industries are coal-mining; the making of bricks, pipes, and tiles; textiles, including hosiery, wool spinning, felt hats, silks, and rayon; fellmongery and leather goods; light engineering, and rly. work. A house for Benedictine nuns was founded here in 1150 and around it Nuneaton grew up. There are a few remains of the nunnery. The town was made a borough in 1907. George Eliot (q.v.) was born at Arbury Farm and around are other places associated with her life and work. Market day, Sat. Pop. est. 52,000.

Nuñez Cabeza de Vaca, ALVARO (c. 1490–c. 1564). Spanish explorer. In 1527 he sailed from Spain with an expedition which met with disaster in the Gulf of Mexico, but Nuñez reached land, and after a most adventurous journey reached the city of Mexico in 1536, and returned to Spain. In 1540 he was appointed governor of the provinces of the La Plata river, and reached Asunción in 1542. The colonists revolted and sent him home in 1545, and later he was sentenced to banishment. On being pardoned he was made a judge. Nuñez wrote an account of his first expedition (Eng. trans. 1851).

Nuñez de Arce, GASPARE (1834–1903). Spanish poet and politician. Born Aug. 4, 1834, at Valladolid, he was intended for a priest, but, refusing to adopt that vocation, he went to Madrid and became a journalist. He was only a youth when his first play was produced. Later he served as a war correspondent in Africa. Soon he was conducting a paper of his own, and in 1865 he entered political life, his liberal views having attracted attention. In 1868 he was made governor of Barcelona, and during 1882–90 was a cabinet minister, being in turn in charge of the colonies, home affairs, the finances, and education. He died at Madrid, Feb. 12, 1903. His lyrics are considered his best work.

Nunhead. District of S.E. London. It is E. of Peckham Rye, and forms part of the bor. of Camberwell. It has a rly. station, a cemetery of 50 acres, consecrated in 1840, and the underground Beachcroft reservoir of the Metropolitan Water Board, which cost £230,000.

Nunkiang. One of the nine north-eastern provinces of China. Area 23,912 sq. m. Population

2,094,000. It contains 16 counties with Mergen as its capital. The Changchun rly. runs through the province, linking it with branch lines to other parts of the north-east. Principal products are soya bean, kaoliang, wheat, and gold.

Nun Moth. Popular name for a black and white moth (*Liparis monacha*) known in Britain as the Black Arches. In central Europe it is a great pest, since its caterpillars destroy the leaves of spruce and other trees. In Bohemia an attack lasting for four years defoliated over 90,000 acres of forest. Experimental control by poison dust liberated from aeroplanes gave encouraging results.

Nunn, SIR PERCY (1870–1944). British educationist. Educated at Bristol university, he was a secondary school teacher, and in 1905 was appointed vice-principal of the London Day Training College, succeeding as principal in 1922. Ten years later, when the college was transferred to the control of London university, he continued in office as director until 1936. He also represented London university on the teachers' registration council, and was visiting professor at Columbia university in 1925. He wrote extensively on educational methods, e.g. Education Reform, 1917; Education: its Data and First Principles, 1920. He was knighted in 1930. Nunn died Nov. 12, 1944.

Nupe. District of Africa, now part of Nigeria. It forms a prov. N. of the Niger and the capital is Bida. About the middle of the 19th century the country came under the rule of the Fulas. The British took possession of it in 1897, but only temporarily, its real absorption taking place in 1901, when a new emir, favourable to British interests, replaced a deposed one. See Fula; Nigeria.

Nuraghe. Prehistoric round tower in Sardinia. The typical form is of rough-coursed blocks, clay-mortared, having a basal diameter of about 30 ft., sloping slightly inwards. From the doorway, usually facing S., a corridor leads to an inner chamber, about 15 ft. across, with a vaulted roof. On the right of the entrance is a guard-niche, on the left an ascent to an upper chamber, similarly guarded. Traces of 6,000 have been found. The largest, protected by platforms with flanking towers, are sometimes surrounded by villages of smaller nuraghi. See illus. p. 6,153; See also Broch.

Nur-ed-din (c. 1118–1174). Mahomedan warrior. He was born at Damascus, and about 1145 he

succeeded his father as ruler of a state in Syria, making Aleppo his capital. During the Second Crusade he took Damascus and drove the Christians from Syria. In 1159, however, he was beaten by Baldwin, king of Jerusalem, but later sent into Egypt an army which conquered that country from the caliph. An uncle of Saladin, Nur-ed-din died May 15, 1174. Another Nur-ed-din was an astronomer. Born in Morocco, he lived in the 12th century, and wrote an astronomical work of some note.

Nuremberg (Ger. Nürnberg). Second largest city of Bavaria, Germany. It is the capital of the

Nuremberg arms

prov. of Franconia, and is situated on the Pegnitz, 95 m. N. of Munich. Nuremberg was for long an important rly. junction and occupied a key position on the Rhine-Main-Danube canal system. Until the Second Great War the city possessed unrivalled relics of its historic past, whole streets being virtually unaltered from medieval times. They centred upon the burgrave's castle and the imperial castle, dating respectively from the 11th and 13th centuries. The 15th-cent. house of Dürer and the 16th-cent. house of Hans Sachs were noteworthy private houses, and there were numerous churches of great historic value, e.g. S. Sebaldus (13th cent.), S. Lawrence (13th-15th cent.), the Holy Ghost (1331), S. Aegidius, with a Van Dyck altar (1140, rebuilt 1711-18), S. James (14th cent.), S. Peter (15th cent.), S. Rochus (16th cent.) Of other public buildings the town hall was remarkable, being erected 1332-40, with additions dating from 1520 and a beautiful renaissance wing of 1616-22. The grammar school was founded by Melanchthon in 1526.

Nuremberg has a long and chequered history, having become a free city in 1219 and being endowed with unusual privileges—rights of coinage, customs rights, urban laws and judges, and the ownership of the castle and its surroundings. It traded with all European countries, especially in silks, oriental goods, and various

products of its artists and craftsmen. The first watches, known as "Nuremberg eggs," are said to have been made here. During the 15th and 16th centuries many of the greatest German painters, sculptors, poets, and scientists lived in the town. During the Thirty Years' War it fell into decay, and was embodied with Bavaria in 1806 when she joined the Rhenish federation. In the later 19th century the industrial importance of Nuremberg again increased, when its toys, pencils, and beer became widely known. The establishment of a large factory by Siemens Electric, and other large engineering works, brought additional prosperity to the town, the pop. of which (1939) was 430,851. During the Second Great War the town, which had been the scene of the annual Nazi party congress, was repeatedly bombed by Allied aircraft, much of the old town being virtually destroyed. It was entered by units of the U.S. 7th army on April 16, 1945. S.S. troops defended it bitterly, but all organized resistance ceased on April 20. The town was, after the end of the war, included in the U.S. zone of occupation. The trial of the major war criminals (see Nuremberg Trials) was held here.

Nuremberg Laws.

Series of anti-Semitic edicts promulgated at the German Nazi party conference at Nuremberg, Sept., 1935. One edict, the Reich citizens' law, deprived Jews of their rights as German citizens, and reduced them to a status called "members of the state"; this deprived the Jew of the vote, forbade him to serve in the armed forces, and excluded him from

participating in the cultural life of the country. Another edict, the protection of German blood and German honour, prohibited marriage or extra-marital relations between Jews and so-called Aryans. Any Jew contravening the measure, even before the passage of the law, was liable to a long term of imprisonment. "Aryans" were required to leave any house where there were resident Jews, and no Jewish household with adult males might employ female domestic servants under the age of 45.

Within certain limits, the original Nuremberg Laws permitted Jews their own religion, culture, and social economy. Later the laws became more severe, notably after the assassination of the German diplomat vom Rath by a Polish Jew in Paris, Nov. 7, 1938. Jews were then excluded from places of entertainment, deprived of the right of inheritance, made liable to heavy poll taxes, forbidden to practise any of the professions or engage in journalism; their passports were withdrawn, and they were held collectively responsible and were collectively fined for any individual Jew's offence or alleged offence. Jewish premises were required to be marked with a distinctive sign, while Jews themselves had to wear a distinguishing mark (the Star of David) on their clothing.

Jews were thus reduced to the status of complete social outcasts in obedience to the Nazi doctrine that a permanent barrier must be erected between German and Jew. The Nuremberg Laws formed the pattern of the anti-Jewish legislation introduced into fascist Italy and other German satellites, as well as, during the Second Great War, into German-occupied territory. See Anti-Semitism; Germany in the Second Great War; Jews.

Nuremberg Trials. Trials of the civil and military leaders of Nazi Germany, together with certain Nazi organizations, by international military tribunal at Nuremberg, Nov. 20, 1945-Oct. 1, 1946.

In Oct., 1943, a United Nations war crimes commission was set up in London to collect evidence for the preparation of an indictment against Axis and satellite war leaders. A declaration by the foreign ministers of Great Britain, the U.S.A., and the U.S.S.R. proclaimed that at the time of any armistice to any govt. which might be set up in defeated Germany, such Germans as had been responsible for, or

consenting parties to, atrocities, massacres, or executions alleged against them should be sent back to the countries in which their crimes had been committed and there tried by local laws. The major criminals, whose offences had no particular geographical location, were to be arraigned and tried by joint decision of the Allied govts.

After the surrender of Germany legal experts of the U.K., U.S.A., U.S.S.R., and France met in London on June 26, 1945. Their conference resulted in the four-power agreement of Aug. 8, setting up an international military tribunal for the trial of war criminals whose crimes had no precise geographical location. The law under which defendants were to be tried was to be international law, not the law of the victorious countries.

Members of the Tribunal

The tribunal, as established by the charter, comprised the following members and alternate members: U.K., Sir Geoffrey Lawrence (president), Sir Norman Birkett (alternate); U.S.A., Francis Biddle, Justice John J. Parker (alternate); France, Prof. D. de Vabres, R. Falco (alternate); U.S.S.R., Maj.-Gen. I. Nikitchenko, Lt.-Col. A. Volchikov (alternate). Chief prosecuting counsel were Sir Hartley Shawcross, British attorney general; R. H. Jackson, U.S.A.; F. de Menthon, France; and Gen. Rudenko, U.S.S.R.

This tribunal was given the following powers: (1) to summon witnesses to the trial and require their attendance and testimony; (2) to interrogate any defendant; (3) to require the production of documents and other material evidence.

The tribunal was not to be bound by the technical rules of evidence, and was relieved of any obligation to require proof of facts of common knowledge, though it was required to take judicial notice of government and U.N. documents and reports. It was authorised to impose a capital sentence or any other punishment it deemed just; and to deprive the convicted person of any stolen property and order its surrender to the Allied control council for Germany. The judgement of the tribunal was final and not subject to appeal, and in case of guilt the sentences were to be carried out in accordance with the orders of the control council, which was authorised to reduce or otherwise alter the

sentences at any time it considered fit, but not to increase their severity. Neither the tribunal nor its members or their alternates could be challenged by prosecution, defendants, or counsel. Decisions of the tribunal were by majority vote, the president having a casting vote.

The function of counsel for the defendant was allowed to be discharged at the defendant's request by any person professionally qualified to plead in courts of the defendant's country, or by any person authorised by the tribunal. All court proceedings had to be conducted in, and all official documents submitted on either side had to be translated into, English, French, Russian, and the language of the defendant. The indictment was required to include full particulars specifying in detail the charges against the defendants. Every defendant had the right to produce evidence in support of his defence and to cross-examine witnesses called for the prosecution.

The permanent seat of the tribunal was at Berlin, but the trial itself was held at Nuremberg in the U.S. sector. The U.S. army was made responsible for guarding the prisoners, the press arrangements, and the elaborate system of headphones and interpreters for simultaneous translation of the proceedings into the four languages. During the course of the trial the defendants were kept in rigid solitary confinement. They were deprived of all insignia of rank and fed on army rations. They were forbidden to possess any article likely to facilitate self-injury; and as a precaution against suicide each prisoner was watched by guards day and night.

Indictment on Four Counts

On Aug. 29 a committee of the four chief prosecuting counsel issued from London a first list of criminals to be tried. There were four counts of the indictment, charging the defendants with (1) conspiring, or having a common plan, to commit crimes against peace; (2) committing specific crimes against peace by planning, preparing, initiating, and waging wars of aggression against a number of states; (3) war crimes, i.e. murder and ill-treatment in occupied territory or on the high seas, deportation for slave labour, murder and ill-treatment of prisoners of war, killing of hostages, plunder and devastation of property; (4) crimes against humanity, i.e.

murder, extermination, enslavement, and deportation committed against civilian populations before and during the war, and political, racial, and religious persecution.

The 24 accused were:

Hermann Goering
Joachim von Ribbentrop
Rudolf Hess
Ernst Kaltenbrunner
Alfred Rosenberg
Hans Frank
Martin Bormann
Wilhelm Frick
Robert Ley
Fritz Sauckel
Albert Speer
Walter Funk
Hjalmar Schacht
Franz von Papen
Gustav Krupp
Konstantin von Neurath
Baldur von Schirach
Arthur Seyss-Inquart
Julius Streicher
Wilhelm Keitel
Alfred Jodl
Erich Raeder
Karl Doenitz
Hans Fritzsche

With the exception of Bormann, who had disappeared in the capture of Berlin, all these defendants had been arrested after the German collapse.

Moreover, the following organizations were declared illegal, and any defendant who had been a member of any of them could be tried and punished on that ground alone: the Reich cabinet, the leadership corps of the Nazi party, the S.S., the Gestapo, the S.A., and the general staff and high command of armed forces.

Ley committed suicide Oct. 25, Kaltenbrunner was ill, and the tribunal decided to defer the trial of Krupp on account of his physical and mental condition; so that only 20 defendants appeared when the trial opened at Nuremberg, Nov. 20. During the 10 months it lasted, 403 open sessions were held; 33 witnesses testified orally for the prosecution; and 61, in addition to 19 of the defendants, for the defence; a further 143 witnesses gave evidence for the defence by written answers, 88,000 affidavits signed by 155,000 persons were submitted for the living defendants and 158,000 were sent in on behalf of the organizations. Much of the evidence tendered by the prosecution was derived from captured German documents, and films of concentration camps were shown.

On Aug. 31, 1946, the tribunal retired to consider its verdict. On Oct. 1 the judgements were read. The general judgement found that a common Nazi plan to prepare and wage war had existed. Certain

defendants had planned and waged aggressive war against 12 nations. War crimes had been committed by Germany on the high seas and in every country occupied by her. The Germans were guilty of crimes against humanity. The leadership corps of the Nazi party and the S.S. were declared

and were discharged. The Russian members of the tribunal added a rider dissociating the U.S.S.R. from the acquittals, and declaring that Hess should have been sentenced to death.

All those whose lives were forfeit, except Kaltenbrunner, appealed to the control council

1946; 22 Cells in Nuremberg. D. M. Kelley (psychiatrist to the prison), 1947; War Crimes Trials, ed. Sir D. M. Fyfe, 1948, etc.

After the main Nuremberg trials, 177 lesser Nazis—diplomats, civil servants, and others—were charged with war crimes at Nuremberg in 12 separate cases brought before U.S. military courts. Of 142 convicted, 24 were sentenced to death by hanging, the others to imprisonment. Two American and 373 German defence counsel were engaged. The last case ended April 15, 1949.

Nurmi, PAavo (b. 1897). Finnish runner, born at Åbo (Turku), June 13, 1897. He established world records for the mile in 1923, two miles in 1931, five miles in 1924, six miles in 1930, and ten miles and one hour in 1928. One of the greatest and most consistent long-distance runners of all time, he won six Olympic titles; in 1924 he was champion over 1,500 metres, 5,000 metres, and in the cross-country race. Known as the Flying Finn, Nurmi paid several visits to Great Britain, and besides setting up various records won two A.A.A. championships in 1922.

Nürnberg. German name for the city more familiar to English speakers as Nuremberg (*q.v.*).

Nursery. See Crèche; Day Nursery; Nursery School; also Garden and Gardening; Grafting.

Nursery Rhymes. Verses repeated to young children, and often handed down by tradition. The first actual collection is supposed to have been made in Boston, U.S.A., in 1719; the first known British collection, Mother Goose's Melody, was issued about 1780 by John Newbery, and comprised but 30 pieces. It may possibly have been compiled and in part written by Goldsmith. To each rhyme a whimsical moral is appended.

Nursery rhymes are of the most varied origin. Some are believed to contain traces of heathen worship and magical incantations. In others allusions to historical events or political controversies have been suspected. But, in spite of much discussion, few definite results have been attained. Some counting-out rhymes contain Welsh numerals in a corrupt form. Other rhymes, accompanied by action, are probably derived from medieval dances.

References to some rhymes—such as Sing a Song of Sixpence—are to be found in Elizabethan drama. The Wise Men of Gotham (*q.v.*) probably dates from the 16th century. Some rhymes are but

Nuremberg Trials. The chief Nazi defendants face their judges, November 20, 1945. Front row, L. to R., are Goering, Hess, Ribbentrop, Keitel, Rosenberg, Frank, Frick, Streicher, Funk, Schacht. Back row, L. to R., are Doenitz, Raeder, Schirach, Sauckel, Jodl, Papen, Seyss-Inquart, Speer, Neurath, Fritzsche

criminal organizations; the Reich cabinet as such was not, nor were the S.A., the general staff, or high command. The Nazi leadership was guilty on all four counts. Responsibility could not fall on Hitler alone, but must be shared by generals, statesmen, and business men who cooperated with him in his regime.

In the cases of individual defendants, verdicts and sentences (the latter passed in the afternoon of Oct. 1) were as follows: Goering, Ribbentrop, Keitel, Rosenberg, Jodl, guilty on all counts; Kaltenbrunner, Frank, Sauckel, Bormann, guilty on counts 3 and 4; Frick, Seyss-Inquart, guilty on counts 2, 3 and 4; Streicher, guilty on count 4. These twelve were sentenced to death by hanging. The following received life imprisonment: Hess, guilty on counts 1 and 2; Funk (counts 2, 3 and 4); Raeder (counts 1, 2 and 3). Schirach, guilty on count 4, and Speer, on counts 3 and 4, were sentenced to 20 years' imprisonment. Neurath, guilty on all counts but with mitigating circumstances, received 15 years' imprisonment; Doenitz, guilty on counts 2 and 3, received 10 years. Schacht, Papen, and Fritzsche were found not guilty,

for clemency. Goering, Jodl, and Keitel asked to be shot instead of hanged in the event of their pleas being rejected. Hess, Funk, Neurath, and Doenitz appealed for mitigation of their prison sentences. On Oct. 10 the council rejected all appeals and announced that death sentences would be carried out by hanging at Nuremberg prison. On Oct. 15 it was stated that Hess, Funk, Raeder, Speer, Schirach, Neurath, and Doenitz would serve their sentences in Spandau prison, in the British sector of Berlin. Executions were fixed for 1 a.m. of Oct. 16, but at 10.45 p.m. on Oct. 15, Goering was found poisoned in his cell. Execution of the rest, completed by 2.45 a.m., was carried out on two gallows in the gymnasium of the prison by an American sergeant and lance-corporal in the presence of the quadripartite allied commission, doctors, army officers, representatives of the German authorities, eight press representatives, and an official photographer. The bodies were cremated and the ashes disposed of secretly. See War Criminals; also biographies of the individuals in this Encyclopedia. Consult The Nuremberg Documents, P. de Mendelssohn,

surviving scraps from much longer pieces. Others that have definitely taken their places in the corpus of British nursery rhymes are demonstrably modern, and of some the authors are known. A Frog He Would a Wooing Go was written by John Liston, who based it on an earlier series of verses; Wee Willie Winkie was written by the Scottish poet William Miller.

Bibliography. Popular Rhymes of Scotland, R. Chambers, 1826; Nursery Rhymes of England, J. O. Halliwell-Phillips, 1842; Games and Songs of American Children, W. W. Newell, 2nd ed. 1903; Nursery Rhyme Anthology, L. Derwent, 1838.

Nursery School. School for children from two to five years of age, i.e. below the age of compulsory school attendance. The purpose of such schools is to provide a healthy, happy environment in which the child can develop physically, mentally, and socially. They bridge the gap between the child welfare clinic and the infant school. The pioneer of nursery schools in the U.K. was Rachel

Macmillan, who planned and operated at Deptford a large open-air school in which children enjoyed benefits at a cost of less than £12 per annum a child. In 1914 she opened a training centre for teachers in open-air nursery schools; in 1930 the Rachel Macmillan training college for teachers was established. Nursery schools are still relatively few. Under the Education Act, 1944, if parents require education for children between 2 and 5, local authorities must provide it, either in special nursery schools or in nursery classes in other schools. In 1946, however, only 6,500 children in England and Wales were attending nursery schools; but 54,000 were attending nursery classes in infant schools, more than 100,000 were in ordinary classes in primary schools, i.e., 9·4 p.c. of all children in the age group were attending school. There is a Nursery School Association of Great Britain, 1 Park Crescent, London, W.1. Consult The English Nursery School, Mrs. P. E. Cusden, 1942.

at S. Thomas's Hospital, London, which became the prototype of nurses' training schools in almost every country.

Although a movement towards organization and registration of trained nurses began in England in 1887, and a bill was introduced in 1904, the Nurses Registration Act did not become law until 1919. This Act set up a general nursing council for England and Wales to keep the state register, conduct examinations, and approve training schools. Similar councils were set up in Scotland and Northern Ireland. The register is divided into parts: general trained nurses (S.R.N. = state registered nurse); sick children's nurses (R.S.C.N. = registered sick children's nurse); fever nurses (R.F.N. = registered fever nurse); mental nurses (R.M.N. = registered mental nurse); mental defective nurse (R.N.M.D. = registered nurse, mental defective). State registration is usual in most countries.

As the field of nursing expanded, specialised training was added to hospital instruction. District nursing (founded in 1859 by William Rathbone of Liverpool, with the help of Florence Nightingale) needed special training, and the district nurse with midwifery and public health training as well as three to four years' hospital training is often a very highly qualified woman. Other categories are: the public health nurse, or health visitor as she is known in Great Britain, whose function is almost entirely educational and preventive, as is that of the school nurse; the industrial nurse, who in factories, big stores, hotels, etc., is responsible for the health and welfare of the staff; the private nurse, who attends a patient in his or her own house.

Many nurses take up midwifery, or maternity nursing, in hospital or domiciliary practice, but midwifery, although allied to nursing, is a separate profession, defined by Act of parliament. Nursing overseas in the mission field and elsewhere often necessitates special training in tropical medicine.

With the Services

In the U.K. there are permanent nursing services connected with the fighting forces. The Army Nursing Service, the direct descendant of Miss Nightingale's band of ladies in the Crimea, was named, 1902, Queen Alexandra's Imperial Military Nursing Service, renamed, 1949, Queen Alexandra's Royal Army Nursing Corps. Queen Alexandra's Royal Naval Nursing

NURSING: CARE OF THE SICK

J. Elise Gordon, Editor, *Nursing Mirror and Midwives' Journal*

The history and scope of nursing is here described, as well as some of the problems associated with it. See also Hospital; Midwife; Nightingale, Florence; Nursing, Male

Nursing as an art, and as a profession, has been carried on since the earliest days of history. The early Hindus, the Egyptians, and above all the Jews, laid down excellent rules for hygiene and health, and Hippocrates (q.v.) sought 400 years B.C. to inculcate the principles of good nursing.

With the coming of Christianity the care of the sick and suffering assumed new importance, and orders of women were formed specially devoted to nursing. The first woman to be named specifically in connexion with nursing care in the early church was the deaconess Phoebe, but during the centuries of the church's growth others are mentioned by name out of a considerable body of women devoting themselves to succouring the sick. The religious orders of nuns, which flourished from the 5th century onwards, took up the work, and at the time of the Crusades there arose the famous military nursing orders, notably the Knights Hospitallers of S. John of Jerusalem, of Rhodes, and of Malta (an order still in existence and world-wide), the Teutonic Knights, who combined military and nursing duties, and the Knights of S. Lazarus, who devoted

themselves to the service of lepers. Famous medieval saints associated with the care of the sick are S. Francis of Assisi, S. Clare, S. Elizabeth of Hungary, and S. Catherine of Siena. The 12th and 13th centuries also saw the rise of secular nursing orders, such as the Béguines of Flanders, the Franciscans, the Poor Clares. With the decay of the religious orders in Protestant countries, nursing was relegated to ignorant and sometimes unscrupulous persons, such as those depicted by Charles Dickens in *Sairey Gamp* and *Betsey Prig*. But in 1836 Theodor Fliedner and his wife set up at Kaiserswerth, Germany, a hospital where women were trained in nursing. From this model, deaconesses' hospitals sprang up in many parts of the world; and from it—even more important—Florence Nightingale received inspiration for her great work. Her influence upon contemporary nursing has never been properly assessed, and 20th century practice has not even yet caught up with all her ideas. Following her practical demonstration of military nursing in the Crimea, which shook the world, she founded the famous training school for nurses

Service, a much smaller body, was formed in 1902; Princess Mary's R.A.F. Nursing Service in 1918. Queen Elizabeth's colonial nursing service, the prison nursing service, the ministry of Pensions nursing service, the industrial nurses employed in royal ordnance factories, and the Civil Nursing Reserve formed during the Second Great War complete the govt. dept. nursing services.

The Nurses Act, 1943, limited the use of the term nurse (though not the right to practise as a nurse) to certain specified categories, and authorised the setting up of the assistant nurses roll, and training for the assistant nurse. By 1946 there were more than 37,000 state enrolled assistant nurses (S.E.A.N.).

Ministry of Health Inquiries

The British ministry of Health set up a division of nursing and midwifery in 1941, with a chief nursing officer and assistants; the ministry of Labour and National Service has a nursing services branch, with a principal nursing officer, concerned with recruitment. A committee for England and Wales, under the chairmanship of Lord Rushcliffe, appointed by the ministry of Health in 1941, reported in 1943 advocating improvements in salaries and conditions of work, which were accepted by the govt.; similar improvements for Scotland and Northern Ireland were put into effect; these and subsequent improvements did not provide enough nurses to meet the ever increasing number needed, although the British nursing force increased by more than 15,000 between 1938 and 1945. A working party set up Jan., 1946, to consider recruitment and training reported in Sept., 1947, emphasising the importance of loss of students in training through dislike of hospital discipline, hours and pressure of work, and other causes, and recommending reorganization to ease the strain on both teachers and taught. The Nurses Act, 1949, authorised the minister of health to set up a standing training committee in each of the 14 hospital areas of England and Wales, and gave the general nursing council power to finance training, and to admit to the register some nurses (*e.g.* those trained abroad) formerly excluded.

The International Council of Nurses, inaugurated 1899 by a British nurse, Mrs. Bedford Fenwick (the first of all international women's organizations), is a federation of national nurses' associa-

tions (32 belonged to it in 1939) with four major interests: (1) the professional, social, and economic welfare of nurses; (2) nursing education; (3) nursing service; (4) legislation as it affects nurses and nursing. Committees collect and collate information. Conferences are held in different countries, usually at four-yearly intervals; that held at Atlantic City, U.S.A., in 1947 was, however, the first for ten years. A golden jubilee congress was fixed for Stockholm in 1949. The H.Q. is at 19, Queen's Gate, London, S.W.7. The National Council of Nurses of Great Britain and Northern Ireland (at 17 Portland Place, London, W.1) is a federation of professional nursing organizations in the U.K.

Another organization with international interests, with H.Q. at 45, Gloucester Place, London, W.1, is the Florence Nightingale International Foundation, set up in 1934 as a memorial to Miss Nightingale, the function of which is to provide postgraduate nursing courses for nurses of various countries.

Postgraduate training for nurses in the U.K. is carried out by various bodies, including a few university faculties which offer a diploma in nursing. There is scope, however, for much more, and the British Empire nurses war memorial fund, founded 1946 (through the Nursing Mirror, a professional weekly journal for nurses) as a memorial to the 3,000 nurses and auxiliaries of the British Commonwealth who gave their lives in the Second Great War, had as its object the provision of postgraduate travelling scholarships for nurses, as well as the creation of a memorial chapel in Westminster Abbey. To this fund, the nurses of the British Commonwealth themselves subscribed the first £50,000.

The International Red Cross is in many countries responsible for professional nursing training, for which purpose it runs training hospitals; in the U.K. it is concerned with the training in home nursing and first aid of auxiliaries and voluntary workers.

Nursing, MALE. In mental hospitals men nurses care for male patients. Their training, similar to that of women nurses, is carried out in mental hospitals recognized as training schools by the Royal Medical Psychological Association. They sit for the same examinations as women; and their conditions of service are also governed by the

Rushcliffe committee's recommendations. *See* Nursing.

Nursing, ROYAL COLLEGE OF. Professional organization founded 1916. It has a membership of over 46,000 registered nurses, and a junior branch, the Student Nurses' Association, composed of over 13,000 persons in training. It aims at furthering the progress of nursing as a profession; at presenting to the government and representative bodies the views of state registered nurses on problems of their work, and negotiating on their behalf; and at promoting post-certificate nursing education. Six area organizers act as links between headquarters (1a, Henrietta Place, London W.1) and 126 branches. A Scottish board and a committee for N. Ireland also operate. The official journal, *Nursing Times*, is published weekly. Affiliated to the Royal College of Nursing are the Association of Sick Children's Hospital Nurses and also the Society of Registered Male Nurses.

Nursing Home. Home where invalids and others are received for operations, childbirth, rest cures, etc. It must be registered by a local authority. The certificate of registration must be displayed, and the medical officer of health may inspect the home at any time.

Nut. Strictly speaking, the dry fruit developed from the carpels of the flower. The carpel contains two or more ovules, but as a rule only one develops into a seed—the kernel of the nut. This is invested by a shell of hard or leathery tissue, which does not split until the seed germinates. The term as used commercially or popularly does not always coincide with the botanical meaning; thus, an acorn is a true nut; a ground-nut is not a nut, but a pod; walnut is the "stone" of a fruit formed like a plum or cherry (drupe); and earth-nut, or pig-nut, is a tuber. Types of true nuts are found in hazel, beech mast, and sweet chestnut. *See* Brazil Nut; Cob-nut; Fruit.

Nut. Small piece or block of metal or other material pierced with a hole which is threaded to conform to a standard screw-thread system. It is used in securing a bolt or attaching one member in machinery to another. Nuts for bolts are usually of mild steel, but sometimes of brass, aluminium, or alloy. For common bolts they are square on plan; for engineers' bolts the hexagon is usual. Spanners turn them, and a washer is interposed between the inner surface of the nut and the face of the

Nutcracker. Occasional British visitor, of the crow family

member through which the tail of the bolt protrudes. Nuts to be turned by the fingers are of two kinds; wing-nuts, which have projecting lugs facilitating grip by thumb and fingers; and milled-edge nuts, cylindrical in plan and with a roughened periphery. Lock-nuts incorporating a locking device, and double nuts turning in opposite ways, prevent loosening and back-turning under vibration.

Nutation. In astronomy, the oscillatory movement produced in the earth's axis by the attraction of the moon on the equatorial protuberance of the earth. The line of the earth's axis cuts the heavens at a point known as the celestial pole, which describes a circle round the pole of the ecliptic, and this circle is in itself subject to a small disturbance, making the circle a wavy one instead of uniform. This nodding motion is called nutation (Lat. *nuere*, to nod). See Precession.

Nutcracker (*Nucifraga caryocatactes*). Bird belonging to the crow family. Widely distributed over Europe and Asia, it is an occasional visitor to Great Britain. The bird is rather smaller than a jackdaw, and has brown plumage spotted with white, except the wings and tail, which are black. It occurs in woods, where it feeds mainly on seeds of conifers and insects. The word is also used as the name for a metal implement used for cracking nuts.

Nuthatch (*Sitta*). Genus of birds of the family Sittidae. The common nuthatch, *S. europaea*, is a small bird, fairly common in the S. and Midland counties of England, rare in Scotland, and not found in Ireland. It is about 5 ins.

Nuthatch searching a tree trunk for insects

long; the plumage is bluish grey on the upper parts, with white throat, buff under parts, and grey and black tail. It has the habit of running upwards or downwards over the branches and trunk of a tree like a mouse. It nests in a hole in a tree; and if the hole is large, stops it up with clay, leaving an opening only large enough to pass through. It feeds upon insects and grubs that it finds in crevices in the bark, in search of which it taps the tree like a woodpecker. In autumn it takes partly to a diet of nuts, which it fixes in a crevice in the bark and splits with its beak.

Nutmeg (*Myristica fragrans*). Seed of a tree of the family Myristicaceae, native of Malaya. The

Nutmeg. 1. Fruit beginning to open. 2. Nutmeg covered with mace. 3. After removal of mace

tree attains a height of about 30 ft., has large, aromatic, leathery, alternate, evergreen leaves, and small, pale yellow flowers. The small fruits are pear-shaped, containing a single seed (nutmeg), which is invested first with a crimson fibrous network (mace), and externally by a thick, fleshy coat. The tree begins to bear fruit when eight years old, attains its maximum at twenty-five, and continues profitable for another 35 years or so. Nutmeg and mace are used in cookery as a flavouring for custards and puddings; and in medicine as an aromatic, stimulant, and carminative, but chiefly to disguise the taste of less pleasant drugs, such as rhubarb.

Nutrition. This subject is discussed under Food and Nutrition.

Nux Vomica. Seeds of a small tree, *Strychnos nux-vomica*, member of the family Loganiaceae. A native of India and N. Australia, it has strongly veined, oval, opposite leaves, and panicles of greenish-white tubular flowers. The fruit is a large berry, resembling an orange, with numerous silky-haired, disk-like seeds an

inch across, embedded in the edible pulp. The dried seeds, ground to powder, yield the alkaloids strychnine, brucine, and loganin. The proportion of alkaloids varies from 2 to 3 p.c., of which half is strychnine.

The latter drug is also obtained from the triangular, hairless seeds of the allied plant Ignatius Bean (*S. ignatii*), of the Philippines, which are frequently substituted. See Strychnine.

Nux Vomica. Foliage, flowers, and fruit (A)

Nyamwezi. Negroid people of Bantu speech in Tanganyika Territory, E. Africa. The plural is Wanyamwezi. Mostly in the highlands between the Victoria Nyanza and Tabora, they are a muscular, dark-brown people, 5½ ft. tall, long-nosed, and often curly-haired. The men tend cattle, sheep, and donkeys; the women raise crops of grain, sweet potatoes, and cassava. Beehives are often kept in the oblong dwellings.

Nyanza. Central African word for lake. Examples are the three lakes which form the main sources of the Nile, i.e. Victoria Nyanza, Albert Nyanza, Edward Nyanza.

Nyasa. Third largest lake in Africa. It is a deep basin about 360 m. long and from 10 to 55 m. wide, lying at an alt. of 1,555 ft., and occupies part of the Great African Rift Valley. Its greatest depth is 386 fathoms. To the N. and E. it is closely approached by lofty mts. and tablelands. The only outlet is the Shire river, issuing at its S. extremity and flowing into the Zambezi. The principal affluents are the Songwe, Rukuru, Bua, and Lintipi on the W. coast. The water of the lake is fresh and its level varies with the amount of the annual rainfall. Fort Johnston, at the S. outlet, Kota-Kota, and Karonga are the most important ports. Lake Nyasa was discovered in 1859 by Livingstone from the S. and Roscher from the E.

Nyasaland. British protectorate in Central Africa. It lies along the W. shores of Lake Nyasa and to the S. of that lake, is approximately 520 m. in length, and has a land area of 37,374 sq. m. The S. portion is about 130 m. from the sea. The protectorate is bounded N. by Tanganyika Territory, W. by Rhodesia, S.W. and S.E. by

Portuguese East Africa, and E. by Lake Nyasa. There are two natural divisions, the one consisting of the W. littoral of Lake Nyasa, with the tablelands separating it from the basin of the Loangwa river and the districts between the watershed of the

Nyasaland arms

Zambezi and the Shire rivers on the W., and the other on the E., the districts of Lakes Chiuta and Chilwa and the Ruu, with the Shire highlands and Manje.

The modern history of Nyasaland dates from Sept., 1859, when Livingstone first reached the southern shores of Lake Nyasa. Livingstone was closely followed by various church missions, which have played an important part in its subsequent history.

The spheres of influence of Great Britain, Germany, and Portugal were defined by agreements made in 1890 and 1891, and the limits of the protectorate were settled by a proclamation of May 14, 1891; in the following spring a British protectorate was proclaimed over the countries adjoining Lake Nyasa. Before that time the territory was part of British Central Africa. From 1893 until 1907 it was known as the British Central Africa Protectorate, but the former name of Nyasaland Protectorate was revived in Oct., 1907. The administrative capital is at Zomba, but the chief town is Blantyre, on the Shire Highlands railway. The protectorate is administered by a governor, assisted by an executive council.

A large portion of the protectorate is mountainous or composed of lofty plateaux rising somewhat abruptly. The principal ranges are the Manje Mts., between Lake Chilwa and the river Ruu, of which the highest peak is 9,843 ft. in alt.; the Shire highlands lying E. of the Shire river, of which the highest portion is Mt. Zomba, 7,000 ft.; the Kirk range, W. of the Shire, reaching 7,000 ft.; the Angoniland plateau, at the S.W. end of the lake, reaching 8,000 ft.; and the Mangoche Mts. In addition to Lake Nyasa, there are three considerable lakes, Chilwa or Shirwa, 100 sq. m., Chiuta, 30 m. long, and the swampy Malombe; but the only important river is the Shire.

The most important products are cotton, tobacco, coffee, tea, chillies, rubber, rice, maize, vegetable oils, and soya beans. Most

travel by rly. to Port Herald on the river Shire and to Chindio on the Zambezi, and thence to the mouth of the Zambezi. In April, 1922, a railway line, 175 m. long, from Murrao, on the southern bank of the Zambezi, to Beira in Portuguese East Africa, was opened for traffic. This set up direct rly. connexion between Blantyre and Beira. On March 1, 1935, the great Zambezi bridge was opened, establishing unbroken communications between Nyasaland and Beira. This is the longest railway bridge in the world, 12,004 ft.

The various missions are mainly responsible for education in Nyasaland. The Government maintains the Jeanes training centre, but apart from that its function is to

coordinate and advise. The enrolment at the African primary schools is about two-thirds of the children available, but only a small number reach the end of the course. There are elementary schools for European children, but it is considered unwise to keep European children in Nyasaland after the age of 11. They then usually go to S. Rhodesia, where the parents are assisted by substantial financial grants.

At the outbreak of the First Great War prompt action surprised and disabled the German steamer Hermann von Wissmann while on the stocks at Sphinxhaven, and gave the British command of Lake Nyasa. On Sept. 8, 1914, a British force, working N.,

attacked the enemy, whose main body had arrived simultaneously to attack Karonga. This German force was routed. In May, 1915, a naval detachment reached the protectorate, and as reports were received that the Germans were repairing the Hermann von Wissmann, a force went to Sphinxhaven on May 30, disabled the steamer, and captured a large supply of stores and ammunition. In the Second Great War Nyasaland was free from hostilities. Land area 36,829 sq. m. Pop. 2,033,697 (Europeans 1,948).

Bibliography. British Central Africa, Sir H. H. Johnston. 1897; Nyasaland under the Foreign Office, Duff, 2nd ed. 1906; Peace Handbooks No. 95, Nyasaland, 1921; Report on Tea Cultivation, 1933; Emigrant Labour Report, 1935.

Nyborg. Port of Denmark, on the E. coast of the island of Fünen. Lying 18 m. by rly. S.E. of

Nyasaland. Map of this British protectorate in the uplands of Central Africa

Odense and one hour by steam ferry from Korsør in Zealand, it has a deep and spacious harbour, and exports cereals. It has a Gothic church and an arsenal housed in an old royal residence. Founded in the 12th century, Nyborg was a fortress until 1867. Here in 1659 the Swedes were defeated by the Danes. Pop. 9,740.

Nygaardsvold, JOHAN (b. 1879). A Norwegian statesman. Born near Trøndhjem, he went to the U.S.A. in 1900, working as a farm labourer and railwayman. Returning to Norway in 1907, he was elected to the *storting* in 1916, and in 1928 became minister of Agriculture in the first Norwegian Labour govt. In 1935 he became prime minister, an office he held when the Germans invaded Norway in 1940. After the withdrawal of Allied troops from Norway, Nygaardsvold came to Great Britain with King Haakon and formed the Free Norwegian govt. in London. He returned to Norway as premier after the liberation, but after a short time retired from active politics.

Nyköping. A port of Sweden, capital of the län or govt. of Södermanland. Situated on a bay of the Baltic 52 m. direct (100 m. by rly.) S.W. of Stockholm, it has a good harbour and a ruined castle, destroyed by the populace in 1317. Nyköping has cloth and engine factories and exports grain and iron ore. One of the most ancient towns in the country, 15 national diets were held here in the 13th-15th centuries. Pop. 14,260.

Nylon. Generic name coined by the Du Pont Company of America to cover a series of synthetic linear polyamides. The materials were developed as the result of long-term research begun in 1928 by Dr. W. H. Carothers. In chemical structure they are similar to natural silk and wool, but they are obtained from coal which yields phenol, water which yields hydrogen, and air which yields nitrogen and oxygen. From these fundamentals are obtained dibasic acids such as adipic or sebacic, and diamines such as hexamethylene diamine. While the number of possible combinations of these materials theoretically runs into thousands, only about eleven types of nylon were at first developed.

The large-scale manufacture of nylon was started in the U.S.A. in 1940. Its production was rapidly expanded to meet an increasing demand for fibres and also for special plastics used during the Second Great War. To many

people, however, the word nylon became merely a synonym for super-fine fully fashioned stockings, but filaments have been used in the production of bristles for brushes and, made up into ropes, have been utilised for special high duty applications such as glider tow ropes and parachute harness.

The application of nylon as a mouldable plastic has been limited, though it has many advantages, being very light, having a specific gravity of 1.14 compared with 1.30 for cellulose acetate. The injection moulding of nylon calls for high temperatures since it melts at 450° F., and special precautions have also to be taken to deal with its high fluidity when melted. Nylon has a very low inflammability, and is resistant to water, most solvents, grease, oil, alkalis, and weak acids. Bearings made from nylon require no lubricant other than water. In solution the material is used in the production of films for special purposes, and for coating wires and fabrics.

Nymph (Gr. *nymphē*). In classical mythology, a localised nature spirit, regarded as a minor deity. Different groups of nymphs were sea and water nymphs, such as the Oceanids, the Nereids, and the Naiads; Oreads, or mountain-nymphs; Dryads and Hamadryads, or tree-nymphs. Temples were not built to them, but offerings of milk and honey were made in grottoes, at fountains, trees, etc. Anyone meeting a nymph became frenzied.

The word nymph is sometimes used for an insect in the stage of development before its last metamorphosis. See Insect; Larva.

Nymphaeaceae. A family of aquatic, perennial herbs. Natives of the temperate and tropical regions of the world, they have stout creeping rootstocks, and mostly floating leathery leaves. The flowers are solitary, with three or six sepals, three or more petals (often numerous), and many stamens. It includes the sacred bean (*Nelumbium*), water lilies (*Castalia*, *Nymphaea* and *Victoria*), etc.

Nymphomania (Greek, *nymphē*, a bride; *mania*, frenzy). State of excessive sexual desire in women due to disorder of the endocrine glands. More often met with is pseudo-nymphomania, which has a psychological origin. Women afflicted with it generally obtain less than the normal satisfaction from sexual intercourse; the urge which prompts their behaviour is (according to psycho-analysts) unconscious sadism, directed both

against their partners and themselves, with an equally unconscious desire to mutilate the partner.

Nyon Agreement. Nine-power "anti-piracy" agreement. A conference met at Nyon, Switzerland, in Sept., 1937, during the Spanish Civil War, to consider measures to check the attacks being made on shipping by submarines of unknown nationality. The adoption of an "anti-piracy" patrol was agreed by Gt. Britain, France, Russia, Turkey, Greece, Yugoslavia, Rumania, Bulgaria, and Egypt. Great Britain and France were to provide naval forces to patrol the Mediterranean. The others being responsible only for their own territorial waters.

Nyren. Name of two English cricketers. Richard Nyren came of a Scottish family, originally Nairn. He was settled in Hampshire by about 1750 when he founded the Hambledon club (see Hambledon). He kept the Bat and Ball Inn, on Broad Halfpenny, and looked after the adjoining ground. Left-handed and one of the finest bowlers of his day, he was also a good batsman. His son John (1764-1837), besides being a cricketer of repute, wrote *The Young Cricketer's Tutor*, comprising full directions for Playing the Elegant and manly Game of Cricket, 1833. John died at Bromley, June 30, 1837. See Cricket.

Nystad. Town and seaport of Finland. Called in Finnish Uusi-kaupunki, it is in the district of Abo-Björneborg (Turku-Pori), on the Gulf of Bothnia, 40 m. N.W. of Turku. It has a good harbour and docks, and a considerable trade. The port has direct connexion with the Åland Islands. The peace of Nystad, 1721, gave Russia extensive Baltic territories.

Nystagmus. Oscillating movement of the eyeball, usually lateral, but sometimes vertical or rotatory. The most frequent form is coal-miner's nystagmus, which is due primarily to working in a dim light. It improves if work in the mine is given up. Miners working in open mines to which daylight penetrates do not contract nystagmus. It is a symptom of various nervous disorders, particularly the affection known as disseminated sclerosis. Nystagmus following disease of the nervous system is practically incurable. See Eye.

Nyx. In Greek mythology, the personification of night, called Nox by the Romans. Daughter of Chaos, the primal void, and mother of Aether (Heaven) and Hēmera (Day), she is represented as a winged goddess in a chariot.

IN its direct descent from the Phoenician (100 B.C.) letter *ayin* (meaning eye), the letter O, alone among the letters of the alphabet, has undergone virtually no change. Such departures from the perfect circle as are found in ancient examples are due to the difficulty of inscribing a circle in stone; such variations in its representation range from the ellipse to the diamond. The Greeks were the first to call the letter by the sound for which they made it the symbol. But they also differentiated between the long o sound and the short o sound, inventing the modified symbol Ω to represent the former. The two letters o and Ω

were known respectively as *o mikron* (small) and *o mega* (large). The Roman alphabet, having adopted the o before the introduction of the Ω retained the one form for both sounds. Classic Roman inscriptions introduced certain refinements. For example, in formal inscriptions

it was found that if the letter were proportionate to the other letters its circular shape gave it undue prominence, and it was therefore made relatively smaller, raising its base slightly above the base level of the rest, a device that was followed in formal MSS. even as late as the Middle Ages.

O Fifteenth letter and fourth vowel of the English and Latin alphabets. As with e, it is impossible to give any definite rules for its various sounds and combinations. Its two chief values are long o, as in *dote*, short o, as in *dot*, which is really the *au*, *aw* heard in *call*, *bawl* shortened. It equals short u in *another*, and oo in *prove*. It combines freely with other vowels. *Oa* equals long o in *boat*, *moat*, but not in *abroad*, *board*; *oe* equals e in words of Greek origin, and is now generally so spelt, as in *economy*, *ecology*; in other words it equals long o as in *hoe*, *roe*. *Oi*, *oy* in *boiler*, *boy* really equals *aw* plus i; oo is long in *boon*, and short in *wood*, and in words such as *blood*, *flood* equals short u. *Ou* presents a great variety of sounds. See Alphabet; Phonetics.

Oahu. The Hawaiian island on which Honolulu stands. Area, 589 sq. m. See Hawaii; Honolulu.

Oak (*Quercus*). Large genus of trees of the family Fagaceae, including about 300 species, natives of the N. temperate regions, Indo-Malaya, the Pacific coasts, etc. The typical species is, of course, the British oak (*Q. robur*) whose trunk may be 120 ft. high, with a girth of 60-70 ft., covered with thick rugged bark, which cracks both vertically and horizontally. The branches are massive and tortuous, and in the open spread widely with a downward tendency, producing a dome-shaped mass. The oblong oval leaves are arranged spirally, and their edges are cut into variable lobes. The minute flowers are green and inconspicuous; the fruit nut is known as the acorn (*q.v.*).

Two well-marked British forms of this species are given specific rank by some authorities. In one of these (*sessiliflora*) the leaves have a distinct but variable stalk, and the acorns are seated almost directly on the twig; in the other (*pedunculata*) there is little or no leaf-stalk, and the acorns have long, slender stalks. Several exotic oaks have been introduced to the U.K., and are frequently seen in parks and gardens. The most common are the holm oak (*Q. ilex*) and the Turkey oak (*Q. cerris*) both from S. Europe. The latter was introduced about 1735, and is distinguished by its pyramidal form, its narrower, more acutely lobed leaves, and the long, curled scales of the acorn cup which give it a mossy appearance. Another S. European oak well established in British parks is the

Oak. Specimen of the British oak tree. *Quercus robur*, in full leaf

cork oak (*Q. suber*), and a well-represented N. American species is the dyer's oak, whose large leaves turn orange or dull red in autumn. N. America has over a score of oaks. Several besides British oak yield bark suitable for tanning.

Although the fine-grained, hard oak timber has lost much of its former importance through the introduction of steel girders and framing in structural work, and

Oak. Leaves of a variety of the Turkey oak, *Quercus cerris*

the competition of the more easily worked coniferous woods, it is still employed where endurance and the bearing of strains are needed; also for cabinet making, furniture, and panelling. For this purpose oaks have to be grown closely in woods to produce great length and equal thickness of trunk, and to discourage the production of lateral branches—which were in request in the era of wooden ships. Propagation is effected by the acorns. British oaks thrive best in rich loam.

The British oak is a tree of great longevity, as shown by many existing ruins of former giants, such as the Greendale oak at Welbeck, variously estimated by experts as being from 700 to 1,500 years old; and the Cowthorpe oak near Wetherby, Yorks, considered to have survived for 1,800 years. The tree does not produce any acorns until between 60 and 70 years old, and it does not pay to cut it for timber until it is in its second century. See Forestry.

OAK FINISHING. The contemporary finish of oak furniture and woodwork synchronise with the modern art movement. Mouldings, carving, inlay, and other embellishments being discarded in favour of simple design, there must be alternative attraction. If the wood is not painted, the eye must be pleased by its natural beauty. The demand that the wood shall not be hidden by layers of polish is sound aesthetically and represents a reaction against the decadent period of the late 19th century. Oak lends itself specially to this idea.

Theoretically, unpolished oak woodwork is ideal, but in practice the surface soon becomes soiled, so needs protection.

Polishing with raw linseed oil probably gives the best results, but there are difficulties. The oil being rubbed in with a clean white rag, it takes about a month to dry, and the process must be repeated about five times. It is not wise to oil veneered woodwork. For wax polishing, white wax (not paraffin or candle wax) or beeswax is shredded, placed in a jar, and covered with turpentine. The jar having stood for 24 hours, the mixture is rubbed into the grain with a piece of white rag. Applications are made every three or four days, and about four coats should be sufficient. If the process is continually repeated, the grain will eventually be entirely levelled up and the beauty of the wood impaired. While white wax has little effect on the colour, beeswax gives a warmth of tone.

The usual commercial method is to apply one or two thin coats of french polish. If the finish is to be in the natural colour of the wood, the polisher treats the light parts with extremely weak stain before applying the polish. In the finishing process known as weathered oak, the grain pores are filled in with lime before french polish is applied. Japanese oak is best suited for the process, on account of its small grain pores due to slow growth, combined with rich colour.

Oak Apple. Popular name for the growth on an oak, properly termed Oak Gall (*q.v.*).

Oak-Apple Day. Name given in England to May 29. The birthday of Charles II in 1630, and the day in 1660 on which he rode into London at the Restoration, it was celebrated by royalists, who decorated their houses with branches and leaves of oak, so commemorating also the king's escape from the parliamentary soldiers searching for him after the battle of Worcester, Sept. 3, 1651, when he hid with Colonel Careless in the oak at Boscobel, near Donington, Salop. Oak-apple day is still observed in many parts of England, notably at the Royal Hospital, Chelsea, as Founder's Day, when the statue of Charles II is decorated with oak-leaves and solemnly saluted.

Oakengates. Urban dist. and market town of Shropshire, England. It is 13 m. by rly. E. of Shrewsbury. The chief industries

are light engineering and steel and iron works. Market day, Sat. Pop. 10,860.

Oak Gall. Abnormal growth of the surface tissues of the oak caused by attacks of gall-wasps of the family Cynipidae, order Hymenoptera. The female gall-wasp pierces the tissues and deposits her eggs in the punctures, and swelling of the

Oak Gall. Marble or bullet galls affected part results. These attacks give rise to such familiar objects as spangle galls on the leaves, oak-apple and marble galls on the buds, and galls on the roots. Usually there are two generations of a gall-wasp annually, and the resulting swellings are different. Wasps emerging from the oak-apple galls seek the roots where other galls are produced; wasps from these last ascend the tree and there cause the oak-apple galls of the following year.

Oakham. Market town and co. town of Rutland, England. It is 94 m. N. by W. of London and 9 m. S.E. of Melton Mowbray, having a rly. station. The principal building is the church of All Saints.

Oakham arms

The banqueting hall of the castle built in the 12th century, is used for county business. Of interest, too, are Floro's House and the butter cross. The main industries are the manufacture of boots and shoes. Oakham is also a hunting centre. The lord of the manor has the right to claim a horseshoe from any peer passing for the first time through the town, and there is a collection of these in the castle hall. Market day, Mon. Pop. 3,191.

Oakham school was founded in 1584 by Archdeacon Robert Johnson. Its constitution was remodelled in 1875, and it is now a public school with accommodation for about 300 boys. The old school still stands with additional modern buildings.

Oakland. City of California, U.S.A., the co. seat of Alameda co. A residential place opposite San Francisco, on the E. shore of San Francisco Bay, it is served by rlys. and has tram and ferry services. With a sub-tropical climate, it is surrounded by

gardens and vineyards. Educational institutions include S. Mary's R.C. college and a Congregational seminary. Oakland has shipbuilding yards, fruit canneries, flour and planing mills, carriage works, and cotton, iron, steel, and leather manufactures. Until the American defeat of Mexico in 1848 and the "gold rush" in the same year, cattle grazed on a Spanish-owned ranch on the site of the city. From a yard supplying timber to the rising city of San Francisco, it developed into a suburb from which 30,000 people travel daily to the metropolis. Since 1936 an 8-mile double-deck steel bridge with six traffic lanes has connected Oakland with San Francisco. Pop. 302,163.

Oak Ridge. Atomic fission plant in the Tennessee valley, U.S.A. Covering 59,000 acres, it was established by the govt. in 1943 as a pilot plant to produce plutonium for the manufacture of the atomic bomb. The site was chosen for its proximity to the T.V.A. power and water facilities and for its remoteness from the coast. Officially known as the Clinton engineer works, Oak Ridge became the largest division of the atomic bomb project, and at the peak of war-time production in 1945 had a pop. of 78,000.

Oaks, THE. English horse-race. It is run at Epsom, normally on the Friday of Derby week. The course is the same as for the Derby, and the race is for fillies three years old. The Oaks is the name of a house near Epsom. In 1778 it was the property of the earl of Derby, and it was during a dinner party there that the earl and his friends decided to found the race. During both Great Wars the race was run at Newmarket. See Horse-racing.

Oaksey, GEOFFREY LAWRENCE, BARON (b. 1880). British judge. Son of the 1st Baron Trevethin, he was educated at Haileybury and New College, Oxford, and became a barrister at the Inner Temple in 1906. Recorder of Oxford, 1924-32, and for long counsel to the Jockey Club, he was made a judge in the king's bench division, 1932, and lord justice of appeal in 1944. Lawrence was president of the international tribunal during the Nuremberg trials (q.v.), 1945-46. He was given a peerage in 1947, and made lord of appeal in ordinary. He was chairman of a committee on police conditions, 1948-49.

Oakum (A. S. *acumbe*, off-combings). Loose hempen fibre made

from old ropes, used for caulking seams and stopping leaks on ships, and as an emergency surgical dressing. Tarred ships' ropes make the best oakum. Picking oakum was formerly a common employment in prisons and workhouses. White oakum is made from untarred ropes. Tow, the inferior parts of the flax fibre which separates out during the process of hankling, was formerly known as oakum.

Oamaru. Town and port of South Island, New Zealand. Situated 152 m. S.W. of Christchurch, and 78 m. N. of Dunedin by rly., it exports wool and grain. The centre of a rich agricultural district, it has freezing works and woollen mills. Its limestone is a useful building stone. Pop. 7,476.

Oar. Implement for moving a boat. It consists of a long, slender piece of wood, with a handle at one end and a blade at the other, the blade acting as a lever when in contact with the water. Each oar rests in an oarlock or rowlock. In early times galleys were propelled

The name was suggested by the long, slender ventral fins expanded at their extremity. North Sea fishermen know the fish as King of the Herrings. On the rare occasions when it comes to the surface it swims with an undulating movement and the crest and dorsal fin out of the water, when it may be mistaken for a "sea serpent." Little is actually known about it, for the few specimens that have been cast

Oar Fish. Specimen of the deep-sea fish called by North Sea fishermen King of the Herrings

ashore have broken up rapidly. Allied, some say identical, is the ribbonfish (*R. banksii*).

Oarweed (*Laminaria digitata*). Large olive seaweed of the Laminariaceae. It has a long, thick, round stem, with claw-like false roots, which attach it to the rocks. The thick, leathery, leafy portion, at first undivided, splits up into a number of segments. The whole plant is 15 ft. long, and grows on the rocks below ordinary low-tide

Oasis. Scene at the Oasis of Tonggourt in the Sahara

by slaves sitting in rows. The implements used for propelling a light boat are called sculls; the sculler uses two of them, whereas the oarsman proper uses only one, another oarsman rowing on the other side of the boat. See Eight; Galley; Rowing; Sculling.

Oar Fish (*Regalecus glesne*). Remarkable deep-sea teleostean fish of the family Trachyteridae. It is found in the Atlantic, Mediterranean, and North Sea, off the Faroes, Scotland, Norway, and N.E. England. The compressed, elongated, and scaleless body may be as much as 20 ft. long, with soft bones, a small mouth without teeth, and a dorsal fin that extends from behind the head to the imperfect tail. The first few rays of this fin are very long, with dilated tips, forming a conspicuous crest.

level. Tangle and sea-girdles are popular names for this alga.

Oasis. Fertile tract in a desert. The fertility of oases is due to water near the surface, either in depressions, so that the sinking of wells will give permanent supplies of water, or along the course of wadies, or, as with the Nile, along the banks of permanent waterways passing through deserts. By cultivation they can be made to produce a wide range of crops. The date palm groves of Saharan oases are famous. See Desert.

Oast House. Kiln in which hops or malt are dried. They are seen especially in Kent. See illus. p. 6164; see also Hops.

Oates, LAWRENCE EDWARD GRACE (1880-1912). British explorer, born on March 17, 1880. He was gazetted to the Inniskilling

Oast House. Three oast houses, or kilns near Sittingbourne, Kent.
See page 6163

Dragoons, and served in the S. African War and in India and Egypt. He joined the Antarctic Expedition in 1910, and was one of the sledge-party who accompanied Scott

L. E. G. Oates,
British explorer

in his final dash for the South Pole. On returning the party was storm-bound and on his birthday, March 17, 1912, Capt. Oates, crippled by frost-bite, went out alone into the blizzard to die rather than be a burden to his starving comrades. See Antarctic Exploration. Consult A Very Gallant Gentleman, L. C. Bernacchi, 1933.

Oates, Titus (1649 - 1705). British conspirator and perjurer. He was born at Oakham, the son of an Anabaptist minister. Although expelled from Merchant Taylors' and sent down from Cambridge without taking a degree, he received ordination, but shortly afterwards was imprisoned for perjury. In 1677 he joined the R.C. Church, and went to the English Jesuit college at Valladolid, whence he was expelled, as also from St. Omer.

In 1678, Oates was in London concocting details of an R.C. "plot" to kill the king, invade Ireland, and indulge in a general massacre of Protestants. He duly revealed it to Sir Edmund Godfrey, a justice of the peace, who was found dead shortly after. For a time Oates was a popular idol.

Titus Oates,
British conspirator
After R. White

Nearly three dozen people were executed through his machinations. At last, in 1684, he was arrested for calling the duke of York a traitor, and after the duke's accession as James II, was tried, and sentenced to a heavy fine, whipping, and imprisonment for life, and annual exposure in the pillory. After William III came to the throne, Oates was released, and enjoyed a pension. He died July 12, 1705. Consult Liars and Fakery, P. W. Sergeant, 1926.

Oates Land. That part of South Victoria Land, Antarctica, lying between King George V Land (q.v.) and Cape Adare in lat. 70° S. and long. 160° E. See Antarctic Exploration.

Oath. In law, an appeal to God to witness the truth of evidence given. In English courts a witness must take an oath before giving evidence unless he has no religious belief or the taking of an oath is contrary to his belief, in which cases he may affirm. (See Affirmation.) A Christian takes the New Testament and a Jew the Old Testament in his uplifted hand and swears by Almighty God to speak the truth, the whole truth, and nothing but the truth. Until 1909 the English form required a "corporal" oath, i.e. the touching of some object, which had for long come to mean kissing the testament. This was strongly opposed by the medical profession on health grounds, and they took advantage of a provision introduced in 1888 and primarily intended for Scottish witnesses in England by which any person could insist on the Scottish form of oath which does not involve kissing the book. Any extension of this was at first bitterly opposed by the courts, but finally its legality was admitted. A witness may still if he wishes use the Scottish form. A witness who is neither Christian nor Jew may take an oath in any form binding on his conscience; thus a Mahomedan may swear upon the Koran.

There are extra-judicial oaths. The principal of which is the oath of allegiance, which has to be taken by M.P.s, ministers of the crown, clergymen, naturalised aliens, etc. See Coronation Oath; Perjury.

Oatlands. Estate near Weybridge, Surrey, England. Here Henry VIII built a magnificent palace, surrounded by a large hunting park. After the time of Charles I it fell into decay. The estate came later to the earl of Lincoln, who, about 1720, built another house in the park, on a different site. This was sold in

1794 to the duke of York, son of George III, who rebuilt the house, which had been damaged by fire in 1793. In 1857 the house became an hotel. The grounds contain a remarkable grotto, and a cemetery wherein the duchess of York buried her domestic pets.

Oats. Cultivated cereal. Varieties used in Great Britain belong mainly to the species *Avena sativa*,

Oats. Heads of *Avena sativa*

the origin of which is a matter of speculation. In Wales and in some of the Western Isles, varieties of *A. strigosa* are grown in regions of high rainfall and low fertility. Oats require a much cooler and wetter climate than barley and wheat, and so are extensively grown in N. and N.W. England and in Scotland, Wales, and N. Ireland. Oats prefer a less alkaline soil than barley, and too much lime in the soil is harmful to them. The greater portion of the British oat crop is spring-sown, but the use of autumn-sown varieties is increasing, especially in the E. and S.E. Cultivation of oats is similar to that of other cereals, but as they suffer more severely from spring drought and insect pests, early sowing is still more imperative.

Oats may be sown at almost any position in the crop rotation, but preferably on soils that are not too rich. As they need abundant moisture in early stages, any condition which leads to a check in growth in the spring should be avoided. Artificial fertilisers may be applied in a mixture immediately before sowing, at the rate of 1 cwt. sulphate of ammonia or 1 cwt. nitrate of lime, 3 cwt.

superphosphate, and 3 cwt. kainit per acre. Yield of grain varies greatly with the district, but averages 40-60 bushels (15-22 cwt.) per acre, with about 25-30 cwt. straw. As oats are not taken to the same degree of ripeness as barley or wheat, this straw usually contains valuable nutriment for stock feeding.

In composition the true kernel of oats, *i.e.* the grain separated from the husk, is as rich in protein as wheat, but contains three to four times as much oil; this in conjunction with about 60 p.c. carbohydrates makes the oat grain a well balanced and safe food for livestock. Its feeding value is modified by the composition of the husk, which contains a high proportion, sometimes one-third by weight, of indigestible fibre. The proportion of husk to kernel varies, the best oats containing 20-23 p.c. husk, while inferior sorts often have over 30 p.c. Oats are used by human beings in the form of oatmeal, which is the kernel ground, and as flaked oats, which are the kernels crushed and sometimes partially cooked.

Oaxaca. Maritime state of S. Mexico, bounded S. by the Pacific Ocean. It is largely covered by the wooded spurs of the Sierra Madre. There are numerous small streams. Sugar, coffee, cotton, tobacco, and cocoa are cultivated, and cattle rearing is carried on. A rly. extends from the N. to the capital, Oaxaca; a second line in the E. crosses the isthmus of Tehuantepec to Puerto Mexico on the Gulf of Campeche. There is a fine highway from the capital to Matamoros. Area, 36,371 sq. m. Pop. 1,192,794.

Oaxaca. Capital of the state of Oaxaca, Mexico. It is about 100 m. N.W. of Tehuantepec. It contains a massive cathedral, an institute of arts and sciences, and a natural history museum. Jewelry, cotton goods, chocolate, and fibre are manufactured. Oaxaca has rly. and road communication with Mexico city. On Monte Alban, near by, and on other sites in the valley, are remains of ancient Mexican civilization. Pop. 29,306.

Ob or **OBI.** River of Asiatic Russia. It is formed by the union of the Biya and Katunya, in the W. Siberian region, in the little Altai range. It first flows N., next N.W. to its junction with the Irtysh below Samarovsk, then N., and below Salekhard, turns sharply E. and discharges into the gulf of Ob, an arm of the Arctic Ocean, 600 m. long and 60 m. broad. The length

of the Ob is 2,100 m. or (including the Irtysh) 2,500 m.

Obadiah. Minor prophet of the O.T. In the single chapter of his book his predictions include the complete ruin of Edom, and also the coming of the Day of the Lord.

Oban, Scotland. The town and harbour of this Argyllshire seaport

Oban. Mun. burgh, seaport, and watering-place of Argyllshire, Scotland. It is 62 m. directly N.W.

of Glasgow, but much farther by rly. and bus. A great tourist centre, it has a splendid harbour, protected by the island of Kerrera. There is a modern R.C. cathedral. Oban was made a burgh in 1811. Market day, Wed. Pop. 5,791.

Obbligato (Ital.). Instrumental accompaniment to a vocal or solo line in a musical composition. This is written out by the composer or arranger instead of being left to the discretion of the performer. Favourite examples have been scored for flute or cello in songs, while there is a harp obbligato to the bass aria Quoniam in Bach's Mass in B minor.

Obeah or **OBI.** West African term denoting a form of negro witchcraft practised in some W. Indian islands and the southern United States. The obeah-man or obeah-woman employs incantations, and charms such as bottles containing feathers, pebbles, plants, and rags, sometimes resorting to poison. *See* Fetishism; Juju; Magic; Voodoo.

Obelisk (Gr., spit for roasting). Tapering pillar-stone. In ancient Egypt it was usually a four sided monolith of pink sye-

nite, with a base-width one-tenth of its height, and a copper-sheathed pyramidal apex, and bore incised hieroglyphs upon each face. Obelisks stood in pairs before temple portals, indicative of sun-worship. This colossal type was introduced

Oban arms

by Senusert I (XIIth dynasty). One remains at Heliopolis (Jer. 43); others, once there, are now in New York and London. One of Hatshepsut's at Karnak still stands. The tallest extant, 105½ ft., is in Rome; Paris has one of Rameses II from Luxor. One brought in 1815 from Philae to Kingston Lacy, Dorset, assisted Champollion to decipher the hieroglyphs. *See* Cleopatra's Needles; Heliopolis; Karnak; Manishtusu; Pylon; Shalmaneser.

Oberammergau. Alpine village in Upper Bavaria, Germany. In the Ammer valley, 45 m. by rly. S.S.W. of Munich, it is 2,800 ft. high. It is world-famous for its Passion Play (*q.v.*), held since 1634, at roughly ten-year intervals, in fulfilment of a vow made by the inhabitants of the village during a plague. The performances were cancelled during the First Great War, and again during the Nazi period, after which some of the

Oberammergau, Bavaria. Stage and crucifixion scene of the Passion Play

actors had to undergo denazification trials. Previously playing in front of the fine rococo church (1736-42), the actors, in ordinary life farmers and wood-carvers, secured in 1830 a large open-air scene seating 5,000 spectators under cover. A 40-ft. sandstone Crucifixion group, gift of Louis II in 1871, and the neighbouring Benedictine monastery of Ettal, are other attractions of the place, which lies in a region of winter sports. Pop. 2,341.

Oberhausen. Industrial town of Germany. It is situated near the N. bank of the Rhine, 44 m. by rly. N. of Cologne, and, although founded only in 1845 and with urban rights since 1875, it was a highly important industrial centre, with some of the greatest iron and steel works of the Ruhr area. Almost linked with Essen in the E., and Duisburg in the W., it was at the heart of the heavy industry of the Ruhr, and as such, was almost wiped out by the bombing attacks of the Second Great War. In spite of its condition, its pop. in 1946 was still 174,096.

Oberlin, JEAN FRÉDÉRIC (1740-1826). Alsatian pastor and philanthropist. Born Aug. 31, 1740, at Strasbourg, he studied at the university, and in 1767 became pastor of Waldbach, on the borders of Alsace-Lorraine. Here he built school-houses, introduced improved methods of agriculture, laboured devotedly to improve the well-being of the people, and preached a mystical piety. Awarded the medal of the legion of honour, 1819, he died June 1, 1826.

Oberon (Fr. *Auberon*, Ger. *Alberich*, ruler of the elves). King of the fairies. He appears as king in the Charlemagne romance of Huon of Bordeaux, and as the dwarf, Alberich, of the Nibelungenlied, long before he was anglicised by Shakespeare in *A Midsummer Night's Dream* (q.v.).

Oberon. One of the four satellites of the planet Uranus. Discovered by Herschel in 1787, it is fourth in order of distance from the planet. It is probably about 600 m. in diameter and revolves in its orbit, which is 729,000 m. across, in just over 13 days 11 hours. Like other satellites, its orbital plane is remarkable in being inclined at 82° to the ecliptic.

Oberon, MERLE (b. 1911). British film actress. Estelle Merle O'Brien Thompson was born Feb. 19, 1911, in Tasmania, and educated at Bombay and Calcutta. After appearing in cabaret at the Café de Paris, London, she met Alexander Korda (to whom she was married, 1939-45) and was in his first film, *Wedding Rehearsal*, 1933, then played Anne Boleyn in *The Private Life of Henry VIII*. An exotic appearance gave her distinction in many films, e.g. *The Scarlet Pimpernel*, 1935; *The Dark Angel*, 1936; *Wuthering Heights*, 1939; *Forever and a Day*, 1943; *Temptation*, 1947.

Merle Oberon,
British actress

Obesity. Excessive deposit of fat in the body. Corpulence, or general overgrowth of fat in the body, results from some disorder of nutrition, probably due to excessive absorption of the fat-producing constituents of food, to incomplete combustion of fat in the tissues, or to retention of fluid in the tissues. Some persons remain thin in spite of being large eaters, and others put on weight though they take food sparingly. Heredity is a marked factor. Excessive obesity leads to shortness of breath, interference with the action of the heart, and difficulty in walking. Corpulent persons should avoid taking too much food, and particularly should reduce those articles of diet which contain much starch or sugar. Several diets and treatments have been advocated for lessening obesity. See Diet.

Obey, ANDRÉ (b. 1892). French writer. Born at Douai, May 8, 1892, he was educated there and at Lille university, and after serving in the First Great War lived in Paris, where he became a critic. A novel, *Le Joueur de Triangle*, 1928, was awarded the Théophraste Renaudot prize. Obey founded his reputation as a dramatist with *Noé*, 1931 (produced, as *Noah*, at the New Theatre, London, 1935), and *Le Viol de Lucrèce*, 1931. Other plays included *La Bataille de la Marne*, 1932 (Brioux prize); an adaptation of Shakespeare's *Richard III*, 1933; *Loire*, 1933; *Don Juan*, 1936.

Obiter Dictum (Lat., said by the way). Legal phrase denoting an opinion expressed incidentally by a judge in the course of his judgement, which is not an in-

tegral part of the judgement, i.e. is not necessary for the decision of the case. Though it may be valuable, owing to the learning of the judge who pronounces it, a dictum which is merely obiter is not binding in any other court of the same or inferior jurisdiction. See also Birrell, Augustine.

Object. In grammar, a word, phrase, or clause used substantively in immediate dependence on a verb, as denoting that on or toward which its action is directed. As an example, in the sentence "I killed him," him is the object of the verb killed. In optics the object glass is the lens or system of lenses, also known as the objective, placed at the end of a telescope or microscope nearest the object being examined. In philosophy, object is the antithesis of subject, and denotes the totality of external phenomena observed by the individual.

In military phraseology, an object is any prominent feature of landscape which can be used as an aiming point, or as zero point in compiling a visual range card for field artillery. In this sense, object is distinct from objective, which describes any position the capture of which is the aim of a military operation.

Object teaching is a method of instruction in which illustrative objects are employed, e.g. as in a kindergarten. The object ball in billiards, pyramids, etc., is the ball which is designed to be hit by the cue ball, i.e. the ball which is being directly aimed at. In medicine, object blindness is a condition in which objects may be seen distinctly, but are of no significance to the mind. In astronomy, object metal is the principal mirror of a reflecting telescope.

Oblates (Lat. *oblatus*, offered, part. of *offerre*, to offer). Word used in various monastic senses. Originally oblates were children brought to the monastery by their parents and dedicated to the religious life. Later they were lay brothers. Still later, they were associate members, sometimes known as confratres or tertiaries, who observed a simple rule of life, and devoted themselves and their fortunes to the service of the community. Henry VI of England was a confrater of the abbey of S. Edmundsbury. In the R.C. Church, the title oblates has been assumed by congregations of priests devoted to preaching, conducting missions, and education, and the female congregations devoted to high school teaching.

Obligation. Term used in English law. It describes any act or instrument whereby a person, called in England the obligor, is bound by law to do or refrain from doing something. The person in whose favour the obligation runs is called the obligee.

Obock OR **OBOK.** Port on the Red Sea, in French Somaliland. Situated on the N. shore of the Bay of Tadjoura, opposite Jibuti (q.v.), it was acquired by France in 1856, officially annexed in 1862, but not occupied until 1884. Formerly it was an independent sultanate.

Oboe. Italian form, and that most commonly used, of the name of the double reed musical instrument, the hautboy (q.v.).

Obolensky, ALEXANDER, PRINCE (d. 1940). Russian-born English footballer. From Trent College he went to Brasenose College, Oxford, and made his mark as a Rugby wing three-quarter. Naturalised in 1936, he became an English international player of exceptional speed and skill. A pilot officer in the R.A.F., he was killed at the age of 24 on March 29, 1940, when his machine crashed in East Anglia.

Obolus. Ancient Greek silver coin alloyed with copper. Six obols made a drachma (q.v.). An obol, traditionally placed in the mouth of a Greek corpse, was Charon's fare for rowing the soul of the departed across the Styx.

Obregon, ALVARO (1880-1928). Mexican president. Born in Sonora, he became the leader of a troop which helped to suppress Orozco's rebellion. In 1913 he joined Carranza, defeating Huerta's forces at Santa Rosa. In command of the Constitutional army, he won several battles and entered Mexico City, Aug. 15, 1914. During this period of unrest Obregon had made himself Mexico's most prominent soldier. After Carranza's murder a provisional president was elected, but he soon gave way to Obregon, who, the most powerful man in the country, was elected without opposition in 1920. He remained in office until 1924, when Calles became president for four years. Obregon was chosen to succeed him, but before he could assume office he was murdered, July 17, 1928.

Obrenovitch. Former ruling dynasty of Serbia. Its founder was Milosh Obrenovitch (1780-1860), elected prince of Serbia in 1817. The Obrenovitch rule saw the emergence of Serbia as a kingdom independent of Turkish

domination. For nearly a century there was rivalry between the dynasty and that of Karageorgevitch, and the last Obrenovitch to occupy the throne, Alexander I (1876-1903), was assassinated with his queen, June 11, 1903. See Karageorgevitch.

O'Brien, KATE (b. 1897). Irish writer. Born at Limerick, Dec. 1897, she was educated at a convent there and at Dublin university. She made her reputation as a novelist by the finely written *Without My Cloak*, 1931, which gained the Hawthornden and the James Tait Black prizes. There followed *Mary Lavelle*, 1936; *Farewell Spain* (travel), 1937; *Pray for the Wanderer*, 1938; *English Diaries and Journals*, 1943; *That Lady*, 1946. Her plays included *Distinguished Villa* (Aldwych Theatre, London, 1926), *Ante Room* (Queen's, 1936), and *The Last of Summer* (Phoenix, 1944).

O'Brien, WILLIAM (1852-1928). Irish journalist and politician. Born Oct. 2, 1852, he became a

William O'Brien,
Irish journalist
M.P.

reporter for the *Cork Daily Herald*. In 1880 he founded *United Ireland*, a paper of advanced Nationalist views. Indefatigable in working for the Irish cause, he was nine times prosecuted for political offences and spent over two years in prison. Nationalist M.P., 1883-95, and member of the land conference of 1903, he advocated a policy of conciliation and toleration, founding the All-for-Ireland league. M.P. for Cork city from 1910, he withdrew from parliament at the general election in 1918. He died Feb. 25, 1928.

O'Brien, WILLIAM SMITH (1803-64). Irish politician. Born Oct. 17, 1803, son of a landowner in Clare, and educated at Harrow and Cambridge, he became M.P. for Ennis in 1828, and represented Limerick, 1835-48. In 1843 he joined O'Connell's association for the repeal of the Union, but seceded in 1846 and founded the Irish Confederation, with a more violent policy. When the Habeas

Corpus Act was suspended in Ireland in 1848, O'Brien attempted an armed rising which failed. He was sentenced to death, but the penalty was commuted to transportation to Tasmania. His health giving way, he was released in 1854. He died June 18, 1864.

Obscenity. In English law, conduct or publications tending to corrupt or deprave public morals. Such conduct or publication is an offence. Anybody publicly exhibiting obscene books or drawings is liable to a fine of 40s. or 14 days in prison. By the Indecent Advertisement Act, 1889, it is an offence, punishable by a fine of 40s. or a month's imprisonment, to exhibit, or affix, or offer to any member of the public in a public place any obscene picture or printed or written matter. An obscene libel is indictable at common law. To send through the post a package bearing on the outside obscene words, designs, etc., is an offence under the Post Office Act, 1908, and is punishable by a fine not exceeding £10, or imprisonment with or without hard labour not exceeding 12 months.

Obscurantist. Term applied derisively at the revival of learning to the clerical opponents of learning and education. It appears to have gained currency through the publication in 1515 by Ulrich von Hutten's circle of the *Epistolae obscurorum virorum*, a satire on certain monks of Cologne who wished to destroy all Rabbinical literature. Obscurantism is a term often applied by their opponents to the supporters of traditional beliefs in theology and politics, especially to those who desire the suppression of what they consider subversive teaching, such as modernism, republicanism, free thought, etc.

Observation. The discriminate and retentive mental registration of things and happenings in the outer world. The faculty of accurate observation is a preliminary condition of science, and is of incalculable value in life. When the faculty of observation is highly developed, there are three elements or components which may be distinguished, though they are in reality inextricably intertwined.

(a) There is sensory acuteness—an eye to see. Many children have an almost photographically precise

observational power, which is partly an inborn gift, like a musical ear, but is also an expression of wide interests and inquisitiveness, and of a mind whose receptivity has not been dulled by the trivial, or overloaded with a plethora of pictures. Even when there is no special gift of observing, the average capacity is usually there, and both educational experiment and everyday experience show that this can be greatly developed. Early practice in recognizing flowers and birds, or analysing the jetsam of the shore and the stones by the wayside, educates the power of precise seeing.

(b) Inseparable from sensory acuteness is the power of clear-cut perception, i.e. of building-up lucid mental pictures of what is seen. This implies discrimination, knowing what one is looking at, the introduction of a more definite intellectual element into the sensory photograph. As a matter of fact, perceptions continually blend with our sensations. In perception we see the different parts of a thing making up a related whole, and we see this whole in relation to other parts of the picture. The very beginning of a knowledge of the outer world is a process of selecting from our thought-stream certain groups of vivid sense-impressions, and if we are to go on to know, the process of selecting must continue.

(c) There is a third element in observation of a still higher order, namely, conceptual. The mind sees what it brings with it, the power of seeing. Those who have thought over things, who have, as we say, ideas about them, who have what we may call preconceptions, are likely to see more than the thoughtless and the ignorant—provided always that they keep an open mind as well as an open eye, and do not allow prejudice or desire to influence their vision. The botanist who knows the flora of a countryside is likely to see much more than the casual observer; his store of concepts exerts an influence on his perceptual faculty.

In the mind of the scientific observer, even when precision becomes habitual, there is always caution; he is more aware than others of the possibilities of error; he has learned how easy it is to see what one wishes to see. He has ever before him the test of scientific knowledge, that it must be verifiable by competent observers in similar circumstances.

Observation Post. Military term denoting a position from which it is possible to direct, and to

observe the effect of, artillery fire. In modern warfare the guns frequently fire from positions from which the target is invisible. An observation post from which the target can be seen must then be established well in front of the gun line. The artillery commander is usually the observing officer and passes back his orders to the gun position officer by means of radio or telephone. With very long-range artillery, the observation post may be in an aircraft flying near the target. Artillery is directed in this way only when the target is fixed or slow moving; an observation post is seldom necessary for anti-tank artillery, for this type of weapon is usually sited and fired individually. In anti-aircraft artillery, the predictor, an automatic ranging device, performs the functions of an observation post. (*See Artillery.*) The term observation post is also applied to the sighting positions manned by the Royal Observer Corps.

Observatory. Building constructed and used for the purpose of making astronomical, meteorological, or other kindred scientific

Observatory. The University of London observatory at Mill Hill, Middlesex

observations. Astronomical observatories were founded in China very early, and one was built at Alexandria about 200 B.C.

The most important parts of an astronomical observatory are the cupolas or domes which house the telescopes. Sliding shutters are so arranged that the telescopes can be pointed from the horizon to the zenith, while by the rotation of the whole dome on rollers it is possible to observe any point in the heavens. Where the telescopes are of great size the floors of the domes are made to rise by hydraulic power, to enable the observer to accommodate himself to the changing height of the instrument. A separate building contains the transit instrument, which, together with a sidereal clock, forms an

indispensable part of the equipment of an observatory. The transit instrument is mounted to point N. and S., so that it can move only up and down, and it is used for observing the time a star crosses the meridian of the instrument. This observation gives the means of checking the sidereal clock, since the time the star should be on the meridian is known from other considerations.

The Royal Observatory was founded at Greenwich in 1675 and transferred to Herstmonceux Castle, Sussex, in 1948. At Edinburgh and Cape Town also there are royal observatories. Other national observatories are in Paris, Pulkovo (near Leningrad), Madrid, Tokyo, and Washington. They provide a time service and the observations for a nautical almanac for their respective countries, and engage in long-term astronomical research—Oxford, Cambridge, and other universities have observatories for post-graduate work. Another type is exemplified by the institutions at Lick, Mount Wilson, and Mount Palomar, Calif., the Lowell observatory, Ariz., and the David

Dunlap observatory at Toronto. Large telescopes are maintained in the S. hemisphere at Arequipa, Peru; Bloemfontein and Pretoria, S. Africa; and Canberra, Australia. These were set up because parts of the sky are not visible from older observatories in the N. (*See Astronomy.*)

Meteorology; Telescope.

A. Hunter, F.R.S., F.R.A.S.

Observer. Term formerly used in the R.A.F. to designate any member of an air crew other than the pilot or gunner. Observers were trained at the air observers' school in map reading, the use of navigational instruments, bombing, artillery direction, and reconnaissance. During the Second Great War the increasing complication of duties led to the trade being abolished, and the observer's functions were divided between two men designated navigator and signaller. The navigator's badge

Observer. Badge worn on left breast

consists of a half wing attached to a laurel circle enclosing the letter N; the signaller's badge is similar except that the letter is S. Either is worn on the left breast.

Observer, THE. Oldest Sunday newspaper in London. It was founded in 1794 by William Clement and was controlled by the Clement family until 1870, when it was purchased by Julius Beer, whose wife owned The Sunday Times (*q.v.*). In 1905 The Observer was purchased by Northcliffe, who appointed J. L. Garvin (*q.v.*) editor. In 1907 it passed to Viscount Astor, who retained Garvin. Under the latter The Observer made rapid progress, his political articles achieving great popularity. Garvin retired in 1942. The paper is now owned by a trust, its directors including Viscount Astor. Later editors were Ivor Brown (1942-48) and David Astor. Its dramatic, literary, and music criticism is distinguished, and by 1948 had helped the paper to reach a circulation of 350,000.

Observer Corps, ROYAL. Civilian corps formed in 1925 to track and report movements of enemy aircraft flying over Great Britain. The corps is not part of the R.A.F., but during war it comes under R.A.F. control and forms part of the A.A. defence. Personnel are recruited on a part-time basis from the district in which their posts are situated. On mobilisation a certain number of observers are employed on a full-time paid basis, and the part-time members perform 24 hours' duty weekly. Observers are trained in recognition, plotting, and height-finding. The commandant is responsible to the c.-in.-c., Fighter Command, for operational work, and to the Air ministry for administration and equipment. Officers wear a uniform of R.A.F. blue with black braid on the cuff and distinctive cap-badge; other ranks wear blue battle dress with the corps badge on the left breast.

The corps took up its duties 10 days before the outbreak of the Second Great War, and quickly proved a vital factor in Great Britain's A.A. defence. For outstanding work in the battle of Britain it was given the designation Royal. It guided back to their base R.A.F. bombers crippled in operations over enemy territory, and played a vital part in the defeat of the flying bomb.

Many women were enrolled in the corps, which eventually exceeded 50,000. After the end

of the war in Europe the corps was disbanded, but on Jan. 1, 1947, it was re-formed on a peace-time basis; a nucleus of permanent officers was established and 28,500 spare-time volunteers were enrolled. See Air Defence.

Obsession (Lat. *sedeo*, sit). A fixed idea. Such notions haunt the mind and are often thought to be either panaceas or sources of every kind of evil; e.g. alcohol in the minds of some total abstainers. Serious obsessions are compulsive in that they persist even when the patient realizes that they are abnormal and does his best to drive them from his mind. Obsessions may be regarded as disguised symbols for repressed memories to which a great deal of guilt is attached. As the guilt is felt to be unbearable it is kept out of consciousness altogether, or is eased by being changed into anxiety, while the disguised form of the forgotten behaviour must be one which does not arouse the idea of guilt in the conscious mind. See Neurosis.

Obsidian. Name given to an acid lava akin to rhyolite. The rock is glassy from rapid cooling and is extremely hard and brittle. Usually black or dark grey, it may be occasionally brown or green. It is found in many volcanic regions, and because of its hardness and ability to take a high polish, it was used by primitive man for making his arrow and spear heads, also for knives, ornaments, and mirrors.

Obstetrics (Lat. *obstetrix*, midwife). Art of helping women in pregnancy and childbirth. In the human species the duration of normal labour with a first child is usually from 20 to 24 hours, but after the first delivery the process is easier, and does not usually last more than about 12 hours.

As soon as the child is born, its eyes should be wiped clean with a little cotton wool soaked in a silver or penicillin solution to combat infection possibly acquired in the vagina. The cord which still connects the child with the placenta should be ligatured and divided after pulsation has ceased. The child usually breathes or cries freely; if not, steps should be taken to promote respiration by holding at the heels and slapping. The period following the birth of the child is known as the puerperium, during which the mother's diet should be light and nourishing. She should remain in bed several days. The child should be put to the breast within 12 hours after delivery.

O'Casey, SEAN (b. 1884). An Irish dramatist. Shaun O'Cathasaigh was born of working-

Sean O'Casey,
Irish dramatist

class parents in Dublin, March 31, 1884, and at 14 worked as a builder's labourer, later on the railway. The first play he wrote was *The Shadow of a Gunman*, 1922 (produced at the Court Theatre, London, 1927); most famous were *Junio* and the *Paycock* (Royalty Theatre, 1925, and Hawthornden prize, 1926), and *The Plough* and the *Stars*, 1926. These masterpieces gave vivid pictures of Dublin life during "the troubles." In *The Silver Tassie*, 1929, and *Within the Gates*, 1933, he turned to expressionism, but with *Red Roses for Me*, 1942, he was back in the Dublin slums. *Oak Leaves and Lavender*, 1946, was placed in S. England during the battle of Britain. Autobiographical volumes include *I Knock at the Door* 1939; *Pictures in the Hallway*, 1942; *Drums under the Window*, 1945; *Inishfallen Fare Thee Well*, 1949.

Occasional Conformity. Practice by which many nonconformists avoided the penalties and disabilities of the Test and Corporation Acts. These two Acts forbade anyone to hold any public office unless he took the sacrament according to C. of E. rites. Many nonconformist office holders did this now and again. Attempts in Anne's reign to stop this practice were successful when in 1711 the Occasional Conformity Act made it illegal. In 1718 the Act was repealed and the practice renewed. From 1727 to 1829 it was made unnecessary by an annual Act of Indemnity. See Toleration.

Occasionalism. System of philosophy founded by Arnold Geulinx (1624-69), professor of philosophy at the universities of Louvain and Leyden successively. It denies any reciprocal action of body and soul, comparing them to two watches, which, although separate and independent, are in agreement. God is the intermediary. On the occasion of a bodily process, a definite association arises in the soul, and on the occasion of an idea in the soul, the body moves—as the result of divine agency.

Occiput. Back of the human head, the occipital bone forming

the greater part of it. The lower part of the bone carries two knuckles or condyles, which are jointed to the highest vertebra of the neck. Nodding movements of the head are carried out at these joints.

Occeleve, THOMAS (1368–c. 1450). English poet. A clerk in the privy seal office, he is chiefly remembered for his *Male Regle* and *De Regimine Principum*, two long moral poems of greater historical than literary value. Occeleve continually pays tribute to Chaucer and Gower, to whom he is considered far inferior.

Occultation. In astronomy, the eclipse of a star or planet by the moon or another planet. Occultation observations are now chiefly used for determining the moon's exact position. *See* Eclipse.

Occultism (Lat. *occultas*, hidden). Term applied to any theories, doctrines, arts, or practices dealing with alleged phenomena not explained by physical science, but attributed to supernatural or non-natural causes. *See* Magic; Necromancy; Spiritualism; Theosophy; Witchcraft.

Occupancy. A term used in English law. It means taking possession of something, whether land or chattels, which belonged to nobody. It was recognized as a legal title to land only in the case of tenancies *pur autre vie* (old Fr., for the life of another). When an estate was granted to A for the life of B, and A died before B, anybody who could first go in and occupy the land might keep it for the rest of the life of B. But by the Wills Act, 1833, this has been altered. A can now devise the estate by his will; or, if he does not so deal with it, it passes with the rest of his property to his executor or administrator.

Occupational Diseases. Diseases that occur more frequently among those in certain occupations than among the general population. Officially termed industrial diseases, they include (a) dust disease of the lung (pneumokoniosis), which may be anthracosis from coal-dust (miners' phthisis); siderosis from fine metallic particles in mines; asbestosis associated with the manufacture of asbestos goods; silicosis from quartz, sand, slate, etc.; (b) poisoning caused by breathing in vapour (mercury, lead, aniline, benzene); (c) anthrax, a microbic disease associated with sorting wool, hair, hides, skins, etc.; (d) poisoning caused by the absorption through the skin of lead or aniline; (e) dermatitis, inflam-

mation of the skin through many irritants; (f) chronic ulceration of the skin; (g) skin cancer, associated principally with contact with pitch, tar, bitumen, paraffin, etc.; (h) physical defects and abnormalities, e.g. nystagmus (miners' blindness), housemaids' knee.

Measures taken against industrial diseases include regulations for air purification, water spraying to lay dust, and protective clothing; factory inspection; the work of the industrial health research board; and publicity. The Factory Act, 1937, and the Lead Paint (Protection against Poisoning) Act, 1926, empower the minister of Labour to make regulations for the protection of employees, and require employers to report cases of lead poisoning, anthrax, skin cancer, and chrome ulceration. The incidence of the first has been much reduced, but skin cancer and dermatitis have increased, principally because of unsuspected dangers associated with new processes and substances.

Ocean (Gr. *okeanos*, stream encircling earth's disk). Name applied to the great sheet of seawater which covers about 70 p.c. of the surface of the earth. The descriptive science of the ocean is termed oceanography, which includes research on the ocean boundaries and the form of the sea floor, the physics and chemistry of seawater, the types of ocean currents, and the many aspects of marine biology and marine sedimentation. The foundations of oceanography were laid by the worldwide investigations of the Challenger Expedition (*q.v.*), 1872–76. Since 1920 knowledge of the shape of the sea floor has been greatly increased by the introduction of echo sounding, which reveals more clearly than the laborious method of sounding with line and lead the uneven nature of the sea bottom. A series of soundings taken from the shore line out to sea shows that the sea floor slopes gently downwards out to distances of 10 to 150 m. At the seaward limit of this slope, termed the continental shelf, the depth may average from 50 to 100 fathoms. From the edge of the continental shelf the sea bottom drops more rapidly to the floor of the oceans, with gradients reaching as much as 1 in 10 and averaging 1 in 15. This region actually represents the flank of the continent and is known as the continental slope. The floor of the oceans is much less regular and is characterised by two large-scale features: the presence of great

circular or oval depressions called ocean basins, and of elongate elevations or ridges generally with steep sides. The larger ridges tend to run parallel to the continental coasts, thus dividing the oceans into elongate troughs. This ridge and basin structure is a striking feature of the bottom of the Atlantic and Indian oceans and of the W. part of the Pacific ocean.

The temp. of seawater is measured in degrees centigrade and ranges in the open ocean from -2° C. to 30° C. The oceans derive a great part of their heat from the absorption of radiation from the sun and sky; they lose heat by back radiation from the surface, by convection of heat to the atmosphere, and by surface evaporation. The oceans are great reservoirs of heat and in conveying it to the atmosphere exercise a moderating influence on climate. Surface temps. are naturally highest in the equatorial regions and coldest at the poles. In the depths of the oceans the temps. are uniformly low and range from -1° C to 4° C. The dissolved salts in seawater are principally chlorides and sulphates of sodium, magnesium, potassium, and calcium, the salt content or salinity being expressed as the number of grams of salt contained in one kg. of seawater, for which the symbol ‰ is used. In the open ocean the surface salinity is generally between 33‰ and 37‰ . The surface salinity is chiefly determined by three processes; evaporation from the sea increases it, precipitation decreases it, processes of mixing continually change it.

Ocean currents are of three types: (1) those that are related to the differences of density in the sea; (2) those set in motion by wind; (3) tidal currents and currents associated with internal waves. The great ocean currents such as the Gulf Stream and the equatorial currents belong to the first type. Winds can drive water in a definite direction if they blow prevailingly from one quarter, but the oscillating currents generated by the tides are of little direct importance in the oceanic circulation. The velocity and direction of currents can be measured either directly, e.g. by current meters, or indirectly by observations on the distribution of salinity or density. *See* Fish; Marine Biological Research; Marine Sedimentation; Plankton.

Ocean Falls, Town of British Columbia, Canada. 350 m. N.W. of Vancouver, to which it is con-

A. Diagram illustrating results of deep-sea research. B. Some methods used in exploring the depths of the North Atlantic. 1. Instrument for obtaining samples of water for analysis. 2. Hensen's deep-sea net. 3. Trawl. 4. Instrument for taking soundings, temperature, and samples of ocean bed. 5. Globigerina ooze with

6. globigerina and, 7. radiolarians, all highly magnified. C. Fish with luminous head organs found at a depth of from 1,000 to 2,000 fathoms. D. Fish with highly sensitive organs of touch. E. Fish with distending stomach, capable of holding prey larger than itself. F. Fish with entirely phosphorescent head

OCEAN: METHODS AND RESULTS OF SCIENTIFIC EXPLORATION

nected by steamship services. It has important pulp and paper works. Pop. 2,700.

Oceania. Collective name for the groups of islands in the South Seas, or South and Central Pacific Ocean.

Physically, Oceania includes five groups of islands: (1) the Australasian Festoon stretches from New Guinea to Macquarie Island, and includes the Papuan Islands, New Caledonia, and New Guinea; the natural features of this group are cognate with those of Australia; the Loyalty Islands are coralline, the Solomons volcanic. (2) The Micronesian Festoon extends from the Caroline Islands to the Friendly Islands and includes Fiji and Samoa; the islands rest on the outskirts of a submarine platform connected with Australia. (3) The Pelew-Ladrone Festoon includes the Volcano Islands and forms a link along the E. of the China Sea between Japan and the East Indies; it belongs to Asia. (4) The Central Pacific Chain rests on an isolated submarine platform, and includes Hawaii and the Ocean Islands. (5) The S. Pacific Chain includes Easter Island on the E., the Society, Cook, and Phoenix Islands, and Fanning Island.

The islands of Oceania are also loosely grouped in relation to their inhabitants into Melanesia, Micronesia, and Polynesia (*q.v.*); this grouping ignores New Guinea, New Zealand, and New Caledonia, as well as the relation of the islands to the relief of the floor of the Pacific. Politically, Oceania is divided among Great Britain, France, the U.S.A., and Chile.

British Oceania includes the crown colony of Fiji, islands administered by the high commissioner for the Western Pacific; Cook and other islands annexed to New Zealand, including Auckland and Chatham Islands; Norfolk Island, which is Australian; as well as the former German islands now administered under mandate by Australia, New Zealand, or Great Britain.

French Oceania comprises New Caledonia and its dependencies, Tahiti, and the rest of the Society Islands, The Marquesas, Low Archipelago, the Leeward Islands, and the Gambier group. The New Hebrides are jointly British and French. Hawaii is the chief U.S. group in Oceania; Guam, Tutuila, and other Samoan islets also are American. Easter Island belongs to Chile. Between the Great Wars Japan administered the former German islands north of the

equator, the Pelews, Ladrone, Carolines, and Marshalls.

Ocean Island. Island in the Pacific Ocean. Situated just S. of the equator, $0^{\circ} 52' S.$, $169^{\circ} 35' E.$, it is 6 m. in circumference. First occupied by Great Britain in 1901, it was annexed to the Gilbert and Ellice Islands colony in 1916 and became headquarters of the administration of the W. Pacific. The island is rich in high-grade phosphates; the right to work them was purchased by the British phosphates commissioners in 1921. Normally the island has a pop. of some 2,500. In the Second Great War it was occupied by the Japanese, who deported the population, but surrendered to an Australian landing party in Oct., 1945.

Oceanography. This subject is fully treated under Ocean (*q.v.*).

Oceanus. In Greek mythology, the god of the ocean, the father of all things. The name was also given to the river supposed to encircle the whole earth, which was regarded as being flat. At a later date, the term Oceanus was applied generally to the greater seas outside the Mediterranean.

Ocelot (*Felis pardalis*). Species

Ocelot. Specimen of the South American tiger-cat
W. S. Derridge, F.Z.S.

of wild cat occurring in tropical America. It has tawny fur, beautifully marked, and is usually nearly 3 ft. long. It spends much of its time in the trees, where it preys upon birds and small mammals. In captivity it is morose and savage. Pron. O-selo.

Ochil Hills. Range of hills in Scotland, principally in Perthshire, but also occupying parts of the cos. of Stirling, Clackmannan, Kinross, and Fife. They trend 25 m. N.E. from Bridge of Allan to the Firth of Tay, and enclose many valleys and glens of great beauty. The principal summits are Ben Cleuch (2,363 ft.) and King's Seat (2,111 ft.). Coal and other minerals abound.

Ochre. Iron ore consisting essentially of iron oxide more or less hydrated and mixed with clay. The colour varies from yellow to red according to the degree of oxidation—ferrous oxide (FeO) yellow, ferric oxide (Fe_2O_3) red. The strength and purity of colour depend upon the proportion and

quality of the non-ferrous constituents. Deposits of this type occur in many parts of the world, but those of sufficiently pure colour and in quantity great enough for commercial development and use in the paint industry are comparatively few. France, South Africa, and India supply ochres of high quality. See Pigments.

Ochrida, OKHRIDA, OR OHRID. Lake and town of Yugoslavia. The lake lies in the S. of Serbia, high among the mts., on the Albanian frontier: 18 m. long by 8 m. in breadth, it has a depth of almost 1,000 ft., and is drained by the Black Drin. The ancient Via Egnatia connected the N. end of the lake with the Adriatic coast by the Skumbi valley. The town, situated on the N.E. shore of the lake, is the seat of a Greek Orthodox bishop. It is connected by the modern equivalent of the Via Egnatia with Monastir. After the evacuation of Monastir in 1915, the Serbians retreated through Ochrida, which was finally recovered by the Allies in Sept., 1918. Pop. est. 10,000.

Ochs, ADOLPH SIMON (1858–1935). American newspaper proprietor. Born at Cincinnati, March 12, 1858, he spent most of his early days in subsidiary newspaper posts at Knoxville, Tenn. In 1878 he became owner of The Chattanooga Times, in the same state, and in 1896 acquired The New York

Times (*q.v.*), the circulation of which had dropped to 9,000, and which was losing \$1,000 a day. By his skilful management he raised it to the highest position in the daily press of the U.S.A. From 1900 he was a director of the Associated Press. By a gift of \$500,000 he made possible the preparation and publication of the Dictionary of American Biography. He died while on a visit to Chattanooga, April 8, 1935.

Ochterlony, SIR DAVID (1758–1825). British soldier. Born at Boston, U.S.A., Feb. 12, 1758, he

Sir D. Ochterlony,
British soldier
After Davis

entered the service of the E. India Co. in 1777. He won distinction by his defence of Delhi in 1804 and by his successful leadership during the war with the Gurkhas, when the ruler of

Nepal was forced to terms. As resident at Rajputana, his action in 1825 led to a rupture with the governor-general, Lord Amherst, and he resigned. He died almost at once at Meerut, July 15, 1825. He was made a baronet in 1816.

Ockham OR **OCCAM**, **WILLIAM** OF (d. 1349). English Franciscan monk and schoolman, known as the Invincible Doctor. He was born at Ockham, in Surrey, and died at Munich. His defence of Nominalism against Realism gained him the name of Prince of Nominalists. One of his chief merits is that he restored induction to its proper place as the handmaid of deduction.

O'Connell, **DANIEL CHARLES** (c. 1745-1833). Irish soldier. Born in co. Kerry, he entered the French army in 1770. With the Irish brigade he served in the Seven Years' War, in Mauritius, and at the siege of Gibraltar, winning the title of count and the rank of colonel. In 1792 he took the side of the Bourbons, and, having sought refuge in London, he proposed to form an Irish brigade to serve against the republic. The scheme, however, failed. He returned to France after the peace of Amiens in 1802, and died there, July 9, 1833. The Liberator (*v.i.*) was his nephew.

O'Connell, **DANIEL** (1775-1847). Irish leader, known as the Liberator. Born near Cahirciveen, co.

Kerry, Aug. 6, 1775, he was educated at the English Colleges at St. Omer and Douai, studied at Lincoln's Inn 1794-96, and was called to the Irish bar, 1798.

Daniel O'Connell
Irish leader
After T. Garrick

Starting in 1803 on his long struggle for Catholic emancipation, by 1808 he had become the virtual leader of the movement in Ireland. In 1815 he killed in a duel a Dublin tradesman named D'Esterre, and in 1820 a duel with Sir Robert Peel, arranged to take place in Ostend, was prevented by O'Connell's arrest and his being bound over in London.

In 1823 O'Connell founded the Catholic Association (*q.v.*), and in 1826 the Order of Liberator, which was to prevent secret societies, feuds, and riots, protect the rights of franchise holders, and generally unite Irishmen of all classes for the common good.

His election as M.P. for co. Clare, 1828, and his refusal to take

the oath, had their influence in the passage of the Catholic Relief Bill, 1829, and, re-elected unopposed, he took his seat in Feb., 1830. Before long he started his struggle for the repeal of the legislative union, and came to a working arrangement with the Whigs in 1835. The Repeal Association was founded in 1840, the powerful Nation newspaper in 1842, and in 1843 came monster meetings all over Ireland. A great gathering fixed for Clontarf was proclaimed, and O'Connell was arrested and tried for sedition. He was fined £2,000, and sentenced to one year's imprisonment, but the sentence was reversed by the house of lords, 1844. He supported Lord John Russell's ministry, 1846; but ill-health and increasing party dissensions in Ireland clouded his genius. He died at Genoa, May 15, 1847. See Catholic Emancipation; Ireland: History. Consult Lives, R. Dunlop, 1900; D. Gwynn, 1929.

O'Connor, **FEARGUS EDWARD** (1794-1855). Irish agitator and Chartist. The son of Roger O'Connor, one of the United Irishmen, he was born July 18, 1794, educated at Trinity College, Dublin, and entered parliament in 1832 as M.P. for co. Cork. In 1835

Feargus O'Connor
Irish agitator

he was unseated on petition, and transferred his activities to England, where he became leader of the Chartist movement, advocating extreme measures in his speeches, and in a paper, The Northern Star, which he established at Leeds. In 1846 he was imprisoned for seditious libel. In 1847 he was elected M.P. for Nottingham, and in 1848 he presided over the great Chartist demonstration at Kennington. Found to be insane in 1852, he died in London, Aug. 30, 1855. See Chartism.

O'Connor, **THOMAS POWER** (1848-1929). Irish journalist and politician. Born at Athlone, Oct. 5, 1848, he was educated there and at Queen's College, Galway, and became a journalist in Dublin in 1867. In 1870 he joined the Daily Telegraph. He founded and was first editor of the Star, the Sun, the Weekly Sun, M.A.P., and T.P.'s Weekly (later revived as T.P.'s and Cassell's Weekly). A fluent and picturesque writer, he was the author of a brilliant life of Lord Beaconsfield and studies of

the Parnell movement, and Gladstone's house of commons. In 1880 "Tay Pay" was returned as

Nationalist M.P. for Galway. Elected in the same interest in 1885 for both Galway and the Scotland division of Liverpool, he chose the latter constituency, and represented

it until his death. He earned great popularity in the house of commons, of which he became the Father, and in 1924 was made a privy councillor. He was president of the United Irish League of Great Britain from 1896, and in 1917 became chairman of the British board of film censors. He died Nov. 18, 1929. His Memoirs of an Old Parliamentarian appeared in 1929. Consult Life, Hamilton Fyfe, 1934.

Ocotlan. The principal port of the lake of Chapala, Mexico, a body of water 70 m. by 20 m. Constant trainloads of cereals, fruit, and vegetables travel to Mexico City and even to the U.S.A. from this busy port. Pop. 15,000.

Octane Number. A means of rating spark-ignition engine fuels in terms of their ignition quality. When the compression ratio of such an engine is increased, all other factors being constant, the power output will also increase until detonation (knock) commences, when it will decline. Normal paraffin hydrocarbons are poor in this respect, aromatic hydrocarbons good, and certain isoparaffins and alcohols excellent. A poor fuel can be improved by adding very small quantities of substances such as tetra-ethyl lead. To rate fuels in order of their ability to resist detonation the characteristics of the fuel under test are compared with those of mixtures of normal heptane (a very poor fuel) and iso-octane (2:2:4-trimethylpentane, a high-grade fuel). The percentage of iso-octane in the mixture which has the same characteristics as the fuel under test is said to be the octane number of that fuel. On this basis the highest number should be 100 and no fuel should be rated above iso-octane, but such fuels are known. These are compared with mixtures of *n*-heptane + 4 ml. tetra-ethyl lead and iso-octane + 4 ml. tetra-ethyl lead, when a maximum rating of 120 can be reached.

Although the octane number is supposed to be a measure of the knock characteristics of a fuel, other factors sometimes enter, e.g. engine design and adjustment, load, and atmospheric conditions. Persistent detonation in aero engines, because of much more severe operating conditions, cannot be tolerated, and therefore for rating aviation spirits the details of the testing method are altered so as to take those special factors into account.

Octans. Constellation which surrounds the Southern Pole. It is of considerable extent, but its stars are faint. The Southern Pole star, Sigma Octantis, is between fifth and sixth magnitude. *See* Constellation.

Octave (Lat. *octavus*, eighth). Word used in several senses. (1) In music, an interval of 8 scale steps, and the second note of the harmonic series. It is a perfect consonance, and the upper note of an octave bears the same alphabetical name as the lower note. An organ stop of 4-ft. pitch on the manuals and of 8-ft. pitch on the pedals is called an octave. (*See* Organ). (2) In literature, the first two quatrains of the sonnet, written on the same pair of rhymes, are termed the octave, and the word is applied less technically to any stanza of eight lines. (3) In ecclesiastical terminology, an octave is the eighth day after a festival, the feast day itself being reckoned as the first.

Octave Flute. Small flute sounding an octave higher than the ordinary flute. *See* Piccolo.

Octavia (d. 11 B.C.). Sister of Octavian, afterwards the Roman emperor Augustus, and wife, first of G. Marcellus, by whom she was the mother of Marcus Marcellus (q.v.), and secondly of Antony, the triumvir. The desertion of Octavia by Antony for Cleopatra was an important factor in causing the war between Octavian and Antony.

Octavo (Lat. *octo*, eight). Term used in connexion with the size of books. An octavo or 8vo volume is one in which the sheets have been cut into eight. The size of a page is usually about 5 ins. by 9½ ins., but royal octavo is somewhat larger. *See* Book.

Octet (Lat. *octo*, eight). Musical composition for eight performers. The term is sometimes applied to a double quartet, but belongs properly to a work in which the eight instruments are treated independently. Schubert wrote a famous one for clarinet, horn, and bassoon, with two violins, viola,

violinello, and double bass. Gade, Svendsen, and Mendelssohn wrote octets for strings alone, and Beethoven left one, called Grand Octuor (Op. 103), for two oboes, two clarinets, two horns, and two bassoons. An orchestra of eight performers is also called an octet.

October (Lat. *octo*, eight). Eighth month of the old Roman and tenth of the Christian calendar. For short periods it was given different names in honour of Roman emperors, e.g. Domitianus, in honour of Domitian; and Invictus (unconquered), in allusion to the athletic prowess of Commodus. It was also called temporarily Faustinus, in honour of Faustina, wife of the emperor Antoninus Pius. The Anglo-Saxons called it Winter-fylleth (winter full moon), from the supposed beginning of winter with the October full moon. *See* Calendar.

October Revolution. Name given to the Petrograd revolution which was the first stage in the Bolshevik rising in Russia. By western calculations the outbreak occurred on Nov. 7, 1917, but in Russia the Greek Orthodox calendar was in force, which is 13 days behind the rest of Europe; Russians therefore regard Oct. 25, 1917, as the date of the Revolution, and accordingly speak of the October Revolution to distinguish it from that of March, 1917.

Octodon. Generic name of a rodent mammal known as the degu. In form it is like a common rat, is about 8 ins. in length, and has yellowish-brown fur, mottled with black, on the upper parts, and yellowish below. It occurs in Chile and Peru. The family Octodontidae includes about 27 genera.

Octopus (Gr. and Lat. *octo*, eight; *pous*, foot). Genus of cephalopodous (head-footed) molluscs. There are numerous species, the common octopus (*O. vulgaris*) occurring round the S. British coasts. It has a rounded bag-like body, with a large head bearing eight long "arms" or tentacles thickly studded with suckers. It is greyish brown in colour, with numerous tubercles on the skin, and it can alter its hue considerably to suit its surroundings. When irritated, it becomes dark, and large tubercles rise on the skin. The mouth is provided with a horny beak resembling a parrot's. The round eyes are prominent and staring.

The octopus lurks in holes in the rocks and crawls on the sea bottom in search of the crustaceans and bivalves on which it chiefly feeds; but it can swim backwards by forcibly

expelling water from its siphon. The female produces about 50,000 eggs in the season. These resemble grains of rice, and are attached in stalked clusters to rocks and stones.

Octopus vulgaris creeping forward; top, turned on its side, showing tentacles studded with suckers

On the Mediterranean shores and in the Channel Islands the octopus is dried and used for food. *See* Animal colour plate; Cephalopoda.

Octroi (Fr. *octroyer*, to grant). French name for a local tax, one in the nature of an import duty. Roman in origin, the custom took root in France, but its modern use dates from the 12th century. Many cities and towns obtained from the king the right to levy octroi duties and retained it until the Revolution. They were paid on goods sold in their markets or entering their town. A percentage of the duties was usually paid to the national treasury, and they were let out to farmers. The octroi was abolished in 1791, but restored in 1798 to Paris, and later to other cities, under conditions which have been several times revised. It was abolished in Belgium in 1860, and in Great Britain never found favour, though the coal and wine dues which were levied at one time on goods entering the port of London were a kind of octroi. *See* Customs; Taxation.

Odde. Village and tourist resort of Norway. It stands at the S. end of the Sor fjord, an arm of the Hardanger fjord, and is the terminus of the routes from Telemarken and Stavanger fjord.

Odd Fellows, ORDERS OF. Fraternal, benevolent, and sickness insurance friendly societies. Founded early in the 18th century, when mentioned by Defoe, the earliest known lodge was existing in London in 1745. Members

were assisted in sickness or poverty from lodge funds. In the latter half of the century the order was proscribed as seditious, but in 1813 a great revival took place at Manchester, where the Independent Order of Odd Fellows, Manchester Unity Friendly Society, the largest order, was founded. This speedily absorbed most of the minor lodges in Great Britain, and in 1819 spread to the U.S.A. Daughter organizations exist in most civilised countries. See Friendly Societies.

Ode (Gr., chant). In its literal sense, any poem written to be sung to musical accompaniment. The Greek ode developed along two wholly different lines. As the subjective expression of personal emotion it was moulded by Alcaeus, Anacreon, and Sappho into the lyrical stanzas still known by their names, adapted with exquisite perfection to the genius of the Latin language by Catullus and Horace, and reproduced in an infinite variety of graceful shapes by lyricists of every cultured race. As the ritual hymn solemnly chanted by the chorus at festivals primarily religious in intention, the ode was developed by Stesichorus, Simonides, and Bacchylides, and brought to its finest perfection of structure and fiery splendour by Pindar (*q.v.*).

It is to the stately choric composition that the word ode is now more generally applied. But while many poets, impressed by the majesty and the concurrent exuberance of the Pindaric ode, have sought to capture its spirit and acclimatise it in their own country, few have had the perception and the learning necessary to analyse its composition and master the intricate detail of its technical structure. The earliest Stesichorean ode, with its division into strophe, antistrophe, and epode, has been reproduced with considerable success by several poets, Congreve, Gray, and Matthew Arnold among them. The true Pindaric ode still remains a thing apart, unmatched. Meanwhile, though his odes were not Pindaric at all, Cowley in his so-called Pindaric Odes created a literary form, now generally called the irregular ode,

very suitable to the English genius, and put to triumphant use by Milton, Dryden, Wordsworth, Tennyson, and by Francis Thompson in *The Hound of Heaven*.

Odenathus. Prince of Palmyra, and husband of Zenobia. After the defeat of the army of the Roman emperor Valerian by the Persians, he organized a successful resistance, and in a series of campaigns from 262 to 264 restored Mesopotamia to Rome, and carried his arms as far as Ctesiphon. For these services he was rewarded by Valerian's successor Gallienus with the title of Imperator, but was shortly after assassinated. His widow, Zenobia, then reigned as queen.

Ödenburg. Alternative name for the Hungarian town more usually called Sopron (*q.v.*).

Odense (*Odins-ø*, i.e. Odin's Island). City of Denmark, capital of Fünen, and third largest city in the kingdom. Situated near the mouth of the river Odense, and connected with Odense Fjord by a ship canal, it has a good harbour, a castle, museum, technical schools,

ft. in alt. and has an observation tower. Odenwald is a populous region and there are castles and hamlets in the valleys. The Bergstrasse on the W. Odenwald is rich in legend and is mentioned in the *Nibelungenlied* (*q.v.*).

Oder. A river of Eastern Europe. It rises near Kozlau in Moravia, Czecho-Slovakia, and flows through Silesia and Pomerania to the Baltic Sea at the Stettiner Haff. In Silesia it occupies a valley between the Bohemian and Polish plateaux. It has been canalised to a depth of at least 5 ft. for 480 m. from the mouth of Swinemünde to Ratibor, although boats of 400 tons stop at Kosel, the river port for the mining region of Upper Silesia. The chief tributary is the Warta (Warthe), which with its affluent the Netze drains the W. plains of Poland. Canals connect with the Elbe and Vistula. Length, 550 m.

When in the last stages of the Second Great War the Russians pressed beyond the Vistula, the Oder formed the last natural obstacle before Berlin, and by Jan. 24, 1945, Koniev's troops had reached the upper Oder and captured Oppeln. He then surrounded and cut off Breslau (Wrocław) and Glogau on the opposite bank and deployed his troops on the Neisse. Farther north, Zhukov reached Küstrin (Kistrzin), 60 m. from Berlin, by Feb. 7, and set about extending his line to the N. Küstrin fell March 12, Altdamm, on the Oder estuary, March 20, and by the end of March the E. bank of the river was in Russian hands.

In the S., Breslau and Glogau held out, and the Russians paused; but on April 16 they crossed the Oder. Frankfurt-on-Oder was captured April 23, the same day as the Russians entered Berlin. (See Russo-German Campaigns.)

At the Potsdam Conference (*q.v.*) it was agreed that Poland should occupy E. Germany up to the Oder and Neisse rivers pending the settlement of her claims against Germany in the peace treaty.

Odessa. City and seaport of Ukraine S.S.R., the chief business centre. It is situated 25 m. N. of the mouth of the Dniester, 90 m. S.W. of Kherson, and is the terminus of the south-western rly. It contained a large cathedral, university, and observatory.

Odense, Denmark. House where Hans Christian Andersen was born

seminary, and a park. The cathedral of S. Knud, founded 1086, is one of the finest Gothic edifices in Denmark; the church of Our Lady dates from the 12th century. It is a fine town, with a modern town hall. Cloth, gloves, chemicals, and tobacco are manufactured, and grain, eggs, butter, bacon and other dairy produce, and hides exported. Odense was the meeting-place of several diets and councils, and the birthplace of Hans Andersen, whose house has been converted into a museum. Pop. 92,436. See Andersen, H. C.

Odenwald. Wooded mt. region in the *Land of Hesse*, W. Germany. It lies between the Neckar and the Main. Composed of basalt, gneiss, granite, and syenite, the mts. have many valleys and ravines. The highest peak, the Katzenbuckel, is 2,057

Odessa arms

Odessa, Ukraine. The broad stairs which descend from the main boulevard to the harbour

Odessa (the Roman *Istrianorum portus*) was founded by Catherine II in 1795 on the shores of the Black Sea, in order to provide the country with one ice-free winter port. Cut off from communication with the Allies when Turkey closed the Dardanelles, in 1914, Odessa was bombarded by the Turkish fleet on several occasions. It was occupied from the land side by the Germans on March 12, 1918, and was taken by the Bolsheviks in 1920. The Soviet government made it an open port.

Heavily bombed by German aircraft in June, 1941, Odessa was encircled by a German-Rumanian army by Aug. 23. The defenders held out until Oct. 16, when the city was evacuated after all buildings and industrial plants had been destroyed. On April 10, 1944, the 3rd Ukrainian army captured the city from the Germans and Rumanians, the Russian Black Sea fleet and air force preventing any large scale evacuation by sea. Pop. (pre-war), 604,223. *See* Ukraine.

Odets, CLIFFORD (b. 1906). American dramatist. Born at Philadelphia, July 18, 1906, and educated in New York, he became an actor in repertory during 1923-28, also playing in Theatre Guild productions. His first play, *Waiting for Lefty*, established his reputation as a playwright, and he achieved popular success with *Awake and Sing*, 1935 (produced at the Arts Theatre, London, in 1942). Other plays included *Paradise Lost*, 1936; *Golden Boy*, 1937; *Clash by Night*, 1942; and *Rocket to the Moon* (produced at S. Martin's Theatre, London, in 1948).

Odeum. Latin form of the Greek *Odeion*, name for a building devoted to musical performances. Such buildings used to be found in many Greek cities, but the most famous were the odeum of Pericles S.E. of the Acropolis at Athens,

and that built by Herodes Atticus at the foot of the Acropolis in Athens A.D. 160. The Athenian odeum held about 8,000 people, and its ruins still stand.

Odiham. Village of Hants, England. It is 8 m. E. of Basingstoke, and has a Gothic church containing interesting brasses, also some ancient houses. The ruins of Odiham Castle, 1 m. N.W., date from the 14th century.

Odin. In Norse mythology, the greatest of the gods. He is the Anglo-Saxon Woden and German Wotan, and his name, cognate with Lat. *vates*, a seer, probably means 'frenzied'. Creator of the world and of mankind, he is called All-father. Contrasted with the rough peasants' god Thor, he was worshipped specially by the noble families, many of whom claimed descent from him, and was a patron of culture, inventor of runes, and god of wisdom, poetry, magic, and prophecy. In various forms, but chiefly as a one-eyed old man wrapped in a mantle, he wandered through the earth. As a war god Odin was lord of the Valkyries, and those who fell in battle, regarded as sacrificed to him, were received by him into Valhalla. *See* Mimir; Valkyrie; Wednesday; Mythology; Ymir.

Odo (c. 1036-97). A Norman prelate. A half-brother of William the Conqueror, who made him bishop of Bayeux in 1049, he fought at the battle of Hastings and was made earl of Kent in 1067. After William's death he led a rebellion against William Rufus, and escaped to Normandy, dying on the first crusade, at Palermo, in Feb., 1097. *See* Bayeux Tapestry.

Odoacer, ODOVAKAR, OR OTTO-KAR (c. 435-493). German soldier. A prince of one of the tribes on the Danube, he entered the Roman army and became one of the imperial bodyguard. Putting himself at the head of a revolt of German mercenaries, he compelled the emperor Romulus Augustulus to abdicate, was raised to the rank of patrician by Zeno, emperor of the East, and became ruler of the West, nominally as a representative of Zeno, but in reality independent. Zeno, jealous of his success, persuaded Theodoric the Ostrogoth to attack him. Defeated on the Isonthius (Isonzo), 489, and at Verona, 490, Odoacer was be-

sieged in Ravenna for three years. Theodoric at first treated Odoacer well and accepted him as joint ruler, but on the pretext that he was scheming to gain possession of the whole of Italy, treacherously slew him, March 5, 493.

Odometer (Gr. *hodos*, way; *metron*, measure). Instrument to register the number of revolutions of a carriage wheel to which it is attached, and thus the distance travelled by the vehicle. It consists of two wheels of the same diameter placed face to face and turning freely on a common axis. The edge of one wheel is cut into 100 teeth and that of the other into 99 teeth, an endless screw working in the notches of the wheels. When the screw has turned 100 times, the wheel with 99 teeth will have gained one notch on the other, which gain is registered on an index. Modern speedometers incorporate two odometers; one to record mileage run from zero to 99,999 m., the other the mileage of individual journeys.

Odontoglossum. Large genus of orchids of the family Orchidaceae, natives of tropical America. They have pseudo-bulbs and sword-shaped, more or less leathery leaves. The large, showy flowers are in handsome sprays. They are distinguished by the column being long and narrow, and by the base of the lip being parallel with the face of the column. *See* Orchid, colour plate; Orchis.

Odontolite. Fossilised bone or tooth, tinged blue by impregnation with phosphate of iron, or green by copper. It is known as bone turquoise or occidental turquoise, and when cut *en cabochon* resembles the true gem; but it is softer, appears grey by candle-light, and bleaches in alcohol.

Odontology (Gr. *odous*, tooth; *logos*, science). Science relating to the teeth. *See* Dentistry; Teeth.

Odontornithes (Gr. *odont-*, tooth; *ornith-*, bird) or **ODONTOGNATHAE** (Gr. *odont-*, tooth; *gnathos*, jaw). Name given to a group of fossil toothed birds. Though living birds have no teeth, there are embryonic evidences of their descent from toothed birds. Fossil remains of the latter, which include the orders Hesperornithiformes and Ichthyornithiformes, are found in Cretaceous and Jurassic beds. The teeth of these fossil birds closely resemble those of present-day reptiles. *See* illus. in facing page.

O'Duffy, EORN (1892-1944). Irish politician. Born in Monaghan, Oct. 30, 1892, he joined the

I.R.A. in 1917, becoming chief of staff. When the Irish Free State was created in 1922 he was given the rank of general and appointed head of its forces and chief of the civic guard. Dismissed by Eamon De Valera in 1933, he formed his own force, the national guard, adopting the blue shirt as its uniform. Declared illegal, this body fused with Cumann na nGaedheal to form the Fine Gael party, of which O'Duffy was president. In 1934 the latter withdrew his bluishirts from the coalition to form the National Corporate party. He led an Irish brigade which fought on the side of Gen. Franco in the Spanish Civil War; and published *The Crusade in Spain*, 1938. He died Nov. 30, 1944.

O'Dwyer, Sir Michael Francis (1864-1940). British administrator. Born April 28, 1864, he was educated at S. Stanislaus college, Tullamore, and Balliol College, Oxford, and entered the Indian civil service in 1885. Appointed lieut.-gov. of the Punjab in 1913, he was concerned with Gen. Dyer in the suppression of the Amritsar riots in 1919, and was relieved of his position. It was made clear, in the course of a libel action he brought in 1930 against a member of the Indian government, that O'Dwyer was in no way responsible for Dyer's action in opening fire on the rioters, although he supported the general against critics. He was made K.C.S.I. in 1913. On March 13, 1940, he was shot dead by an Indian at a meeting at the Central Hall, Westminster. He was the author of *India as I Knew It*, 1925.

Odontornithes. Reconstruction of skeleton of *Ichthyornis victor*, one-sixteenth actual size. See facing p.

Odysseus. Greek form of the name of the hero called in Latin Ulixes and later Ulysses. In Greek legend, he was king of Ithaca, one of the leading heroes on the Greek side in the Trojan war, and the type of a resourceful and versatile leader. Many tales were told of the ways in which he distinguished himself by his prowess and wisdom.

His wanderings after the fall of Troy are the theme of the *Odyssey*. Having reached Ithaca, he found that during his absence his wife Penelopë had been plagued by about 100 suitors for her hand, who had quartered themselves in the royal palace. Disguised as a beggar, and making himself known only to his son Telemachus and a trusty swineherd, Odysseus made his way to the palace, and was discovered by an old nurse. Penelopë, apprised of the return of her husband, agreed to give her hand to the suitor who should be able to bend the great bow of Odysseus. He alone succeeded, and then turned its arrows upon the suitors, whom he slew with the help of Athena and Telemachus. Odysseus was unwittingly slain by Telegonus, his son by Circe.

Odyssey. Greek epic poem attributed to Homer. It is in 24 books dealing with the 10 years' wanderings of Odysseus on his way home after the fall of Troy. After relating Odysseus's many surprising adventures, such as those with the lotus-eaters, the Cyclops, the enchantress Circe, the shades of the dead, the Sirens, the nymph Calypso, the Phaeacians, and other strange happenings, the poem ends with his return to his native Ithaca. Whatever may be the secret of its authorship, the *Odyssey* is a rich storehouse of folklore and romance, and one of the world's masterpieces of literature. There are verse translations by Pope and others, and a prose version by T. E. Lawrence, 1935. See Homer.

Oecumenical. Term of Greek origin, meaning "of the whole world." It is applied to a Church council of bishops from all countries, or one whose decisions have been accepted by the universal Church. See Council.

Oedema (Gr., a swelling). Effusion of fluid into the tissues of the body. See Dropsy.

Oedipus (Gr., swollen foot). In Greek legend, son of Laius, king of Thebes, and Jocasta. An oracle having declared that Laius would perish at the hands of a son born of Jocasta, Oedipus, at birth, was exposed on the mountains with his

feet pierced. There he was found by shepherds, by whom he was taken to Polybus, king of Corinth, who brought up Oedipus as his own son. The Delphic oracle declared that he would slay his father. Oedipus happened to meet Laius, and in a sudden brawl killed him without suspecting his identity.

At this time the Sphinx (*q.v.*) was plaguing Thebes by devouring everyone who failed to answer a riddle. The Thebans proclaimed that the kingdom and the hand of Jocasta would be the reward of the man who rid the country of the monster. Oedipus essayed the adventure, and when the Sphinx propounded the riddle: What is the being which has four feet, two feet, and three feet; but its feet vary, and when it has most feet it is weakest? Oedipus answered that it was man. Enraged at receiving the correct answer, the monster threw herself from the rock. Oedipus thus became king of Thebes, and unwittingly married his own mother, by whom he had children. A plague then ravaged the land, and an oracle having declared that the plague would continue until the slayer of Laius was found, Oedipus set himself to discover the murderer, and learnt the truth from the prophet Tiresias. Jocasta hanged herself, and Oedipus put out his own eyes. The story is handled in the two great plays by Sophocles. Among later dramatists, Corneille, Dryden, Voltaire, and Jean Cocteau have treated the subject. See *Antigonë*; Sophocles.

Oedipus Colonus (Oedipus at Colonus). Tragedy by Sophocles. It takes its name from the grove of the Eumenides at Colonus, near Athens, whither the blind and weary Oedipus is led by his daughter Antigonë, there to find relief from his bodily and mental sufferings in death. One of the most beautiful of the choric passages contains a glorification of the poet's home. The date of the play is unknown.

Oedipus Complex. Neurosis of boyhood. Freud (*q.v.*) claimed to have discovered its existence, naming it after the Greek king Oedipus, who, in ignorance of his parentage, slew his father and married his mother. The corresponding condition in girls is called an Electra complex. Until the age of four to six the love of most children is directed primarily towards their mothers; it is a possessive and greedy emotion, which gives rise to much jealousy, sometimes unconscious, against those who interfere with the

child's demands upon the mother, e.g. a younger child or the father. At about five many girls tend to transfer their love to their fathers, so that both girls and boys are then devoted to the parent of the opposite sex.

Freud stated that this emotion was largely sexual, though in general unconsciously. In normal children, however, the Oedipus situation is outgrown without psychological damage, since the child learns to repress much of his emotional life. If, however, a child is treated leniently by the parent of the opposite sex and disciplined sternly by the parent of the same sex, considerable psychological difficulties may be caused. The normal growth of the love instincts will tend to be impeded and sexual development may be abnormal. Even if he escapes actual neuroses or perversions, the child's emotional relationships may well be unsatisfactory for the rest of his life. According to Freud, the common feature in all persons suffering from an unresolved Oedipus complex is that in the field of personal relations both the conduct and the emotions are dictated by unconscious urges arising from past relations with their parents. *See* Fixation; Homosexuality; Neurosis; Perversion. *Consult* Introductory Lectures on Psychoanalysis, S. Freud, 1917; *The Psychoanalytic Study of the Family*, Flugel, 1921.

Oedipus Tyrannus (King Oedipus). Tragedy by Sophocles, produced 430 or 429 B.C. Although generally regarded as the greatest of his plays, it failed to obtain the prize at the Dionysia. It is one of the few ancient tragedies which have been successfully produced before a modern audience in spite of the somewhat repellent plot. Two noteworthy productions, one with Martin Harvey in the main rôle (1912) and one with Laurence Olivier (1945) have reached the London stage as Oedipus Rex. Olivier used a translation by Yeats. *See* Oedipus.

Oehlenschläger, ADAM GOTTLIEB (1779-1850). Danish poet. He was born Nov. 14, 1779, at Vesterbro, Copenhagen.

A. Oehlenschläger, Danish poet

became an actor, but literature absorbed him, and he fell under the influence of Goethe and other German thinkers. In 1803 he

published his first volume of poems, which included the play entitled *The Eve of St. John*. More books followed, that winning most fame being his drama *Aladdin*. In 1805 the Danish government allowed him a pension which enabled him to spend some years in Halle, Berlin, Weimar, Dresden, Paris, and Switzerland. In 1810 he was appointed professor of aesthetics at the university of Copenhagen, and continued to produce works remarkable for their wealth of invention and wide range. He died Jan. 20, 1850.

Oenanthe Ether (Gr. through Lat., *oenanthe*, wine blossom). The essential oil which gives characteristic aroma to wine; called oil of cognac. *See* Wine.

Oenone. In Greek legend, a nymph of Mt. Ida, and wife of Paris, who deserted her for Helen. Her story is the subject of a poem by Tennyson. *See* Paris.

Oerlikon. Alternative spelling of the name Orlikon. *See* Orlikon Gun.

Oersted, HANS CHRISTIAN (1777-1851). A Danish physicist. Born at Rudkjøbing, Langeland, and educated at Copenhagen he won a travelling scholarship and visited Holland and Germany and Paris. In 1820 he made the discovery, on which his fame rests, that a magnetic needle was deflected by a current in a wire passing below or over it, the initial discovery in electro-magnetism. For the discovery he was awarded the Copley medal of the Royal Society. The oersted, the unit of magnetic field strength, is named after him. *See* Ampère.

Oesel, ŌSEL, EZEL, OR SAARE MAA. Island of Estonia S.S.R. Situated at the entrance to the Gulf of Riga, the island has an irregular coastline and a low, level surface. Farming, horse-rearing, and fishing are the principal occupations of the inhabitants. Karesare (formerly Arensburg) is the chief town. Area, 1,010 sq. m. In 1939 it was fortified, and made a Soviet military base, as a result of the assistance pact signed in Sept. between Estonia and Russia. Evacuated during the Russian retreat of 1941, it was not cleared of Germans until Nov. 24, 1944.

Oesophagus or GULLET. Muscular tube, lined internally with

mucous membrane, which leads from the pharynx or posterior part of the mouth to the stomach. About nine inches in length, it passes down behind the trachea and in front of the spinal vertebrae. In the chest it lies behind the left bronchus and the pericardium.

Obstruction of the oesophagus may result from swallowing a foreign body, such as a fish bone, coin, false teeth, etc. The obstruction can sometimes be withdrawn by a suitable oesophageal forceps, but when firmly impacted there is serious risk of injury to the walls of the oesophagus in the process of extraction, and the case should be promptly referred to a surgeon.

Oestrogen. Term for one of a group of hormones which produce female characteristics. Oestradiol, the typical oestrogen, which is formed by the ovary and the ovarian follicles, plays the dominant rôle in the sexual cycle of female animals. It is sometimes used in medicine in the treatment of symptoms of the menopause. Stilboestrol, a synthetic oestrogenic compound, has been used successfully to control the symptoms in cancer of the prostate. *See* Endocrinology.

Oestrous Cycle. Biological term. In almost all animals reproduction takes place at certain seasons. When the cooperation of male and female individuals is necessary a mechanism has been evolved which ensures that sperms shall meet eggs at a time when these are ready for fertilisation. Eggs are produced by the ovary of the female mammal at regular intervals. The timing of this ovulation is controlled by the products of the pituitary gland (*q.v.*). The cyclicity imposed upon the ovary by this gland produces a resulting cyclicity in the appearance of a hormone called oestrin. Oestrin enlarges the uterus in, for instance, the mouse, and also brings about a change in the epithelium lining the vagina. At ovulation, therefore, the uterus is ready for the egg to develop in, and the vagina is ready for the intromission of the male organ during mating. In fact the female will allow copulation only at this time. If the female mouse is not mated, she will reach this state every four days or so; this cycle of recurring sexual desire is the oestrous cycle. It is seen in a bewildering number of variations among dogs, cows, sheep, pigs, ferrets, etc.; the period varies from a few days to over a year. If a female mouse becomes pregnant, her cycle stops; so it does if she is mated to a

Hans C. Oersted, Danish physicist

sterile male, when she is said to exhibit pseudo-pregnancy. At the end of pseudo-pregnancy she will experience a pseudo-birth, and may produce milk. The cycle will then recommence. In primates such as man, the normal cycle is of this latter kind, involving a regular pseudo-pregnancy terminated each time by a recurring pseudo-birth, or menstruation (*q.v.*). Ovulation in the primate takes place midway between menstruations. It will be seen that the oestrus, or coming on heat, of a bitch or a cow, though it may be accompanied by some bleeding, has no resemblance to the menstruation of a woman.

Oeuvre, *L'*. French newspaper. Originally founded in 1904 as a weekly journal by U. Gohier and G. Téry, it was transformed into a daily in 1915, when it attracted many famous contributors. Radical in outlook, it remained independent and critical, and during 1925-39 grew enormously in importance, eventually achieving a circulation of 500,000. It was one of the first French papers to be abolished by the Germans in 1940. After the liberation of France it did not appear again.

O'Faolain, SEAN (b. 1900). Irish writer. He was born Feb. 22, 1900, and educated at the national university of Ireland and at Harvard. He was lecturer in English at Boston College, U.S.A., in 1929, and at St. Mary's College, Strawberry Hill, Middlesex, 1929-33. He made his reputation as a writer of vividly imaginative prose with *Midsummer Night Madness*, 1932, and *A Nest of Simple Folk*, 1933. He wrote biographies of Constance Markievicz, 1934; Wolfe Tone, 1937; De Valera, 1939; O'Neill, 1942; and books on Ireland: *An Irish Journey*, 1940, and *The Story of Ireland*, 1943.

Offa (d. 796). King of Mercia. A member of the royal house, he obtained the crown by crushing a rival in 757. Mercia was then in a shrunken and distressed condition, but Offa restored its fortunes, victorious battles bringing Kent, Essex, and probably Sussex and other regions under his rule, and driving the Welsh farther into their own land. He was overlord of all England except Northumbria, created a third English archbishopric, that of Lichfield, and founded St. Albans Abbey.

Offal. Word, literally off-fall, meaning refuse or waste. It is used for feeding stuffs for animals, these consisting of husks, etc., which are stripped from grain. It is also used for those parts of the

bull, sheep, or pig which are not eaten as food by human beings. In both Great Wars, however, an extended use was given to the word, and it included those parts of the animal which were eaten, but were not rationed, such as liver, kidney, sweetbread, etc.

Offaly. County of Eire. In the prov. of Leinster, its area is 771 sq. m. The Shannon forms its W. boundary, and it is also watered by the Brosna, Barrow, and small streams. It includes much bogland, including part of the bog of Allen, and the surface is flat, except in the S., where are the Slieve Bloom Mts. Oats, barley, and potatoes are the main crops; cattle, sheep, and pigs are reared. The Eire state rlys. and the Grand Canal afford transport facilities. Tullamore is the co. town; other towns are Birr or Parsonstown, Clara, Banagher, and Edenderry. Remains of the most extensive group of ancient religious establishments in Eire are at Clonmacnoise, on the Shannon. In early times the co. formed part of the kingdom of Offaly, and afterwards part of Glenmallery. In 1556 it was named King's co., in honour of Philip II of Spain, husband of Mary I, but in 1921 reverted to the earlier name. Pop. 52,029.

Offa's Dyke. Ancient entrenchment built by Offa, king of Mercia, about 779, to form a barrier between England and Wales. It extended from the mouth of the Dee to the Wye, close to its confluence with the Severn, and passed through the counties of Flint, Denbigh, Montgomery, Shropshire, Radnor, Hereford, and Gloucester. It was preceded by Watt's dyke, some little distance to the E., and both probably utilised prehistoric entrenchments. It consisted of an earthen rampart and a ditch.

Offenbach. Town of Hesse, Germany. It is on the Main, 5 m. E. of Frankfurt, and has been known since 977, having been an industrial and trading centre since the 17th century settlement of French refugees. It has a fine Renaissance castle, built 1559-78, several 18th century churches, and a town hall dating from 1775. It was long known as the centre of the German leather goods industry. After the Second Great War it was in the American zone of occupation. Pop. (1939) 81,329.

Offenbach, JACQUES (1819-80). French composer. His real name was Lévy, and he was born at Offenbach-on-Main. June 21, 1819, son of the cantor of the Jewish synagogue at Cologne. In 1833 he

entered the Paris conservatoire, where he studied the 'cello; in 1837 he joined the Opéra-Comique orchestra, and began to write operettas. *Pépito*, 1853, attracted little attention, but *Les Deux Aveugles*, 1855, scored success. Offenbach took the Théâtre Comte, re-named it the Bouffes Parisiens, and produced there a succession of witty and sparkling light operas which for later generations conjured up the gaiety of the Second Empire. Of some 70 pieces for the stage, based mainly on the libretti of Meilhac and Halévy, the most famous are *Orphée aux Enfers*, 1858; *La Belle Hélène*, 1865; *La Vie Parisienne*, 1866; *La Grande Duchesse de Gêrolstein*, 1867; *Madame Favart*, 1878. His most ambitious effort, *Les Contes d'Hoffmann* (Tales of Hoffmann), was produced posthumously in 1881; in England it failed to achieve popularity until presented in 1910 at His Majesty's. Offenbach died Oct. 4, 1880.

J. Offenbach,
French composer

Offence. In law, the widest term used to describe breaches both of the criminal law and of regulations made for the public good, *e.g.* Public Health Acts. In England it is also used in a narrower sense, to describe an act which is not an indictable crime or misdemeanour, but is nevertheless punishable by fine, imprisonment, or other penalty, *e.g.* adulteration of food and drugs, selling short weight or measure, and breaches of town by-laws.

Offertory. Ecclesiastical term for that part of the Holy Communion service in which the alms and oblations of the congregation are offered, and oblation of the bread and wine is made at the altar by the officiating priest. It is also applied to the sentences read by the priest while the alms are being collected. In the Anglican Church these sentences have taken the place of the antiphon or anthem, called the offertory, which used to be said or sung while the people made their oblations. In early times the offerings included the bread and wine, as well as things needful for the maintenance of divine worship. The word offertory is loosely applied to all church collections; and to organ pieces suitable for playing while such collections are being made.

Office of War Information. This approximate equivalent in the U.S.A. of the British wartime Ministry of Information is referred to under Information.

Officer. A person serving in the army, the marines, navy, or air force on the terms of a commission granted by the sovereign. In a legal sense a military man is either an officer or a soldier, and the latter term embraces warrant officers (*q.v.*) and non-commissioned officers (*q.v.*). The symbol of commissioned rank is a sword, of which an officer is deprived when placed in arrest. On active service, for purposes of discipline, certain civilians who are permitted to accompany the army are graded so as to receive the treatment of officers, *e.g.* a newspaper correspondent would be dealt with in all respects as an officer, if holding a pass from the army commander—otherwise as a soldier. An officer who resigns his commission becomes again, in a legal sense, a civilian, but it is customary to address him in the rank he held on leaving the army, if this was captain or higher.

In peace-time, an officer usually wears plain clothes (called *muffi*) when out of his quarters and off duty. He receives his pay monthly in advance through an army agent, buys his own uniform, and is privileged to keep a soldier's servant. He must, if unmarried, live in quarters (*q.v.*) and dine in mess (*q.v.*). His pay is supplemented by various allowances, and by serving the required number of years he is entitled to retired pay or gratuity. An officer must retire at a fixed age according to rank, but he may be permitted to retire at any time after a certain period of service, on a pension, the latter varying according to the service. *See* Captain; Commission; General; Lieutenant; Major, etc.

Officer Cadet Training Unit. Organization established in the Second Great War for commissions in the army or R.A.F. Regiment. The course of infantry cadet training units lasted 2-4 months; several such units were maintained at home and overseas. The O.C.T.U. for the Royal Armoured Corps was at Sandhurst, where the course lasted 4-6 months. The R.A.F. Regiment O.C.T.U. was in the Isle of Man. Cadets attending an O.C.T.U. wore a white band round their caps and white tapes on the shoulder-straps of the tunic. After the Second Great War, O.C.T.U.s were abolished and cadets for commissions went

to Sandhurst, after a period of service in the ranks.

Officer's Friend. Name given to an officer who represents an accused brother officer at a court-martial. *See* Court Martial; Prisoner's Friend.

Officers' Training Corps. Former organization of the Territorial Army attached to universities and schools. In these corps cadets were trained for commissions in the special reserve. They were required to pass two examinations before being granted commissions. The officers were generally members of the staff of the university or school who held commissions in the T.A. Instruction included practical work and lectures on military subjects. During the Second Great War the O.T.C. was replaced by the junior and senior training corps, which perform the same functions. *See* Training Corps.

Official Receiver. The public official who manages the affairs of bankrupts, taking over their property, realizing the assets, and distributing the money to the creditors. England and Wales are divided into bankruptcy districts, each with a receiver appointed by the board of trade, while others are attached to the bankruptcy department of the high court of justice in London. A trustee appointed for a bankrupt's estate is under the supervision of the receiver. Official receivers perform similar duties in cases where public companies go into liquidation. They were first appointed under the Bankruptcy Act of 1883. *See* Bankruptcy.

Official Referee. Official of the English high court of justice. He is one of three subordinate judges, whose business it is to try cases, or hold inquiries involving long investigations into accounts, etc. They usually sit in London, but an official referee may hold inquiries elsewhere, if that is the more convenient course. An appeal lies from an official referee to the court of appeal.

Official Secrets Acts. Acts punishing spying and similar offences. The principal Act, passed 1911, and amended 1920 and 1939, makes it a felony punishable by 14 years' penal servitude for any person, for any purpose prejudicial to the safety of the state, to be in a prohibited place (*e.g.*, arsenal or dockyard), make a sketch or note of use to an enemy, or to obtain or communicate any secret code word, document, or information.

It is a misdemeanour punishable by two years' imprisonment if a person, through misadventure and without any purpose prejudicial to the state, communicates to any unauthorised person any document or information relating to a prohibited place, or which has been entrusted to him by a person holding office under the crown, or which he has obtained through himself holding office under the crown. Registration with the police is compulsory for every person carrying on the business of receiving postal packets for reward and forwarding them to the persons to whom they are addressed.

A chief officer of police, if he has reasonable ground for suspecting that the offence of spying has been committed, may, with the permission of the home secretary, authorise an officer to require any likely person to furnish information about the offence. Anyone who refuses is guilty of a misdemeanour. A person suspected of having committed, or attempted to commit, or being about to commit an offence may be arrested without a warrant; but no prosecution may be brought without the consent of the attorney-general, solicitor-general, or director of public prosecutions.

Offset. This method of printing is described under Lithography.

Off-side. Term used in various senses. (1) Of a horse or a vehicle, the side facing the centre of the road when it is obeying the rule of the road; *e.g.*, in Great Britain, where traffic keeps to the left, the off-side is the right, the left being called the near-side. (2) In cricket, the side of the field towards which the batsman's body is turned when he is taking the strike, *i.e.* on the bowler's left for a right-handed batsman and *vice versa*. The other side of the field is called the leg or on-side. (3) The off-side rules in football and hockey are described in the articles on those games.

Offag. Camp for officer prisoners of war in Germany during the Second Great War. The word is an abbreviation of *Offizierlager*, officers' camp.

O'Flaherty, LIAM (b. 1897). Irish writer. Born in the Isle of Aran, Aug. 28, 1897, and educated at Dublin university, he volunteered for the republican forces in 1913, but joined the British army at the outbreak of the First Great War. He returned to Eire in 1920, became a Communist, and went to London to devote himself to writing. Of his novels the best-

Liam O'Flaherty,
Irish writer

lected edition of his brilliant short stories in 1937. He also wrote a biography of Tim Healy, 1927, and a travel book, *I Went to Russia*, 1931.

Ofterdingen, HEINRICH VON (c. 1170-1250). German minnesinger. Some writers have suggested that Ofterdingen was the author of the *Nibelungenlied* (q.v.).

Ogam OR OGHAM. System of writing employed in early Britain and Ireland. The name is connected with Ogmios, the Gaulish god of eloquence. The alphabet comprised 21 characters, composed of straight incised lines or notches on one side of or across a stem line. In stone inscriptions this was usually one of the upright edges, the characters being read upwards:

Perhaps invented at the end of the Roman occupation—one of the oldest examples having come from Silchester—ogam-writing continued in use until the 10th century. Of the 300 examples known, about 30 are from E. Scotland, Orkney, Shetland, and the Isle of Man, and an equal number, mostly with Latin legends as well, from Wales, Devon, and Cornwall. The remainder were found in Ireland. Mostly they are stone epitaphs, sometimes associated with Christian symbols, but a few occur on metal ornaments. The key to their decipherment was furnished by the 14th century MS. Book of Ballymote. See *Epigraphy*; *Inscriptions*; *Ireland*.

Ogden. City of Utah, U.S.A. The co. seat of Weber co., it stands 4,338 ft. in alt. at the junction of the Ogden and Weber rivers, 38 m. N. of Salt Lake City, and is served by the Union Pacific and other rlys. It dates from 1848, the Mormon church having paid \$2,000 to establish title to the surrounding region. Older

houses are former dwellings of Mormon families. A city since 1851, Ogden is the largest sheep and cattle shipping point in the west. Pop. 43,688.

Ogdensburg. City of New York, U.S.A., in St. Lawrence co. A port of entry, it stands on the St. Lawrence river, at its junction with the Oswegatchie, opposite Prescott, Ont. Its buildings include the U.S. government building, the R.C. cathedral, and the state hospital and armoury. A large lake shipping trade is carried on. Half the people are of French Canadian origin and hold an annual street gala at which they entertain Canadians. Settled in 1749, Ogdensburg was incorporated in 1817 and became a city in 1868. Pop. 16,346.

Ogee. Type of arch or section of architectural moulding of which the curve is an S-shape. It was used extensively in 14th century Gothic architecture. See *Arch illus.* (Decorated); *Moulding illus.*

Ogier the Dane. A hero of medieval romance, belonging to the Charlemagne cycle. Historically he represents the Frank Atchar, who conducted the widow of Charlemagne's brother, Charlo-man, to Desiderius, king of the Lombards, and joined him in his war against Charlemagne. His connexion with Denmark seems due to a mistake, though as Holger Danske he was adopted as a Danish national hero. Ogier is the subject of French and Italian romances, and of Spanish and Scandinavian tales.

Ogive. Name for a pointed arch, as used in Gothic architecture; also used in mathematics, through confusion with ogee (q.v.), to denote an S-like curve in a graph, e.g. the curve that represents cumulative frequency distribution in relation to size.

Ogive, OGOWE, OGOWAY, OGOWAL, OR OGOWO. River of French Equatorial Africa. It falls into the sea a few miles S. of Cape Lopez, and forms the principal coastal river between the Niger and the Congo. It is obstructed by numerous rapids, but is navigable as far as Njole, 160 m. from its mouth. Its length is 700 m.

Oglethorpe, JAMES EDWARD (1696-1785). English soldier and philanthropist. Born Dec. 21, 1696, he served under Prince Eugene, and entered parliament in 1722. His attention having been drawn to the sufferings of debtor prisoners, he formed an association for the establishment of a colony of released debtors, and in

1733 he settled Georgia, acting as governor there for 13 years. In 1745 he was sent against the Scottish rebels, and though acquitted on a charge of failing to overtake Prince Charles's army, he resigned his commission. He died July 1, 1785. See *Georgia*; *consult* *Memoir*, R. Wright, 1867.

Oglio. River of Italy, an affluent of the Po. It rises in the Alps in the neighbourhood of Mte. Adamello, and flows in its upper course through Val Camonica to the Lago d'Isco. Issuing from the S. end of the lake, it crosses the plain of Lombardy by a curved course, receiving from the left the Mella and Chiese, to join the Po 10 m. S.W. of Mantua. Its total length is 130 m.

Ogmore-by-Sea. Part of the rural dist. of Penybont in the co. of Glamorgan, Wales. It is three m. from Bridgend, and has remains of a castle dating from Norman times. Near is Ewenny, with the ruins of a Benedictine abbey. Ogmore is also the name of a small river which flows into the Bristol Channel at Ogmore-by-Sea.

Ogmore Vale. Part of the urban dist. of Ogmore and Garw in the co. of Glamorgan, Wales. It is eight m. from Bridgend and has a rly. stn. It is a coal mining centre.

Ogpu. A former name of the political police organization established in the U.S.S.R. in Dec., 1917, under the name of Cheka. It was originally organized to deal with sabotage and counter-revolutionary manifestations, but as the internal difficulties of the early Communist regime increased, its activities were extended to embrace smuggling, speculation, and military and political counter-espionage. Eventually the Cheka was given authority to make summary arrests and judgements and to execute persons sentenced. Arrests were usually carried out at night and news of prisoners was rarely received until they had been either sentenced or freed. The name Cheka thus became one of terror, and no doubt the strength of the organization and the numbers of its victims were fantastically exaggerated.

In 1922 the Cheka was re-organized under the name Ogpu, a word formed from the initials of the Russian words for unified

James E. Oglethorpe,
English soldier

political state administration. The OGPU retained great power and had a leading share in preparing the political trials of 1936-37 (see Moscow Trials). In 1936 the OGPU was incorporated in the commissariat for internal affairs and given charge of forced labour camps. Special detachments dealt with internal opposition, and served on the frontiers. Later, with the renaming of the political dept. controlling it, OGPU was named first the N.K.V.D., then the M.V.D. (abbreviation for ministry of the interior). The M.V.D. remains the instrument by which the decisions of the Politbureau are enforced within the U.S.S.R. It is said to be 600,000 strong, equipped like an army, and it includes many spies, informers, and agents-provocateurs.

O'Grady, STANDISH (1846-1928). Irish author. Born Sept. 18, 1846, he was educated at Trinity College, Dublin. His literary work marks the starting point of the modern Irish literary revival. His publications include *The History of Ireland, Heroic Period*, 1878; *The Coming of Cuculain*, 1894; *Chain of Gold*, 1895; *Ulrick the Ready*, 1896; *The Flight of the Eagle*, 1897. He died May 18, 1928.

Ogygia. In Greek mythology, the island upon which Odysseus spent eight years with the nymph Calypso. See Calypso; Odysseus.

O'Higgins. Inland prov. of central Chile. Named after Bernardo O'Higgins (*v.i.*), it is bounded N. by Santiago and S. by Colchagua. The E. portion is traversed by the Andes, the surface sloping W. to the fertile valley of Chile. The N. boundary is partly traced by the river Maipo, while the Rapel flows along its S. frontier. The chief products are wheat, wine, and fruit, and cattle-rearing and gold-mining are carried on. The capital is Rancagua, 40 m. by rly. S. of Santiago. Area, 2,745 sq. m. Pop. 200,297.

O'Higgins, AMBROSIO (c. 1720-1801). S. American administrator and soldier. Of humble parentage, he was sent from Ireland to his uncle, a Jesuit in Seville, who, finding him unsuited for the Church, sent him to S. America, where he became a S. American administrator, and made his way across the Andes to Lima, where he kept a stall and

trafficked in mules. He eventually obtained a govt. contract to build rest-houses on the mountain roads.

In 1770 O'Higgins was sent to suppress a rising of the Araucanian Indians, whom he defeated, but he won their good will after peace was concluded. In 1788 he became captain-governor of Chile with the title of marquis of Osorno. He governed with an iron hand, repaired roads, encouraged trade, and checked official corruption. Promoted viceroy of Peru in 1796, he thus became the king of Spain's representative in S. America. O'Higgins was the first and greatest of the many Irish who acquired fame in S. America. He died Feb. 18, 1801. His natural son, Bernardo O'Higgins (1778-1842), born at Chillan, Aug. 20,

Bernardo O'Higgins, 1778, became Chilean dictator and commander-in-chief (1813) and dictator (1817-23) of Chile, and declared its independence in 1818. He died Oct. 24, 1842.

O'Higgins, KEVIN CHRISTOPHER (1892-1927). Irish politician. He was born at Stradbally, June 7, 1892, the son of Dr. T. Higgins, who was assassinated, 1923. Educated at S. Peter's College, Carlow, he was articled to a solicitor, his uncle, M. Healy of Cork. He took part in the Easter rebellion, 1916, and while in prison was elected Sinn Féin M.P. for Queen's co. In the Cosgrave government of 1922 he was minister of Justice and vice-president of the executive council; he established the civic guard and had rebels executed. On July 10, 1927, he was murdered by three assailants near Bookers-town, while on his way to Mass.

Ohio. River of the U.S.A. Commercially the most important, and next to the Missouri, the largest tributary of the Mississippi river, the Ohio is formed by the union of the Monongahela and the Allegheny rivers at Pittsburgh. It flows generally S.W. for 975 m., joins the Mississippi at Cairo, and during its course separates West Virginia and Kentucky from Ohio, Indiana, and Illinois. It has a breadth varying from rather less than $\frac{1}{2}$ m. to a little more than $\frac{3}{4}$ m., and drains an area exceeding 200,000 sq. m. Among its principal affluents are the Tennessee, Cumberland, Wabash, Kentucky, Kanawha, and Big Sandy. In addition

to Pittsburgh and Cairo, the towns standing on its banks are Cincinnati, Paducah, Marietta, Louisville, Evansville, and Mount Vernon.

The Ohio, except for a short distance at Louisville, where there is a fall of 26 ft. in 2 m., is navigable for large vessels throughout its length, although delay is caused during drought periods by the low level of the water, and at other times by flood. A canal with locks was constructed to overcome the obstruction caused by the falls.

Ohio. North-central state of the U.S.A. Its area is 41,222 sq. m., or nearly one-third larger than Scotland. Though 34th in size of the U.S., it is the 4th in pop. The state is crossed from N.E. to S.W. by a low hill ridge, whence the surface slopes to Lake Erie in the N. and to the Ohio river in the S. The Maumee, flowing into Lake Erie, is the chief northern river; the S. part of the state is watered by many affluents of the Ohio, which have cut deep valleys through the sandstone rocks.

Ohio produces large quantities of maize, wheat, and oats, besides tobacco, hay, potatoes, fruit, etc.; stock-raising is a valuable interest. The coalfields comprise an area of nearly 12,000 sq. m., and natural gas, petroleum, limestone, and other minerals are obtained. The important manufactures include iron and steel products, flour, and rubber goods. The State, Ohio, Cincinnati, and Miami universities are among higher educational institutions. Besides the lake, river, and canal facilities, 9,121 m. of rlys. are available for transport. Two senators and 23 representatives are sent to congress. Columbus is the capital and Cleveland and Cincinnati the largest cities. Ohio was admitted to the Union in 1803. Pop. 6,907,612.

Ohlau (Pol. Olawa). Town of Lower Silesia at the confluence of the Ohle and the Oder, 16 m. S.E. of Breslau (Wroclaw). Buildings include a 16th cent. castle and several churches. It was a centre of the tobacco and cigar trade, and had machinery and chemical factories. It had also lime kilns and a horse and cattle market. Ohlau was made a town in 1290 and was at one time a residence of the Sobieski family. It became Prussian with the rest of the Silesian duchies in 1742, and after the peace treaty of 1919 was in a plebiscite area. It is in the part of Germany occupied by Poland after the Second Great War. Pop. (1939) 11,894.

Ohm. Unit of electrical resistance. The resistance of a circuit is

Ambrosio O'Higgins, S. American administrator

1 ohm when a pressure of 1 volt is required to cause a current-flow of 1 ampere. See International Units.

Ohm, GEORG SIMON (1787-1854). German physicist. He was born at Erlangen, March 16, 1787, and educated there. After holding a series of academic posts, he became in 1852 professor of experimental physics at Munich, but is chiefly remembered as the discoverer, in 1827, of Ohm's Law (*q.v.*). He died July 7, 1854.

Ohmmeter. Instrument for measuring the electrical resistance of conductors in ohms or of insulation in megohms. In one type, known as the Wheatstone bridge, comparison is made of a known resistance with the resistance to be measured. Its simplest form is shown in the diagram (Fig. 1) and

Ohmmeter. Diagrams illustrating types of instruments for measuring electrical resistance. See text

consists of a wire L of uniform resistance and one metre in length. To its two extremities (*a* and *b*) are connected a coil of known resistance *R* and the unknown resistance *X* in series. A battery *B* sends a current through the two circuits in parallel, while a galvanometer *G* is joined at a point between the two resistances and to a sliding contact *S* on the wire *L*. Current will then flow through both *R* and *X* in series and through the slide wire *L*. The sliding contact is adjusted until there is no deflection of the galvanometer needle. When this happens the circuit through *R* is equal in resistance to *aS* while the circuit through *X* is equal to *Sb*. No current can flow through *G*; there will be no deflection of the galvanometer needle. As the slide wire *L* can be scaled in centimetres and millimetres, proportions of *aS* and *Sb* are easily ascertained. The resistance $X = R \times aS/Sb$.

In another type of instrument, (Fig. 2), a magnetic needle *n* is subjected to the influence of two coils *A* and *B*, arranged at right angles to one another. Each coil, when current passes through it, tries to turn the needle into a line parallel to its own axis. A mag-

neto generator *G* supplies current to the instrument and is connected by coil *A* and also by coil *B* in series to the resistance *X* under test. Assuming *X* to offer infinitely great resistance, all the current will pass through *A*, and the pointer attached to the needle will move into the infinity position at one end of the scale of the dial. If, however, any current passes through *X*, coil *B* acts in opposition to *A*, and the deflection of the pointer is modified accordingly. The graduation of the dial scale is based upon tests made with calibrated resistances.

Ohm's Law. A relationship in electricity first investigated by G. S. Ohm (*q.v.*), who found that the ratio of the (direct) current, *I*, to the e.m.f., *E*, in any circuit is proportional to the total resistance, *R*, of the circuit (including the internal resistance of the cell, etc.); i.e.

$$E/I = R; I = E/R; E = IR.$$

If *E* is in volts and *I* in amperes, *R* will be in ohms.

Ohre. River of Czechoslovakia described under its more familiar German name, Eger.

Ohthere (fl. 880). Norse navigator. He entered the service of Alfred the Great, who described two of his voyages in his translation of Orosius. Ohthere sailed round the North Cape, explored the Murman coast, and discovered the White Sea.

Oich, Loch. Lake of Invernessshire, Scotland. It is 4 m. long and about $\frac{1}{2}$ m. broad, and is the summit level (105 ft.) of the Caledonian Canal. It has a depth of 155 ft., and fills part of the Great Glen. The Glengarry flows into the loch, which is drained by the Oich ($6\frac{1}{2}$ m. long) into Loch Ness at Fort Augustus. Trout and salmon are plentiful.

Oil. Organic liquid of definite composition or origin. By definition and general acceptance so-called oily liquids such as sulphuric acid (oil of vitriol) are excluded. There are two large groups of oils: those obtained from animals and plants, and those of mineral origin; although it can be argued that the genesis of all oil is ultimately animal or vegetable since that is the source of coal, petroleum, shale, etc., from which mineral oils are derived. Oils of relatively simple composition can be synthesised in the laboratory and some of them also on an industrial scale.

Oils obtained directly from animals and plants are of two types. Fixed (fatty, non-volatile) oils

come from the cells of the organism Triglycerides, they can be distinguished from other oils because with suitable treatment they will yield glycerine. To these may be added substances such as sperm oil which, strictly a liquid wax, is a typical oil in appearance and commonly classed with the fixed oils. Although such waxes are esters they are not glycerides, the alcohols being monohydric and, to some extent, dihydric. Essential (volatile) oils are contained mainly in the leaves, stems, and flowers of plants. They all have characteristic odours—peppermint, lavender, turpentine, etc.—and are obtained by distillation with steam. They differ completely in composition from the fixed oils, containing terpenes, camphors, olefinic terpenes, and olefinic camphors.

Mineral oils are complex mixtures of hydrocarbons with varying amounts of oxygen, nitrogen, and sulphur compounds. There are three main groups: petroleum (crude oil), shale oil, and coal tar. Crude oil does not contain unsaturated hydrocarbons; it is a mixture of paraffins, naphthenes, and aromatics. Shale oil, produced by the destructive distillation of the organic matter in oil shale, contains important quantities of olefines. Coal tar, in addition to a high aromatic content, has an appreciable amount of phenols and some nitrogen compounds such as pyridine. Unlike the fixed and essential oils, mineral oils are not generally of much use as they are obtained, but must be divided into fractions of more limited range. Petroleum is split into gasoline, kerosene, gas oil, lubricating oil, fuel oil, etc. Shale oil gives a similar range, while coal tar gives benzols, solvent naphtha, naphthalene, cresols, cresote oil, etc. Differentiation between the products of petroleum and shale oil is difficult, frequently impossible, but those from coal tar can readily be separated.

This classification of oils gives an impression of definite boundaries between the major groups; but some crossing is possible. Thus, from the resin tapped from various species of conifers, turpentine is distilled, leaving a residue of rosin. On dry distillation of the rosin, hydrocarbon oils are obtained which are not readily distinguished from mineral oils. Similarly with the uses to which the various groups of oils are put. Fixed oils are used for foods, soaps, lubricants, paints, etc.;

essential oils for perfumery, varnishes, paints, solvents, etc.; and mineral oils for fuels, solvents, lubricants, etc. *See* Essential Oils; Fats; Fixed Oils; Fuel Oil; Petroleum; Waxes; also Cetane Number; Cracking; Flash Point; Fractionation; Octane Number; Refinery; Selling Point; Smoke Point.

Oil Beetle. Insects of the family Meloidae, which include nine British species. Those of the genus *Meloe* are commonly named oil beetles from the fact that an oily fluid exudes from the joints of their legs

Oil Beetle. *Meloe violacea* (male)

and probably serves the purpose of making them distasteful to their enemies. Large in size, with short wing covers and a long abdomen, these beetles inhabit grassy places, where they lay eggs. The larvae attach themselves to bees and get carried to nests, living as parasites. The Spanish fly (*Lytta vesicatoria*), which yields the drug cantharidin, also belongs to the Meloidae. *See* Cantharides.

Oilcake. The term originally applied to linseed cake. It is now used also for other kinds of cake rich in oil. *See* Earth-nut Cake; Linseed Cake; Palm-nut Cake; Rape Cake.

Oil City. City of Pennsylvania, U.S.A., in Venango co. It stands on the Allegheny river, 130 m. by rly. N. by E. of Pittsburgh, and is served by the Pennsylvania and other rlys. Its buildings include the city hospital and the Standard Oil co.'s building. Situated in the Pennsylvania oil region, it is concerned chiefly with the refining of bases for lubricating oil. Settled in 1825, Oil City was incorporated in 1863 and chartered as a city in 1871. Oil was first discovered in the locality in 1859, and between 1860 and 1870 it was the centre of American oil production. After 1870 it continued to supply crude oil which was unobtainable elsewhere. Pop. 20,379.

Oilcloth. A name sometimes used to describe floorcloth (*q.v.*). Table oilcloth, Lancaster cloth, or American cloth consists of a cotton grey cloth coated on one side with a flexible film of several thicknesses of oil paint. It is used for table, shelf, and wall covering. The cloth is prepared for coating by sizing, stentering, and rubbing. The under-surface may be raised to produce a soft back. Paint is applied in spread-

ing machines, the surface is usually printed with a pattern, and a protective coating of varnish or lacquer is finally applied.

Oil-Drop Experiment. Method of determining the charge of an electron. Devised by the U.S. physicist R. A. Millikan (*q.v.*), it consists of holding an oil-drop of suitable size between two parallel metal plates maintained at a constant electrical potential difference. If ne represents the charge on the drop, e being the electronic charge and n a number to be found, then

$$ne \frac{V}{d} = mg, \text{ where } V$$

represents the value of the potential difference which maintains the drop in balance, d is the distance between the plates, g is the acceleration due to gravity, and m is the mass of the drop. The last quantity is determined by timing the rate of fall of the drop under gravity without an electric field, and by applying Stokes's law, the viscosity of the air being known. If n is not too large, it is easily deduced from an inspection of the values of ne for a number of differently charged drops.

Oil Engine. Name formerly given to a type of internal combustion engine using paraffin (or kerosene) as fuel; whereas a gas engine uses coal gas or producer gas. The paraffin was converted into vapour in an externally heated vaporiser, mixed with air, and drawn into the cylinder on the induction stroke, thereafter operating as in a gas engine. The vaporiser was heated by a separate burner for starting, the heat of the exhaust gases being used for this afterwards. Except for small engines for outboard motors, etc., the advent of reliable compression ignition engines has rendered paraffin engines obsolete. Much higher mean effective pressure is practicable with the former type and its fuel consumption is lower. *See* Diesel Engine; Internal Combustion Engine.

Oilfield. Area in which oil is being produced from natural subterranean reservoirs. Its characteristic surface feature is the tall derrick, used for drilling wells, the number and spacing of which depend upon the depth, geological structure, and fluid conditions in the reservoir. Sand and sandstone reservoirs generally

require relatively close spacing, whereas efficient production from many limestones is possible with the wells far apart; in the sandstone reservoirs of the W. hemisphere wells do not usually occupy more than 50 acres each, but in the limestones of Iran there is only one well per 500 to 1,000 acres. The surface equipment of an oil-field consists of drilling rigs and derricks; separators; of pipe lines, pumps, and tanks; pumping and gas-lift equipment for raising oil when the reservoir pressure is insufficient; workshops, stores, offices, laboratories, and accommodation for the staff, which in undeveloped country may amount to the pop. of a town.

Oil Gas. Gas obtained by the cracking of gas oil and used for heating and lighting. The first patent for manufacture of gas from vegetable or animal oil, fat, bitumen, or resin was granted in England to Taylor in 1815, but the best-known process, which involved cracking gas oil in retorts at high temperatures, was developed by Pintsch in Germany in 1870. Production of oil gas is now largely limited to the Pacific coast region of the U.S.A., where the cost of solid fuels is high and petroleum is abundant. A fire-brick-lined steel shell, filled with checker brick, is heated by oil burners to about 2,000° F.; air is blown in to burn off carbon deposited in an earlier cycle; and oil, atomised by steam, follows. The oil cracks as it passes through the hot brick, forming oil gas and free carbon, and the steam reacts with part of the carbon to give water gas. Six or seven gallons of oil make 1,000 cu. ft. of gas of calorific value 550 B.Th.U. per cu. ft. *See* Cracking.

Oil Painters. ROYAL INSTITUTE OF. British society of artists founded in 1883. It became a royal society in 1909, and holds annual exhibitions (open to non-members) at the Royal Institute Galleries, 195, Piccadilly, London, W.1. Members are entitled to the letters R.O.I.

Oil Palm (*Elaeis guineensis*). A tree of the family Palmac, native of W. Africa, but much grown in the W. hemisphere. It grows to a height of about 30 ft., with a stout stem bearing at its extremity a crown of magnificent feather-like leaves, 15 ft. long. The male and female flowers are borne usually by separate trees, but sometimes on the same tree. Bright red fruits, which yield palm oil, form large, oval heads. This oil is

obtained principally from the external fleshy coat, by boiling the fruits in water, and skimming the

Oil Palm. Crown of feather-like foliage. Inset, part of fruit head

orange-red, butter-like fat off the surface. The seed, enclosed in a hard shell, also yields oil under pressure. The latter is used as a lubricant and in making margarine.

Oil Rivers Protectorate. Name formerly applied to the coastal districts in the estuary of the Niger. In 1885 the Berlin conference acknowledged that a British protectorate had been virtually established over these regions, and an order in council defined the boundaries of the territory. The British commissioner was stationed at Old Calabar. In 1893 the Oil Rivers protectorate became part of the Niger Coast protectorate, afterwards S. Nigeria. See Nigeria.

Oil Shale. Shale which contains organic matter insoluble in normal solvents of oil but which, on retorting, produces oil. The organic matter is called kerogen (*q.v.*). The term oil shale is frequently applied to varieties of rock which on heating produce an oil or tar in addition to the true oil shale, *e.g.*, kukersite, torbanite, boghead coal, cannel coal. Commercial exploitation of oil shale and similar rocks was started by Young in Midlothian, Scotland, in 1851, but as the production of petroleum from wells increased rapidly in the 20th century, the oil shale industry had a hard struggle to survive. It is continued in Scotland, Estonia, S. Africa, France, Manchuria, and Sweden, where there is no indigenous crude oil. There are deposits in England (Dorset and Norfolk), but their oil is too sulphurous to use. The U.S.A. has vast reserves, while in the U.S.S.R. the production of shale oil is said to be proceeding apace.

After mining by normal open-cast or underground methods, the

oil shale is heated in retorts—directly or indirectly heated, vertical or horizontal, rotary, tunnel, or stationary. The shale may be merely heated, or steam and air may be passed through it during heating, and it will give shale oil, combustible gases, carbon, and ammonia. Oil recovery varies from 20 to 100 gallons or more per ton of rock, the lower figure being representative of Scottish yields. Crude shale oil from the retorts is treated much as crude petroleum is.

Mining costs are a major item adversely affecting the use of oil shale. In Sweden a process invented by Ljungström aims at avoiding these by heating the shale *in situ*. Heating is by electricity through elements carried in 2-in. boreholes, so the method depends on cheap electric power. In Germany attempts have been made to distil Württemberg oil shale *in situ* by adapting the Russian process for the underground gasification of coal. *Consult* Oil Shale and Cannel Coal, Institute of Petroleum, 1938.

Ointment. Preparation consisting of an active drug mixed with a fatty substance, intended to be applied to an external surface. The substances most frequently used as the basis of an ointment are lard, olive oil, wax, paraffin, and hydrous wool fat (lanolin).

Oïrot. Autonomous prov. of the R.S.F.S.R. It is bounded W. by W. Siberia region and Kazakh S.S.R., the Altai Mts. and China lying to S. and E. The people are Kalmucks and the chief town is Oïrot-Tura.

Oise. Dept. of France. In the N. of the country, between the old regions of Normandy, Picardy, and Île de France, its area is 2,272 sq. m. The surface is hilly, and across the dept. flows the Oise. Other rivers are the Aisne, Brèche, Nonette, and Oureq. The soil is fertile; wheat and other cereals are grown, cattle are reared, and there are many dairy farms. Here are the forests of Chantilly and Compiègne. The chief town is Beauvais; others are Chantilly, Noyon, Clermont, Compiègne, Creil, and Senlis. Partly overrun by the Germans in Aug.—Sept., 1914, and again in June—Oct., 1918, the dept. saw furious fighting in the First Great War. Pop. 396,724.

Oise. River of France. Rising near Chimay, in the Ardennes, in Belgium, it enters France, and after flowing past Guise receives the waters of the Serre and the Ailette.

Near Compiègne the Aisne flows into it; other tributaries are the Thérain and the Brèche. It falls into the Seine, 40 m. below Paris, after a course of 186 m. For about 60 m. the river is canalised and linked up by canals with the waterways of Belgium and N. France. The battle known to the French as that of the Oise, in the First Great War, began Aug. 16, 1918. It was opened by the French by heavy bombardment and patrol encounters between the Aisne and Oise on a front of 20 m. In the infantry attack, Gen. Mangin took 13,000 prisoners and 300 guns. When the Germans invaded France in 1940, their armoured formations crossed the Oise on May 17. This endangered British communications and compelled the B.E.F. to withdraw behind the Schelde.

Ojibwas or **CHIPPEWAS.** North American Indian tribe of Algonquin stock. The name, meaning "roast-till-puckered-up," alludes to their puckered moccasins. Established N. of Lake Superior from time immemorial, they moved W. until their range embraced 3,000 m. Owing to their remoteness from early colonial contact, they long maintained their tribal organizations in comparative purity. Living in birchbark wigwams, and using canoes for fishing, their possession of the wild-rice (*zizania*) region led to warfare with the Dakotas. They number about 30,000. See American Indians colour plate.

Oka. River of central Russia. It rises near Ochka, in the region of Kursk, and flowing alternately N. and W. for 950 m., discharges itself into the Volga at Gorky. It connects the industrial and grain-producing districts of the country, and is nearly everywhere navigable.

Okanagan. River of Canada, in British Columbia, affluent to the Columbia river. With its numerous tributaries it drains the W. slopes of the S. Monashee Mts. and the Gold Range, which separate its basin from that of the Kootenay and Upper Columbia. Its upper valley is filled mainly by the narrow Okanagan Lake, 80 m. long; thence it flows S. through smaller lakes into the U.S.A., to join the Columbia river at Brewster.

Okapi (*Ocapia johnstoni*). Ruminant mammal related to the giraffe. First discovered by Sir Harry Johnston, in 1900, in the Semliki forest of Central Africa, though supposed to have been seen by Stanley some years earlier, it is about as large as a mule, and the general colour of the pelt is blackish brown, with yellow legs striped

Okapi. Specimen of this Central African ruminant

By courtesy of Dr. Michel L'Hoest, of the Royal Zoological Society, Antwerp

horizontally with black. The neck is long in proportion to the body, and the head is giraffe-like, with large, upstanding ears. The male has two short pedicles of bone arising from the head, like the so-called horns of the giraffe. The okapi lives in the densest parts of the forest, and appears to go in small herds.

Okayama. Town of Japan, in Honshu. Situated 240 m. by rly. E.N.E. of Shimonoseki, on the route to Kobe, it stands on a wide alluvial plain in the lower course of the Asahi river, 7 m. from its mouth. Branch rlys. run to Uno, Tatai, and Tsuyama, the Uno line providing connexion with Shikoku. The castle is in ruins, the park, one of the most beautiful in the country, extends over 22 acres, and there are three Buddhist temples. Cotton and silk yarns, cotton goods, and rice have been produced. Pop. 166,144.

Okeechobee. Lake of Florida, U.S.A. The largest lake in the S. portion of the U.S.A., it borders the Everglades on the S., and is 40 m. long by 28 m. broad, its area being about 730 sq. m. Canals link it up with the Caloosahatchee river. Drainage was begun in 1881, and excess water is taken off to the Atlantic and the Gulf of Mexico.

Okehampton. Mun. bor. and market town of Devon, England. It is on the N.W. edge of Dartmoor, where the rivers East and West Okement meet. It is 25 m. by rly. from Exeter. The church of All Saints is modern, save for its noble tower, and there are the remains of a 15th century castle, in-

cluding parts of the chapel and banqueting hall. Okehampton was a bor. before 1886, and had then a castle. It sent two members to parliament until 1832. Outside the town are artillery ranges. Market day, Sat. Pop. 4,000.

O'Kelly, SEAN THOMAS (b. 1883). President of Eire. He was born in Dublin, and educated there at the Christian Brothers' schools. He became an assistant in the national library of Ireland, and a political journalist. In 1905 he assisted Arthur Griffith (*q.v.*) in founding the Sinn Féin movement, being secretary 1908-10. During the rising of Easter, 1916, he fought in the G.P.O., Dublin; he was imprisoned for this, but released after a year. In 1918 he was returned as Sinn Féin M.P. for College Green, and soon became a Dublin alderman. In the first (illegal) Dáil of 1919 he was chosen speaker, and he went to the Versailles conference, and later as Republican envoy to Rome. After the establishment of the Irish Free State in 1921 he retired into the political wilderness. When Eamon de Valera came to power in 1932, O'Kelly was made vice-president of the executive council, attending the League assembly at Geneva and the imperial economic conference at Ottawa. During 1932-39 he was minister for local government and public health, and in 1938 was made vice-premier. From 1939 he was an able minister of finance, until on June 25, 1945, he succeeded Douglas Hyde in the presidency.

Okhotsk, SEA OF. Gulf in the Pacific Ocean. It is formed by the peninsula of Kamchatka, the maritime region of Russia, and the islands of Sakhalin, Yezo, and Kurile. It is 1,535 m. long and 795 m. broad. On the N. shore is the small town of Okhotsk, in the region of Kamchatka.

Oki Islands. Archipelago of Japan, in the Japan Sea, W. of Honshu. The group is 44 m. from Sakai, on the mainland, with which a ferry service has been maintained from Saigo, the administrative centre for the islands. Area 135 sq. m.

Okinawa. Island in the Pacific Ocean. The largest island of the Ryukyu group, it is long, narrow, and irregular, with constricted waists of land and rugged peninsulas projecting E. and W. into the sea. Approximately 65 m. long from N. to S., it has a maximum width of 10 m., and an area of 485 sq. m. Some 325 m. from the Japanese mainland, it was a

prefecture of the Japanese empire until its capture by the U.S.A. in the Second Great War.

Okinawa had been developed by the Japanese as an air base, and fighter aircraft from the island offered serious opposition to U.S. bombers from the Marianas attacking industrial centres in Japan. Possession of Okinawa, with its good anchorages, was essential to the U.S.A. for the building up of forces for the final assault on the Japanese mainland. With the capture of Iwojima on March 26, 1945, Okinawa remained as the final stepping stone for the Allies to cross in the Pacific. Garrisoning the island with 60,000 troops, the Japanese had made elaborate preparations for the impending attack. Caves were turned into strongpoints, warships and aircraft assembled, while piloted flying bombs, suicide swimmers and boatmen, and mortars throwing 1,000-lb. projectiles were used for the first time.

Preceded by a devastating naval bombardment, the U.S. 10th army, commanded by Gen. Buckner and consisting of one corps of four army divisions and a corps of two marine divisions, went ashore near Yontan on Easter Sunday, April 1. A feint had deceived the Japanese as to the actual point of attack, and opposition was slight. By the end of the day the Americans had secured two airfields and advanced 3 m. On the 2nd their marines forced a corridor across the island and cut the defences in two. As the Americans had immense superiority in men and materials, resistance should have collapsed. But the American command made a serious tactical error in assuming that the Japanese would withdraw N. to take advantage of natural defences. Even when it became evident that they had concentrated in the S., Buckner committed his marine corps to an unnecessary mopping-up operation towards the N., while he wheeled the 24th army corps against the main enemy force. The wheel was carried out so slowly that the Japanese had sufficient time for improvement of the defences.

Thereafter the Americans continued to advance slowly and at heavy cost. The enemy had dug themselves into caves and along high ridges; the campaign became a series of hand-to-hand encounters over the most elaborate system of concealed fortifications yet encountered in the Pacific war. The Japanese navy and air force car-

ried out devastating attacks on the beaches and ships, while suicide pilots were brought into action against merchant vessels. Out of an invasion fleet of over 1,000 ships the U.S.A. lost approximately 100 sunk or seriously damaged. Buckner withdrew his marine corps from the N., but instead of landing it in the rear of the enemy, he placed it on the right flank, so that two army corps were crowded on a front of 8 m. Gradually, however, the weight of men and materials told in favour of the invaders, until the Japanese, fighting stubbornly to the end, were reduced to shattered remnants. With the break-through beyond Yonabara, the campaign became a mopping-up operation, and the American flag was hoisted over Okinawa on June 21, four days after the death of Buckner in action.

Estimated to last 40 days, the campaign on Okinawa had taken 82, and cost the U.S.A. 47,000 casualties, of whom 12,000 were killed and missing. Of the Japanese garrison of 60,000, only a few hundreds survived to be taken prisoner. American casualties shocked the people and drew adverse criticism, but military commentators justified the losses when balanced by the gains. Occupation of Okinawa enabled the U.S. air force to intensify its attacks on the Japanese mainland, while the loss of 4,000 aircraft over the island by the Japanese was a crippling blow. It remained a U.S. military base after the war.

In Oct., 1945, the island was struck by a typhoon which caused much material damage and heavy casualties among natives and U.S. troops.

David Le Roi
Oklahoma. State of U.S.A. One of the W. South Central States, it became a member of the Union in 1907. It lies between Texas and Kansas, E. of Arkansas. Part of the great basin of the Mississippi, it is a rolling plain varying in elevation between 1,000 and 2,500 ft., rising gradually from E. to W.; in the extreme N.W. it reaches 5,000 ft. The plains are almost treeless, and are scarred by cañons cut by the rivers; the rugged Ouachita (Washita) Mts. in the S. rise to 3,000 ft. Much of the state is arid, and the rivers, of which the chief are the Arkansas, Cimarron, Canadian, and Red, are frequently waterless during hot summers. To the N.W. lie the Great Salt Plains, a flat area 6 m. by 8 m., covered with a deposit of salt. Minerals include zinc, lead, and natural gas, but the leading

industry is oil production. Wheat-fields adjoin the oilfields, and other important crops include broom corn, cotton, maize, and oats. There are over 6,000 miles of rly.

Part of their territory was ceded by the Indians to the U.S.A. in 1866; from 1889 to 1903 various sections were laid open for white settlers. Oklahoma Territory was created as an administrative unit in 1890, and became a state in 1907. Nearly 20 p.c. of North American Indians live in the state. The capital is Oklahoma City (*v.s.*). The state sends two senators and eight representatives to congress. Pop. 2,250,000.

Oklahoma was the title of a musical show by R. Rodgers and O. Hammerstein, produced in New York in 1943, where it ran until 1948. It was also produced at Drury Lane in 1947.

Oklahoma. City of Oklahoma, U.S.A., the state capital and seat of Oklahoma co. It stands on the North Fork of the Canadian river, 31 m. S.S.W. of Guthrie, and is served by various rlys. Prominent buildings are the Capitol and Epworth university. There is a large trade in cattle, fruit, cereals, cotton, and oil. Pop. 204,424.

Olaf I Trygvesson (c. 960-1000). King of Norway, 995-1000. He had made expeditions to England, and even perhaps as far as Italy, when he returned to Norway, overcame Haakon Jarl, and secured his throne. Having become a Christian in England, he sought to make his people Christians also, founding a bishopric at Nidaros or Trondhjem, and building the first Norwegian churches. In 1000 he was attacked by the sons of Haakon Jarl, aided by the kings of Denmark and Sweden. Defeated at Svoldr, Olaf leaped into the sea and was drowned.

Olaf II (995-1030). King of Norway, 1015-30, and saint. He was a descendant of Harold Fair-Hair, and during his years of seafaring, in which he is said to have captured London on behalf of Ethelred the Unready, he was converted to Christianity in England. When he became ruler of Norway, which he made into one kingdom, he spread the faith with insistent severity. The pagan rulers, having banded together, called Canute of Denmark to their aid, and Olaf fled to Russia, 1028; but he returned and fell in battle at Stiklestad, July 29, 1030. He was canonised in 1164, and recognized as Norway's patron saint.

Öland. Island off the S.E. coast of Sweden. It is separated

from the mainland by Kalmar Sound, is 88 m. in length, and from 5 m. to 10 m. broad. Wooded in parts, it has good pasture ground and corn is grown near the coasts. Chalk, alum, and sandstone are exported, but the chief occupation is fishing. Borgholm on the W. coast is the chief town. Öland is rich in barrows, stone monuments, and other antiquities. Pop. 40,000.

Olav (b. 1903). Crown prince of Norway. Alexander Eduard Christian Frederik, called Olav, was born July 2, 1903, son of King Haakon VII and Queen Maud, and cousin of King George VI.

After leaving the Norwegian military academy he studied for two years at Balliol College, Oxford. On March 21, 1929, he married Princess Martha of Sweden. He accompanied his father and the Norwegian govt. to England in 1940. Commander-in-chief of Norwegian armed forces from 1944, Prince Olav was the first member of the royal family to return to Oslo after its liberation, May, 1945.

Old Age Pensions. This subject is fully treated under the heading Pensions.

Old Bailey. London thoroughfare. It runs S. from Newgate Street to Ludgate Hill, E.C. At its N.E. corner is the Central Criminal Court (*q.v.*), on land occupied by old Newgate (*q.v.*) prison, opposite which were set up the pillory, whipping post, and gallows. There was a prison here in the 12th century. A mansion of the Sidneys stood in the Old Bailey. Camden was born in this thoroughfare, William Hone and Jonathan Wild lived in Ship's Court, and Goldsmith in Green Arbour Court. The Old Roman Wall extended along the E. side. The name is derived from the old court of the city chamberlain, or from the *ballium* or outer space near Ludgate.

Oldbury. Mun. bor. and market town of Worcestershire, England. It is 5 m. W. of Birmingham, has a rly. station, and is on the Birmingham canal. Standing on the coalfield of the Black Country, it has steel works, iron foundries, and makes nails, tools, chemicals, etc. Pop. 53,000.

Oldcastle. SIR JOHN (d. 1417). English Lollard, known also as Lord Cobham. He is first men-

Prince Olav,
Crown Prince of
Norway

tioned as serving in the Welsh marches in 1401. In 1409 he married Lady Cobham, of Cooling,

Sir John Oldcastle,
English Lollard

and after several citations was arrested, tried, and sentenced to death. Escaping from the Tower, he was engaged in a Lollard conspiracy which nearly brought about a rebellion. Many leaders were arrested, but Oldcastle remained in hiding until 1417, when he was captured, taken to London, and hanged Dec. 14. Some have supposed him to be in part the original of Shakespeare's Falstaff. See Lollards.

Old Catholics. R.C. congregations, chiefly in Germany, Holland, and Switzerland, who have separated from the Church of Rome mainly on the question of papal infallibility. The movement originated in a conference at Munich in 1863 under the presidency of Dr. Dollinger, which was attended by about a hundred scholars and priests, with the purpose of uniting German R.C. divines in the work of promoting unity in religion and scientific thought.

Jesuit influence resulted, Dec., 1869, in the summoning of the Vatican council, which in the following June voted on the question of the infallibility of the pope when defining doctrine *ex cathedra*. The opposing bishops handed in a protest and left Rome before the session of July 18, which almost unanimously passed the decree.

Most of the opponents subsequently submitted under pressure; but Dollinger and Friedrich refused on the grounds that papal infallibility was contrary to Scripture and tradition, condemned by previous councils, based upon unauthentic authorities, and incompatible with civil order. As a result, both were deposed and excommunicated. Dollinger then called together an Old Catholic congress, which met at Munich in Sept., 1871, and issued a manifesto asserting adhesion to Catholic doctrine, and to the ancient constitution of the Church, repudiating papal infallibility, and declaring a desire to reform the Church and bring about reunion with the

Oriental and other episcopal churches. Old Catholic churches were opened in various towns in Germany and Switzerland.

A second congress at Cologne in Sept., 1872, was attended by the archbishop of Utrecht, bishops of the Anglican and American Churches, and a representative of the Russian Church, among about 500 other deputies. In 1873 Dr. Reinkens was consecrated the first bishop of the Old Catholics by the Jansenist bishop of Deventer, according to the Roman rite. See Dollinger; Infallibility; Jansenism; Papacy; Vatican Council.

Old Contemptibles. Nick-name given to men of the B.E.F. who crossed to France in 1914. See Contemptibles, Old.

Old Cocks' Race. Popular name for the Royal Automobile Club emancipation rally, an annual run from London to Brighton for veteran motor cars which commemorates the abolition of the 2 m.p.h. speed limit in 1896. Up to that date motor vehicles had to be preceded by a walker carrying a red flag. The event was suspended during the Second Great War, but revived in 1946. It takes place on a Sunday in Nov.

Old Curiosity Shop. THE. Charles Dickens's third novel, begun in the fourth issue of Master Humphrey's Clock (*q.v.*), April, 1840, and concluded in the number for Jan. 17, 1841. The illustrations were by George Cattermole and Phiz. The theme of the story is an old man's affection for his granddaughter for whose sake he becomes a hopeless gambler, and their wanderings together through the countryside. Little Nell, Daniel Quilp, Dick Swiveller, and Mrs. Jarley (*qq.v.*) are among the more famous creations of the novelist.

The novel is a remarkable example of *ad hoc* writing. The first intention of the author was to make it little more than a short story, first of a series describing the "personal adventures" of Master Humphrey, and the first instalment was printed under that heading, with the present title as a sub-heading. The first few chapters are told in the first person, and in a manner suggesting that the characters were completely unknown to the narrator; yet in the event it is revealed that this same Master Humphrey was closely related to the principal characters. Moreover, the curiosity shop itself plays no part in the story after the first few chapters.

Oldenburg. A former grand duchy, later free state, of Germany. In early times it was the homeland of Saxon tribes; its present name dates from 1059 and its dynasty has been one of the most widespread, giving kings to Denmark, dukes to Slesvig-Holstein, heirs to the Russian tsars, and to German emperors. The territory, with detached portions in Holstein and the S. Rhineland, embraces 2,480 sq. m.; most of the inhabitants are engaged in agriculture and cattle breeding, one quarter in industry. Before the Second Great War Oldenburg was famous for horses, cattle, and sheep. The coastline and rivers, including the Weser, lend themselves to the fishing industry, which in turn favours shipbuilding and fish and food preserving. Other occupations are engineering and textile work. There are several canals, and main rly. lines connect Bremen, Wilhelmshaven, and Osnabrück. Oldenburg became a duchy in 1777, and in 1815 a grand duchy. A free state from 1918, it was united with Bremen under a Nazi chief in 1933. It became part of British-occupied Germany, 1945, and was joined, 1946, with Hanover and Brunswick to form the *Land* of Lower Saxony. Pop. 585,000.

Oldenburg. A city of W. Germany. Formerly the capital of Oldenburg state, it is on the Hunte, 26 m. W. of Bremen, and is served by the Hunte-Ems canal and several rlys. The inner town contains many ancient, though restored buildings, *e.g.* the churches of S. Lambert (13th century), Holy Ghost (1468), S. Gertrude (1481). There are two town halls, one ancient, a palace in Renaissance style, 1607-15, several museums, two fine libraries, an art gallery, and an academy of engineering. During the Second Great War Oldenburg surrendered to units of the 1st Canadian army, May 3, 1945. S. Lambert's church and a library had suffered some damage. Pop. (1939), 66,951; (1949) 119,000

Oldfield, ANNE OR NANCE (1683-1730). An English actress.

Introduced to the stage by Farquhar and Vanbrugh, she first attracted attention at Drury Lane by her creation of two comedy rôles, Lady Betty Modish in Cibber's Careless Hus-

Anne Oldfield,
English actress

band, and Biddy Tipkin in Steele's *Tender Husband*. Renowned for beauty and talent, she played original parts in Addison's *Cato*, Rowe's *Jane Shore* and Lady Jane Grey, and Thomson's *Sophonisba*. She died Oct. 23, 1730. A comedy by Charles Reade, entitled *Nance Oldfield*, was produced at The Olympic, Feb. 24, 1883.

Oldfield, WILLIAM ALBERT (b. 1897). Australian cricketer, born at Sydney, Sept. 9, 1897. He first appeared in England with the Australian Imperial Forces team which toured in 1919. One of the finest wicket-keepers known in the game, he played regularly in test matches from 1924 to 1937. Once he gave away no byes in two English innings totalling 863. He was also a sound batsman late in the innings.

Oldham. A county borough in Lancashire, England. It stands on the Medlock, 6 m. N.E. of Manchester, has rly. stations and is served by a canal to Manchester docks and ship canal to Liverpool. The principal buildings are the town hall, art gallery and

Oldham arms

library, school of art, and technical college. Over 100 schools are administered by local authority, while there are two endowed independent grammar schools. The town is the centre of the cotton spinning industry, and makes textile machinery. Alexandra Park has long tree-lined walks and floral displays. There are eight suburban parks, bowling greens, tennis courts, and playing fields. Oldham made hats in the 18th century, but really developed from about 1790 with the introduction of cotton manufacture. It began to send two members to parliament in 1832, but was not made a corporate town until 1841. Market days, Mon. and Sat. Pop. est. 118,280.

Oldham, JOHN (1653-83). English poet. Born near Tetbury, Glos, Aug. 9, 1653, and educated at S. Edmund Hall, Oxford,

he was a schoolmaster and tutor, and was then befriended by the earl of Kingston, at whose place, Holme Pierrepont, Notts, he died of

John Oldham,
English poet
After Dobson

smallpox, Dec. 9, 1683. Oldham's reputation rests chiefly on his satires, especially *Satires upon the Jesuits*, 1681. These, though rugged in versification, are interesting as being the lineal predecessors of the satirical writings of Pope.

Old Jewry. A London street. Leading N. from Poultry to Gresham Street, E.C., and known in 1181 as *The Jewry*, and later as *Colechurch Lane* and *Sakfrelanelane*, it was once a Jewish quarter. In 1641 Sir Robert Clayton built a house here, which became the first home of the London Institution in 1806, and was taken down in 1863. The headquarters of the City of London police are at 26, Old

Oldham, Lancashire. Parish church of S. Peter, built in 1754

Valentine

Jewry. Half the W. side of the street was destroyed by German bombs in air raids during the Second Great War.

Old Kent Road. Thoroughfare of S. London. From the junction in Bermondsey of New Kent Road, Great Dover Street, and Tower Bridge Road, it runs S.W. 1 mile 6 furlongs to New Cross. Busy shopping districts alternate with residential areas along both sides, and it carries bus and tram routes. The main exit from London to Kent, it received severe damage from bombs and rockets in numerous air raids over south London during the Second Great War.

Old Man OR LAD'S LOVE. Popular name for southernwood (*Artemisia abrotanum*). See *Artemisia*; *Southernwood*.

Old Man Cactus (*Pilocereus senilis*). Succulent perennial herb of the family Cactaceae. A native of Mexico and Guatemala, it has a fluted cylindrical stem from 20 to 35 ft. high, the ridges bearing tufts of long white spines and long white hairs.

Old Man of Coniston. Mountain in the Furness dist. of Lancs, England. A familiar landmark of the Lake District, N.W. of Lake Coniston, it is 2,633 ft. high. Close to the Cumberland border, it forms the S. termination of the Cumbrian Hills.

Old Man of the Mountains. Name given to Hassan Ibn Sabbah (Sheikh-al-Jebal), founder of the secret Mahomedan sect known as the Assassins (*q.v.*).

Old Man of the Sea, THE. Character in *The Arabian Nights' Entertainments* (*q.v.*). In his fifth voyage Sindbad the Sailor, having been wrecked, assists a helpless old man by carrying him on his back. The old man twines his legs round Sindbad's neck and cannot be dislodged until he has been made thoroughly drunk.

Old Man's Beard. Rustic name for (1) traveller's joy or wild clematis (*Clematis vitalba*), a hedge plant; (2) a lichen, *Usnea barbata*, which attaches itself to the rowan tree.

Old Masters. Term applied to painters of a bygone age, and of established reputations; also used of the works produced by them. See *Art*; *Painting*.

Old Mortality. First of Scott's *Tales of My Landlord* ("arranged by Jedediah Cleishbotham, schoolmaster and parish-clerk of Gandercleugh"), and fourth of the *Waverley* novels. It was published with *The Black Dwarf* in Dec., 1816. The title was suggested by the hobby of Robert Paterson, a stone-cutter who wandered about Scotland for some forty years repairing the graves of the Covenanters, of whose fiery zeal the novel contains many vivid pictures together with graphic impressions of the battles of Drumclog and Bothwell Brig. The marriage of the hero, Henry Morton, with the heroine, Edith Belleniden, is brought about in one of the most convincing love-stories written by Scott.

Old Pretender. Name given to James Edward (*q.v.*), the son of James II and Mary of Modena, and claimant to the English throne in the early 18th century.

Old Red Sandstone. In geology, name given to a series of Palaeozoic rocks. They are named from their commonest constituent, red sandstone, but the series also contains grey, yellow, and green sandstones, and limestones and clay beds. The rocks of the group are of immense thickness, computed to be 20,000 ft. thick in Scotland, and are called Old to dis-

tinguish them from similar deposits of a later period of geological time. The series lies below the Carboniferous strata. The time of the formation of Old Sandstone rocks corresponds to that of the Devonian marine deposits. The series is found in Scotland, Wales, Ireland, Russia, where it alternates with Devonian deposits, Scandinavia, and N. America. Some Old Red Sandstone rocks contain no fossils; in others there are remarkable remains of fossil fishes and plants. *See* Devonian; Triassic.

Old Street. Street in the boroughs of Finsbury and Shoreditch, London. It runs from West to East, from Aldersgate Street to High Street, Shoreditch. Mainly commercial in character, its buildings include the Shoreditch town hall, a police court, and a station on the Northern line.

Old Style. *See* Calendar.

Old Testament. Name given to the collection of books which form the first part of the Bible and give an account of the history and religion of the Jewish people from the earliest times to the beginning of the Christian era. From one point of view, the O.T. is the literature of the Jewish nation; from another, it is the record of the Divine education of Israel for the reception of the Christian Revelation.

The books as they stand in the English Bible were written during the 600 years between 750 and 150 B.C., but many of them embody documents and excerpts which go back to a much earlier period. It was only gradually, however, that these books were collected together into what is known as the O.T. canon. The process of forming the canon took about 500 years. It commenced c. 440 B.C. and was not finally completed till the synod of Jamnia, in A.D. 90.

There are three well-defined stages in the growth of the O.T. (1) The earliest canon, which was formed c. 440 B.C., contained the Hexateuch including the book of Joshua. The explanation of the canonisation of the Pentateuch (without Joshua) is to be found in the fact that it contains the Law of God, on which the whole national life was centred. (2) About 200 years later the first edition of the O.T. was expanded by the addition of the prophetic writings, or the major part of them, among which were included the historical books known as Samuel and Kings. (3) During the last two centuries B.C. various other additions were made at different times, known as "the writings," including

Job, The Psalter, the Minor Prophets, Proverbs, Ecclesiastes, Chronicles, etc.

For some time several of these books were the subject of considerable controversy, e.g. Esther, Ecclesiastes, etc., but by the decision of the synod of Jamnia their inclusion in the canon was finally sanctioned. It was the destruction of Jerusalem and the loss of the Temple that finally gave the O.T. its supreme place in the religion of the Jewish race, and its adoption by the Christian Church secured it a position which it could not otherwise have gained. The process of enlarging the canon was continued in Alexandria, after it was completed in Palestine. The Alexandrians made a fourth addition, consisting of the books which are now placed in the Apocrypha (q.v.). This addition is recognized as canonical by R.C.s, but not by Protestants. *See* Bible; Criticism, Biblical; Hexateuch; and the articles on the various books.

Old Trafford. Suburb of Manchester. In the W. of the city proper, it has rly. stations. Here is the cricket ground of the Lancashire County club and near is Trafford Park (q.v.). *See* Manchester.

Old Vic. London playhouse in Waterloo Road, S.E.1. Opened in 1818 as the Coburg, it was a favourite place of entertainment for many years, Edmund Kean appearing here on several occasions. It later became the Royal Victoria Hall, popularly known as the "Old Vic," and by mid-Victorian times had declined into a "coffee-music-hall." Taken over in 1880 by Emma Cons (q.v.) its entertainments included concerts, and performances of popular plays of an "uplifting" kind. It was not until Emma Cons's niece Lilian Baylis (q.v.) assumed management and launched regular performances of Shakespearean drama from 1914 that the theatre became the recognized home of Shakespeare and of opera in English during the 1920s. Under her management many fine productions were given by producers who included Robert Atkins, Andrew Leigh, Harcourt Williams, Tyrone Guthrie, and Henry Cass, and by performers including Edith Evans, Athene Seyler, Charles Laughton, John Gielgud, Laurence Olivier, and Nicholas Hannen. After it became associated with Sadler's Wells in 1931, the organization was known as the Vic-Wells.

During the Second Great War the Old Vic company transferred

its headquarters to Burnley in 1940, its own theatre having been badly damaged by bombs. From Burnley a series of companies toured England during 1941-44. In the latter year drastic alterations were made in the Old Vic's policy. In conjunction with C.E.M.A. (later the Arts Council, q.v.) the organization, apart from continuing to maintain companies at the Theatre Royal, Bristol, and the Liverpool Playhouse, founded a permanent repertory company for performances of the classics, and during 1944-50 gave seasons at the New Theatre, London, the Old Vic having ceased to be a "people's theatre" in the broadest sense. The directors were John Burrell, Laurence Olivier, and Ralph Richardson. In 1946 an experimental theatre, a theatre school, and a theatre for children were inaugurated. The school provided theatrical training in all its branches, and became a nursery for Old Vic companies; the theatre for children became the "Young Vic" and its company began to give successful performances at London and provincial theatres during 1947-48.

Terence Dennis

Old Wives' Tale, THE. Novel by Arnold Bennett, published 1908, and generally considered the author's masterpiece and among the greatest works of English fiction. Some 250,000 words in length, it relates with a tenderness and sympathy unusual in the author as well as with all his faithful observation of minute objective detail, the life stories of two sisters from childhood to old age and death. The period is Victorian, and the scene is principally the Potteries (or Five Towns), with a long interlude in Paris which includes a description of life there during the siege of 1870. In the writing of the MS. Bennett adopted an exquisite style of calligraphy and made astonishingly few corrections; a complete facsimile was published in 1927, in a limited edition, 2 vols.

Oleaceae. The olive family of trees and shrubs. They are natives of the tropical and temperate regions, chiefly of the N. hemisphere. They have opposite leaves and four-part flowers, the calyx and corolla being sometimes absent. Representative genera are *Olea* (olive), *Fraxinus* (ash), *Jasminum* (jessamine), *Syringa* (lilac), and *Ligustrum* (privet).

Olean. City of New York, U.S.A., in Cattaraugus co. It stands at the junction of the Olean

Creek and the Allegheny river, 70 m. S.S.E. of Buffalo, and is served by the Erie and other rlys. Its buildings include the state armoury. Near by is Rock City, a group of uniform conglomerate rocks about 40 acres in area. Olean lies near the Pennsylvania oil and natural gas region, for the produce of which it provides storage, also making oil-well machinery. Other industries include tanneries and engineering works. Settled in 1804, Olean came to life as a lumber camp. A city charter was granted to it in 1893. Pop. 21,506.

Oleander (*Nerium oleander*). Evergreen shrub of the family Apocynaceae, native of the Mediterranean region. The erect stems grow to a height of 14 ft., and the narrow lance-shaped, leathery leaves are in whorls of three. The large, bright-red, funnel-shaped flowers are produced in clusters. The plant grows by riversides, and all parts of it are extremely poisonous, so that care is needed in handling it, pruning, etc.

Oleandra. Small genus of tropical ferns, natives of Ceylon, Natal, N. India, Malaya, Mascarenes, and the W. Indies. Their average height is 1 ft., and in temperate climates they thrive in hot-houses in a mixture of peat and loam. They should be planted in early spring, and receive plenty of water until the autumn. Oleandras

Oleandra. Rootstock with leaves, one turned to show spores

are propagated by spores from the back of the leaves of the ferns, sown in sandy soil at an average temperature of 75°.

Olearia. Genus of trees and shrubs belonging to the family Compositae, natives of New Zealand and parts of Australia. They are distinguished by the fact that

Olearia. Flower clusters and leaves of *O. haasti*

they yield a multitude of small white or blue daisy-like flowers. *Olearia haasti* is the most familiar of the many species.

Oleaster (*Elaeagnus*). Genus of shrubs of the family Elaeagnaceae, natives of Europe, Asia, and N. America. The shrubs range in height from 5 to 20 ft., and thrive in any ordinary soil, especially in S. or W. positions. They are increased by seeds sown in boxes of light soil in early spring, or by cuttings taken in autumn. The flowers are yellow, white, and occasionally green in colour.

Olefines. Hydrocarbons having the general formula C_nH_{2n} . The simplest representative of the series is ethylene, C_2H_4 , also known as olefiant gas. The lower members are gases at the ordinary temperature, and are followed by others which are liquids and solids. The distinction between them and the paraffins is that the olefines do not carry the maximum complement of hydrogen. They are therefore unsaturated and readily form addition compounds. See Hydrocarbon.

Oleic Acid. Acid occurring in most natural animal and vegetable oils and fats as the glyceride triolein. At ordinary temperatures it is an almost colourless oily liquid, which on exposure to light and air slowly becomes yellow and rancid. See Fatty Oils; Soap.

Olein. Commercial term applied to triolein, the glyceride of oleic acid, and to any liquid oil obtained from fats by pressure. It is also applied to impure oleic acid and to the sylvpholeates. Triolein occurs naturally in fats and oils, and can also be prepared by heating glycerine with oleic acid. It is a colourless oily liquid devoid of smell and taste. The liquid is made on

a large scale commercially for the manufacture of margarine (*q.v.*).

Olekma. River of Asiatic Russia. Rising in the Yablonoi Mts., in the E. Siberian region, it flows N. into Yakutsk A.S.S.R. and discharges itself near Olek-minsk into the Lena, after a course of 700 m. The neighbourhood abounds in furred animals, especially the sable, and gold is found.

Ole Luköie (Dan., Olaf the Eyeshutter). The Danish equivalent of the legendary character known to children as the Dustman. It is the title of one of the longer stories of Hans Andersen. Ole Luk-Oie was also the pen-name adopted by Sir Ernest Swinton (*q.v.*) for his works of fiction.

Oleaster. Spray of foliage and flowers

Olenek. River of Siberia, in Yakutsk A.S.S.R. After a tortuous course of 850 m. it discharges into the Arctic Ocean at Ust-Olenok.

Olenellus. Genus of trilobites belonging to the Lower Cambrian series of rocks. The animal had a flat, tapering body of 14 or more jointed segments, covered with a hard shell like a lobster. The head was comparatively large and broad, the tail long and slender. The body, head, and tail were usually provided with slender spines. *Olenus* is a similar fossil belonging to the Upper Cambrian series of rocks. These are the oldest fauna discovered by geologists. See Trilobites.

Oleograph (Lat. *oleum*, oil; Gr. *graphein*, to write). Name given to a kind of chromolithograph which imitates the effect of an oil painting. The colours used are generally darker than the corresponding ones for ordinary chromolithographs, and the resultant print is mounted on canvas and varnished, to imitate still more closely the oil-painting effect.

Oléron. Island off the W. coast of France, opposite the mouths of the Charente and Seudre. About 18 m. in length and 7 m. in extreme

breadth, with an area of 66 sq. m., it is included in the department of Charente-Inférieure. The chief places are St. Pierre, Château d'Oléron, and St. Trojan-les-Bains. Pop. 15,000. Oléron lay within the Gironde redoubt left behind by the German army in its retreat from France, 1944; French troops of the 1st army took it, May 1, 1945, the last point in the Gironde pocket to be cleared of the enemy.

Oléron gave its name to a code of maritime law. This was composed of judgements of the maritime court here, together with a collection of the accepted customs of the sea. It was introduced into England in the 12th century, England and Aquitaine being then under the same sovereign, and had influence on later developments of this branch of law.

Olfactory Nerve. Nerve of smell. It arises from the brain by three roots, uniting in the olfactory tract, which expands at its end into the olfactory bulb. From the bulb about 20 fine prolongations are given off, which pass through the cribiform plate of the ethmoid bone, and terminate in the olfactory mucous membrane in the upper part of the nose and nasal septum. *See* Nerve; Nose.

Olga (d. 968). Russian saint. She was the peasant wife of Igor, third grand duke of Russia, who first met her while hunting, and married her about 913. She became regent for her son, Sviatoslav, and is said to have been a capable ruler. After Igor's death, 946, she carried out a terrible vengeance on the Drevliens, who were guilty of his death. She went to Constantinople, where she was baptized and received the name of Helen. She was canonised by the Greek Church. Her feast day is July 11, O.S.

Olhão. Seaport of Portugal, in the prov. of Faro. It stands on the S. coast in a garden-like region, facing the Atlantic, 6 m. by rly. E. of Faro. It is noted for its sardine fisheries and canning houses, and engages in boat-building and the manufacture of cordage and sails, exporting figs, almonds, carobs, chestnut, cork, sumach, baskets, and tunny fish. Pop. 14,500.

Olibanum Tree (*Boswellia serrata*). Small evergreen tree of the family Burseraceae, native of the East Indies. Its leaves are divided into two rows of oval-oblong leaflets with saw-toothed edges. The small white flowers are borne in sprays. From the bark exudes a resinous gum, olibanum, believed to be the frankincense

Olibanum Tree. Foliage and fruit of the East Indian evergreen. Inset, flower sprays

of the ancients. It is astringent and stimulant, but is chiefly employed as incense. According to some authorities true frankincense is the product of *B. carteri*, an African species.

Olifants. Name of several rivers in S. Africa, of which the following are the chief: (1) River rising in the mountains N.E. of Cape Town and flowing about 150 m. N.W. to the Atlantic. It supplies irrigation water to Van Rhyn's Dorp. (2) River rising in the Kareeberg, Cape Province, and flowing N.W. into Great Bushmanland. (3) Tributary of the Gouritz river, Cape Province, flowing W. from the neighbourhood of Uniondale. (4) Tributary of the Limpopo, rising near Ermelo, S.E. Transvaal, and running N. and then E. to the Limpopo, which it enters in Mozambique.

Oligarchy (Greek *oligoi*, few; *archein*, to rule). Political term, meaning government by the few. It was used by Aristotle to describe a perverted form of aristocracy; it was government by the few in their own interests, whereas aristocracy was government by the best men in the public interest. Some of the city states of Greece had an oligarchical government, and so had Venice and other Italian republics. A well-known British example was the Whig oligarchy brought into existence by the events of 1688. *See* Government; Politics.

Oligocene System (Greek *oligon*, a little; *kainos*, new). In geology, a subdivision of the Tertiary period of time. It was the epoch which followed the Eocene and preceded the Miocene. Sediments of the Oligocene occur in Hants, the Isle of Wight, and at Bovey Tracy, Devon, where they contain lignite and pottery clays.

Oligocene beds are also found in the Paris Basin (*q.v.*), containing the gypsum deposits of Montmartre, gritstones, and lignite. There are rocks of the same age in Belgium and Germany. In the New World, the White River formation of Colorado is of this age, while Oligocene beds are known in the N.W. Territory of Canada. The beds are rich in fossil remains, including that of the three-toed horse, *Meshippus*, crocodiles, turtles, large land snails, insects, etc. *See* Eocene; Geology; Miocene.

Oligoclase (Gr. *oligon*, little; *klasis*, fracture). In geology, name given to one of the plagioclase (*q.v.*) or soda-lime feldspars. It is a sodium-calcium aluminium silicate, white with occasional grey, green, or red shades, and has a vitreous lustre. Varieties of oligoclase containing finely scattered grains of iron oxide are polished to make the gems known as sun stones. Oligoclase is found in subacid and intermediate igneous rocks (syenites, diorites, and their volcanic equivalents); accompanying orthoclase in many granites; and in metamorphic rocks, e.g. schists and gneisses.

Olinda. City of Brazil, in the state of Pernambuco. It stands on the coast, 4½ m. by tramway N. of Recife or Pernambuco. It has a cathedral, botanical gardens, colleges, law school, and a wireless telegraphy station. It was founded in 1535, and was the capital of the state for over 200 years, until superseded by Recife. Pop. 8,000.

Oliphant, LAURENCE (1691-1767). Scottish Jacobite. Of the family of Oliphant of Gask, prominent Perthshire royalists, he took part in the rising of 1715, and became laird of Gask on his father's death.

Laurence Oliphant, Scottish Jacobite

1732. He accompanied Charles Edward in the '45, and, with his son Laurence (1724-92), fought at Prestonpans, Falkirk, and Culloden. After the last battle father and son escaped abroad and the estate was forfeited. The elder returned to Scotland in 1763, his lands having meanwhile been purchased on his behalf from the crown, and died in Jan., 1767. *See* Nairne, Baroness.

Oliphant, LAURENCE (1820-88). British author. He was born at Cape Town, a son of the attorney-general of Cape Colony, educated in

Ceylon, and practised at the colonial bar. In 1853 he became private secretary to the earl of

Laurence Oliphant,
British author

and for a short time joined his religious community at Brocton, N.Y. Oliphant afterwards acted as correspondent for *The Times* in the Franco-Prussian War, and interested himself in a scheme for settling the Jews in Palestine. He died Dec. 23, 1888. Among his works are several travel books; *Piccadilly*, 1870, a brilliant satire; the mystical *Sympneumata*, 1885; and *Scientific Religion*, 1888.

Oliphant, MARCUS LAURENCE ELWIN (b. 1901). An Australian physicist, born at Adelaide, Oct. 8, 1901. He was educated at Adelaide high school and Trinity College, Cambridge. He became assistant director of research, Cavendish Laboratory, Cambridge, in 1935, and professor of physics at Birmingham university in 1937; then in 1948 was designated director of post-graduate research in physical sciences in the national university of Australia. He wrote on electricity in gases, surface properties, and nuclear physics, and was one of those who developed the atomic bomb.

Oliphant, MARGARET OLIPHANT (1828-97). British author. Born April 4, 1828, in Midlothian, she made her reputation with her first book, *Passages in the Life of Mrs. Margaret Maitland*, 1849, and thereafter produced more than 100 books. In 1859 her husband, Francis Wilson Oliphant, died, and her industry was the sole support of her own three children, and after 1864 of a widowed brother and his three children as well. Mrs. Oliphant died at Windsor, June 25, 1897. Among her best known novels are *Caleb Field*, 1851; *Lilliesleaf*, 1855; *Zaidee*, 1856; *Salem Chapel*, 1863; *The Minister's Wife*, 1869; *The Wizard's Son*, 1884; *Kirsteen*, 1890. She also wrote historical

M. O. Oliphant,
British author

works and popular biographies of Edward Irving, 1862, and S. Francois of Assisi, 1871.

Olivares, GASPAR DE GUZMAN, COUNT OF (1587-1645). Spanish statesman. Born at Rome, Jan. 6, 1587, he was educated at Rome and Salamanca. Securing a position at court, he became first minister of the crown and grand chamberlain to Philip IV, and for 24 years was the real ruler of Spain. While vigilant and hard-working, he brought the country to the verge of ruin by harsh taxation. He was outmanoeuvred by Richelieu, and the warfare to which he committed Spain brought no profit. Revolts having broken out in Portugal and Catalonia, Olivares was exiled in 1642 and died July 22, 1645.

Olive (*Olea europea*). Small evergreen tree of the family Oleaceae (q.v.), native of the Mediterranean region. It attains a height of about 20 ft., and has almost four-sided spiny branches and opposite oblong leaves. The small, white funnel-shaped fragrant flowers are produced in panicles, and the fruit is a small plum. This is the wild form. Pickled olives and olive oil are the produce of the variety *sativa*, which has been cultivated from time immemorial. It differs from the wild form in the branches being less square, without spines, the leaves more lance-shaped, and the fruit much larger and more fleshy. The oil is obtained from the fleshy part of the fruit by pressure, but much of the "olive oil" of commerce is more or less extensively adulterated with oils of cotton-seed, monkey-nut, sesame, and walnut. Pickled olives have had their natural bitterness reduced by soaking in a solution of lime and wood-ashes, after which they are bottled in salt and water variously flavoured.

The olive is cultivated occasionally in Great Britain as a greenhouse plant, and outdoors in a few favoured S. and W. localities. It is of easy culture in well-drained loam, and may be propagated by

means of cuttings of firm shoots or by seeds, treated as half-hardy subjects. Several species from the Cape of Good Hope (*O. capensis*, *O. laurifolia*, *O. verrucosa*) are found in cultivation.

Olive Branch Petition. Name given to a petition by the American colonists in 1775 pleading for the recognition of their constitutional claims by the British government. The petition was a last effort for a peaceful settlement, though hostilities had already begun when it was sent. The deputation was not allowed to present the petition. See *United States: History*.

Olive Oil. Oil obtained from the ripe fruit of *Olea europea*, the olive tree of S. Europe. Extensively used in cookery in S. Europe, it is chiefly employed in the N. as salad dressing. It is nutritious and mildly laxative, and finds uses as a constituent of ointments, liniments, cosmetics, and soaps.

Oliver (Lat., olive). Masculine Christian name. Feminines are Olive and the less familiar Olivia. Oliver was the name of one of the twelve peers of Charlemagne, and the phrase a Roland for an Oliver refers to the tremendous blows struck by these heroes when fighting in Spain. See *Roland*.

Oliver, EDNA MAY (1883-1942). American actress. Her real name was Nutter. Born at Boston, Mass., Jan. 12, 1883, she intended to become a singer, but owing to lack of means went on the stage, making her debut at Boston in 1911.

From her entry into films in 1929 she was a famous portrayer of eccentrics and dowagers, giving

memorable performances as Betsey Trotwood in *David Copperfield*, and as the Nurse in *Romeo and Juliet*. One of her last rôles was that of Catherine de Burgh in *Pride and Prejudice*, 1940. She died Nov. 9, 1942.

Oliver OR OLIVIER, ISAAC (c. 1556-1617). Anglo-Fr. miniature painter. After living in Rouen he settled in London, where he died Oct. 2, 1617, being buried in S.

Count of Olivares,
Spanish statesman

Olive. Foliage and flowers
of this South European tree

Edna May Oliver,
American actress

Anne's church, Blackfriars. Among his famous miniatures were those of Sir Philip Sidney and Henry, prince of Wales, both at Windsor Castle. He also executed some minutely finished portraits in oils. Isaac's son Peter (1594-1648) was another celebrated miniaturist.

Oliver, Victor (b. 1898). Austrian-born British comedian. Son of Baron von Samek, he was born July 8, 1898, and educated at Vienna university. Renouncing his title, he became a pianist, but in 1926 went to the U.S.A., toured in vaudeville, and first appeared on the New York stage in 1929. His London debut was at the Palladium in 1931, and he was in demand as a compère of revue and musical comedy, e.g. *Black and Blue*, 1939; *Get a Load of This*, 1941; *The Night and the Music*, 1945. In 1938 he won a radio popularity contest. He was married from 1936 to 1945 to Sarah, daughter of Winston Churchill.

Oliver Twist. Charles Dickens's first long continuous story. It appeared serially in Bentley's *Miscellany*, under his own editorship, Feb., 1837-March, 1839, with the sub-title *The Parish Boy's Progress*. The original book edition had illustrations by Cruikshank. Earlier instalments were written and published contemporaneously with the writing and publishing of the monthly parts of *The Pickwick Papers*. Branding the old workhouse system, it also pictures contemporary crime in its "miserable reality." Famous characters include Bumble, the pompous parish beadle and later workhouse master; Fagin, the old Jew who ran a gang of thieves; Bill Sikes, the brutal burglar and murderer; and the Artful Dodger, a diminutive pick-pocket. Oliver's "asking for more," which has become proverbial, refers to his appeal for a second helping of workhouse gruel. There have been several stage versions, Tree having been a memorable Fagin. A British film version was shown in 1948.

Olives, Mount OF, OR OLIVER. Mt. about 2,700 ft. high, situated E. of Jerusalem, from which it is separated by the valley of the Kidron. Its chief associations are with the life of Christ. On the brow

of the mountain He wept over Jerusalem; and from its summit He ascended into heaven. *See* Bethany.

Olivetans. Reformed branch of the Benedictine Order, known as the Congregation of Our Lady of Mount Olivet. It was founded in 1313 at Siena by Giovanni de' Tolomei, professor of philosophy in the university there, who became their first abbot-general in 1319. The Olivetans follow the rule of S. Benedict, but with somewhat stricter observances.

Olivier, Sydney Haldane OLIVIER, 1st BARON (1859-1943). British politician and reformer. Son of a clergyman, he was born April 16, 1859, and educated at Tonbridge and Corpus Christi, Oxford, joining the Colonial Service in 1882. He early became associated with the Fabian Society, of which he was secretary, 1886-1890. He held a number of appointments in the W. Indies; colonial secretary of Jamaica, 1899-1904, he returned there as governor in 1907, and was knighted in that year. He was permanent secretary of the board of agriculture 1913-17, then assistant comptroller and auditor of the exchequer, retiring in 1920. In 1924 he was secretary for India in the Labour government, being raised to the peerage. He was a member of the commission which investigated the sugar industry in the W. Indies and British Guiana, 1929-30. His publications included *White Capital and Coloured Labour*, 1906; *The Anatomy of African Misery*, 1927; *Jamaica: the Blessed Isle*, 1936, as well as a volume of light verse. He died Feb. 15, 1943.

Olivier, Sir Laurence Kere (b. 1907). British actor and producer. Born at Dorking, May 22, 1907, he was educated at St. Edward's School, Oxford, and

after studying with Elsie Fogerty, joined the Birmingham Repertory in 1926. He acted in London in *Bird in Hand*, 1928, and *Beau Geste*, 1929, in which year he first visited New York. He sprang to fame in 1935 by interchanging with John Gielgud the parts of Romeo and Mercutio at the New Theatre. In 1937 he joined the Old Vic company, giving virile performances as Hamlet, Henry V, and Macbeth. Co-director of the company, 1944-46, he played Richard III, Hotspur, Shallow, Astrov in *Uncle Vanya*, and Sergius in *Arms and the Man*, and achieved a triumph in *Oedipus Rex* and *The Critic* in the same programme. In 1945 he produced *The Skin of Our Teeth* and in 1949 *A Streetcar Named Desire*, in both of which his wife Vivien Leigh (q.v.) played the leading parts.

Olivier entered films in 1930, and took leads in *Wuthering Heights*, 1939; *Rebecca*, 1940; *Pride and Prejudice*, 1940; *Lady Hamilton*, 1941. He achieved international fame with a screen version of *Henry V*, 1944, of which he was director and star, as he was of a screen version of *Hamlet*, 1948. He was knighted in 1947.

Olivine. In mineralogy, a ferrous and magnesium orthosilicate. The name is given to the intermediate members of the olivine isomorphous series of minerals, which range from the magnesium-rich forsterite (q.v.) to the iron-rich fayalite (q.v.). All olivines are so called because of their olive-green colour. The mineral is a common constituent of igneous rocks, especially basalts, and is often found in meteoric stones; fayalite is occasionally found in acid igneous rocks. Cut and polished, it is used as a gem stone under the names of chrysolite and peridot. Olivine easily weathers into serpentine or hydrated magnesium silicate. *See* Chrysolite; Peridot; Serpentine.

Olla Podrida (Span., putrid pot). Name originally given to fragments of meat, vegetables, etc., collected in a pot, and later to the favourite Spanish dish of highly seasoned stew. The name alludes to the contents of the pot being cooked until the solid parts fall to pieces, and the French equivalent is *pot-pourri* (putrid pot), most

Sir Laurence Olivier, British actor

Mount of Olives, from the Kidron valley. In the foreground to the right is the Tomb of Absalom; above is the Russian Gethsemane Church

familiar in the sense of a vase of dried flower-petals. The term, like hotch-potch, is also applied to any miscellaneous collection, such as a literary or musical medley.

Ollerton. Market town of Nottinghamshire, England. It stands on the river Maun, 9 m. N.E. of Mansfield, and has a rly. station. It is a convenient centre for visitors to Sherwood Forest and the Dukeries (*q.v.*) The nearby village of New Ollerton was built to house the workers in the colliery of that name. Pop. 4,500.

Olmütz OR **OLOMOUC.** Town of Czechoslovakia, in Moravia. It stands on the right bank of the March, 41 m. N.E. of Brünn. The site of the fortifications is laid out with promenades, and there are a park and a kursaal. The cathedral of S. Wenceslaus is a 14th century Gothic structure, and S. Mauritius' Church, belonging to the 11th and 12th centuries, is noted for its organ. Other buildings include the archiepiscopal palace and the old town hall. Olmütz was unsuccessfully besieged by the Prussians in 1758. Pop. 60,030.

Olmütz, CONVENTION OF. Agreement signed at Olmütz, Nov. 29, 1850, by Austria and Prussia. It restored the Austrian, as against the Prussian, influence among the German states, shaken by the events of 1848-49, and left the difficulties in Hesse-Cassel and Schleswig-Holstein to be settled by all the German states. *See* Germany: History.

Olney. Market town of Buckinghamshire, England. It stands on the Ouse, 11 m. W. of Bedford

Olorgesallie. Early Stone Age site in Kenya. Situated near Lake Mogadi at the foot of Mt. Olorgesallie, it was first excavated in 1942 by Dr. L. Leakey. The site yielded one of the most complete Stone Age camps ever discovered; weapons, tools, and ornaments suggested greater advance in arts and crafts than previously had been suspected of that age. Bolas were found to indicate that Stone Age man hunted animals in much the same manner as do the gauchos of S. America.

Olsa. Tributary of the river Oder, rising in the Tatra Mts. In 1920 this river marked the general frontier between Poland and Czechoslovakia, except that at one or two places the Czechs occupied small areas on the E. bank.

Olštyn. Polish form of the name of the former E. Prussian town of Allenstein (*q.v.*); it became the capital of the new Polish prov. of Masuria (*q.v.*), 1945.

Olten. Town of Switzerland, in the canton of Solothurn. On the river Aar, 25 m. by rly. S.E. of Basel, it is an important rly. junction with large rly. engineering workshops. It is a tourist resort, and manufactures footwear. Pop. 15,287.

Olenitza. Town of Rumania. It stands on the left bank of the Danube, 35 m. S.E. of Bukarest, at the mouth of the Argesul. It is a river port and terminus of a branch rly. from the capital. Pop. 10,396.

Oltu. Rumanian name of the tributary of the Danube known also as the Aluta (*q.v.*).

Olympia. Small plain in Elis in the Peloponnese, Greece, in ancient times the scene of the Olympic games (*q.v.*). It was situated on the right bank of the Alpheus, where it joins the Cladeus. *See* illus. in next page.

Olympia. City of Washington, U.S.A., state capital, and co. seat of Thurston co. It stands on a

promontory at the S. extremity of Puget Sound, 70 m. by rly. S.W. of Seattle, and is served by the Northern Pacific rly. and by steamers. Chief buildings are the capitol and federal building. The port of Olympia (700 sq. m.) established in 1926 receives annually over 200 ships trading in timber products, building stone,

oysters, oil, and fruit. It was the first port of entry on Puget Sound, though a customs house there dates from 1851. The Deschutes river supplies water power for industry in Olympia. Pop. 13,254.

Olympia. London place of exhibition and entertainment. Situated in Hammersmith, it was opened in 1886 as the National Agricultural Hall. Later additions were the National Hall, 1922, and the Empire Hall, 1930. It is now the largest exhibition building in Great Britain, with floor space of 450,000 sq. ft. Among the outstanding early events at Olympia were: Paris Hippodrome, 1886; Barnum's Circus, 1889; the first international motor show, 1896; Buffalo Bill, 1902; Cochran's production of the Miracle, 1911; and the Carpentier-Gunboat Smith heavyweight championship fight, 1914. Annual shows there have included: Ideal Home Exhibition, British Industries Fair (part), Royal Tournament, Radiolympia, Shoe and Leather Fair, International Horse Show, and International Motor Show; also Bertram Mills's circus.

Olympia was requisitioned by the govt. in the First Great War as a German civilian internees' camp and then as an army clothing depot. During the Second Great War, in which the buildings suffered some bomb damage, it was in turn a civilian internment camp, an army vehicle depot, a Free French reception depot, an R.A.O.C. depot, a mess for H.Q. 21 army group, and a demobilisation centre.

Olympiad. The period of four years which elapsed between each celebration of the Olympic games. The Olympiad was the basis of a system of chronology used by the Greek historians, events being reckoned as so many olympiads from the first celebration.

Olympic Games. In ancient Greece, a great athletic festival held at Olympia; also a modern international athletic festival. The ancient festival, which was in honour of Zeus, lasted five days, and took place every four years at the first full moon after the summer solstice. There was a record of victors from 776 B.C., but the games were regularly held long before that date. By 620 B.C. the festival had been thrown open to all free-born Greeks. It was abolished in A.D. 394. During the celebration a truce was observed by the various Greek peoples, and visitors flocked from all parts to the games.

The centre of the festival was the precinct consecrated to Zeus and

Olney, Buckinghamshire. Summer-house in the garden adjoining Cowper's house, where The Task and John Gilpin were written

and 55 m. by rly. from London. Its large and beautiful church of S. Peter and S. Paul is a fine example of the Decorated style. Olney is known for its associations with William Cowper and John Newton. Cowper's house in the market place is now a museum devoted to the two men. Market day, Thurs. Pop. 2,400.

Olympia. Reconstruction of the ancient Greek sanctuary where the great games were held. 1. Palaestra or wrestling ground. 2. Hill of Cronos. 3. Philippeum, erected by Philip of Macedon. 4. Heraeum, temple of Hera. 5. Hall of Herodes Atticus, a famous Sophist and public benefactor. 6. Pelopium, grave of Pelops. 7. Treasuries. 8. Metroum.

temple of Cybele, mother of the gods. 9. Arcadian mountains. 10. Site of the city of Phrixia. 11. Porch of Echo. 12. Great altar of Zeus. 13. Temple of Zeus. 14. Statues of Messenian boys. 15. Statue of Nike, goddess of victory. 16. Festival gate. 17. Sacred olive tree. 18. West Altis wall, enclosing sacred precincts. 19. Procession street.

known as the altis, an enclosure 750 ft. by 550 ft. Here stood a temple of Zeus containing the magnificent statue of the Olympian Zeus by Pheidias, the Heraeum or temple of Hera, and other temples, treasuries in which the Greek states deposited their offerings, and the *bouleuterion*, or council chamber, for the accommodation of the presidents of the games. The site has been excavated since 1875 by German archaeologists, and among the results was the discovery of the exquisite statue of Hermes by Praxiteles. Outside the altis stood the palaestra or wrestling ground, the stadium or racing track, with accommodation for about 40,000 spectators, the hippodrome where the chariot racing took place, and the gymnasium where the competitors did their final training.

In historical times the chief events were: foot races, long and short, chariot races, the *pancratium*, a combination of wrestling and boxing, and the *pentathlon*, a combination of long jumping, throwing the discus and the javelin, running, and wrestling. The prizes were wreaths of olive, but a successful competitor enjoyed free maintenance for life by his native city, or received some other tangible reward for the honour he had brought to it. (See Ladas; Ludi.)

MODERN FESTIVALS. Olympic games, with an international entry, were held in Athens, 1896; Paris, 1900; St. Louis, U.S.A., 1904; London, 1908; Stockholm, 1912. Owing to the First Great War, the sixth meeting, due in 1916 in Berlin, was postponed until 1920, when it took place at Stockholm. Thereafter the games were held in Paris, 1924; Amsterdam, 1928; Los Angeles, 1932; Berlin, 1936. Nazi Germany made lavish preparations for these last games, which became a display of propaganda for the regime and were marred by exhibitions of racial prejudice when several events were won by negroes. The meeting of 1940 was allotted first to Tokyo, then to Helsinki, but was not held because of the Second Great War; that of 1944 was likewise abandoned. The 14th meeting, held in the London area, July-Aug., 1948, was actually the 11th to take place, but it is a rule that cancellation of any meeting must not alter the numbered sequence. New events in 1948 included rifle shooting. A pentathlon of winter sports was held at St. Moritz, Switzerland, Jan. 30-Feb. 8, 1948, nearly 1,000

athletes from 28 nations competing. See Athletics; Marathon.

Olympic Line. Greek defensive position of the Second Great War. It extended from the Aegean Sea E. of Mt. Olympus to Veria and Edessa, thence N. to the Yugoslav frontier, having a total length of 100 m. The line was naturally strong against a frontal attack, but could easily be outflanked by an advance through a valley from Monastir, Yugoslavia. When the Germans attacked on April 10, 1941, the line was held by the N.Z., 6th Australian, and the 12th and 20th Greek divisions. By April 13 heavy enemy pressure, coupled with a threat from the flank, compelled the Allies to withdraw to the Thermopylae line. See Greece in Second Great War.

Olympus. Name of several mts., or mt. ranges, in ancient Greece. The best known forms the boundary between Macedonia and

thiacs, vainly urged his countrymen to send help. Excavations have been carried out by American archaeologists.

Om or **On** (Skt.). In Hindu religious literature, a solemn affirmation. The teacher begins and the pupil ends each lesson in the Veda with this word, which is equivalent to the Christian Amen (q.v.). Mystically, Om is regarded as symbolising the Hindu triad, Vishnu, Siva, and Brahma.

Omagh. Market town, urban dist., and county town of Tyrone, N. Ireland. It stands on the Strule, 34 m. S. of Londonderry, and has a rly. station. The chief buildings are the R.C. cathedral and the Protestant church. There are remains of an early castle rebuilt 1641. Linen is manufactured, and milling is another industry. The town, on its steep slope, is said to have grown around a religious house founded before 800.

In 1689 the force of James II damaged it. Market day, Sat. Population 5,741.

Omagua (flat-head). South American Indian tribe of Guarani stock, on the upper Ucayali river, Peru. Under Andean influence they formerly practised head-shrinking. Their fabled wealth led to several 16th century expeditions. For a century they have intermingled with other tribes. In Brazil they are called Umauas, perhaps their original name.

Omaha. Tribe of American Indians. They lived in what is now the state of Nebraska, and carried on a long and bitter war with the Sioux. The remnants of the tribe live on a reservation in Nebraska. The name means people of the upper stream.

Omaha. City of Nebraska, U.S.A., the co. seat of Douglas co. The largest commercial and industrial city of the state, it stands on the Missouri river, about 500 m. N.W. of St. Louis, and is served by eight major rly. systems, as well as the trans-Continental Union Pacific, of which it is the E. terminus. The city is built on a plateau, the commercial portion lying below the residential quarter, close to the river, which is here spanned by three bridges communicating with Council Bluffs. Among notable buildings are the city hall, the U.S. government building, two cathedrals, a public

library, a convention hall and auditorium, and several imposing business blocks. It is the seat of Omaha and Creighton universities, and has, among other educational establishments, two medical colleges.

Omaha has upwards of 1,000 acres of parks, and the military headquarters of the Department of the Missouri, which covers 80 acres. The Union Pacific rly. has extensive workshops, and here, also, is one of the best equipped plants in the world for the smelting of gold, silver, copper, lead, and zinc. Other industries include meat-packing and the manufacture of motor vehicles. Settled in 1854, Omaha was chartered as a city in 1857, and from its settlement down to 1867 was the state capital. South Omaha, until then an independent city, was incorporated with Omaha in 1915. The population is 223,844.

Omaha Beach. Operational code name given at the time of the Allied invasion of W. Europe, June, 1944, to the stretch of beach between Port-en-Bessin and the Vire river, in Calvados dept., France. Here the U.S. 5th corps landed on June 6. The troops met with the strongest opposition experienced on D-day, as the Germans, although in ignorance of the impending assault, had chosen that time and area to hold an anti-invasion exercise.

Oman. State of Arabia. It stretches for about 1,000 m. along the coast of S.E. Arabia, being bounded on the land side by the desert. Its area is about 82,000 sq. m., and the pop. about 500,000, chiefly Arabs, but some negroes. Much of the surface is mountainous, reaching 9,000 ft. in the Jebel Akhdar, but these are a coastal plain and an inland plateau. The chief products are dates and other fruit. Muscat is the capital, and Matrah the biggest town. In 1741 an Arab chief, having seized Muscat, called himself imam or ruler of Oman, and his descendants have since kept their authority. The area under their rule has varied considerably, having been especially extensive about 1800, when it included part of E. Africa. The government of British India, which had a resident at Muscat, found it necessary from time to time to interfere in the affairs of Oman, the integrity of which was last guaranteed by Great Britain in 1939.

Oman, GULF OF. N.W. extension of the Arabian Sea. It lies between Oman, S.E. Arabia, and Makran, Persia. It leads to the

Olympus. Highest peaks of the mountain famous in the history of ancient Greece, with their modern names. A. Throne of Zeus. B. Peak Venizelos. C. Cock's Comb. D. Virgin. E. Tarpeian Rock. F. Black Peak

Thessaly, the highest peak of which reaches an alt. of 9,800 ft. On its snow-capped summit the ancient Greeks placed the home of the gods, whence Olympus came to be used as a synonym for heaven, and later for the sky. Other mts. of the same name were in Lycia and Mysia in Asia Minor, in Cyprus, and in Laconia.

Olynthus. Ancient Greek city in Chalcidice, at the head of the Toronaic Gulf, a few miles from the coast, where Micyberna was its port. Under Perdiccas II it became a place of considerable importance. After the Peloponnesian war, in which it assisted Sparta against Athens, it was the head of a confederacy of Greek cities, and maintained its independence until besieged and captured in 348 B.C. by Philip of Macedonia, who sold its inhabitants into slavery. In its last extremity it appealed to Athens, and Demosthenes, in a series of speeches known as Olyn-

N.W. through the Strait of Ormuz to the Persian Gulf, and is over 200 m. wide at its entrance.

Oman, SIR CHARLES WILLIAM CHADWICK (1860-1946). British historian. Born in India, Jan. 12,

Sir C. W. Oman,
British historian
Russell

1860, and educated at Winchester and New College, Oxford, he became a fellow of All Souls, devoting himself largely to military history. In 1891

appeared his *Warwick, the King-maker*, and in 1898 his *History of the Art of War in the Middle Ages*. His *History of the Peninsular War*, 5 vols., 1902-14, cannot rival Napier in style and life, but it corrects some errors made by the earlier writer. Oman also wrote *Wellington's Army*, 1912, and popular *Histories of Greece, England, and Europe*. From 1905 he was Chichele professor of modern history at Oxford until his retirement in 1946. He was M.P. for Oxford university 1919-35, and knighted in 1920. He died June 23, 1946. His daughter, Carola Oman, was also known as a historian.

Omar (d. 644). Mahomedan caliph. One of those who were attracted to Mahomet, he became a leader of the new faith. In 634 he succeeded Abu Bekr as caliph, and held that position for ten years before being murdered by a slave. Omar carried on a warlike policy, bringing Palestine, Syria, and Egypt under his rule and crushing the Persians. He also ordered the internal affairs of the caliphate and was the first to bear the title Commander of the Faithful. The Mosque of Omar at Jerusalem, which he is said to have built to hold the rock from which Mahomet ascended to heaven, perpetuates his name. See Jerusalem.

Omar Khayyám, HAKIM (c. 1071-1123). Persian poet, astronomer, and mathematician. Born at Nishapur, Khorassan, he is said to have studied under the imam Mowaffak with Hassan-al-Sabbah, later founder of the secret sect of Assassins (q.v.), and Nizam-al-Mulk, who became vizier of Malik Shah. Khayyám means tent maker, which was perhaps the trade of his father. Omar helped to revise the Persian calendar, compiled astronomical tables, and wrote on mathematics. In Europe he was chiefly known as author of a work on algebra until attention

was drawn to his value as poet by the rendering into English, by Edward FitzGerald (q.v.), of part of his Rubáiyát (q.v.) or quatrains. These have been variously interpreted as praise of love and wine and of making the best of the present world because it is the human all-in-all, and as a Sufiite allegory in which wine is an emblem of God. As rendered by FitzGerald, the Rubáiyát is frankly an expression of hedonism touched with a certain melancholy that attunes with western as well as eastern pessimism.

Though much of it is mystical, there runs through it a strain of protest against bigotry which caused the poem to be judged heretical by some Mahomedans. Consult *Life*, J. K. M. Shirazi, 1905; *O. K. and His Age*, O. Rothheld, 1923.

Ombre. Card

game. Popular at the end of the 18th century, it is of Spanish origin, the name Ombre signifying the Man. It is played by three persons with a pack of 40 cards, the 8, 9, and 10 of each suit being thrown out. The peculiarity of the game is that cards have different values when forming the trump suit; and that certain black cards are trumps even when the trump suit is a red one. The game has a nomenclature of its own, Ace of spades (invariably the highest trump card) being *spadille*; 7 of hearts or diamonds, *manille*; Ace of clubs, *basto*; Ace of a red trump suit, *ponto*.

Nine cards are dealt to each player, three at a time, the remainder forming the stock or *talon*. The player on the dealer's right is the *ombre*, who plays against the combined efforts of the other two, as in three-handed solo. The *ombre* has the naming of the trump suit and also the privilege of changing any of his cards for those in the *talon*. If he is satisfied with his cards, and thinks he can make the majority of the tricks, he says "I play." The player on his right has the chance of calling over him and becoming the *ombre* if he decides to play from his original hand (termed *sans prendre*); or should he pass, the third can do so. If the *ombre* discards, the other players have the same privilege. Tricks are made as in a solo call. If the *ombre* makes all nine tricks

he scores a *vole*, and is paid a larger stake. There is a classic description of a hand at ombre in Pope's *Rape of the Lock*.

Omdurman. City of the Anglo-Egyptian Sudan. Situated on the left bank of the Nile, facing Khartum, and stretching for 7 m. along the river, it is the headquarters of the chief native traders of the Sudan, and an important native mart. As the resting place for pilgrims from the Western Sudan on their way to Mecca it was venerated by the Mahomedan tribes of North-Central Africa. During the regime

Omdurman, Sudan. House of the Khalifa Abdullah el Taashi

of the Mahdi (q.v.) this old dervish capital became the chief place in his empire and rallying place for his forces. The ruins of his tomb are in the centre of the city which has technical and other schools. Pop. 116,196.

Omdurman, BATTLE OF. Fought between the British and Egyptians and the forces of the Khalifa, Sept. 2, 1898. After his victory at the Atbara, Kitchener prepared for a further advance along the Nile, and in Aug., his force having been strengthened, he set out for Khartum. His own army, consisting of two British and four Egyptian brigades with attendant artillery and cavalry, marched along the W. bank of the river; on the E. marched a body of Arab irregulars, and in the Nile itself were the gun-boats. Altogether he had 26,000 men.

On Sept. 1 the gunboats were able to shell Omdurman, and that night Kitchener's force encamped in a zareba with the Nile behind them, about 4 m. from Omdurman. In the early morning the battle began with a dervish attack, easily repulsed. The British, anxious to seize Omdurman before the enemy could return to it, began to march forward, but danger threatened them from forces hidden in and behind the hills to right and left. One body was assailed by the 21st Lancers, in what has been called the last classic cavalry

charge in the history of warfare; the enemy held their ground and the Lancers had to cut their way through, losing heavily. Meanwhile the brigade under Hector Macdonald in the rear, was assailed from both sides, one attack being delivered by 15,000 picked men. For a moment the danger was real, but other brigades were able to assist and the enemy was beaten off. Omdurman was soon entered. The British and Egyptians lost about 500; the dervish loss was estimated at 10,000 in addition to 5,000 prisoners. Winston Churchill was in the battle as a subaltern taking part in the charge of the 21st Lancers and described it in *The River War*, 1899. See *Atbara*; *Egypt*; *Kitchener*.

Omelette. Dish made with eggs beaten up. A savoury omelette is seasoned with salt and pepper, and mixed with herbs, chopped kidneys, bacon, tomatoes, cheese, etc.; a sweet omelette is mixed with sugar, and flavoured with jam, maraschino, etc. A piece of butter is put in the pan, and when melted the mixture is added, stirred with a fork, cooked quickly, and served very hot. The word *omelette* is French, a corruption of *la lamelle*, from Lat. *lamella*, little plate.

Omen (Early Lat. *osmen*, probably from *audire*, to hear). Phenomenon observed as a means of divination (*q.v.*). The practice of observing omens is widespread, and was elaborated into systems by the Babylonians, Greeks, Etruscans, and Romans. Among omens observed by the Romans were lightning, the flight and feeding of birds, and the meeting with various animals. Omens were interpreted by the augurs and haruspices, and were especially looked for at sacrifices, *e.g.* by inspection of the entrails of the victim, and from chance utterances of the bystanders, who were enjoined to speak no ill-omened words. Words of ill-omen might be countered by a ready retort. See *Augur*; *Shamanism*.

Omentum. Fold of the peritoneum which connects the stomach with other internal organs.

Omeo. Agricultural and mining town in a dairy farming district on Livingstone Creek, Victoria, Australia. The town, 84 m. N. of the rly. at Bairnsdale, is a tourist centre for the grand mountain scenery of the Australian Alps, and is snowbound in winter. There are mineral and marble deposits, and mining interests are active. Settlement dates from 1835. Pop., town, 600; dist., 2,700.

Omniads, OMMAYADS, OR UMAYYADS. Dynasty of caliphs. Founded by Moawiya (c. 610–80), with the capital at Damascus, the dynasty lasted until 750, when it was replaced by that of the Abbassides (*q.v.*). The last of the Omniads, Abd-ur-Rahman I, made his way to Spain and founded another Omniad dynasty at Córdoba, which existed until 1031, when it ended with Hisham III.

Omnibus (Lat., for all). Public conveyance, carrying passengers for hire, over a regular route, taking them up or setting them down at fixed points. For fuller details and illus. see *Bus*, the form to which the word has been shortened in common speech. The term was also formerly used for a large box in a theatre which was let out on subscription to a group of patrons (*cf.* A Row in an Omnibus, in *The Ingoldsby Legends*).

In the 1920s the word came into use again to describe, by false analogy (false, because the intention was to suggest large size rather than universal appeal), a single volume containing several associated books. The vogue for omnibus volumes began with *The Forsyte Saga*, by Galsworthy, published 1922, which comprised within a single book the reprint

of three novels and two short stories. Similar groups of novels by Arnold Bennett, R. H. Mottram, and other novelists followed, as well as selections, or complete collections, of short stories by H. G. Wells, W. W. Jacobs, O. Henry, Galsworthy, etc., and of plays (Barrie, Galsworthy, etc.). Later many special kinds of omnibus books were issued, associating the

works of different authors by a unity of subject, *e.g.* detective fiction, books for children: really large-scale anthologies. The only novelty was the convenience of the single volume, which in effect enabled purchasers to acquire several books for the price of one. Yet even this was less of a novelty than might be thought as the Bible itself is an omnibus volume.

Omphacite. In petrology, name given to a pale green variety of pyroxene (*q.v.*). See *Eclogite*.

Omphalē. In Greek legend, wife of Tmolus, a Lydian king, whose kingdom she ruled after his death. When Hercules was condemned to a period of slavery as a punishment for the murder of Iphitus, Omphalē bought him, and the hero and the queen became deeply enamoured of each other.

Omsk. Town in the Omsk region of Siberia, R.S.F.S.R. Built on the right bank of the Irtysh at its confluence with the Om, it was the former capital of Akmo-linsk prov. and of the general government of the steppes. A fort was established here in 1716 to protect Russian settlers from Kirghiz raids. After the revolution of 1917, various governments rapidly succeeded one another; Koltchak declared himself dictator of Siberia at Omsk; and the town was the scene of fierce fighting during the civil war. An important junction on the Trans-Siberian rly., it has many educational institutions. Pop. 280,700.

Onager. Local breed of wild ass occurring on the steppes of W. and Central Asia. It differs from the kiang and the African wild asses in its smaller size, sandy-coloured hair, shorter legs, and narrower ears. It has a black stripe down the centre of the back,

Onager. Specimens of this Asiatic breed of wild ass
Gambier Bolton, F.Z.S.

and occasionally it is striped on the shoulders and legs. See *Ass*.

Onagraceae. Botanical family consisting chiefly of herbs, mostly natives of the temperate regions. They have regular flowers, made up of a two or four-lobed calyx and two or four petals. The fruits are seed-capsules or berries, the latter as a rule being edible. Well-known genera are fuchsia, evening primrose (*Oenothera*), and willow-herb (*Epilobium*). They are of little economic importance.

Oncidium. Extensive genus of epiphytes of the family Orchidaceae, natives of tropical America and the West Indies. With a few exceptions, they have pseudobulbs, from which the leaves proceed. As a rule the flowers are large and showy, borne in sprays or clustered in spikes, but a few have solitary long-stalked flowers.

Onega. River in the N. of European Russia. Rising in Lake Lacha, it flows N.E. and then N.W. into the Gulf of Onega. In length about 245 m., it runs parallel with Lake Onega, which lies about 200 m. W. The Gulf of Onega is an arm of the White Sea, with a length of 80 m. At the point where the river enters the gulf is the town of Onega.

Onega. Lake of N.W. Russia, the second largest in Europe. It is in the Leningrad region of R.S.F.S.R. and the Karelo-Finnish S.S.R., between the White Sea and Lake Ladoga, with which it communicates by means of the Svir. It is also connected by the Vytegra with the Mariinskaya canal-system, and the Onega (now Stalin) Canal has been constructed along its S. shore to avoid the difficulties of navigation. Its length N.-S. is 145 m. and average breadth 40 m. It contains numerous islands and an abundance of fish. In 1919 fighting took place around Lake Onega between the Allies and the Bolsheviks. Finnish forces reached the W. shores shortly after the declaration of war against Russia in 1941, but the sector was not strongly held, and rly. traffic to Murmansk was not seriously hindered. See Murmansk Expedition.

Onehunga. Town and port of North Island, New Zealand. On Manukau Harbour, it is the W. outlet for Auckland, 7 m. away. Woollen mills, shipping, and the export of timber and farm produce are its important industries. Pop. 13,886. *Pron.* O-nee-hunga.

Oneida. Lake of New York, U.S.A. It lies about 12 m. N. of Syracuse, and is 24 m. long and 5 m. broad. The Oneida river drains it to the Oswego river, a feeder of Lake Ontario. Sylvan Beach, on the E. side of the lake, is a favourite holiday resort. The town of Oneida stands on Oneida Creek, 26 m. E. of Syracuse, in Madison co. Chartered as a city in 1901, it specialises in furniture. Pop. 10,291. *Pron.* O-needa.

Oneida Community. Communistic society originally founded in Vermont, U.S.A., by John Humphrey Noyes, and restarted at

Oneida, Madison co., N.Y., in 1847. It has a religious basis, Noyes alleging N.T. authority for the doctrine that selflessness could be attained by holding all things in common. Even marriage was not a permanent relation in the community, but Noyes expressly disclaimed free love doctrines. Government was carried on by a system of mutual criticism. In deference to outside opinion the Oneida theory of marriage was given up in 1879, the community was dissolved, and in 1881 it was reorganized as a cooperative limited company.

O'Neill, EUGENE GLADSTONE (b. 1888). American dramatist. Son of an actor, he was born in New York, Oct. 16, 1888, and educated at Princeton and Harvard. He spent two years at sea, and worked as a journalist and actor before making a name with the one-act play *Thirst*, 1914. The Emperor Jones, 1921, and Anna Christie, 1922, brought him international fame. Then came mystical and semi-symbolical pieces, e.g. *All God's Chillun Got Wings*, 1924; *The Great God Brown*, 1926. A play of passion, *Desire Under the Elms*, 1924, was at first banned from public performance in the U.K. In *Strange Interlude*, 1928, and *Mourning Becomes Electra*, 1931—O'Neill's most ambitious pieces—the characters speak their thoughts. Each was filmed, as was Anna Christie. O'Neill's innovations in technique limited his appeal, but his work had a marked effect on the development of American drama, and in 1936 he received the Nobel prize for literature. A later play was *The Iceman Cometh*, 1946.

O'Neill, SHANE (c. 1530-67). Irish chieftain. Son of Con O'Neill, 1st earl of Tyrone (c. 1484-c. 1559), he was excluded from the succession by his father in favour of Matthew, his brother, possibly illegitimate, whom he murdered in 1558. He resisted the government of the earl of Sussex, but was recognized by Elizabeth as heir to Tyrone, visiting London in 1562. His remaining years were spent in fierce wars and harryings in the N., chiefly against the Scots settlers in Antrim and the O'Donnells. With a traitor's price on his head, he was murdered, June 2,

1567, by the MacDonnells, whom he defeated at Ballycastle in 1565.

Onesimus. Christian convert. He was a slave who ran away from Philemon at Colossae and made his way to Rome. There he met S. Paul, who converted him to Christianity and sent him back to his master with a letter, the Epistle to Philemon (*q.v.*), and also mentioned him when writing to the church at Colossae.

One-Step. American dance, popular also in England, where it was introduced about 1910, and in France. In the U.S.A. it was also known as the Castle Walk, after its inventor, Vernon Castle. It is virtually a running walk, performed to rag-time music. See Dancing, Ballroom.

One Thousand Guineas. Second of the five classic English horse-races. It is for three-year-old fillies, and is run annually at Newmarket over the Rowley mile on the Friday of the first spring meeting. The race was founded in 1814. See Horse-racing.

Ongar. Market town of Essex, England. In full Chipping Ongar, it stands on the Roding, 23 m. N.E. of London, with which it is connected by rly. and Green Line. It was scheduled as a "new town" after the Second Great War, but the project was abandoned because it would have raised insoluble problems of transport. Traces remain of a castle which stood here in the Middle Ages. Livingstone was trained for the ministry at Ongar, which has associations with Isaac Taylor. Market day, Sat. Pop. 2,481.

Onion (*Allium*). Hardy bulbous plant of the family Liliaceae. The plants are perennial, though

Onion. Two common varieties, 1. Long-keeping. 2. White Spanish
By courtesy of Sutton & Sons

onions and leeks for edible purposes are raised annually from seed. Native of Asia, *A. cepa*, the parent species of the garden onion, has been cultivated for centuries.

The onion requires a light, loamy soil, richly manured. The seed should be sown in rows about 12 ins. apart early in spring, covered only lightly, and the surface of the soil beaten down hard and firmly. As soon as the young plants show themselves, the top-soil should be

dressed with a dusting of soot and nitrate of soda, and the onions should be thinned out to about 6 ins. apart, the thinnings being useful for salads. At the end of the summer the ripened onions should be lifted from the ground and hung in a shed, or spread on a dry floor. Care must be taken not to allow damp to reach them. Successional sowings may be made at any time up till Aug. in order to provide for fresh winter crops.

Of the onions grown outside the British Isles, the Tripoli, Madeira, and Brittany varieties are the most popular in Britain. They are more delicate in flavour and less coarse of texture than the better known Spanish onion. The usual method of propagating onions is by seed from the top growth of bulbs which are left in the ground to ripen, and of which 10 lb. to the acre should result in a crop of 35-40 tons.

Onions, OLIVER (b. 1873). British writer. Born at Bradford, his real name being George Oliver, he became a journalist and black-and-white artist, contributing to many newspapers and magazines. His first book, *The Compleat Bachelor*, appeared in 1900, but it was the trilogy of novels of London, eventually collected in 1926 as *Whom God Hath Sundered*, which established his reputation as a master of atmosphere and a writer of impeccable prose. His ghost stories, collected into one volume in 1935, also secured a wide audience. Later works included *The Italian Chest*, 1939; *The Story of Ragged Robin*, 1945; and *Poor Man's Tapestry*, 1946 (awarded the James Tait Black memorial prize). Onions married Berta Ruck, a writer of popular light fiction.

Only Way, THE. A romantic drama founded by Freeman Wills and Frederick Langbridge on Dickens's *A Tale of Two Cities* (q.v.). Produced Feb. 16, 1899, at the Lyceum Theatre, London, it had a run of 167 continuous performances. The play laid the foundation of Sir John Martin-Harvey's success as a popular romantic actor. See *Martin-Harvey, Sir John*.

Onnes, HEIKE KAMRELINGH (1853-1926). Dutch physicist. Born at Groningen, Sept. 21, 1853, he was appointed in 1882 professor of experimental physics at Leyden. He died Feb. 21, 1926. Onnes, who received the Nobel prize for physics in 1913, is known particularly for his work on thermodynamics, his liquefaction of helium, 1908, and

his discovery of superconductivity (the virtual disappearance of electrical resistance in metals at very low temperatures).

Onomatopoeia (Gr. *onoma*, name; *poiein*, to make). Philological term for the formation of words in imitation of external sounds, whether uttered by living creatures or produced by inanimate objects. Instances are bang, bow-wow, buzz, cuckoo, frou-frou, mew, puff, quack, whir, in which the sound is an echo to the sense (hence the term *echoism*). Older etymologists regarded this method as one of the chief factors in word-formation in the earliest stages of a language, but it is now generally recognized that its influence can only have been limited. See *Philology*; *Phonetics*.

Onomichi. Town of Japan, in Honshu. It is a shipping centre on the coast of the Inland Sea, 191 m. by rly. from Shimonoseki, on the route to Kobe. The town lies along a narrow coast strip, backed by a high hill opposite the island of Mukai, which protects the harbour. There are 48 Buddhist temples, of which the finest is Senko-ji. Mattings, both plain and figured, and saké are the chief articles of trade. Steamers connect the town with Tadotsu, on Shikoku. Pop. 42,000.

Onslow, EARL OF. British title borne since 1801 by the family of Onslow. This goes back to Roger, lord of Ondeslowe, Shropshire. His descendant Richard Onslow (1528-71), was Speaker of the house of commons in Elizabeth's time. A later Richard (1601-64) was knighted, served in the Long and Protectorate parliaments and in the army, and sat in the house of lords called by Cromwell. His son, Sir Arthur (1621-88), became a baronet, and the latter's son, Sir Richard (1654-1717), was chosen Speaker, as was his nephew, Arthur (1691-1768), who filled that position during 1728-61. Sir Richard was made Baron Onslow in 1716, and the 4th baron, an official of the royal household, was made earl of Onslow in 1801. William, the 4th earl (1853-1911), was a Conservative politician who was governor-general of New Zealand, 1889-92. Richard, the 5th earl, was parliamentary secretary to the ministry of health 1921-23, under-secretary for war from 1924 to 1928, and paymaster-general from 1928 to 1931. He died June 9, 1945, and was succeeded by his son William Arthur Bampfylde Onslow (born June 11, 1913). The earl's seat is Clandon

Park, Guildford, and his eldest son is called Viscount Cranley.

Onslow Bay. Broad bay on the S.E. coast of North Carolina, U.S.A. It extends W. from Cape Lookout, and flowing into it are the New, White Oak, Newport, and other rivers.

Ontake. Mountain peak in the Japanese Alps. The most frequented sacred mountain after Fujiyama, its alt. is 11,000 ft., and the summit is marked by a Shinto shrine dating from 1385. In summer crowds of pilgrims make the ascent, which, like that of Fuji, is divided into 10 stages. A sulphur crater and mountain tarns occur near the summit, which resembles that of Fuji in shape.

Ontario. Smallest and most easterly of the five Great Lakes of N. America. Its length is 193 m., width 53 m. at the broadest part, area 7,540 sq. m., maximum depth 774 ft., and average depth 412 ft. With a surface 246 ft. above sea level, it occupies a shallow depression in the earth's crust. It is fed by the Niagara river from Lake Erie, and is known at its N.E. outlet to the St. Lawrence as the Lake of a Thousand Isles. The chief feeders are the Genesee, Oswego, Black, and Trent rivers. An important section of the St. Lawrence and Great Lakes navigation, the lake is connected with Lake Erie by the Welland Canal, with the Ottawa river by the Rideau Canal, and with the New York State barge canal system by the Oswego Canal; shore ice interferes with navigation in the winter.

Called Lake St. Louis by Champlain, it was known to the French settlers in Canada as Lake Frontenac. See *Canada*; *Great Lakes*.

Ontario. Prov. of Canada. Its area is 412,582 sq. m., of which 49,300 are covered by water. The

Ontario arm.

prov. consists of two parts—the older, smaller, and more settled Lakes pen., which is something like a triangle between L. Huron, the Ottawa river, and Lakes Erie and Ontario; and the newer and larger part extending north to Hudson bay and west to Manitoba. The prov. capital is Toronto.

The climate is varied over this region extending 1,050 m. from N. to S. The Great Lakes exercise a moderating influence on the climate in the S. Mean annual temp. at Toronto is 45·8°. In the

N. the climate is colder and drier. The S. is gently rolling country, but N. of a line running from Georgian bay to the E. end of L. Ontario is the Laurentian plateau, or Precambrian shield, the surface of which is generally rugged with successions of rocky hills 100 to 200 ft. high. The area has been heavily glaciated, and contains many lakes and swift-flowing rivers and much mineral wealth.

The pop. (est. 1946, 4,107,000) is formed chiefly of people of British stock—72 p.c. in 1941. French constitute about 10 p.c. of the pop. The prov. has many attractive parks and lakes. The leading industries are manufacturing, agriculture, mining, and forestry, in that order. Ontario's manufacturing output is roughly equal to that of the rest of the dominion.

About 22.3 million acres are farmed, of which some 9 million acres are devoted to field crops. Mixed farming with a trend toward dairying is predominant, especially along the N. shore of Lakes Erie and Ontario. The prov. produces a greater value of minerals than any other part of Canada. Gold, nickel, and copper are the most important metals produced; iron, silver, lead, zinc,

and magnesium are also mined. Lumbering is very important in N. Ontario, where the manufacture of newsprint from pulpwood bulks large. Fishing is also important. The prov. is well served by rly., water, and air transport.

Electric power from Niagara and numerous other waterfalls is available. The hydro-electric power commission of Ontario generates most of the power. Appointed an independent, self-sustaining, cooperative organization 40 years ago by the prov. govt., the commission now owns and operates 47 hydro-electric power developments in different parts of the prov.

Ontario sends 82 members to the house of commons at Ottawa. Prov. govt., which is managed by

a cabinet responsible to a legislature (one chamber of 90 members), has control of education, hospitals, sanatoriums, highways, property and civil rights, natural resources, sale of alcoholic beverages, municipal institutions. A lieutenant-governor represents the crown.

Before 1782, when land in Ontario was given to loyalists from the U.S.A., the white pop. comprised only a few hunters. Until 1791 the country was administered

from Quebec, but in that year a separate prov. called Upper Canada (or sometimes Canada West) was formed. The monopoly of political power by a small group called the family compact, and the distribution of public lands, involving the clergy reserves, brought about a rebellion in 1837. As a result, by the Act of Union, 1841, Upper Canada was united to Lower Canada (Quebec), and responsible govt. was introduced in 1849. When the British N. American colonies of Upper and Lower Canada, Nova Scotia, and New Brunswick were united in the Dominion of Canada by the British North America Act of 1867, Upper Canada became the prov. of Ontario.

J. S. P. Armstrong, Agt. Gen.

Ontogeny. The development of the individual plant or animal. The term is applicable, in a structural sense, especially to organisms which being initiated as single cells grow by cell division and differentiation into the tissue masses that constitute the organs of the ultimate entity. Early cell divisions usually occur according to a pattern characteristic of the type, and are often spatially related to the position of structures in contact with the dividing cells or to the direction of an external stimulus impinging on them. In later stages of ontogeny, the products of one part of an organism may influence the manner of development of other parts. The course of ontogeny thus primarily depends on the hereditary endowment, and takes place in a coordinated manner, which may, however, be subject to the effect of environment.

Ontology (Gr. *logos*, theory; *ontos*, of that which is). The science of being as being, the investigation of its properties and relations, and of the ultimate principle of the physical and intellectual world. It is sometimes used as synonymous with metaphysics, of which, however, it is in reality a part. The ontological proof of the existence of God concludes, from the conception which we ourselves have of an infinitely perfect being, that such a being must necessarily exist. *See* Metaphysics.

Onus (Lat., burden). Legal term generally used in the phrase *onus probandi*, burden of proof. The rule is that he who affirms must prove; and in the course of a case the onus of proof often shifts from one party to another. Thus in an action for libel, with a defence denying publication and pleading that the libel is true, first the onus is on the plaintiff to prove that the defendant published the words complained of, and that they are defamatory of him, the plaintiff. Then the onus shifts to the defendant; and it is for him to prove that the words are true.

Onychia (Gr., *onyx*, finger-nail). Inflammation of the bed of the nail. It may be due to direct infection, or may develop in the course of diseases of the skin such as eczema. It is difficult to cure, but penicillin and the sulpha group are useful.

Onyx. General term applied to riband agates characterised by well-defined alternate rings of pure milk-white with bands of other colours. If the tint of the secondary rings is flesh colour, the agate is known as chalcedony-onyx; if red, carnelian-onyx; if green, sardonyx.

All these are utilised for intaglios (incised) and cameos (relief) carving for jewellery.

Onyx opal is a natural stone built up of alternate layers of precious and common opal. Onyx marble, from Mexico, and onyx alabaster, from Egypt, are handsome forms of stalactite marble, mostly calcite. They are sometimes used for ornamental purposes.

Oolite (Gr. *ōōn*, egg). In geology, (1) term used for a texture observed in some limestones, the rock being made up of small spherical or elliptical grains of calcium carbonate which look like fish roe, from which the term is derived. The texture results from precipitation of calcium carbonate around a small nucleus such as a sand grain, in shallow water where the grain is rolled back and forth by waves or current. Oolitic deposits are now being formed off the Bahamas and Florida; others are found on the shores of the Red Sea, where at low tide the oolitic grains are dried and drifted by the wind into dunes.

(2) Name given to the upper and middle divisions of the Jurassic system (upper and lower oolites) because the limestones present are characterised by oolitic texture. These rocks are valuable building stones. When they can be cut equally well in any direction they are termed freestones. Important beds have local names, Portland stone, Bath stone, etc. Iron ores of lower oolitic age showing similar texture are found in Northants. The two groups are highly fossiliferous, containing dinosaur remains in addition to ammonites and other shells. *See* Geology; Jurassic System; Rock. *Pron.* o-olite.

Oology (Gr. *ōōn*, egg). Branch of ornithology which deals with the eggs of birds. All birds' eggs are alike in the general arrangement of their contents and in the chalky nature of the shell; but differ widely in size, colour, and shape. The largest known egg is that of the extinct *Aepyornis* of Madagascar, which had a capacity equal to about two gallons, while the smallest are those of certain humming birds. *See* Bird; Egg colour plate; Embryology. *Pron.* o-ology.

Oosphere. The larger of two cells which unite during the sexual reproduction of many plants that form gametes of two sizes. An oosphere, like all gametes, is haploid, and differs essentially from the antherozoid or any other form of male gamete which fertilises it

in having a relatively large bulk of cytoplasm. It is usually non-motile, but often emits soluble material which attracts the male gamete chemotactically.

Oosterbeek. Village of the Netherlands. Lying 3 m. W. of Arnhem in Gelderland, it was the headquarters of the 1st airborne division in the battle for Arnhem (q.v.). On Sept. 17, 1946, there was unveiled a memorial erected by the Dutch people to British troops who fell in the battle. Near Oosterbeek is the cemetery in which most of them are buried.

Oosterhout. Town of the Netherlands, in the prov. of N. Brabant. It lies 5 m. N.E. of Breda, with which it has tramway connexion. Situated in flat agricultural country, it has a considerable trade in local produce. Industries are the manufacture of tiles and pottery, sugar-refining, and tanning. Pop. 15,107.

Ootacamund. Hill station and summer capital of Madras state, India. In Nilgiris dist., it is about 75 m. E. by N. of Calicut. It is the finest hill station in India, being over 7,000 ft. in alt., and having a temperate climate, with night frosts in Dec. and Jan. Around the station, where eucalyptus and wattle grow in profusion, are the open, rolling downs of the Nilgiri Hills. Here the Madras government sits during the hot season; the government offices on Stonehouse Hill date from 1821, and Government House from 1876. The station is reached by a branch rly. from Podanur. It was much used as a leave centre by British troops after service in Burma in the Second Great War. At Wellington, 7 m. S., was a British military convalescent centre. Pop. 29,850.

Ooze. Name given to deposits of mud on the ocean bed at great depths, composed mainly of the external skeletons of minute protozoa. The animals belong largely to the foraminifera. As globigerina is one of the commonest forms, globigerina ooze occurs frequently. These minute animals swarm near the surface as plankton, and as they die their skeletons sink. Globigerina ooze lies at depths above 2,000 fathoms, for calcareous skeletons will sink only so far before they dissolve. Below that depth siliceous skeletons of radiolara only will persist, some down to 5,000 fathoms. *See* Foraminifera; Plankton.

Opal. In mineralogy, an amorphous (colloidal) variety of hydrated silica. It contains a variable

quantity of water, up to 10 p.c., and varies in colour from dark to pale yellow, red, blue, or green, the lighter colours being more common. Sometimes it shows a rich play of colours (opalescence).

The mineral is most probably a dried-up gel and occurs in many ways; as deposits from siliceous waters at low temperatures in veins and thermal springs; from the weathering of different types of rock; forming skeletons of various marine organisms, diatoms, sponges, etc.; in most chalcedony and flint.

The precious opal has been from time immemorial one of the best-known gems. It is a semi-transparent, semi-translucent stone, bluish or yellowish white as a rule, and showing a wonderful play of all colours of the rainbow as the light strikes it at various angles. This play of colour is due to tiny fissures filled with air and water.

The chief producers of precious opal are New South Wales, S. Australia, Queensland, and Mexico. Opalescence is best brought out by giving the gem a rounded polished surface, and the loss of colour is due to the surface wearing, the stone being comparatively soft. The fire opal, a beautiful red stone, with yellow, or yellow and green reflections, is found in Mexico; as is the girasol, a bluish white opal, with red reflections. Hyalite (*q.v.*) is a glassy variety of the mineral without opalescence, and hydrophane is another variety of porous texture which becomes transparent on immersion in water. Menilite is a variety found in concretionary form, and is opaque grey. The common opal, which is not opalescent, occurs in a variety of colours from white to brown.

Opata. American Indian tribal division of Piman stock, in Sonora, Mexico. Embracing the Eudeva, Jova, and Teguma sub-tribes, they were more submissive than the Pima, and are now so thoroughly merged in the Spanish stock that in 1910 only 43 were separately enumerated. See Sonoran.

Opava. Czech name for the town also known as Troppau (*q.v.*).

Open Air Theatre. Enclosure in Regent's Park, London. The theatre, established by Sydney Carroll (*q.v.*), was opened June 5, 1933, with a performance of Twelfth Night. It forms a pleasing natural setting for out-of-doors drama, especially Shakespeare. Performances are given throughout the summer months (under cover in bad weather), and are enhanced at night by flood-lighting. The theatre was closed during the

Second Great War, and re-opened in 1945. See As You Like It illus.

Open City. In wartime, a city declared by the government of a belligerent country to contain no military installations, and therefore to be immune from bombardment. Paris was declared an open city in 1940, and Damascus in 1941. The Italians declared Rome an open city in 1943, but as it remained the seat of the government and an important rly. centre, it was bombed by American aircraft.

Open Hearth Furnace. Regenerative, metallurgical furnace used chiefly for the melting and refining of steel. In steel-making, the furnace charge, which consists of pig iron, steel scrap, and fluxes, is melted on a shallow or "open" hearth to produce a liquid bath of large surface area, which facilitates refining. The furnace is approx. rectangular in section. The hearth is built of steel plate lined (1) in the acid process with silica bricks, on to which fine silica sand is fritted to give the working surface; (2) in the basic process usually with magnesite bricks, a dolomite-tar mixture forming the working surface.

Open Hearth Furnace. Diagram showing the main construction features. The liquid bath contains A, molten slag, and B, molten metal. C is the tap hole

The walls and roof of the furnace are usually of silica brick, and in basic furnaces a neutral course of chrome magnesite separates the acid walls from the basic hearth. The front wall of the furnace contains the working doors, through which the charge is introduced and additions made to the liquid bath. The back wall is plain, except for the tap hole through which the bath is poured at the end of the steelmaking process; in the smaller fixed furnaces the tap hole runs from the lowest point in the hearth, through the back wall to a launder, and is kept stopped up during the processing. The capacity of an average sized furnace is 50 to 70 tons; furnaces of capacity up to 100 tons are usually fixed. Larger furnaces are of the tilting type, with the tap hole above the bath level except when tilted.

The end walls contain the port blocks, through which the gas (or oil) and air necessary to generate heat are introduced. The blocks at each end are identical, one serv-

ing for the separate introduction of gas and air, while the burned gases pass out of the furnace through the other; every 20 or 30 min. the direction of the gas-air travel through the furnace is reversed. In order to attain the temp. to melt and refine the charge, regeneration is necessary to pre-heat the gas and air. Below, and slightly to the sides of the furnace, are two pairs of regenerator chambers, one pair connected separately to each port block. The hot, burned gases leaving the furnace are led from the exit port block through slag pockets, where slag and dust particles are deposited, to one pair of regenerators. Most of the sensible heat of these gases is here absorbed by the refractory checker brickwork; when the direction of the gas-air travel is reversed, this heat is transferred to the gas and air. The gas and air pass from their independent regenerators to the entry port block. The air is introduced into the furnace above the lighter gas to effect good mixing, while both gas and air ports are inclined downwards to direct the flame on to the charge in the hearth.

Openshaw. District to the S.E. of Manchester, England. A busy manufacturing area, it makes rly. rolling stock, has iron foundries, dyeing and chemical works, cotton factories, and engineering establishments, and is traversed by the Manchester-Stockport Canal. Pop. 23,240. See Manchester.

Open Space. A space upon which the erection of buildings is prohibited or restricted by law. Open spaces are: (1) royal parks and Royal Botanic Gardens, Kew; (2) village greens, which may be used by the inhabitants of the locality for recreation or games; (3) open spaces as defined by Act of 1906; (4) public walks, pleasure grounds, or recreation grounds laid out by local authorities under *e.g.* Public Health Acts; (5) places held by the National Trust; (6) commons; (7) land to which the public may go for air and exercise under the Access to Mountains Act, 1939. The minister of Agriculture and Fisheries may apply this Act to land which is mountain, moor, heath, down, or cliff. Any person may have access between one hour before sunrise and one hour after sunset. It is forbidden to light a fire; draw a vehicle; take a dog not under control; disturb animals, eggs, or nests; hunt or fish; commit wilful damage; leave gates open; deposit rubbish; or hold political meetings.

OPERA THROUGH FOUR CENTURIES

Dyneley Hussey, author of *Great Composers of Opera*

This survey of the origin and development of a great musical art-form is supplemented by articles on all the famous composers of opera from Monteverde to Britten. See also Music; Orchestra; Singing, etc.

An opera may be defined as a drama of which the text is wholly (or mainly) set to music and sung to the accompaniment of an orchestra with appropriate action, scenery, and costumes.

Although its origins may be traced back through the tragedies and comedies of Athens to the primitive religious ritual of pre-history, opera, as we understand it, is a musical form of comparatively recent creation—a product of the Renaissance in Italy. Even as the Italian painters and sculptors were influenced by the newly discovered or hitherto neglected examples of Greek and Roman art, so the poets and musicians at the end of the 16th century were stimulated by the Revival of Learning to attempt the creation of a contemporary equivalent of Greek tragedy. Fortunately their knowledge was insufficient, and no more than the artists did they achieve a mere reproduction of the antique. They created a new form of dramatic entertainment, to which they gave the title of *dramma per musica* or (later) *opera in musica*, the emphasis being on the drama.

These experiments coincided—else they could hardly have succeeded—with a new development in the structure of the art of music itself. Polyphony, which had been brought to its finest flowering in the sacred music and madrigals of Lassus, Palestrina, Byrd, and Victoria, was giving ground to a homophonic style in which a solo melody was supported by a harmonic accompaniment. Dramatic action could hardly be carried on solely by means of the interwoven counterpoint of several voices, though it may be remarked that Vecchi's delightful madrigalian comedy *L'Amfiparnaso* (1594) provides a successful exception to the rule. Orazio Vecchi was one of a number of Italian musicians who at the turn of the 17th century were concerning themselves with the creation of a musical drama.

The first opera proper was Jacopo Peri's *Dafne* with a text by Rinuccini, produced in Florence in 1597. The real prototype of the lyric drama was, however, Peri's *Euridice*, the first of a long line of operas on the theme of Orpheus and Eurydice, which was performed

at the marriage festivities of Henry V of France and Maria de' Medici, 1600. The experiments of the French poets and musicians of the "Pléiade," who sought to adapt to the setting of French poetry what they imagined to be the principles of Greek music, had a considerable influence upon the new declamatory style developed by the Florentine composers, and especially by Claudio Monteverde, a Cremonese in the service of the duke of Mantua, who in 1607 produced the first masterpiece of opera, *Orfeo*. In *Orfeo* and its successors Monteverde solved the fundamental problems of presenting a dramatic story in music, and established a balance between action carried on by means of recitative and the summing-up of the dramatic situation in extended lyrical movements.

The new form of entertainment soon established itself in Italy and, in the generation after Monteverde, developed that sharp division of the music into recitative and elaborate aria, which was to be characteristic of Italian opera down to the time of Rossini. Although in the early 18th century opera tended to become little more than a concert in costume with characters, usually taken from classical history, giving expression to high-flown sentiments in conventionally tragic situations, the style of recitative (*recitativo secco* in which the voice is accompanied by a keyboard instrument with a violoncello to sustain the bass of the harmony) therein developed is unsurpassed as a vehicle for the carrying on of a swift dialogue in music, as may be heard in the Italian operas of Mozart (1756–91).

Commedia dell'Arte

In the meantime comic opera was also being developed alongside tragedy on the basis of the *Commedia dell'Arte*, whose farcical characters survive in a degraded form in the pantomime harlequinade and Punch-and-Judy show, and in a romanticised form in the ballet *Carnaval*, and in Leoncavallo's *I Pagliacci*. The chief contribution made to opera by the early comedies was the vocal ensemble. In the tragedies it was rare for the singers to be heard together even in a duet, while the chorus was mainly confined to the task of

pointing the moral in sententious couplets at the end of the drama, a function which it still fulfilled in the *opera seria* of the 18th century and, in a more flexible form, in Beethoven's *Fidelio* (1805). But in comedy the action could not very well be carried on without some kind of concerted ensemble, especially as the plot always hinged upon some misunderstanding between the characters. In *opera buffa*, therefore, the acts ended with concerted movements for all the characters—the *finale*, which was developed to such perfection by Mozart in his comedies, and which was transferred to tragic opera by the Italian composers of the 19th century.

France and England

The history of opera down to the 18th century is largely the history of Italian opera. But both France and England produced during the 17th their own characteristic styles of opera. In France the emphasis was upon the just setting of the text, which makes the operas of Lully (1632–87) sound rather stiff and dull to ears not attuned to the precise inflexions of the French language, while Louis XIV's passion for dancing secured to the ballet an important place in French opera, which survived into the 19th century when both Wagner and Verdi had to provide full-length ballets for their operas, *Tannhäuser* (1845) and *Otello*, when they were produced at the Opéra.

In England the suppression of the theatre under the Commonwealth oddly enough fostered the development of opera, since what might not be said was permitted to be sung. Nothing of lasting importance was, however, created until at the end of the century Henry Purcell produced his little masterpiece, *Dido and Aeneas* (1680), the only one of his works that fulfils his own definition of opera as "a story sung with proper action." The Fairy Queen, King Arthur, and the other "operas" of Purcell are spoken dramas with incidental music and elaborate masques at the end of each act.

In Germany still another characteristic form of opera was developed during the 18th century, the *Singspiel*, in which the action is carried on in spoken dialogue with songs and ensembles interspersed at appropriate moments. The earliest example familiar to us is *The Beggar's Opera* (1728). The comic operas of Arthur Sullivan (1842–1900) belong to the same category. The form was used by Mozart in his two German operas

Die Entführung aus dem Serail (II Seraglio, 1782) and Die Zauberflöte (1791), and was developed in France as *opéra comique*.

Even more important contributions made by Germany were the successive reforms of Gluck in the 18th century and of Wagner in the 19th. The Age of Reason could not tolerate the conventions of opera as understood by composers like Scarlatti and Handel and the great theatre-poet Metastasio. The stimulus to reform came especially from Paris, the initiative being taken by J. J. Rousseau, among others. The new theory of opera was proclaimed in the famous preface to Gluck's French version of *Alceste* (1776). In effect, Gluck's practice was a reversion to the principles of Monteverdi, which Gluck applied to the musical idiom of his own day. Similarly, if we cut away the vast quantity of philosophical verbiage in which he enveloped it, Wagner's operatic theory is fundamentally a revolt against the domination of opera by virtuoso singers and a return to the same principle of equilibrium between music and drama, though in practice his symphonic development of his musical material tended to concentrate the greater part of the interest in the orchestra.

Verdi and other Italians

While Wagner (1813-83) was constructing his vast dramas based upon old German legends in a musical style derived from the romantic operas of Weber and the symphonies of Beethoven and Schubert, his contemporary in Italy, Giuseppe Verdi (1813-1901), was slowly forging a style of his own. In this the voice was used as the chief vehicle of dramatic effect and emotional expression, as it had been used by Rossini (1792-1868), Donizetti (1797-1848), and Bellini (1801-35). But the orchestra was also gradually given a more highly developed musical rôle, until in the masterpieces of his old age, *Otello* and *Falstaff*, Verdi's music achieves a subtlety of colouring and expression unsurpassed in the history of opera.

At the end of the 19th century the development of orchestral technique and the reaction against romanticism produced the realistic or "verist" style of opera, represented in Italy by Mascagni's *Cavalleria Rusticana* (1890), Leoncavallo's *Pagliacci* (1892), and Puccini's *Tosca* (1900), and in France by such works as Charpentier's *Louise* (1900). In Ger-

many Richard Strauss carried the Wagnerian procedure to its logical conclusion in what are, in effect, one-act dramatic tone-poems (*Salome*, *Elektra*), before allowing his music to expand into a full-length operatic comedy, *Der Rosenkavalier* (1911).

Nationalism in Opera

The 19th century also saw the growth of nationalism in music, which resulted in the production of distinctive styles of opera upon local themes. In one sense, German opera from Weber to Humperdinck (including Wagner) is nationalist in inspiration. But the term is more obviously applicable to the works of the Russian composers Glinka (1803-57), Borodin (1834-87) Moussorgsky (1839-81) and Rimsky-Korsakov (1878-1908), and to the Czechs, Smetana (1824-84) and Dvorak (1841-1904), whose music is based upon Slavonic traditional melodies, and whose operas are based upon folk-stories or historical and patriotic legends. In the more sophisticated air of France, Bizet (1838-75) created a distinctively French type of opera, which differs from the cosmopolitan "grand" operas of Meyerbeer (1791-1864), Halévy (1799-1862), and Gounod (1818-93).

In England the revival stimulated by the music of Parry and Stanford during the last 20 years of the 19th century resulted in the production of numerous operas, among which those of Stanford (1852-1924) and Ethel Smyth (1858-1944) deserve mention, though they have so far failed to take a permanent place in the repertory. Later, characteristically English operas were created by Vaughan Williams, whose musical style is based upon folk-music and the polyphony of the Tudor period. In the 1940s a great success was scored both in England and abroad by the operas of Benjamin Britten, whose clever manipulation of an eclectic style is undeniably effective in the theatre.

The history of opera is largely the story of a ceaseless interplay between the interests of the singers and the musical and dramatic properties. In Italy, where music means first and foremost *singing*, the voice has tended to dominate opera, while German composers, with their tradition of symphonic music and their usually more serious attitude towards the arts, have tended to concentrate upon the orchestra and upon a careful presentation of the drama in music, sometimes to the detriment of its value as entertainment. In

France, too, the respect for literature has led composers to concentrate upon the just setting of their texts to a degree that makes their operas peculiarly difficult to perform in any other language than French. A perfect equilibrium in this conflict between the several elements that go to the making of opera has rarely been achieved, those who have come nearest to success being Monteverdi, Mozart in his Italian comedies, and Verdi in the operas of his mature years.

Opéra Bouffe. French comic opera, to be distinguished from *opéra buffa*; the latter uses dialogue in recitative accompanied on the piano or harpsichord and approximates to *opéra comique*. *Opéra bouffe* is light in texture. It flourished in France during the 19th century, its chief exponent being Offenbach.

Opéra Comique. Main entrance of this Paris theatre, one of the national theatres of France

Opéra Comique. In the classification of opera, one in which the dialogue parts are spoken, not sung. The plot is generally brought to a happy conclusion, but this is not essential, an example of the contrary being Bizet's *Carmen*. The *opéra comique* should not be confused with the English comic opera, which corresponds to *opéra bouffe* (v.s.).

The Opéra Comique is one of the national theatres of France, now situated in the Place Boieldieu, Paris. Founded in 1714, it had a struggle for existence against the rivalry of the Opéra des Italiens and the Comédie Française, and was suppressed from 1718-21 and 1745-52. In 1801 it merged with the former, and occupied several buildings until the present one was opened, 1898.

A London theatre called the Opéra Comique was opened in the Strand Oct. 29, 1870, for the performance of French plays. As the early home of the Gilbert and Sullivan operas, it disappeared when Aldwych (*q.v.*) was constructed in 1901-05.

Opera Glasses. Type of binocular telescope of small magnification, designed for use in theatres. *See* Field-glasses.

Operation. Military term signifying the conduct of a major action against an enemy, as distinct from a raid or reconnaissance. In the 20th century operations have usually received code names, some of the most important of the Second Great War being: Operation Dynamo, the British evacuation from Dunkirk; Operation Overlord, the Allied invasion of Normandy; Operation Torch, the Allied landings in N. Africa; Operation Strangle, the R.A.F. offensive to cut the enemy supply system in Italy; and Operation Thursday, the dropping of troops behind the Japanese lines in Burma in 1944.

Ophelia (Gr., help). Character in Shakespeare's tragedy Hamlet. Beloved by Hamlet and commanded by her father, Polonius, to repel his advances, she goes mad after her father has been killed by Hamlet, and eventually drowns herself. *See* Hamlet.

Ophicleide (Gr. *ophis*, serpent; *kleis*, key). Brass wind instrument. It was the successor of the serpent, the bass member of the cornetti group. All these instruments had a cup-shaped mouthpiece and had lateral finger holes at distances to fit the stretch of the hand. Intonation was therefore liable to be imperfect. A new model, the ophicleide, was introduced, with keys to correct the imperfections. The ophicleide has been

Ophicleide, with keys to help fingering

succeeded in the orchestra and military band by the bass tuba or bombardon, but it served a useful purpose in the earlier part of the 19th century. It was used by Spontini in his opera Olympia, 1819, and Mendelssohn wrote for it in his Midsummer Night's Dream music, and in Elijah.

Ophidia (Gr. *ophis*, serpent). Scientific name for the sub-order of reptiles known as the snakes. They are grouped with the lizards in the order Squamata.

Ophioglossaceae. A small family of Pteridophyta. It has the leaves rolled lengthwise before expansion, and the spores contained in large two-valved capsules without an elastic ring. It includes the genera *Ophioglossum* (adder's tongue fern), *Botrychium* (moonwort fern), and *Helminthostachys*.

Ophir. Land famed in O.T. times for its gold, which was brought to Palestine by the ships of Solomon and Hiram, king of Tyre. Its locality has been the subject of much speculation, but S.E. Arabia is the most likely region.

Ophites or **NAASANI** (Gr. *ophis*, and Heb. *nahash*, serpent). Sect of serpent worshippers. They arose in Egypt in the 2nd century, existed until the 6th century, regarded the serpent that tempted Eve as the embodiment of wisdom, were antipathetic to Jews, and called themselves Gnostics, claiming that they alone understood the deep things of religion. The doctrines adopted by the various bodies of Ophites included elements of Egyptian and Assyrian symbolism, Indian mythology, Greek philosophy, and corrupt ideas of Christian history and doctrine. *See* Gnosticism.

Ophiuchus (Gr. *ophiuchos*, holding a serpent). In astronomy, equatorial constellation south of Hercules. It represented in ancient astronomy the serpent holder who is trampling on the scorpion and strangling the serpent.

Ophiuroidea (Gr. *ophis*, serpent; *oura*, tail). Class of brittle or sand stars. They are star-shaped echinoderms, having five arms, used for locomotion, extending from a flat central round disk which contains the mouth. Ophiuroidea have a small free-swimming larval stage, called a pluteus; fossil remains are found in the Silurian and later periods of geological time.

Ophrys. Genus of British, European, Asiatic, and African herbs of the family Orchidaceae. The genus includes such well-known species as the bee orchis,

fly orchis, and spider orchis. Their spurless flowers vary from pink to yellow and brown.

Ophthalmia. Inflammation of the conjunctiva or mucous membrane which covers the front of the eyeball, and is reflected on to the inner surface of the eyelids. *See* Conjunctivitis; Eye.

Ophthalmoscope. Instrument invented by Helmholtz, and later extensively modified. It consists of a small mirror with a circular hole in its centre and a rotating wheel in which various types of lenses can be fixed. The patient's eye is illuminated and observed through the small hole and one of the lenses. The condition of the blood-vessels at the back of the eye can be intimately examined, thus giving the physician an impression of the patient's blood condition. *See* Eye.

Opie, JOHN (1761-1807). British painter. A native of St. Agnes, near Truro, he obtained the patronage of Dr. Wolcot, known as Peter Pindar, accompanied him to London in 1780, and at once achieved celebrity as the "Cornish Wonder." He became A.R.A.

John Opie, British painter

in 1787, R.A. in 1788, and professor of painting in 1805; and died in London, April 9, 1807. Most immediately successful were his historical paintings, in which, though his technique was always deficient, he showed extraordinary freshness and vigour, but it is probable that his reputation will eventually rest on his simple scenes of Cornish life.

Opium (Gr. *opos*, juice). Juice obtained by cutting into the unripe capsules of the opium poppy (*Papaver somniferum*). This is solidified by evaporation, and comes into the market in the form of dark brown or black irregular masses. Crude opium contains a number of alkaloids, of which morphine, which may be present to the extent of 12 p.c., is the most important. Others are codeine, thebaine, and narcotine. In addition, opium contains neutral substances, organic acids, water, mucilage, resin, albumen, glucose, oils, and mineral salts. All the important alkaloids of opium have a narcotic action. Morphine from opium is generally used in British medicine as the hydrochloride. Opium and its deriva-

tives are classified legally as dangerous drugs.

Opium acts as an anodyne and narcotic entirely by virtue of the morphine it contains. It is often sprinkled over hot fomentations applied for the relief of pain, and opium liniment is similarly used. It acts either by local attack or by its influence when absorbed by the central nervous system. The principal uses of ointment of gall and opium are to relieve the pain of haemorrhoids and of anal fissure. Morphine is the most valuable drug for the relief of pain.

Morphine is also of great value for insomnia resulting from acute pain, but should not be given for chronic sleeplessness. Morphine also stops the peristaltic movements of the stomach and intestines. Hence it is of service in all inflammatory conditions of the abdomen, and it is by virtue of this property that opium tends to arrest diarrhoea. Opium may also be given with good effect in some cases of heart disease associated with pain.

OPIUM POISONING. Four grains of opium and two drachms of the tincture of opium have proved fatal, but recovery has occurred after much larger doses. The symptoms usually start within an hour. At first there is a mild degree of excitement, with flushing of the face and quickening of the pulse; soon this is followed by headache, giddiness, and somnolence, which gradually passes into stupor. In the early stages the patient can be roused, but later the coma is profound. The breathing is slow and stertorous, the lips livid, the skin cold and clammy, the pulse slow; the breathing becomes slower and slower, convulsions may occur towards the end, and ultimately the patient dies from asphyxia.

Treatment consists of washing out the stomach with a solution of potassium permanganate, about 10 grains to the pint. Coma is to be prevented, if possible. Once coma has supervened, artificial respiration is used.

Effects of Opium Habit

The opium habit is often acquired through the taking of opium to relieve pain. Hypodermic administration is the most frequent form. As the pleasurable excitement and feeling of well-being produced by the drug wear off depression follows, and the victim takes more opium to relieve this. When the habit has been definitely acquired the complexion of the sufferer becomes sallow, he

suffers from sleeplessness, sometimes nausea and vomiting, and emaciation gradually supervenes. He is irritable, and moral changes appear. Eventually there may be signs of peripheral neuritis and death may follow from exhaustion.

The effects of opium-smoking, due to morphine in a minor degree only, differ from those of opium-eating, which is practised in Asia Minor, Persia, and India.

THE OPIUM TRADE. The opium poppy, which is indigenous to W. Asia and S.E. Europe, yielded food and oil long before the 3rd century B.C., when sporadic extracts were made by the Greeks, and the potent sap from the capsules came into medicinal use before the Christian era. The spread of Islam carried the knowledge of the plant and its properties across Asia, and it was cultivated in China by the 8th century A.D. The Mogul emperors monopolised the Indian opium manufacture, and fostered an export trade. Asia Minor is still an important source of opium for medicinal uses. Good qualities have been produced in Egypt and in several Balkan states, and from early Islamic times Persia has been an active source of supply.

Tobacco reached China from Spanish America by 1620, and at first opium was mixed with pipe tobacco. Within a century the smoking of unmixed opium became so rife that in 1729 it was prohibited by Chinese imperial edict. After the ancient Indian monopoly passed to the East India company in 1757 the cultivation and trade grew apace. Successive Chinese edicts were persistently ignored, until in 1839 the seizure of British opium stocks at Canton led to the so-called Opium War, which ended in the cession of Hong Kong to Great Britain. Importation grew until in 1888 it reached 95,000 piculs of 133 lb. Local cultivation then spread swiftly over China and Manchuria.

In 1891 the British parliament adopted a resolution condemning the Indian cultivation and traffic. The poppy was being grown in Bengal, Agra, and Oudh, this "Bengal opium" being manufactured in government factories at Patna and Ghazipur. "Malwa opium" was produced in several princely states in Rajputana and central India. But high duties tended to discourage the traffic. In 1893-95 a royal commission sat, and recommended stricter supervision of the traffic. By 1906, when China was producing

376,000 piculs, her government promulgated an edict requiring the cultivation and use to cease throughout the empire within ten years. Great Britain undertook to reduce the export to China by annual tenths so long as local cultivation diminished *pari passu*. In 1908 the Hong Kong opium dens were closed.

International Control

International cooperation in the control and regulation of the opium trade began with the Shanghai conference, 1909, which cleared the way for the first international opium convention made at The Hague, 1912, and embodying general principles of international control. After the First Great War the League of Nations was given under its covenant the definite task of supervising and executing existing or future conventions and agreements regulating traffic in dangerous drugs.

The Geneva convention, 1925, set up stringent national and international control of the trade in narcotics, except opium for smoking, based on import and export licences, and an international accounting system, working through a permanent central opium board of eight independent experts, with certain powers of overriding national sovereignty. The limitation convention, 1931, limited manufacture of drugs directly, the quantity being determined by an international drug supervisory body. The convention for suppression of illicit traffic, 1936, provided severe penalties for traffickers—an innovation in international criminal law. Two agreements, made at Geneva, 1925, and Bangkok, 1931, concerned measures designed to reduce and eventually suppress opium smoking in the Far East.

By 1939 some 60 countries were parties to one or more international conventions for deciding the total world medicinal need of drugs, and the legitimate quantities to be manufactured in licensed factories. A clear line had been drawn between authorised and illegal traffic. All channels of distribution had been brought under supervision. The League had reduced the illicit trade to a tenth or less of what it was just after the First Great War.

The United Nations continued the work of the League through (i) its permanent central opium board, (ii) a supervisory body which examines and publishes the final estimates of drug requirements furnished to it by member

governments, and (iii) the commission of narcotic drugs, a policy-making body of representatives of 15 govts.

Opland. Inland fylke or co. of Norway. In the N. the Dovrefjeld and the Jotunfjeld rise in Snobetta and Goldhoppiger to 7,546 and 6,490 ft. respectively; in the S. the land is low near Lake Mjosen and Randsfjord. Between the heights a depression connects the Romsdal to the N.W. with the long valley of Gudbrandsdal, which leads to Lake Mjosen in the S.E. Here is the main road to the Atlantic coast, with a rly. for two-thirds of the way from Lillehammer at the head of Lake Mjosen, the chief town. Area, 9,608 sq. m. Pop. 153,201.

Oporto (Port., the port). Second largest city of Portugal and capital of a district. It stands on the N.

Oporto arms

bank of the Douro, $3\frac{1}{2}$ m. from the Atlantic and 209 m. by rly. N. of Lisbon. It is built in a succession of tiers on a hill slope, and lines the river for about 2 m. A striking feature is its two fine bridges; one carries the rly.; the other has two roadways; the upper one is 203 ft. above the water, with its arch, one of the largest in Europe, spanning 560 ft. Gaudily painted houses give the city an Oriental appearance. The cathedral was built on the site of a Visigothic citadel dating from the 12th century. Other buildings include an episcopal palace, many old churches, museums, opera house, bull ring, mint, and university. The Torre dos Clerigos (Tower of the Clergy) is 246 ft. high.

The centre of the port wine trade and a busy manufacturing town, Oporto rivals Lisbon, calling itself the capital of the North. Apart

Opossum. The Azaras opossum
W. S. Burridge

from the shipping, mostly carried on from its harbour of Leixões (*q.v.*), its chief industries are the spinning and weaving of cotton, wool, and silk, sugar refining, distilling, tanning, and the manufacture of pottery, hats, gloves, tobacco, paper, and articles of luxury. Wine barrels are made at the S. suburb of Villa Nova de Gaia, across the river, where are warehouses for the storage of wine, grain elevators, convents, and villas. Fishing is extensively carried on.

The Alani, who conquered the district in the 5th century, called their new town, on the N. bank of the Douro, Castrum Novum. The Visigoths took it about 540, the Moors captured in 716, and the Christians in 997, and finally in 1092. For a time it was the capital of the counts of Portucalia. Its commerce greatly increased after the earthquake at Lisbon in 1755. It was occupied by the French in 1808-09, was besieged by Dom Miguel, 1832-33, and in 1847 was held by revolutionaries. To quell a rising in 1927, government troops shelled the city for three days. It has always shown strong political activity. Pop. 262,309.

Opossum (*Didelphys*). Marsupial mammal. The family to which it belongs is found only in America, though fossil remains occur widely distributed throughout the world. Opossums are all of small size, nocturnal in habit,

carnivorous and insectivorous, and with few exceptions make their home in the trees. Most species have long prehensile tails, but some lack the pouch characteristic of marsupials. In Australia the name opossum is given to the phalanger (*q.v.*). See Marsupials.

Oppeln (Pol. Opole). Former capital of the former German prov. of Upper Silesia. It is situated on the Oder and the main Berlin-Budapest rly. Until severely damaged during the Second Great War it contained many impressive old buildings, such as the church of S. Adalbert (900), the church of S. Cross (1400), and a tower of the 14th century castle. Its industry, which was considerable, included the manufacture of cigars and cement, and the mining of lignite. From 1163 to 1532 it was the residence of the Silesian Piast dukes, and was joined to Prussia in 1742. Its 1939 pop. was 44,680. Captured Jan. 24, 1945, by Koniev's 1st Ukrainian army in an impetuous tank and infantry advance, Oppeln lay in the area placed under Polish administration by the Potsdam agreement (*q.v.*).

Oppenheim. Tn. of Rhineland-Palatinate, W. Germany, on the left bank of the Rhine, 20 m. S.S.E. of Mainz. The Gothic church of S. Catherine contains the tombs of the Dalberg family (*q.v.*). Oppenheim, which produces a well-known wine, was founded in 774 as an estate of Charlemagne. For four centuries it was a free city, but was taken by the Swedes in 1631, and by the French in 1689, 1792, and 1794. In 1816 it became a part of Hesse. After the Second Great War Oppenheim fell within the French zone of occupation. Pop. 4,078.

Oppenheim, EDWARD PHILIPS (1861-1946). British novelist. Born at Leicester, and educated at Wyggeston grammar school, he became widely known as a writer of popular fiction, his

Oporto, Portugal. Left, Ribeira quay and the iron bridge of Dom Luiz I, 203 ft. above the Douro, and spanning 560 ft. Right, Rue dos Clerigos with the Clerigos church

novels of mystery and sensation being marked by ingenuity of construction and high dramatic quality. His huge literary output includes *The Amazing Judgment*, 1897; *The Master Mummer*, 1905; *The Mischief Maker*, 1913; *The Double Traitor*, 1918; *The Great Impersonation*, 1920; *The Golden Beast*, 1926; *The Million Pound Deposit*, 1930; *Murder at Monte Carlo*, 1932; *Envoy Extraordinary*, 1937; *The Last Train Out*, 1941; *Mr. Mirakel*, 1942; and many others. His autobiography, *The Pool of Memory*, was published in 1941. He died Feb. 3, 1946.

E. Phillips Oppenheimer,
British novelist
Russell

Oppenheimer, JOHN ROBERT (b. 1904). American physicist. Born in New York, April 22, 1904, he was educated at Harvard, Cambridge, and Göttingen universities, and then became professor of physics at the university of California. During the Second Great War he became head of a special laboratory for the development and construction of the atomic bomb at Los Alamos, New Mexico. In 1945, Henry Stimson, U.S. secretary of war, declared that the atomic bomb was "largely due to Oppenheimer's genius."

Oppenheimer, SIR ERNEST (b. 1880). S. African financier. Born at Friedberg, Hesse, May 22, 1880, he worked in the London offices of a diamond firm, emigrating to Kimberley, S. Africa, in 1902. Mayor of Kimberley, 1912-15, and its M.P., 1924-38, he was knighted 1921. Chairman of many diamond companies, including De Beers and the Diamond Corporation, he financed the exploitation of Orange Free State gold from 1917 to 1947, and became one of the world's richest men.

Opposition. In British politics, the name given to the party that is out of power and that exists mainly for the purpose of criticising the party in power, and, if possible, supplanting it. An opposition is an essential part of parliamentary government, but in its modern sense the word was first used in 1826 by John C. Hobhouse, afterwards Lord Broughton. Gradually it came into general use, and the opposition became a regular part of the machinery of government, its leaders having recognized places

and precedence in both houses of parliament. The word used in this sense passed into all parliaments of the British Empire, and into some foreign legislatures. In the British house of commons the opposition sits on the benches to the Speaker's left, facing the government and its supporters on his right. The leader of "His Majesty's Opposition" is entitled to a salary of £2,000 per annum, of which £500 ranks as allowable expenses.

Opposition. In astronomy, the position of one heavenly body with respect to another when differing from it in longitude by 180°. When the earth, the sun, and another planet are in a straight line, the planet is in opposition when it is on the other side of the earth from the sun, and in conjunction (*q.v.*) when on the same side.

O.P. Riots. On the reopening of Covent Garden Theatre, London, by J. P. Kemble, in 1809, the theatre having been destroyed by fire, great indignation was aroused by the announcement that prices of admission were to be increased and private boxes installed at the expense of pit and gallery. The resultant rioting among the audience became known as the O.P. (old prices) riots. Disorder broke out on the opening night, Sept. 18, and continued with each performance until Dec. 16. Much damage was done, many persons were arrested, and the old prices were later restored.

Ops. In Roman mythology, wife of the god Saturn, and patroness of agriculture. The Romans identified her with the Greek Rhea (*q.v.*).

O.P. Side. In stage directions, this is the side opposite to the "prompt" side; usually the right of the stage from the actor's point of view.

Oposonin. Term used in bacteriology to explain the effect which normal human blood serum has upon the destruction of bacteria in the blood by leucocytes. Experiment has shown that there are substances in the blood serum which in some way or other so modify bacteria as to render them more easily attacked and devoured by the leucocytes. This change is known as the opsonic effect, and the substances in the serum which render the bacteria more easily destructible are called opsonins. By a highly technical bacteriological process an exact standard of the power of serum in this respect can be

arrived at, and the serum of one individual compared with another before and after treatment. This standard is known as the opsonic index. See Phagocytosis.

Optical Glass. Variety of glass used in the manufacture of lenses for optical instruments. The first essential characteristic of optical glass is that it must be homogeneous, and this has made it one of the most difficult glasses to produce to perfection. Guinand in the 18th century made the first attempt at homogeneous flint glass manufacture by constantly stirring the molten glass, and in 1824 the Royal Astronomical Society appointed a committee to consider the question of optical glass making.

The researches of Abbe and Schott at Jena, however, on the effect of various oxides on vitreous fluxes led to the invention of Jena optical glass, now in general use. The old varieties of optical glass consisted mainly of silicates, while modern glass contains many oxides, *e.g.* those of barium, zinc, aluminium, etc., silicates and boric anhydride, which enable lenses of remarkable purity and optical qualities to be made.

The glass has to go through a number of processes, *e.g.* moulding and annealing, and the high proportion of the finished glass which has to be rejected, on account of air bubbles, fractures, and other defects, makes the glass actually fit for optical purposes very expensive. Not more than one fifth of the total glass manufactured for optical purposes is actually used, as a rule. In the design of lens systems it is an obvious advantage to have available a wide range of glasses with different characteristics, *e.g.* the introduction of lead into flint glass has the effect of increasing the mean refractive index and giving a higher relative dispersion. See Glass.

Optician. One who makes or deals in optical glasses and instruments, or who examines the eyes and prescribes spectacles. There is in the U.K. no legal status for opticians, and the term is often used by those who sell spectacles. When applied to ophthalmic opticians it indicates one who, having passed the necessary examinations, is qualified by the Worshipful Company of Spectacle Makers, or by the British Optical Association. The Spectacle Makers Company holds a royal charter, and grants to all successful candidates.

a diploma and the right to append the initials F.S.M.C. The British Optical Association grants a certificate and the right to append the letters F.B.O.A. Other examining bodies in the U.K. are the Scottish Association of Opticians, the National Association of Opticians, and the Institute of Chemists and Opticians. In the U.S.A., and in many of the provinces of Canada and Australia, compulsory qualification and registration are required before a person can engage in the practice of sight testing. *See Eye; Sight.*

Optic Nerve. Nerve of sight. Arising from the lower part of the brain, it passes forwards into the orbit, where it enters the eyeball, and its fibres spread out over the inner surface of the retina. Inflammation of the optic nerve, or

optic neuritis, is a serious affection which most frequently arises in the course of tumours or other affections of the brain, or Bright's disease. Optic atrophy is a degeneration of the nerve fibres

Optic Nerve. Diagram showing position of optic nerve from above

which may follow optic neuritis, or may be due to tabes dorsalis (locomotor ataxia) and other nerve diseases. The condition eventually results in blindness. *See Eye; Nerve.*

OPTICS : SCIENCE OF LIGHT AND VISION

* R. W. B. Stephens, Ph.D., Imp Coll. of Science and Tech.

Among the articles which supplement the information given below are Dispersion; Lens; Light; Refraction; Relativity; Spectrum

The most familiar phenomena of vision are our inability to see objects round corners; the forms of shadows cast by opaque bodies; the formation of images of luminous objects by mirrors and the lenses of such instruments as reading glasses, telescopes, microscopes, cameras and projecting lanterns. A great deal of the knowledge we possess concerning these matters is very satisfactorily summarised in a few principles which are referred to as the laws of Geometrical Optics; these are statements which if assumed to be true will lead by the deductive methods of pure geometry to conclusions which are in very exact accord with experimental results. In this branch of optical science no hypothesis is made as to the nature of light beyond the simple assumption that it is an influence emitted from all visible bodies and capable of affecting the retinae of our eyes.

Umbra and Penumbra

Very little observation is required to convince us that this influence is propagated in straight lines. If one examines the shadow cast by an opaque body on a white screen in a room lit by one source of light only, an intensely black central part, called the umbra, is, in general, observed, around which is spread a less dark part, gradually fading into the complete illumination of the rest of the screen; this annular, partially illuminated portion of the shadow is called the penumbra.

Careful investigation will show that it is impossible to draw a straight line from any point on the

surface of the luminous source to any point in the umbra which does not cut through the opaque object, and that if we select any point in the penumbra it is possible to draw straight lines to points on a portion of the luminous source which do not meet the opaque object, the portion of the source becoming larger as the point chosen in the penumbra moves further out from the umbra, until we reach those parts of the screen in full view of the complete source. In particular, if the source is of very small dimensions, the penumbra is so small as to be imperceptible except at very close quarters, and the shadow consists almost entirely of an umbra.

Eclipses as Examples

The eclipses of the sun and moon are examples of shadows on an enormous scale, e.g. during total eclipses of the sun there is at any instant one comparatively small portion of the earth where the eclipse is actually total; this portion is the umbra of the shadow cast by the moon. Outside this lies a ring shaped portion, the penumbra, where the eclipse is only partial. Owing to the rotation of the earth, these portions move over the earth's surface, and thus we see the reason for the existence of the "track of totality." As a further illustration of rectilinear propagation we may instance the familiar "streaks" in front of a projecting lantern or within a fairly dark room into which sunlight is streaming through a window; but in this connexion it may be well to remove a common misconception. One is not "seeing

light" in these circumstances; such a phrase betokens a confusion of ideas; what we see is the dust and motes in the atmosphere which are being more than usually illuminated, and the cylindrical or conical form of these streaks arises from the rectilinear paths pursued by the elements of light emitted by the source. The fact of rectilinear propagation leads naturally to the use of the phrase, a beam of light, and still further to the conception that such beams are composed of extremely narrow beams which we idealize as straight lines and call rays.

Principles of Reflection

This concept of a ray is invaluable in the study of reflection and refraction of light. As a rule reflection from the surface of a body is quite irregular; the rays from a self-luminous source when they reach walls, floor, ground, etc. are scattered and redirected in all directions, otherwise such non-luminous, but illuminated, objects would not be visible from all points of view, as they actually are unless opaque bodies intervene. But provided the surface of a body has a certain amount of polish or smoothness, we begin to observe traces of regular reflection. The appearance of a well-polished table is an example of such partial regular reflections; and when the polish reaches that of the best glass or a brilliant metallic surface, practically all the reflected light is regularly reflected, and we get the phenomena of images.

In such cases each reflected ray makes the same angle as its incident part with the "normal," i.e. the line perpendicular to the reflecting surface at the point of incidence, and the incident ray, reflected ray and normal lie in one plane. Such a deviation from their original paths causes a small cone of rays, which could enter the pupil of an eye, originally emitted by a minute portion of a luminous or illuminated body (a "point-source"), to appear on its reception by an eye to be diverging from quite another point. The aggregate of such "point-images" forms the image of the body which is the aggregate of the original "point-sources." In certain cases of curved mirrors, a cone of rays originally diverging from a point-source may be made to converge by reflection and thus pass through a point only to diverge once more from what is called a "real" image which is actually in front of the mirror and not behind it. The reader may verify this for himself by looking into the hollow of a spoon with a lamp near at hand.

When light passes from one transparent medium to another, not only reflection occurs, but it is also observed that the portion of the light which enters the second medium is in general diverted from the original path. This occurrence is called refraction, and in the discussion of it the concept of a ray enables us to reduce our knowledge concerning refracted light to two simple geometrical statements: (1) the incident ray, the refracted ray, and the normal are in one plane; (2) the sine of the angle of incidence bears to the sine of the angle of refraction (*i.e.* the angle between the refracted ray and the normal) a ratio which is definite for two given media. Thus from air to glass this "index of refraction" is $3/2$; from glass to air $2/3$; air to water $4/3$; water to air $3/4$; water to glass $9/8$; glass to water $8/9$; and so on. Each pair of substances has its ratio, and its value gives the ratio of the velocities of light in the two media concerned. Images produced by lenses in reading-glasses, telescopes, cameras, etc., are due to the deviations of the rays of light emitted by a source, and their redirection into new paths which pass "really" or "virtually" through the points of the images which are actually seen by us; and experiment confirms the fact that all such appearances can be arrived at deductively by the methods of geometry, if we apply the two simple statements enunciated above to the given conditions in any case.

But geometrical optics is quite inadequate to explain a large number of observed results of experiment in optical science. The phenomena of interference, diffraction, polarisation, and even chromatic dispersion are quite beyond its scope. As a simple statement of interference we can say that it is possible for two specially adjusted sources of light to produce darkness along certain paths, this being compensated by reinforced illumination along others. In diffraction we deal with the existence of certain colour fringes well inside the geometrical shadow cast by the edge of an opaque object. By considering the effects of diffraction, attention was directed to the limitations on the performance of optical instruments, such information not being derivable from purely geometrical considerations.

When a ray of light passes through calcite it is divided into two rays which travel in general

with different velocities in the crystal. The velocity of the so-called ordinary ray is independent of direction, but the extraordinary ray is variable and has a maximum value in the direction of the optic axis (when it is equal to that of the ordinary ray), decreasing to a minimum in a perpendicular direction. Calcite is termed a negative crystal, to distinguish it from, say, quartz, which belongs to the positive class in which the extraordinary ray has the greater velocity in directions other than along the optic axis. The effect was explained by Young assuming that light waves were transverse, so that for each refracted ray there was a plane containing the ray which inhibited singular physical properties in any subsequent treatment of the ray. This phenomenon is known as double refraction or bi-refringence; and the rays are said to be "plane-polarised" in perpendicular planes. Thus if the ray is directed on to a piece of glass at a definite angle, and if the plane of polarisation of the ray is at right angles to the plane of incidence on the glass, no reflection takes place, the entire energy of the ray being transmitted into the glass.

In such phenomena, no adequate explanation is possible without the help of a definite theory as to the nature of light. In works on physical optics, appeal has to be made to mathematical analysis of a type much more complex than that involved in the comparatively simple geometry employed in geometrical optics.

With the advance of physics, the subject of optics has not lagged behind. Problems of illumination and colour are important in industry and everyday life; one need only cite the existence of the established profession of illumination engineer. In physiological optics considerable advance has been made, and in general the research worker is receiving more assistance from the improvement in such tools of research as optical glasses, light detecting devices, photographic plates, etc.

R. W. B. STEPHENS, Ph.D.

THE METEOROLOGICAL ASPECT. Light reaching the earth's surface from the sun, moon, or stars must pass through the earth's surrounding atmosphere, producing numerous optical phenomena. Refraction of the rays by the gases in the atmosphere results in the formation of mirages and is responsible for the twinkling of the stars. Rainbows and haloes are due to

reflection and refraction by water drops and ice crystals respectively; coronae are diffraction effects produced by water drops. The blue colour of the sky arises from the scattering of sunlight by individual molecules constituting the air, the short waves composing the blue and violet end of the spectrum being more scattered than the long yellow and red waves. Changing colours at sunrise and sunset are accounted for by the loss of the shorter wave-lengths which the white light suffers on passing through the layers of air then comparatively thick. Twilight is caused by the reflection of sunlight on to the earth's surface from the upper regions of the atmosphere, which, although the sun has set, are still illuminated directly.

Humphreys, 3rd ed. 1940; Experimental Spectroscopy, R. A. Sawyer, 1945; Practical Optics, B. K. Johnson, 1945; Applications of Interferometers, W. E. Williams, new ed. 1947.

Optime (Lat., excellently). Adverb taken from the phrase *optime meruit*, he has deserved very well, and used at the university of Cambridge as a name for candidates for honours who are placed in the second and third classes of the mathematical tripos. They are known as senior and junior optimes respectively. Pron. Optim-ee.

Optimism (Lat. *optimus*, best). The tendency to regard things in the most favourable light, opposed to pessimism. In philosophy, it is the doctrine that this world is the best of all possible worlds. There are two kinds of optimism, relative and absolute. The world may not be absolutely good, but at least the good in it is predominant. Leibnitz, in his *Theodicée* (justification of God), endeavours to prove that God, in His infinite intelligence, conceived an infinity of possible worlds, and called into being the one which He regarded, all things considered, as the best. But even this does not exclude the idea of infinite perfectibility. See Pessimism.

Option (Lat. *optare*, to choose). Literally, the act of choosing. In financial language an option is the right to buy or sell something, for which right money is paid. Thus a man pays for the right to buy certain shares at a certain price, or to buy a house or property of other kinds. If he does

not wish to exercise his option he loses the money paid down. An option to buy is termed a call, and an option to sell a put. *See* Stock Exchange.

Opuntia. Genus of succulent plants of the family Cactaceae. All are natives of America and some are familiarly known as prickly pear and Indian fig. The majority require treatment in green-houses, as some of them reach a height of 20 to 30 ft. Several species are quite hardy in the U.K. on well-drained soil. They flower during the summer months, with red, yellow, or purple blossoms, and thrive in a mixture of loam and limestone. Opuntias should be watered liberally during the summer months, but require no water from Nov. till Feb. They are propagated by cuttings of the stem planted in gritty soil in early spring.

Or (Fr.). In heraldry, gold, the principal metal. It is represented in drawings by small dots over the whole space, and in painting either by gilding or by yellow pigment. *See* Heraldry, colour plate.

Oracle (Lat. *orare*, to speak, pray). Originally, in Greece, the seat of worship of a deity where responses were given to inquirers, usually with reference to public events. The word was also used of the response itself. Such responses were accepted as representing the voice of the deity as expressed through a priest or priestess in a state of religious exaltation, or through some other medium, as at the oracle of Zeus at Olympia, where the divine will or knowledge was interpreted by inspection of the entrails of sacrificed animals.

The oracle was a characteristic feature of the religion of the ancient Greeks. Other well-known Greek oracles besides that at Olympia were the oracle of Zeus at Dodona (*q.v.*) in Epirus, which was considered the most ancient, and that of Apollo at Delphi (*q.v.*), the most famous of all. Its responses were interpreted by the priests in hexameter verse. Oracular responses in general were said to be characterised by ambiguity—a notable example being the response to Croesus (*q.v.*). Though the Delphic oracle was accused by the Athenians at any rate of partiality towards the Spartans, there is no doubt that on the whole the ancient oracles were on the side of

morality, both public and private. An oracle was always consulted before the foundation of a colony. The oracle of the hero Amphiaras, at Oropus in Attica, gave replies to inquirers in dreams. Oracles also existed among the ancient Babylonians and Egyptians. The Hebrew Urim and Thummim (*q.v.*) were a kind of oracle.

Oradea. Town of Rumania, in S. Bihar, close to the Hungarian border. Part of Hungary until 1918, it was known as Nagyvarad; earlier it was called by the German name Grosswardein. Lying E. by S. of Budapest, it is 160 m. distant by rly.

on the main line to Transylvania and the Predeal Pass across the Carpathians. It contains many educational institutions and two museums. Near by are the Felix and Bishop's baths, warm springs known to the Romans. Reputed to have been founded by S. Ladislas in 1080, Oradea was sacked by the Tartars in 1241. Pop. est. 92,943.

Oradour-sur-Glane. Village of Haute-Vienne dept., France, 15 m. N.E. of Rouchecrouart. During the Second Great War, on June 10, 1944, the entire village was destroyed by the Germans "in mistake" for another village as a reprisal against activities by the resistance movement. Nearly all the 750 inhabitants were shot or burned alive in the church. The ruins were left as a memorial of German brutality, but a new village was built within sight of the old. Oradour was awarded the Legion of Honour, 1949.

Oræfa Jökull. Volcanic mt. of Iceland, the culminating peak of

Vatna Jökull (*q.v.*), alt. 6,990 ft. It is the highest point on the island, and was first scaled in 1891 by F. W. Howell. Eruptions occurred in 1341, 1342, 1598, and 1727.

Orange, ALFRED RICHARD (1873–1934). British journalist. Born at Dacre, Yorks, Jan. 22, 1873, he became a teacher before adopting a journalistic career in 1906. Editor of *The New Age* before the First Great War, he made it an outstanding literary review, attracting brilliant controversialists to write for him. He later edited *The New English Weekly*. Orange published studies of Nietzsche, and *An Alphabet of Economics*, being an advocate of social credit. He died Nov. 6, 1934.

Orakzai. Pathan tribe of the Pakistan-Afghan frontier. Living S. of the Afridi, they differ in their less guttural N. Pushtu speech, and less robust physique, and are fewer. They occupy the lower valleys, where they raise winter crops.

Oran. Department of Algeria. Bordering upon Morocco, it was conquered by France during 1835–47. It is divided into the five civil arrondissements of Oran, Mascara, Mostaganem, Sidi-bel-Abbès, and Tlemcen, and three military divisions. Its area is 23,500 sq. m. Pop. 1,623,356. *See* Africa.

Oran. Seaport of Algeria. On the Gulf of Oran, is 260 m. by rly. W.S.W. of Algiers, and capital of the dept. of Oran. The city, which has an excellent harbour, now ranks as the second city of Algeria, exporting wine, cattle, grain, and minerals. The modern parts are well planned and stoutly built in the fashion of a French city; notable buildings are the Château-Neuf (1563), the museum and library, R.C. cathedral, and the Grand Mosque. Pop. 194,746.

Oran was captured by the Spaniards in 1509, abandoned by

Opuntia. Stem and flower of the Indian fig

Oran, Algeria. View of the harbour and fort of this important city of N. Africa, from the Promenade de l'Etang

them in 1792, and occupied by the French in 1831. After the Franco-German armistice of 1940, when it appeared likely that French warships would be taken over by Germany or Italy, a British battle squadron arrived at Oran on July 3. The French commander refused the British terms, and a short action ensued in which the battleships Dunkerque and Strasbourg were damaged, an older battleship was sunk, and another badly damaged. On Nov. 8, 1942, U.S. troops landed in the vicinity of Oran, occupying the town and naval base on Nov. 10.

Orange (Arab. *nāranj*). Fruit of *Citrus aurantium* and its varieties, evergreen trees of the family Rutaceae, natives of Asia. Whether the several varieties of orange

Orange. Spray of foliage, flower, and fruit. Inset, fruit in section

are the descendants of a single wild species or of several species is an open question, oranges having been cultivated for so many centuries that there has been time for many varieties to have arisen. The date at which the tree was introduced to Europe is not known; but it is believed that conquering Arabs brought it from India, its native country, as far W. as Arabia in the 9th century, and later to Italy, S. France, and Spain. A tree at the convent of S. Sabina, Rome, is reputed to date from about 1200; and another at Versailles is said to have been sown in 1421. The first British oranges appear to have been grown by Sir Francis Carew at Beddington, Surrey, from 1595. The principal varieties now grown are the sweet S. Michael's, the bitter Seville, the Jaffa, the Maltese blood, the Washington Navel, Seedling, du Roi, and Valencia Late, also the tangerine and the mandarin.

Most imported oranges have had to be gathered and packed while still green, and undergo a sort of

ripening in transport; consequently they have not the delicious flavour of those ripened naturally on the tree, even in Great Britain. Such fruit cannot compete commercially with the imported article, so that British orange trees are chiefly for ornament. For this purpose they may be raised from seed ("pips") or cuttings, and grown in good loam, to which has been added sharp sand and crushed bones, or dry cow-manure. The seeds will germinate in a warm greenhouse (about 60° F.), and when the plants are large enough they should be transferred to tubs, which may be placed outside in the summer, and in winter given a temperature of 50° F. Sheep-dung mixed with loam should be given as a top-dressing in spring, and during summer they require liberal watering.

The cultivation of the orange on a commercial scale is practised in Florida and California. There seedling orange trees are found to last longest, and are more hardy. They are, however, extremely thorny and the fruit was long regarded as inferior, but seedless navel oranges are now marking an improvement in quality. Oranges are grown commercially also in Palestine, S. Africa, Australia, Jamaica, Spain, and Brazil.

Being gross feeders, orange trees must be well manured. It is essential that they receive plenty of potash; stable manure applied alone causes "die-back." They also require spraying to keep down red-spider, scale, and other insect or fungus pests, while careful pruning is most necessary. Well treated, the orange is extraordinarily prolific. Yields of 16,000 oranges have been secured from a single tree. Orange trees continue in bearing for a number of years; many have borne well for a century. See Citrus.

Orange, GARIEP, OR GROOTE RIVER. Largest river of S. Africa. It rises in the Mont aux Sources (11,000 ft.) in the highest portion of the Drakensberg Range, in the N.E. of Basutoland. Its basin comprises 40,000 sq. m. of the high plateau of S. Africa, and it reaches the Atlantic Ocean about 45 m. N.W. of Port Nolloth. The upper tributaries flow among the magnificent mountains of Basutoland,

and on one of them occur the falls of Malutsinyane or Le Bihan, with a drop of 630 ft. There are no permanent left bank tributaries of any size, but on the right bank is the Caledon, whose basin is a rich grain-growing district. It joins the Orange above Bethulie, and the Vaal joins above Prieska; all other perennial affluents are short.

Below Prieska the Orange flows, often through narrow, almost impassable gorges, for 500 m. in a sandy, arid district, the desolate S. portion of the Kalahari Desert, with numerous tributary valleys usually dry. Below Upington are the Great Falls of Aughrabies, 60 ft. wide, 400 ft. drop, at Waterval, which exceed both Niagara and the Victoria Falls in height, but lack their accessibility and beauty. W. from Palmietfontein the Orange forms the N. boundary of the Cape Province. It was explored in part in 1779 by Colonel Gordon, who hoisted the Dutch flag in the middle of the stream, and named it after the stadtholder of Holland.

Orange. Town of France. It is on the river Meyne, 17 m. by rly. N. of Avignon, in Vaucluse dept.

Orange arms

The ancient Arausio, it contains a Roman triumphal arch, probably erected about A.D. 25 and extensively repaired since 1825, and a Roman theatre,

dating from the 2nd century, the colossal façade of which is visible from all parts of the town. The tiers of seats were restored in 1894, and the building is now a national theatre in which open-air plays are occasionally performed. The cathedral of Notre Dame dates from the 11th century. Here are textile, dyeing, and tanning industries. A principality which passed

Orange, France. Interior of the Roman theatre, showing the restored tiers of seats

in the middle of the 16th century to the house of Nassau, it was claimed on William III's death by Prussia, which ceded it to France by the treaty of Utrecht, 1713. Pop. 13,978. *See* Orange (family name).

Orange. Town of New South Wales, Australia. Situated 3,000 ft. above sea level, and 190 m. W.N.W. of Sydney by rail, it is the centre of a fruit and wheat growing district, and a rich mineral area, yielding gold, silver, and copper. The town has been since 1830 an important point on the route W. from Sydney over the Blue Mts., first by the main road, and later by the rly. Pop. 12,190.

Orange. City of New Jersey, U.S.A., in Essex co. It lies 12 m. W. of New York and is connected with that city and Newark by rly. Like East, South, and West Orange, it has become an industrial as well as a residential suburb. Hats are made by the large negro and foreign element. Fine residences of New York business people dominate the neighbouring heights. Settled c. 1670, Orange was incorporated as a township in 1806 and chartered as a city in 1872. Pop. 35,399. *See* East Orange; West Orange.

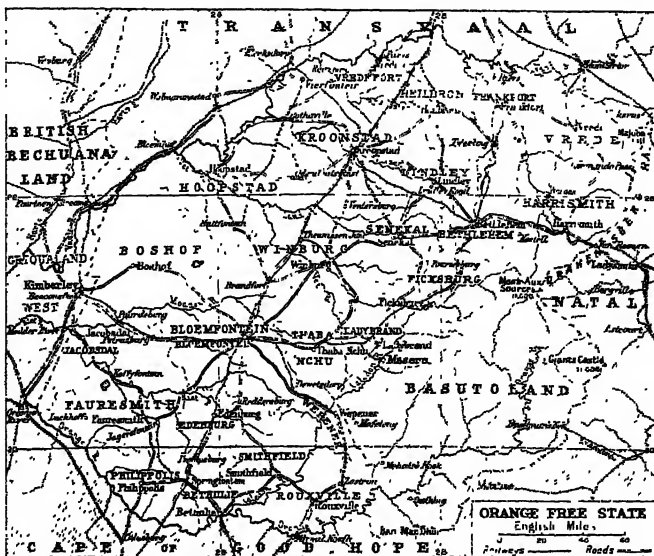

Orange. Name of European family. It is taken from the little French principality of Orange, which had its own rulers from about 900. In 1500 the family died out, and Orange passed to a member of the Nassau family, later princes being known as of Orange-Nassau. One of these was William the Silent. The title was retained by his descendants, one of whom was William III of England; their interests were chiefly in the Netherlands of which a member became king as William I in 1813. *See* Nassau; Netherlands. *Consult* The House of Orange, M. E. Grew, 1947.

Orange Free State or **ORANJE VRYSTAAT**, Province of the Union of South Africa. It is bounded N. by

Orange Free State arms

the flattest stretches of land in the world, it is called the prairie province of S. Africa. The country is an almost treeless tableland at an average alt. of about 5,000 ft., sloping from the Drakensberg

Orange Free State. Map of the province of the Union of South Africa which takes its name from the Orange River

range in the E. to the valleys of the Orange and Vaal rivers, which form its S. and N. boundaries.

The climate is temperate and rainfall moderate, chiefly in the form of violent thunderstorms in late summer. There is some good soil, but irrigation is required in many parts. The farmer has had to struggle against long droughts followed by heavy floods. He is poorer than farmers of the other provinces; for this reason the O.F.S. was known as the Cinderella province. Cattle, sheep, and ostriches are reared. Maize is the chief crop, others being wheat, oats, potatoes, tobacco, and fruit. Rich diamond deposits and coal are worked, and gold and iron are found. Wool, diamonds, and ostrich feathers are exported. Pop. 875,545.

European authority in the country began about 1824, when some Dutch farmers crossed into it from Cape Colony. Previously the only inhabitants had been Hottentots, Bushmen, and other Africans. In 1836 more Dutch farmers arrived, to find suitable land for tilling, and to escape from the jurisdiction of the Cape government. These settlers declared their land a republic. After the British appeared there was continuous trouble, there was no clear dividing line between their spheres of influence. British sovereignty was declared in 1848 but abandoned in 1854, when a Boer republic was formed.

Under the long presidency of Brand, which ended in 1888, the

country prospered, being aided by the opening up of diamond fields. Under his successor, Reitz, the Boer republics entered into closer relations with each other, and in consequence the O.F.S., under Steyn, joined the war against Great Britain in 1899. This ended with the occupation of Bloemfontein and the annexation of the country as the Orange River Colony. In 1902 the Boers acknowledged the rule of Great Britain. Responsible government was given to the prov. in 1907, and in 1910 it joined the Union of South Africa, reverting to the name O.F.S.

To the house of assembly at Cape Town it sends 17 members, and to the senate eight. The franchise is confined to British subjects of the white races. For managing its internal affairs the province has an executive committee of four members, presided over by an administrator appointed by the Union. This is responsible to a council of 25 members elected for three years. The matters under its control include education, and its income is derived from taxation and subsidies from the Union parliament. The judicial system consists of a provincial court at Bloemfontein from which there is a right of appeal to the supreme court.

Bloemfontein is the capital, a city of gardens and stately buildings. Peopled by Dutch and Huguenot stock, it was founded by an Englishman, H. D. Warden. It is an important rail, road, and air junction. One of the chief events in

O.F.S. history was the discovery of gold in 1946 at Odendaalsrust, about 150 m. S.W. of Johannesburg. This was the richest strike in the history of gold mining, Sir Ernest Oppenheimer estimating that it would produce £50,000,000 a year of gold. About eleven new mines will be opened in this area. The O.F.S., hitherto almost completely pastoral, will now be industrialised on a large scale. There has also been a new boom in the diamond industry. See S. Africa; Transvaal; consult The Boer States, A. H. Keane, 1900.

Orangemen's Day. A public holiday celebrated in N. Ireland on July 12. This was the date of the battle of Aughrim, 1691, a victory for Protestants owing allegiance to William III over Catholics who fought for James II.

Orange Society. Irish political association founded in Armagh in 1795 for the defence of Protestantism and the maintenance of the Protestant ascendancy in Ireland. For a century before the Revolution of 1688 there was bitter hostility between Roman Catholics and Protestants in Ireland, aggravated by the regime of the Commonwealth and the plantation, especially in Ulster, of colonies of English Puritans and Scottish Presbyterians. The overthrow of James II by William of Orange made the latter the hero of the Protestant ascendancy, which was then thoroughly established.

In the N., Protestant Peep o' day Boys and R.C. White Boys and Defenders vied with each other in the perpetration of outrages. The antagonism became particularly virulent in Armagh, where the Orange Society sought in effect to make it impossible for R.C.s to live. The society soon came into collision with Wolfe Tone's Society of United Irishmen, which had for its object the union of R.C.s and Protestants for the overthrow of the English ascendancy, though it gradually became an R.C. movement. This society was unjustly held responsible for violence committed in the name of the law in the suppression of the insurrection of 1798; whereas its existence was merely a symptom of the disease of religious animosity affecting both sides. It was, however, antagonistic to the Union of 1801, which was expected greatly to impair Protestant ascendancy.

In the 19th century Orangism was directed to the repression of the movement for Catholic emancipation. It can hardly be said to

have become definitely loyal to the empire until O'Connell's movement for the repeal of the Union, which, since Catholic emancipation had been granted (1829), would have meant the establishment of R.C. ascendancy. See Ireland.

Orange-tip Butterfly (*Euchloe cardamines*). Butterfly of spring, common in British lanes, and distributed over Europe and a great part of Asia. It measures about 1½ ins. across the expanded wings. These on the upper side are

Orang Utan. Specimen of the man-like ape of Borneo and Sumatra, showing its characteristic attitude in the fork of a tree; top, crouching on the ground

mainly white with a black base, and the tips of the fore wings margined with black, broadly in the female, narrowly in the male, in which nearly half the wing is orange. On the under-side the hind wings are heavily blotched with green. When the insect alights on the clusters of small white flowers of Cruciferae or Umbelliferae and elevates its wings over its back, the hind wing becomes part of the flower cluster and the butterfly is invisible as such. See Butterfly, colour plate.

Orang Utan (Malay, man of the woods). Species of anthropoid (man-like) ape (*Pongo pygmaeus*)

found only in Borneo and Sumatra. A full-grown male stands about 4½ ft. high, and its arms are so long that in the erect position the fingers almost touch the ground. The legs are short, and when walking the animal rests on the knuckles of the fingers and the outer edges of the feet, the soles being turned inwards. It thus progresses slowly on the ground, but in the trees it can swing itself along with fair speed, though it seems always to be moving with deliberation. The remarkable disproportion of the limbs distinguishes the orang from the gorilla and the chimpanzee; but, in addition, the skull is differently shaped, and the numbers of the vertebrae and wrist bones are different. In almost all its special anatomical features the orang is further removed from man than the other large anthropoids.

The head of the orang is compressed from back to front, giving the appearance of a high forehead,

and the jaws project considerably. In old males huge ridges develop down the cheeks, and the skin round the neck is distended in such a fashion as to suggest the disease known as goitre. The skin is covered with long, shaggy, reddish-brown hair, and in old animals there is often a full beard.

Orangs occur in the densest forests, and are usually found in families consisting of the two parents and a few young ones. They construct strong but rough nests of sticks in the trees, in which they pass the night. They feed by day, principally on fruit, though they

also eat leaves and shoots. In captivity, young specimens are docile and affectionate.

Oracón. Aboriginal tribe of cultivators, mostly in Bihar, Orissa, and the Central Provinces, India. Calling themselves Kurukh, they number some 700,000; one-fourth have become Hinduised in religion and speech, while three-fourths are still wild hill-dwelling animists. They worship visible objects, such as stones and posts, and at their annual Khaddi festival, for ensuring good crops, their aboriginal deity, Dharmesh, is symbolically wedded to Mother Earth. Their Dravidian language, allied to Khond, is intermediate between the Tamil and Telugu groups.

Oratorians. Familiar term for the R.C. Congregation of the Oratory of Our Lord Jesus Christ, and that of the Oratory of S. Philip Neri (*q.v.*). The first named was founded by Cardinal de Bérulle, at Paris, in 1611, composed of priests, and was instituted to deepen devotion, promote professional studies, and generally to strengthen ecclesiastical discipline. Its rule was adopted by the Oratory of the Immaculate Conception founded at Paris in 1852. The Oratory of S. Philip Neri dates from 1564. In 1575 it was given the old church of the Vallicella, Rome, on the site of which S. Philip caused a beautiful new oratory to be erected. The society is composed of priests without vows, but agreeing to a rule approved by Paul V in 1612. Each house is independent. It was introduced into Great Britain in 1847 by J. H. Newman, and its chief centres in England are at Birmingham and Brompton (*q.v.*).

Oratorio (Ital., first used at musical services given at the Oratory of S. Philip Neri). Sacred story or drama set to music, in which solo voices, chorus, and instruments are used. It occupies in sacred music the place that opera occupies in secular music, but is performed without scenery, costumes, etc.

About 1574, S. Philip Neri (*q.v.*) introduced into his Oratory in Rome the acting of sacred dramas, more refined than the medieval morality plays, and interspersed with sacred music. Hence the name, which is the Italian form of oratory. The earliest surviving oratorio is *The Representation of the Soul and the Body*, composed by Giulio Cavaliere and performed in the Oratory, 1600. The composer, who died before the first performance, left complete directions as to the performance, which

included dancing and gestures. No further development followed until Carissimi increased the importance of the chorus in two works, *Jephthah* and *Jonah*. A pupil, A. Stradella, reached a higher standard in *S. John the Baptist*, 1676. But oratorio in Italy gradually came under the same influences as determined the form and character of opera, the solo singers becoming increasingly important at the expense of the chorus.

Passion Music

In Germany the religious character of the people revealed in the Reformation was also seen in the special attraction which the Passion story had for them. The four settings of the Passion by Heinrich Schütz (b. 1585) mark a beginning in that special form of oratorio which led to the great Passions of J. S. Bach, though the earliest surviving example of German oratorio is Schütz's *Resurrection*, composed before his Passions. Bach's chief works in this form are his two Passions—*S. John*, 1723, *S. Matthew*, 1729—and his *Christmas oratorio*, 1733. The Passions of Bach differ from the ordinary oratorio form in emphasising important points of the story by the introduction of solos and choruses of a reflective and meditative character, also by means of chorales intended to be sung by the whole audience. Handel's oratorios were written as a form of musical entertainment, several being first produced at the same theatre as that at which his operas were produced. The majority follow more or less closely a particular Biblical story: *e.g.* *Israel in Egypt*, *Saul*, *His Messiah*, 1742, however, aims at a presentation of the whole scheme of salvation. The choruses are the great feature of Handelian oratorio.

Haydn's *Creation*, 1798, presenting a series of tone pictures, was the first oratorio in which orchestral accompaniment was treated on modern lines. In Spohr's *Last Judgement*, 1826, a still more modern feeling is emphasised by the free use of the chromatic harmony characteristic of this composer's work. Of Mendelssohn's three oratorios, *Hymn of Praise*, *S. Paul*, *Elijah*, the last, composed 1846, reveals most clearly the composer's complete mastery of the use of chorus and orchestra to secure vivid and dramatic effect. From his time the majority of oratorios have been written either by English composers or for English performance. Works in which the chorus is important have

always made a special appeal to Englishmen. The variety of scheme and treatment adopted by later composers is seen in Gounod's *Redemption*; Parry's *Job*; Elgar's *Dream of Gerontius*, *Kingdom*, and *Apostles*; Walton's *Belshazzar's Feast*. See Bach; Elgar; Handel; Mendelssohn; Messiah; Music; Passion.

Oratory (Lat. *orare*, to speak). The art of speaking in order to please or persuade the hearers. It first became a force in the Greek republics. In 4th century Athens the sophists (*q.v.*) made it their aim to teach oratory as a means to personal success. Eloquence was brought to its perfection, and Demosthenes, surmounting many physical disabilities, attained an excellence never surpassed. Under the Roman republic, public speaking became a leading means of acquiring power, honour, and distinction. Roman oratory was marked by method and stateliness, but lacked the spontaneity and sensitiveness of the Athenian; Cicero, by the magic of his style, stands alone. The first orator to receive a salary from the state as a public teacher was Quintilian, a pleader in Rome. He wrote instructively on the subject, explaining in his *Institutiones Oratoriae* what constitutes the well-graced orator. The artificial oratory of panegyrics and academic declamation was taught by professional rhetoricians such as Dion (*q.v.*) Chrysostom, until with the decline of the empire and the rise of Christianity a new form of eloquence, that of the pulpit, was established, of which S. John Chrysostom (*q.v.*) was a master.

During the Middle Ages oratory suffered from the dominance of scholastic rules, though some of the friars cultivated unconventional popular methods. In later times, although magnificent oratory was heard from the pulpit, the art became increasingly associated with parliamentary politics and the law courts. The 1st Earl of Shaftesbury, an earnest student of Cicero, was the first great parliamentary debater, creating a tradition that developed through the 18th century into the classic exercises of Pitt, Chatham, Sheridan, Fox, and Burke, which remained the model of parliamentary style until the 20th century. H. H. Asquith is sometimes said to have been the last parliamentary orator in the classic tradition.

If contemporary oratory shows a decline, it is largely because the spread of the reading habit has

rendered it to some extent superfluous. Sermons and parliamentary speeches alike have become ever shorter. At the same time, and perhaps inevitably, a certain mistrust of the orator's art has become apparent, so much so that one subtle method of practising it with success is to make a profession of disclaiming it, as did Mark Antony ("I am no orator"), Abraham Lincoln ("The world will little note nor long remember what we say here"), and the 1st Earl Baldwin, one of the most skilful and appealing orators of the 20th century—as well as the many lesser speakers who open their discourse with some variant of the well-worn phrase "Unaccustomed as I am to public speaking." The rantings of Hitler and Mussolini to the accompaniment of synthetic applause brought the art into further disrepute; and the broadcasting microphone has proved itself unkind to any speaker with pretensions to the traditional oratorical devices.

Contemporary public speaking tends to be brief and to the point, divested of rhetoric and dramatic vocal inflexion, though not of wit. Gesture and facial expression are reduced to a studied minimum. Nevertheless, so long as there is any occasion for public speaking, those who would be successful practitioners of the art will need to study its demands even if their artistry must remain concealed; while the born orator—a Lloyd George, a Birkenhead, a Winston Churchill, a W. J. Bryan, or a Franklin Roosevelt—may observe or ignore the prevailing canons as he pleases without ever failing to command attention. *See Rhetoric.*

Oratory. CONGREGATION OF THE. Roman Catholic congregation of priests, founded at Florence in 1556 by S. Philip Neri, popularly known as the Oratorians (*q.v.*).

Orbit. (Lat. *orbis*, a circle). Bony socket containing the eye (*q.v.*).

Orbit. In astronomy, the path of a heavenly body in space. The orbit of a body in the gravitational field of a central mass is a conic section: an ellipse, parabola or hyperbola. Neglecting small perturbations, the orbits of the planets are ellipses, while certain comets move in parabolic or hyperbolic orbits. At any given distance from the sun there is a definite velocity called the parabolic velocity which a freely falling body would acquire if it had entered the gravitational field of the sun from an infinite distance. Any body moving in any

direction with exactly this critical velocity will move around the sun in a parabolic orbit; if it moves faster than this, it will describe a hyperbola; if slower, an ellipse. The branch of astronomy dealing with orbits of planets and comets is known as celestial mechanics.

In atomic physics, the hypothesis of electrons moving in orbits round the positive nucleus forms the basis of Bohr's theory of the hydrogen atom. Bohr made two fundamental postulates, viz. that (1) only those orbits are permissible for which the angular momentum of the electron is a whole multiple of $\frac{h}{2\pi}$ where h is Planck's

constant; and (2) the atom radiates energy only when an electron jumps from an orbit of higher to one of lower energy. This theory has since been modified and under de Broglie's hypothesis of wave-mechanics, instead of the electron moving in a stationary orbit, it is supposed that there is a series of waves in this orbit, which produce a stationary wave-system.

Oragna. Name sometimes given to the Italian sculptor Andrea di Cione (*q.v.*).

Orchard. Plot of land devoted to the cultivation of fruit trees which are generally grown as standards. As these will not yield freely until well developed it is good practice to set bush-shaped trees, budded on a dwarfing stock, as well as soft fruits, among them; these will come into bearing while the standard trees are growing up. When no longer profitable owing to the encroachment of the standards they are uprooted. The best site for an orchard is on well drained loamy ground sloping gently to the south-west and protected from north and east. Nut, plum, and damson make good shelter trees. An orchard should not be planted on low-lying land among hills or in a bleak position where spring frosts may damage the blossoms. For the first 8 or 10 years the soil must be kept clear of grass and weeds for 3 or 4 feet round the tree stems. Standards must be staked securely and wired against rabbits; they are planted 25 feet apart, bush-shaped trees 12 feet, and gooseberry and currant bushes 5 feet from each other. *See Fruit Farming.*

Orchard-house. Name given to a glass-house in which fruit trees, grown in large pots or planted in a border of soil, are cultivated. The best type of glass-house for this purpose is the span-roof. Fruits suitable for the

orchard house are peach, nectarine, cherry, apricot, fig, grape, and choice varieties of apple, pear, and plum. If the trees are grown in pots they may be placed out of doors after the fruits have been gathered, thus leaving the glass-house free for salad crops, tomatoes, and chrysanthemums; the trees must be replaced under glass by December.

Orchardson, Sir William Quiller (1835-1910). British painter. Born in Edinburgh, March

27, 1835, he studied at the Trustees' Academy, and settled in London in 1862. He became A.R.A. in 1868, R.A. in 1877, and was knighted in 1907. He painted historical genre

Elliott & Fry

with a definite aesthetic motive; but the oft-repeated brown tone of his pictures later developed into a mannerism. His most famous picture is that of Napoleon on board H.M.S. Bellerophon, now in the Tate Gallery. He also painted portraits, especially during his later years. He died April 13, 1910.

Orchestra (Gr. *orchesthai*, to dance). Musical term. Before 1720 it was used only in its Greek sense, meaning the place in the theatre where the chorus danced. Although records of concerted instrumental music go back to antiquity, there is no evidence to show that these concerted efforts were anything more than a haphazard collection of instruments without thought of balance or the niceties of instrumental colour and sonority. Even as late as the 16th century, usually described as the golden age of polyphony, a band of instrumentalists used for some ceremonial occasion or as an accompaniment to church choral music might vary from a collection of trombones, cornetti (an obsolete wood and ivory instrument bearing no resemblance to the cornet), violas, and bassoons, to a band consisting of viols, violins, lutes, lyres, harps, trombones, recorders, oboes, and organs. In the actual writing for these bands of instruments there was little or no feeling for instrumental style; in fact, when instruments were added to a choir they merely doubled the vocal parts.

The beginning of opera and the demand for intensified dramatic

expression in the music brought about the creation and early development of the modern orchestra. In fact, it may be said that opera has been a constant spur to the expressive potentialities of the orchestra. The first great composer of opera was Monteverde (1568-1643), who realized the possibilities of colour and helped to create balance and organization in instrumental bands or groups. The 17th century was a period of experiment during which composers gradually and somewhat laboriously evolved a definite style in writing for the strings and laid foundations of a string orchestra divided into either three or five parts, eventually giving way to a four-part division. With the emancipation of the cello a century or more later, the string section of the modern orchestra was divided again into five parts.

It took nearly another century to establish a cooperative, but at the same time independent and flexible, wind section of the orchestra. At first the addition of wind instruments to strings was governed by the necessary but haphazard method of using what instruments happened to be available. What is important to remember is that during the 18th century the actual style and texture of music itself was undergoing a change—a change from the polyphonic to the harmonic style, from the vocal to the instrumental style.

The new style of music (the classical style, we call it) with its appropriate new forms, e.g. the symphony, was brought to its highest stage of perfection by Haydn and Mozart, who established the principles of modern orchestration and a finely balanced instrumentation of the concert orchestra itself, consisting of two flutes, two oboes, two clarinets, two bassoons, two horns, two trumpets, drums, and strings in four parts (cellos and basses almost invariably playing the same part at the interval of an octave). However, it must not be forgotten that the great contributions of Haydn and Mozart to the development of the orchestra would not have been possible if the ground had not been well prepared for them by the work of a host of talented and industrious forerunners, notably Bach's two sons—C. P. E. and J. C. Bach—and a group of composers, headed by Carl Stamitz, which flourished in Mannheim during the middle years of the 18th century.

In opera the French Rameau and the German Gluck were responsible for many innovations,

particularly Gluck, who evolved not only a true orchestral style as distinct from his vocal style, but realized and experimented in the potentialities of instrumental colour and dramatic expression. In the preface to his opera *Alceste* he claimed that instruments ought to be used "in proportion to the degree of interest and passion in the words." Gluck was one of the first to realize the possibilities of the clarinet, which was then a new instrument. He also added trombones and more percussion instruments to his orchestration. The two outstanding characteristics of his orchestral style were the greater independence and individuality given to each section of the orchestra and the fuller and richer use of harmony.

Haydn and Mozart also introduced the clarinet in their later symphonies, but it was not until Beethoven wrote his Fifth Symphony (1804) that trombones were used in the concert orchestra. Beethoven treated the orchestra very sensitively, and much of what awkwardness there may be in his writing is due to mechanical defects of the instruments at his disposal, such as the horn.

Nineteenth-century Development

During the first half of the 19th century the range and flexibility of the orchestra was considerably increased by a generally higher standard of string playing, the emancipation of first the cello and then the viola as melody instruments in their own rights, and by the improvements in the valve mechanisms of wood-wind and brass instruments.

Weber, the first German Romantic composer of opera, showed a wonderful sense of orchestral tone colour, and he used the instruments of the orchestra, both singly and in combination, as an artist uses his palette. He was, however, surpassed by the French Berlioz, who was one of the most original minds in the development of the art of orchestration.

The still further extension of harmonic resources and the increase of virtuosity in all instrumental technique combined to offer in the orchestra a magnificent medium of expression to composers of the second half of the 19th century. Wagner used the orchestra in his great music-dramas with the power, imagination, and skill of genius. Like his younger contemporaries, Rimsky-Korsakov, Debussy, Mahler, Strauss, and many others, Wagner conceived his music in terms of the orchestra,

and not as a kind of transcription or arrangement of music conceived first of all in terms of string or piano tone.

Mastery of the orchestra is the stock-in-trade of every 20th century composer, but new and distinctive sonorities and timbres have been constantly added—notably by Puccini, Sibelius, Ravel, Schönberg, Bartók, Berg, and Britten.

The tendency in the development of the orchestra from Bach to Britten has been the increasing of size and complexity. In the 18th century and the first half of the 19th century orchestras varied in size and instrumentation according to the wealth and importance of their patrons. At Leipzig in 1730 Bach's orchestra consisted of six first and second violins, two violas, two cellos, one bass, two flutes, two oboes, one bassoon (an apprentice), and two trumpets. At London in 1791 the orchestra for the famous Salomon concerts, for which Haydn wrote twelve symphonies, consisted of twelve to sixteen first and second violins, four violas, three cellos, four basses, two flutes, two oboes (clarinets probably engaged when needed), two bassoons, two horns, two trumpets, and one set of drums. In 1841 the Berlin Opera consisted of eighty-two players including two harps and four each of all wind and brass instruments. Finally in 1939 the B.B.C. Symphony Orchestra consisted of about one hundred and ten players.

Ralph Hill

Orchestration OR INSTRUMENTATION. In music, the art of planning music for the orchestra, allotting to each instrument its most suitable duties in view of both its tone and its technique. *See* Full Score; Instrumentation; Orchestra; *consult also* A Treatise on Modern Instrumentation, H. Berlioz, Eng. trans. M. C. Clarke, new ed. 1904.

Orchha. Town and former state of India, now in the Vindhya union. The state lay between the Jamm and Dhasan rivers between Jhansi and Chhatarpur. Its area was 1,999 sq. m. Pop. 363,405. The town, the former capital of the state, is situated on the Betwa. An imposing fortress is connected with the town by a wooden bridge.

Orchid. Family of plants found wild, chiefly in tropical countries. The number of species or wild types runs into thousands. The flowers are extraordinarily varied in shape and size and many of them are exquisitely coloured.

Some, classed as epiphytes, are found on trees; others, known as terrestrial, grow in the soil. The growth is often in the form of a thick, flattened, stem-like structure called a pseudo-bulb, from which the leaves are produced. Almost all kinds must be, in cooler climates, cultivated under glass, those from a tropical climate in a minimum temp. of 65° F. at night and rising much higher by day.

Orchid. 1. Green-winged orchid, *O. morio*. 2. Flower of Butterfly orchid, *Habenaria bifolia*. 3. Fragrant orchid, *Gymnadenia conopsea*

Those native to high altitudes are grown in a glasshouse having a minimum temp. of 50° or even 45° F. Others are suited by the temp. of a warm or intermediate glasshouse where the temp. does not fall below 60°.

Most orchids can be grown to perfection only in glasshouses specially built, where they have expert care. A few, however, will flourish in an amateur's greenhouse among other plants needing warmth. Watering, ventilation, and keeping the air of the glasshouse moist are important details of cultivation. When growth for the year is complete orchids need watering less frequently, but the ventilators must be managed so that draughts are prevented. To prevent the air in the glasshouse from drying out it is usual to cover the staging with shingle and to keep this moist by syringing.

The difficulty of obtaining fuel for heating greenhouses not devoted to food crops led, during and after the Second Great War, to a reduction in the collections of hot-house plants including orchids, while the importation of orchids

steadily declined. Some of the orchids which may be grown successfully in an amateur's warm greenhouse are lady's slipper or cypripedium, some of the cattleyas, odontoglossum, dendrobium, cymbidium, lycaste, coelogyne, and masdevallia.

Although the wild types of orchids number many thousands through crossbreeding by professional and amateur growers of some genera, e.g. cymbidium, cypripedium, and cattleya, the hybrids raised artificially outnumber the species introduced from abroad. Established orchids are repotted at various periods of the year, the best time being when fresh root growth is seen. It is unnecessary to repot them every year.

The terrestrial orchids, e.g. cypripedium, lycaste, and coelogyne, are grown in well-drained pots

in a compost of three parts loamy soil, one part of osmunda fibre, one part of sphagnum moss, and a free scattering of small pieces of broken flower pot. A compost which suits cattleya, laelia, and a number of other popular kinds consists of three parts osmunda fibre and one part sphagnum moss; free drainage is most necessary. Some kinds, e.g. vanda, aerides, oncidium, can be grown in suspended baskets.

The hardy orchids, some of which grow wild in Great Britain, are smaller and far less showy than those cultivated under glass. Most of them need to be planted in loamy soil in cool, slightly shaded places in the rock garden. One of the finest is the Madeira orchid (*Orchis foliosa*). Another striking flower is the North American *Cypripedium spectabile*, which needs peat and leaf mould but not shade. The butterfly orchid (*Habenaria*), the bee orchid (*Ophrys apifera*) are two attractive native species. Others are the early purple *Orchis mascula*, commonest of all, the spotted *Orchis maculata*, the green man orchid (*Aceras*), and the sweetly-scented *Gymnadenia conopsea*.

Orchis (Gr., testicle). Large genus—about 70 species—of herbs of the family Orchidaceae. They are natives of Europe and Asia, and a few of N. America. They have usually a pair of egg-shaped tubers, which suggested the old Greek name; in some species these are flattened with finger-like prolongations (palmate). The annual stem is wrapped around by the few strap-shaped leaves, which sometimes are spotted or blotched, and ends in a spike of irregular flowers, which by the twisting of the ovary are reversed.

Of about a dozen British species the best known are the early purple orchid (*O. mascula*) and the spotted orchid (*O. maculata*). The former, which appears in April in copses and pastures, has the typical oval tubers and the leaves spotted with purple-black. The flowers and the upper part of the stem are red-purple. *O. maculata* has the tubers flattened, and the flower-spike more pyramidal, the flowers pale lilac marked with streaks and curved lines of purple. The pyramidal orchid, handsome but evil smelling, grows on limestone. See Bee Orchid; Butterfly Orchid; Ophrys; Orchid.

Orcus. In Roman mythology, name of the god of the lower world, subsequently identified with Hades or Pluto. Orcus is also used for the lower world itself. See Hades.

Orczy, EMMUSKA, BARONESS. (1865–1947). British novelist and playwright. Born at Tarnaörs, Hungary, daughter

Baroness Orczy,
British novelist
Russell

of Baron Felix Orczy, she was educated at Brussels and studied painting in London. In 1905 she published *The Emperor's Candlesticks*, also (after its rejection by 12 publishers) a tale of the French Revolution, *The Scarlet Pimpernel*, dramatised in collaboration with her husband, Montague Barstow, and produced by Fred Terry and Julia Neilson at the New Theatre, London. The play's success brought immense sales for the book, which was followed by many sequels during the ensuing 30 years. She wrote many other "cloak and sword" romances, and three other plays, though none of the latter attained any comparable triumph. She died Nov. 12, 1947, shortly after the publication of her memoirs, *Links in the Chain of Life*. See *Scarlet Pimpernel*.

1. *C. maculata* (Spotted Orchid), Europe, N. Asia. 2. *Epipodisma*. 3. *Epipodisma*. 4. *Epipodisma*. 5. *Epipodisma*. 6. *Epipodisma*. 7. *Epipodisma*. 8. *Epipodisma*. 9. *Epipodisma*. 10. *Epipodisma*.
 1. *C. maculata* (Spotted Orchid), Europe, N. Asia. 2. *Epipodisma*. 3. *Epipodisma*. 4. *Epipodisma*. 5. *Epipodisma*. 6. *Epipodisma*. 7. *Epipodisma*. 8. *Epipodisma*. 9. *Epipodisma*. 10. *Epipodisma*.

Ordainers, LORDS. Body of 21 peers appointed in 1310, by a parliament consisting of peers only, to amend the unsatisfactory government of Edward II. It was arranged that they should administer affairs for 18 months and then formulate proposals. These proposals, known as the ordinances of 1311, secured the expulsion of Gaveston, the king's disreputable favourite, and of other foreigners, various limitations of the royal power, and the summoning of Parliament once a year. See Edward II; England: History.

Ordeal. Ancient form of trial *per Dei iudicium*, by judgement of God. The underlying belief that Divine providence would intervene to protect the innocent from unjust condemnation is of remote antiquity and universal distribution. A test of innocence of infidelity by drinking bitter water mixed with dust from the floor of the tabernacle (Numbers 5) shows that the practice was in use among the Jews. That it obtained among the ancient Greeks is proved by a passage in Sophocles' *Antigone*, where the watchman protests his readiness to hold red hot iron in his hand and walk through fire, to prove his innocence of Cleon's charge of having given Polynices proper burial.

Among the Anglo-Saxons the test generally took one of four forms: ordeal by battle; ordeal by fire—either by handling hot iron, or walking blindfold and barefoot over red hot ploughshares placed at irregular intervals; by hot water, when the suspect plunged his arm up to the elbow into boiling water; or by cold water, when the suspect was flung into a stream or pond and, making no effort to swim, either sank, when he was deemed innocent, or floated, in which case he was convicted and punished.

Legal ordeals were abolished in England under Henry III, with the exception of trial by battle, which actually survived on the statute book until 1818, when it was abolished in consequence of the right to trial by battle being claimed by a man charged with murder. Swimming, or floating, was the common method of testing witches until the 18th century, the women being bound right thumb to left toe and left thumb to right toe, in which position they could not keep themselves afloat, and were left to the judgement of heaven. See Divination; Duel: Trial by Battle.

Ordeal Bean (*Physostigma venenosum*). Perennial climbing herb, member of the family Legumi-

nosae, native of tropical Africa. The leaves are broken into three leaflets. The purple, bean-like flowers are in sprays, and are succeeded by dark-brown pods containing two or three large blackish

Ordeal Bean: foliage and flowers. Inset, seeds, showing the hilum or deep groove

or brown seeds with a deep groove (hilum) along one side and around one end. These seeds are extremely poisonous, and are employed by the natives of Old Calabar as an ordeal for those suspected of witchcraft. The suspect has to eat beans until he vomits and so prove his innocence, or he dies, and so proves his guilt. It has been found useful in ophthalmic surgery for contraction of the pupil of the eye.

Ordeal of Richard Feverel. THE. Novel by George Meredith (*q.v.*), first published in 1850 with the sub-title of *A History of Father and Son*. The earliest of its author's series of fiction studies of modern life, this story is by some critics regarded as on the whole the greatest of them. Its theme is the danger of applying academic theories to education for practical life. The story represents the best qualities of Meredith as a novelist, his wit, humour, poetry, and rare skill in psychological analysis.

Order (Lat. *ordiri*, to begin). Word used in several senses. Its prime meaning is that of a series or row, hence an order or regular arrangement. From this came the idea of obedience, and so we have the use of the word for a command.

To-day an order means a class of persons united together in some way. Such are the orders of knighthood and other orders of the same kind, which do not carry the honour of knighthood, the order of merit, for instance, and the monastic and other religious and semi-religious orders. (See Knighthood; Merit, Order of; S. John of Jerusalem; Knights Templars, etc.)

In the sense of a command the word is frequent in military and naval language, for instance, close order, fighting order, sealed orders, etc. The same idea is seen in

ecclesiastical matters, the order of service and the phrases Holy Orders and minor orders being examples. It is the same in business, in such phrases as payable to order. In a related sense order implies good and peaceable conditions, *e.g.* public order and to maintain order. (See Holy Orders.)

In natural science, especially in zoology and botany, an order refers to a number of genera having important points in common. It is thus intermediate between a class and a family. In architecture, an order is one of the different ways in which the column, with its various parts and its entablature, are moulded and related to each other. There are three main orders, Doric, Ionic, and Corinthian, and two minor ones, Tuscan and Composite. See Architecture; Column; Corinthian Order; Doric Order, etc.

Ordericus Vitalis (1075–1142). Medieval chronicler. Born near Shrewsbury, England, Feb. 16, 1075, the son of a French priest and an English mother, he passed the greater part of his life in the Norman monastery of St. Evroul. About 1123 he began to write the history of the monastery, but this was soon expanded into a general history, although described as *Historia Ecclesiastica* only. He had good sources of information about England as well as France, and the part of his work which deals with his own age, the eighty years after the Norman conquest, is a valuable contribution to the history of the two countries. It has been edited by French scholars and translated into English.

Order-in-Council. In the United Kingdom, and also in Canada, Australia, and other parts of the British Empire, an order issued by the sovereign on the advice of the privy council. It is thus a method of legislation, having taken the place of the proclamations issued by the Tudor and later sovereigns.

The place of orders-in-council in the parliamentary system is maintained by a fiction. Theoretically they are issued by the advice of the privy council, but in practice, on the advice of only a few of its members, who are also members of the Government, and as such responsible to Parliament. These orders were first issued in the 18th century, and a notable instance was in 1807–8, when by them all vessels were forbidden to trade with ports under French control. (See Berlin Decree.) They were extensively used during both Great Wars, especially for matters of urgency. Orders-in-Council are used to carry out Acts of Parliament. Towards

the end of the nineteenth century, owing to the mass of new legislation, the custom sprang up of drafting Acts of parliament in very general terms, giving very extensive powers to ministries to formulate the details as they thought best, and carry them out by issuing orders-in-council. See Statutory Instrument.

Orderly. Name given in the British army and air force to a soldier or airman who serves as a messenger or attendant. Orderlies are attached to squadron, battalion, company, or other unit headquarters, while others attend officers on duty. Hospitals, sick quarters, and dental centres have orderlies to assist the medical officers. Every unit of squadron or company strength upwards has an orderly sergeant and orderly corporal who do duty on rota and are responsible for routine duties such as parades, guards, etc., over a period of 24 hours. An orderly officer is an officer who is on a 24-hour duty and is responsible during that period for administrative routine. The office dealing with the clerical work of a unit is called the orderly room.

Ordinal Numbers. Name given to those words used to indicate the position of something in a sequence. First, second, third, etc., are ordinal numbers. One, two, three, etc., are called cardinal numbers, though the latter are also used as ordinals, e.g. in numbering the pages of a book.

Ordinance (Fr. *ordonnance*). Edict used by authority. Specifically, the term is applied in Great Britain to an Act of parliament not sanctioned by all three estates of the realm, e.g. the self-denying ordinance (q.v.) passed by the Long parliament in 1645 at Cromwell's instigation. Temporary Acts of parliament and Acts which are merely declaratory are also called ordinances. The edicts issued by the kings of France from the time of Philip IV until the Revolution in their own name, and having the force of laws, were termed *ordonnances*. The ordinances affecting the press and the reconstruction of the chamber of deputies issued by Charles X, July 26, 1830, were the immediate cause of the revolution and his enforced abdication, Aug. 2, 1830. In its connotation of an established rule or rite the word ordinance is also used, especially by Presbyterians, of the sacraments, as the ordinance of baptism. See Ordainers, Lords.

Ordinary. In heraldry, the commonest charge. They are

mostly plain symbols, composed of broad bands. They are among those found on the earliest feudal coats, and by old writers are referred to as the "honourable ordinaries." They are supposed to occupy one-third of the shield, but generally are given less space. Most of the ordinaries have "diminutives," usually smaller representations of the parent charge. The first diminutive occupies half the space of the ordinary, and so they diminish by half at each step.

The names of the ordinaries are chief, pale, or paller, bend, bend sinister, fess or fesse, chevron, cross, saltire, quarter, and pile.

All ordinaries and most of their diminutives may be charged, i.e. ornamented with another ordinary, a diminutive, or some other figure; and they can also be "surmounted," i.e. another ordinary, or an animal or monster, may be placed over them. On the other hand, an ordinary may surmount some ordinary charge. Most of them may be "voided," i.e. only a border is shown, the tincture of the field showing between. See Heraldry, colour plate.

Ordinary. In ecclesiastical law, an ecclesiastic who exercises jurisdiction within a given district. In England it usually means the bishop of the diocese or his chancellor acting by his authority. The expression Ordinary of the Mass means the fixed portion of the service as distinguished from the variable parts—such as collects, gospels, etc.—proper to special occasions. In common parlance, it is applied to the service generally, with the exception of the canon, which consists of the prayer of consecration and its adjuncts. See Bishop.

Ordinary Shares. The shares in the capital of a limited company which are entitled to dividend, and, in liquidation, to repayment, only after the claims of debentures and fixed interest preference shares. There may be two classes of ordinary share, the superior being then designated preferred ordinary shares and the inferior either deferred ordinary or merely ordinary. While a higher class of share thus takes preference over the ordinary share from both an interest and capital point of view, it is important that, after the claims of the fixed interest shares and debentures have been satisfied, the whole of the remaining profits available for distribution, and the remaining assets, belong to the ordinary shareholder. In a successful concern he frequently re-

ceives a much higher rate of interest and possesses a far higher proportion of the assets of the concern than does the holder of shares of a superior class. For that reason the price quoted on the Stock Exchange for ordinary shares (or units of ordinary stock) in the capital of a company often exceeds many times the price quoted for the same company's debentures or preference shares.

Ordinate. In mathematics, the length of the straight line drawn from any point parallel to one of a pair of Cartesian coordinate axes, to meet the other axis. See Coordinates.

Ordination. Ecclesiastical rite in which Holy Orders are conferred upon deacons and priests. In the Greek, Roman, and Anglican communions the rite includes the laying on of hands by a duly consecrated bishop; in the Presbyterian churches the ordination is by the Presbytery. The subject is one of great controversy associated with the Apostolic Succession (q.v.).

Since the beginning of the 17th century the validity of Anglican orders has been contested by the Roman Catholic church. On Sept. 18, 1896, Leo XIII issued a Bull, *Apostolicae Curae*, pronouncing that ordinations performed by the Anglican rite have been and are utterly invalid and altogether void; to which Archbishops Temple and MacLagan replied, Feb. 19, 1897. For some 40 years the Anglican succession derived from Matthew Parker (q.v.), and a crucial point of the controversy is the validity of his consecration.

Deacons and priests are ordained on the four Sundays following the Ember Weeks, the canonical ages being 23 for deacons and 24 for priests. Ordination is a sacrament in the Greek and Roman churches. See Holy Orders; Thirty-Nine Articles.

Ordinance. General designation of all weapons of warfare of greater calibre than a rifle. More specifically, and in the British army, the term ordinance includes the provision, storage, distribution, and maintenance of arms and ammunition of all kinds, personal and camp equipment, vehicles and armour, clothing, and all stores except food. A special unit, the Royal Army Ordnance Corps (q.v.) is responsible for all these duties except the maintenance of guns, armour, and electrical equipment, which is the responsibility of the Royal Electrical and Mechanical Engineers (q.v.). Similar services are

provided for the navy by the directorate of naval ordnance, and for the R.A.F. by equipment and maintenance units.

Ordnance Artificer. Non-commissioned officer of the British navy. The branch to which he belongs was established in 1919, to provide personnel to maintain naval armament. Men are enrolled as chief ordnance artificer and ordnance artificer, and are given the status of chief petty officer. *See* Armour, Naval; Armourer; Artificer.

Ordnance Board. A British advisory committee of experts in armament. Officers from all three services are detailed to act on the committee, which also includes civilian scientists. Its functions are to consider inventions relating to both weapons and ammunition, suggest suitable designs for specific purposes, investigate failures and accidents, and advise the authorities on all questions of ordnance manufacture and practice.

Ordnance Factory. Factory maintained by the British govt. for the manufacture of armaments and other war material required by the army and navy, and ammunition for the R.A.F. During the Second Great War large numbers of additional factories were built by the ministry of Supply and operated directly by the govt., while others were erected by the govt. and the production in them carried out by private firms engaged on govt. contracts. Factories building aircraft for the R.A.F. came under control of the ministry of Aircraft Production. *See* Munitions.

Ordnance Survey. A topographical survey of the U.K. In 1747, following the Jacobite rebellion of 1745, General Watson organized the making of a map of the Highlands, but the ordnance survey cannot be said to have come into existence until 1784, when General Roy measured a base line on Hounslow Heath.

An ordnance survey department was established in 1791 under the joint direction of the Master Gunner (*q.v.*) and the ordnance department to prepare a map of Great Britain on a scale of one inch to the mile. Civil recruitment was introduced in 1824, when a 6-in. survey of Ireland was begun. The office of works took it over in 1870, and the board of agriculture in 1889. It is now administered by the ministry of Agriculture and Fisheries, but the director general has always been a military officer and R.E.

officers have always been in charge of the actual field work. Maps of Ireland are no longer issued by the organization, but it issues maps of Great Britain on a number of scales, based on the 1/2,500 survey—25 ins. to the mile, commenced in 1855, and completed about 40 years later, and since constantly revised. The ordnance survey also carries out surveys for land registration, tithe redemption, and work for the War office and Air ministry. It examines documents and maps relating to administrative and other boundaries for other ministries. The largest scale maps are the cadastral maps on the scales of 1/2,500 and 1/10,560, *i.e.* the 25-in. and 6-in. maps, and the 5 ft. and 10 ft. to the mile maps. The 6-in. map is a reduction of the 25-in.

The maps on the scales of 1/633,360, 1/126,720 and 1/253,440, *i.e.* the 1-in., $\frac{1}{2}$ -in., and $\frac{1}{4}$ -in. to the m. maps respectively, may be termed topographical maps. They show the natural features of the country, as well as towns and villages, railways, roads, canals, bridges, telegraph lines, etc. Unlike the cadastral maps, they do not show the property boundaries. The best known is the 1-in. map, the standard British topographical map. It is issued in three forms, of which that printed in colour and showing relief by means of contours and hachures is perhaps the best example of a British ordnance map. The smallest scale maps are the 1/633,600 and 1/1,000,000.

Ordovices. Celtic tribe inhabiting a large part of N. Wales at the time of the Roman occupation of Britain and subdued by Agricola in the 1st century A.D.

Ordovician. Name given to the geological period following the Cambrian and preceding the Silurian. One of the lower Palaeozoic systems, it lasted from about 400 million to 350 million years ago. It was named after the ancient British tribe of Ordovices who inhabited the Welsh borderland, because Ordovician rocks occur in Wales, as also in the Lake District, S.W. Scotland, and the S. edge of the Highlands. They are mainly grits, greywackes, shales, limestones, and volcanics which filled a subsiding trough trending N.E.—S.W. In Shropshire sandy types which were indicative of shallow water were deposited near the edge of the trough.

The period is divided into the following rock-series, in ascending order: (1) Skiddavian or Arenig; (2) Llanvirnian; (3) Llandellian;

(4) Caradocian; (5) Ashgillian. These last two used to be grouped together as Bala. Each series is subdivided into two or three zones based on their fossil graptolite content. Volcanic activity was violent during this period. Starting in S.E. Carmarthenshire and Scotland during the Llanvirnian, it continued in N. Wales, the Berwyns, and Shropshire, and finished in the Lake District during the Ashgillian. Snowdonia and the Lakes owe their rugged mountains to the resistance to erosion of the massive volcanic rocks poured out or injected during this period. The Ordovician rocks were folded at the end of the Silurian. Good roofing slates were formed then, especially in the Lakes and Wales, while ores of iron, lead, zinc, copper, barytes, and graphite were deposited in these rocks. In N. America such rocks are sources of petroleum and natural gas.

Ore. That part of a geological body from which the metal or metals that it contains may be extracted profitably. Local usage has adopted many words as substitutes for ore; dirt, pay-dirt, wash, rock, mineral, etc. An ore is nearly always a mineral aggregate, consisting of valuable constituents, ore minerals, and worthless constituents or gangue (*q.v.*).

The richness or tenor of an ore is variable; the following are minimum tenors of various ores which can be profitably extracted, given reasonable prices and working and transport costs: iron, 30 p.c.; copper, 1.5 p.c., occasionally 0.5 p.c.; lead, 5–6 p.c.; zinc, 3 p.c.; silver, 15 oz. per ton; tin, 1 p.c., though less if the metal occurs in a placer deposit. *See* under the names of various metals, *e.g.* Copper Ores; also Ore Deposits.

Öre. Bronze coin of Denmark, Norway, and Sweden; the one-hundredth part of a krone (*q.v.*).

Örebro. Sixth town of Sweden, capital of the inland co. of the same name. It is a port of inland navigation at the W. end of Lake Hjälmarn, 104 m. W. of Stockholm, and exports minerals from the local iron, silver, and copper mines and the tobacco, matches, paper, boots and shoes, and machinery manufactured in the town. An important rly. junction with a connexion to Oslo, it has the chief state rly. workshops. The ancient castle, now used as a museum, is in the section of the town built on an island in the Svarta Elf river; the town hall and an old church are other buildings of note. There is a state technical college. The town

was long the place of assembly of the Swedish diet, which in 1529 made Lutheranism the state religion. Pop. 59,879. Örebro co. covers 3,560 sq. m. and has a pop. of 235,384.

Ore Deposit. A geologic body containing a valuable mineral or minerals. All the metals and many of the materials which are of service to man are obtained from mineral deposits occurring in the earth's crust. Such deposits can be grouped into two main classes, syngenetic and epigenetic.

SYNGENETIC DEPOSITS. These are formed at the same time as the enclosing rock. Magmatic segregations (*q.v.*) are one type of syngenetic deposit. Sedimentary deposits, such as bog iron ore, are another. Material is dissolved from rocks by water and carried in solution to lakes and sea where reprecipitation occurs. In this way vast masses of dolomite (calcium magnesium carbonate) have been laid down, and where iron carbonate has been precipitated in large quantity bog iron ore and the clayband and blackband ironstones occur. Saline residues are formed by the drying up of enclosed basins of salt water; the great German deposit of chlorides and sulphates of sodium, potassium, magnesium, and calcium at Stassfurt is a striking example.

It is considered that stream waters containing copper sulphate leached from the neighbouring land surface deposited their copper as sulphide in neighbouring lakes and bogs to form the copper deposits of Mansfeld, also those in Germany. A similar syngenetic theory of origin is held by some for the famous Rhodesian copper field. In these cases it is considered that certain bacteria probably assisted in the deposition. Vast phosphate deposits called guano have been formed from the skeletons of fish and phosphate-bearing bird droppings. Coal is a sedimentary deposit.

Residual deposits, including alluvial or placer deposits, are of similar type. The tropical weathering of aluminous rocks, often igneous but not necessarily so, may give rise to deposits of bauxite (hydrated aluminium oxide) by the removal of the more soluble constituents. Often such deposits contain iron hydroxides and are called laterite. Alluvial deposits of gold and tin are formed by the removal of the lighter minerals during erosion, the heavy gold and tin tending to remain behind.

EPIGENETIC DEPOSITS. These are formed later than the enclosing rock by deposition from mineral-bearing solutions, the ore-fluid, usually in fissures in the host rock. The mineral veins or lodes so formed are of great length and depth compared with their width.

Faults and shear-zones are common kinds of fracture in which veins occur; joints and solution cavities also provide favourable channels for the ore-fluid. The vein-minerals may be deposited in open fissures or they may grow by replacement of the wall-rock. Replacement, or metasomatic, ore-bodies are not always localised along fissures, but may form huge, irregular masses replacing the country rock.

Rock Melt Deposits

Many epigenetic ores are associated with sub-acid and acid rocks, granodiorite and granite respectively. The magmas, or rock melts, from which some of these rocks have been formed, often contain appreciable quantities of volatile constituents, principally water, with boron, fluorine, sulphur, etc. Some of these constituents escape from the magma at an early stage in the consolidation of the melt, but the most important ore-formers appear to be released at a late stage when crystallisation is nearly complete. and the ore metals have been concentrated in the final fluid residuum. According to the conditions in which the volatile fractions escape and are caused to deposit the minerals they hold, so various types of ore deposit are formed.

When the magma residuum reaches a pegmatitic condition (*i.e.* a water-rich silicate melt), in certain conditions pegmatitic deposits occur. These are, characteristically, very coarsely crystalline dykes rich in feldspar and quartz, and containing rare minerals, such as cassiterite, columbite, tantalite, beryl, monazite. Such deposits are found, *e.g.* in Dakota, U.S.A., and in central Nigeria.

The earliest solutions sometimes appear to be characterised by a high content of tin, tungsten, boron, and fluorine, and the fact that tin and tungsten (and many other metals) form volatile fluorides has led many authorities to presume that these solutions were gaseous; such solutions are termed pneumatolytic. The tin mineralisations of Cornwall, Nigeria, Bolivia, and Malaya are thought by some to have been formed in pneumatolytic conditions. Later solutions

are probably liquid and give rise to hydrothermal deposits (*q.v.*) classified as hypothermal, mesothermal, and epithermal, in order of decreasing temp. and pressure of formation. Generally speaking, hypothermal deposits are found near the parent intrusive rock, while epithermal deposits may be far removed from the source, in a position where temps. and pressures were lower. In this way may arise the zonal arrangement of ores found in certain districts, notably Cornwall, where, passing from granite to cooler rock, a tin zone is succeeded by copper, lead-zinc, and iron zones.

Certain ores are often found genetically related to certain rock-types, *e.g.* tin, tungsten, and molybdenum with granites; chromium and platinum with basic rocks; gold with a granodioritic parent; copper, lead, and zinc with granite or granodiorite. Further, ore formation is closely connected with periods of profound disturbance of the earth's crust, *i.e.* orogeny or mountain-building. This periodicity is responsible for metallogenetic epochs, or periods during which ore formation was prolific. A particular type of mineralisation may also be found throughout a well-defined, often extensive region, called a metallogenetic province: *e.g.* Portugal, France, Saxony, and Cornwall constitute one metallogenetic tin province formed during Permo-Carboniferous times.

METAMORPHISM. Mineral deposits can undergo metamorphism (*q.v.*). Hydrated iron ores, such as limonites, may be changed into haematite and magnetite, a transformation accompanied by an increase in the grade of the ore. During the emplacement of an igneous rock, adjacent rocks are often metamorphosed along the contact. Contact metamorphism is partly due to the effect of increased temp. and partly to hot emanations moving out from the igneous centre. Should these emanations be metal bearing, they may give rise to contact metamorphic or pyrometasomatic mineral deposits.

SECONDARY ENRICHMENT. Probably the most important change that ore deposits, especially copper and argentiferous lead deposits, can undergo is secondary enrichment. The outcrop of a sulphide-bearing lode is frequently leached by downward percolating waters forming a gossan (*q.v.*); the ore metals are oxidised to form soluble oxy-salts and the metal-charged solutions descend below

the zone of oxidation. Here chemical reaction takes place between the solutions and the unaltered sulphides, with the result that a new set of minerals is formed whose members are often very rich in the valuable metal of the lode. This chemical process may be responsible for a very rich and valuable ore-body even where the primary mineralisation was low-grade: e.g. the extensive "porphyry" copper deposits of the U.S.A., where the primary ore is often too poor to be worked; and the argentiferous lead-zinc ore-body at Broken Hill, N.S.W., Australia, where a high-grade primary mineralisation has through secondary enrichment become a zone of immense value near the surface. See Metasomatism; Mineral Dressing; Pegmatite; Prospecting, etc.

Ore Dressing. Of this subject a full description is given under Mineral Dressing.

Oregon. Western maritime state of the U.S.A. The surface is extremely diversified. In the mountainous W., the Coast Range separates the rocky coast from the fertile valleys of the Willamette and Umpqua rivers, which are enclosed on the E. by the Cascade Range, containing many extinct volcanoes and snow-capped peaks, the highest of which is Mt. Hood, 11,934 ft. Farther E. lies an undulating prairie, scored by valleys and relieved by numerous mountains, and in the N.E. rise the Blue Mountains. The Columbia river marks most of the N. frontier, and the Snake river a large part of the E. frontier, their valleys providing an extensive tract of fertile land.

The climate of W. Oregon is generally mild and healthy, but farther E. there is a scarcity of rain, and an extremely wide range of temperature. Over a large area in the S. there is no river drainage owing to evaporation, and widespread artificial irrigation is necessary. Wheat, hay, potatoes, hops, and various fruits are produced, and the fisheries and stock-raising are valuable industries. Gold, silver, copper, and other minerals are worked, while the manufactures are chiefly associated with land products and the fisheries. Oregon ranks first among the states in the production of lumber, Oregon pine being the trade name for Douglas

fir (*q.v.*). There is a state university at Eugene, and an agricultural college at Corvallis. The length of the railways exceeds 5,200 m. The Dalles and Celilo canal enables ocean-going vessels to reach Portland, 108 m. inland, and makes the Columbia and Snake rivers navigable to 570 m. inland. A further notable development is the Bonneville power and navigation project completed 1944.

Salem is the capital, and Portland is the commercial centre. Two senators and four representatives are sent to congress. Woman suffrage was adopted in 1912. Washington and Idaho, as well as parts of Montana and Wyoming, were originally included in Oregon, the possession of which was long disputed between Great Britain and the U.S.A. It was jointly occupied 1818-46, when the frontier was fixed at 49°. The state was formed out of the territory in 1859. Area 96,981 sq. m. Pop. 1,089,684.

Oréide or **OROIDE** (Fr. *or.*, gold; Gr. *eidos*, form). Brass introduced in France as a substitute for gold in the manufacture of jewelry. Its composition is usually copper 85.5, zinc 14.5 parts, and its colour resembles real gold. It takes a fine polish, is ductile and tenacious, and can be readily stamped, rolled, or worked.

O'Reilly, JOHN BOYLE (1844-90). Irish-American poet and journalist. Born at Dowth Castle, Meath, June 28, 1844, he joined the Fenian society, and in 1863 enlisted in the British army in order to induce the soldiers to revolt. He was tried for high treason in 1866, and sentenced to be shot, but the sentence was commuted to 20 years' penal servitude in Australia. Having escaped to America in 1869, he settled at Boston, where he became editor of *The Pilot*, and published several works in verse and prose. He died at Hull, Mass., Aug. 10, 1890.

Orel. Town of Central Russia, in the region of Kursk. It stands at the junction of the Oka and Orlik, 170 m. N.W. of Voronezh. It owes its importance largely to the facts that it is also at the point where four lines of rly. meet, and that it is in the centre of a highly fertile agricultural area. Pop. 110,567.

During the Second Great War it was the scene of heavy fighting and changed hands several times before being occupied by German troops, Oct. 7, 1941. Converted into an immensely powerful stronghold by the Germans, it was recaptured by the Russians, Aug. 5, 1943,

only after 24 hours' severe street fighting. *Pron.* Or-el'.

Orense. Inland prov. of N.W. Spain, bounded S. and W. by Portugal. It is traversed by the Miño, and watered by the Limia and smaller streams. Almost wholly mountainous, its climate is generally mild, but cold and damp in the hills. In the valleys fruits, including figs, oranges, almonds, and olives, are grown. In the uplands timber trees abound, walnut and chestnut predominating. Some iron is mined, and fine cattle are reared on the pastures. Orense formed part of the old kingdom of Galicia. Area, 2,694 sq. m. Pop. 477,030.

Orense (anc. *Aurium*). City of Spain, capital of the prov. of Orense. It stands on the Miño river, 45 m. N.E. of Vigo on the Monforte-Tuy rly. The river is here spanned by a bridge, 1,320 ft. long and 135 ft. high, built by Bishop Lorenzo in 1230. The Gothic cathedral, dating from 1220, has been damaged by earthquake. At the foot of the hill on which Orense stands are the warm sulphur springs of Las Burgas, and in the vicinity are the baths of Caldas de Orense, known to the Romans. Its bishopric was founded in the 5th century. The place is noted for its hams, and it manufactures chocolate, textiles, and leather. Iron founding and flour and saw milling are other industries. Pop. 17,800.

Orestes. In Greek legend, son of Agamemnon and Clytemnestra. When his father was murdered, Orestes was saved from a like fate by his sister, Electra, who sent him to Phocis, where he became an intimate friend of the king's son, Pylades. Having slain his father's murderers, he was pursued by the Furies, until his acquittal by the court of the Areopagus, at Athens. According to another legend, he went for purification accompanied by his friend, Pylades, to the country of the Tauri (Crimea) to fetch from there a statue of the goddess Artemis, returning with his sister, Iphigenia, to Argos, where Orestes reigned over his father's kingdom at Mycenae. See Agamemnon; Areopagus; Choephori; Electra; Eumenides; Iphigenia.

Orfila, MATHIEU JOSEPH BONAVENTURE (1787-1853). Franco-Spanish chemist. Born at Mahon in Minorca, April 24, 1787, he studied medicine at Valencia and Barcelona universities, then settled in Paris where in 1823 he became professor of chemistry, and in 1830 dean of the faculty of medicine.

His great work *Toxicologie Générale*, 1813, laid the foundations of the science of toxicology. He died Mar. 12, 1863.

Orford. Town of Suffolk, England. It stands at the confluence of the Alde and the Ore, famous for its oysters. It is 18 m. E.N.E. of Ipswich, and formerly a town of importance, having a market and sending two members to parliament from 1295 to 1832. The church of S. Bartholomew, a fine example of Early English architecture, has Norman work in the chancel ruins. Orford Castle, a Norman stronghold notable for its keep, forms a polygon of 18 sides. Pop. est. 1,000.

Orford, EARL OF. British title borne in turn by the families of Russell and Walpole. In 1697 the seaman, Edward Russell, was created earl of Orford, but the title became extinct on his death in 1727. In 1742 the statesman, Sir Robert Walpole, was made earl of Orford. The title passed to his son and grandson, and, when the latter died without sons in 1791, to Sir Robert's youngest son, the famous Horace. It became extinct on his death in 1797. In 1806 his cousin Horatio, Baron Walpole, was created earl of Orford, and the title is still held by his descendant. Houghton Hall and the estates in Norfolk passed away from the title when Horace Walpole died. The earl's seat is Wolferton Park, Norwich. See Walpole, Horace; Walpole, Sir R.

Orford, EDWARD RUSSELL, EARL OF (1653-1727). Nephew of William, 1st duke of Bedford, he entered the navy and actively supported William of Orange, who made him admiral and treasurer of the navy, 1689. Although intriguing with James Stuart, he engaged the French fleet and gained a signal victory at the battle of La Hogue (*q.v.*), May 19, 1692. Suspicious of his loyalty led to his dismissal, but, reinstated in 1693, he commanded the Mediterranean fleet, 1694-95, and was first lord of the admiralty, 1694-99, 1709-10, and 1714-17. He was made earl of Orford, 1697. Died Nov. 26, 1727.

Orford Process. A metallurgical smelting process used in the extraction of nickel from its ores. The Canadian ores consist of mixed nickel and copper sulphides, and this method of separating the two sulphides depends upon the greater solubility of copper sulphide in sodium sulphide. After melting with sodium sulphate and coke, the product is cast and it separates into two layers, the

"tops" being treated for recovery of copper, while the "bottoms" are used for the production of pure nickel. See Nickel.

Organ. Largest and most powerful of musical instruments. It has the advantage of many tone qualities, but the disadvantages of an unsensitive touch, and the fact that all expression is obtained from it by mechanical means. It has anything from one to five keyboards or manuals, a pedal keyboard, and numbers of stops, in large organs amounting to several hundred. A few organs of very exceptional size, to be found in the U.S.A., have as many as seven manuals. The stops are controlled by knobs arranged on either side of the manuals or by stop-keys generally arranged over the manuals, and there are various accessories to assist in the manipulation of the stops.

A speaking-stop consists of a pipe of the same timbre for every note on the keyboard, 61 pipes on an organ of full compass. The pitch of the pedal keyboard is an octave below that of the manuals. The pedal keys are of wood and very large; the compass is from C₀C to g (32 notes), sounding an octave lower than the lowest note on the keyboards. There are other stops called couplers, controlling appliances for coupling the manuals to the pedals and to each other, so that keys depressed on one keyboard (or pedal-board) sound the corresponding notes or octaves on that to which they are coupled. The length of the pipe governs the pitch and its quality. The pipe sounding C₀ is approx. 8 ft. long, and a stop sounding the notes as printed is known as an 8 ft. stop. Those of 16 ft. sound an octave below what is printed; those of 4 ft. an octave above. The 8 ft. stops give the instrument its breadth and dignity; they outnumber those of any other single pitch. 16 ft. stops are usually found on the pedal keyboard; they fulfil much the same functions as the double basses in the orchestra. 32 ft. stops are included in large organs and in many comparatively small contemporary ones, in which, however, they are included by a method that is compact and convenient. The 4 ft. and 2 ft. stops and others of high pitches (mixtures) add brilliance.

VARIETIES OF PIPES. Pipes are divided into two principal groups, flues and reeds. The flues (diapason, flutes, etc.), made of wood or metal, sound on the same principle as a tin whistle. The front pipes of

an organ belong to this group. The air in a reed pipe, usually of metal, is put in vibration by wind forced between a semi-cylindrical tube, and a brass tongue covering its open side; this is placed in the foot of the pipe. A flue pipe with its upper end closed by a stopper sounds an octave lower than an open pipe of the same length. Harmonic pipes, reed or flue, are so treated that they sound their first harmonic, that is, an octave higher than an ordinary pipe of the same length.

Each manual has a separate function. The most important, the great organ, contains the loud stops of all pitches. The pipes of the swell organ, so called because they are always enclosed in a wooden box, one side of which consists of Venetian shutters which open and close by means of a pedal, are generally not so loud as those of the great organ. In many contemporary organs the whole of the pipes are enclosed in such a box so that every single pipe is expressive by means of the swell-shutter mechanism. The choir organ consists of soft and delicate stops. If there is a 4th manual it is usually called solo organ and contains stops (as its name implies) of distinctive solo quality such as flute, oboe, clarinet, etc. Where there is a 5th manual, it is generally the echo organ and contains very quiet ethereal tone stops, or the bombard organ containing extremely powerful reed stops comparable with the brass in the orchestra. All contemporary organs are blown by an electric motor driving a rotary fan.

History of the Organ

In the 11th century already men were acquainted with the art of manipulating the opening of the lower end of the pipe in order to alter its power and quality. There were various crude mechanical methods of opening a valve and allowing wind to pass into the pipes. It was not until the 16th century that the present system of stop control was initiated. Sliders having holes corresponding with as many pipes as there were in the stop concerned were arranged so that the holes would coincide with the opening of the pipes when the stop was "on." Draw-knobs were placed at the sides of the manuals, and when these were drawn levers moved the sliders until the holes came under the pipes. After the invention of the swell by Jordan in 1712 no important innovation is found until the 19th century. The invention of composition pedals by Bishop in

1809 revolutionised stop control. These are iron pedals placed above the pedal keyboard. When depressed they draw certain groups of stops and take in others, each pedal having a fixed combination of stops.

The size to which organs had grown, and the demand for the performance of rapid and difficult passages, made it necessary to find some improvement upon the heavy and noisy tracker (mechanical) key mechanism. This was first achieved by pneumatic lever action discovered by Barker in 1832. The keys, on being depressed, operated valves admitting compressed air from a wind reservoir to V-shaped motor bellows. One side of these was fixed, the other expanded, and the movable side was attached to the tracker action. Tubular pneumatic action eventually overcame the difficulties of slowness and noise. In this action the key operates a valve admitting compressed air to tubes which transmit the power to other valves moving the pallets. A combination of electric and pneumatic (electro-pneumatic) action was used subsequently for many years until superseded by direct electric action, in which the stop control was an electric switch operating an electro-magnet at the chest containing the wind supply to the pipes. When the magnet was energised the pipe was suddenly flushed with wind by the opening of the pallet. This action was both reliable and rapid.

Thumb pistons placed just below the manuals have the same functions as composition pedals, and are often used instead of them. These pistons, controlling groups of stops, can in many organs have their combination changed at the will of the organist sitting at the console. Most contemporary organs have a crescendo pedal which brings on the stops from softest to loudest as it is gradually depressed; and by the voicing of pipes and their relative scale many beautiful and varied tone colours have been evolved.

Typical of the church organ is its broad diapason tone, the natural kind of tone with which one associates an organ. The whole of the instrument's tonal build-up is based on a "chorus" of diapasons in various pitches, and other tonal qualities in the organ are subservient to this glorious sound.

The concert organ must contain a satisfactory diapason chorus, but it must also possess a variety of tone colours particularly useful for

solo effects such as are found in the orchestra—flute, oboe, clarinet, trumpet, etc.

The theatre organ is a series of extreme solo tone-colours welded together into a pleasant musical whole. One of the most important stops in the theatre organ is the tibia, a large scale flute nearly always used with a tremulant, by means of which the wind supply can be tremulously supplied to the pipes, giving the kind of effect that a violinist obtains from a vibrato on his string. The theatre organ also contains many orchestral-toned stops imitating strings, wood-wind, and brass, and nearly always a vox humana, a reed stop imitative of the human voice. The theatre organ also possesses a number of percussion instruments such as drums, cymbals, xylophone, glockenspiel, and under the hands of an expert can be made to give a realistic and musical representation of light orchestral music.

The basic structure of all three instruments is the same, the variety being obtained by the voicing of the pipes.

From about 1900 a method of organ building on what is called the extension principle was developed by Compton. In organs built in this way the pipes available are made to do maximum duty, and an organ that is both compact and relatively inexpensive can be given great tonal resources. Ingenious and reliable direct electric action contributes to the voicing and regulation of tonal resources of such an instrument. See diagram facing p. 6221.

Leslie Spurling

Organic Chemistry. Term applied to the branch of chemistry dealing with the products of animal and vegetable organisms. The term has become to some extent restricted to the study of carbon and hydrogen compounds and their derivatives. See Carbon; Chemistry; Hydrocarbon.

Organists, ROYAL COLLEGE OF. London institution. Founded in 1864 to further the interests of the profession of organist, and of church music generally, it conducts examinations in organ playing, the theory of music, and choir

training. Upon the results of the organ playing and theory examinations the diplomas of Associate and Fellow are awarded. For many years the home of the college was in Hart Street, Bloomsbury, but in 1904 it moved to the present building in Kensington Gore. This was erected in 1876 for the National Training School for Music and was used by the Royal College of Music 1882-94. The Royal College of Organists received a royal charter in 1893.

Organizer. Biological term. In the developing egg of many forms it has been found that the dorsal part of the rim of the blastopore when it is implanted into another egg, will cause the host egg to produce a supernumerary embryo. The tissue donated organizes the host. This observation was made by Spemann. It has subsequently been found that the organizer works by producing substances which affect the metabolism of the host and evoke from it responses which constitute the formation of this extra embryo. See Evocator; Embryology.

Orgelev or ORGEV. Town of Moldavia S.S.R. It is situated 25 m. N. of Kishinev, on the Reut. The chief industries have been the making of tobacco, candles, and bricks, tanning, and dyeing. Its limestone quarries are famous. Part of the town is built over the site of a Dacian fortress. Pop. 18,000.

Oriel (late Lat. *oriolum*, small room, recess). In architecture, term usually applied to a bay window corbelled out from the wall of an upper floor, or over a porch, but formerly extended to a bay window on the ground floor. A conspicuous feature of Tudor architecture, it became common about the middle of the 15th century. See Gothic Architecture.

Oriel College. College of Oxford University. Founded in 1326 by Adam de Brome, a servant of Edward II, and dedicated to S. Mary the Virgin, it was not called Oriel until a little later, a building called La Oriole having previously stood on the site. The older

Oriel window. Example in Nuremberg, dating from 1361

buildings, including the beautiful front quadrangle, face Oriel Street, while newer ones face High Street.

Oriel College arms the Oxford Movement. Of later members one of the most distinguished is Cecil Rhodes, who left a large sum of money to the college and provided funds for the new buildings. Other famous members have included Sir W. Raleigh, Bishop Butler, Gilbert White, and Thomas Hughes. See Oxford Movement. Consult Oriel College, D. W. Rannie, 1900.

Orient (Lat. *oriens*, rising). Region where the sun rises, i.e. the east. It is used, more or less poetically, as a synonym for the eastern parts of the world, e.g. China, Japan, etc., and their inhabitants are sometimes called Orientals. An Orientalist is one who is acquainted with the learning of the East. In the same way the western parts of the world are sometimes called the Occident.

Oriental and African Studies, SCHOOL OF. London educational institution. Founded in 1916, it is a recognized school of the university of London. The buildings are situated on the university site in Bloomsbury. The academic work of the School is organized in eight departments, viz. India and Ceylon; South East Asia and the Islands; the Far East; the Near and Middle East; Africa; Phonetics and Linguistics; History; and Laws. Instruction is given in all the principal languages and in the histories, religions, and cultures of Asia and Africa. The school provides the language training for the colonial administrative service.

Orientation. Primarily, the turning towards the East, or Orient. In architecture, the term is applied to the setting of a building with reference to the compass points. The main entrance to Greek temples faced E. so that the level rays of the early sun lit up the image of the

divinity. Early Christian basilicas were similarly orientated, but when a change of ritual involved the turning of priest and congregation to the E. the orientation was reversed, and from the 6th century most churches were built with the altar at the E. end and the main doors at the W.

In surveying, orientation means the direction of an object according to the points of the compass. The term is also used in building when siting structures in relation to the sun so that the maximum sunlight will penetrate to the interior. The angle of orienta-

Oriel College, Oxford. Front quadrangle of the old buildings, showing hall (left) and chapel (right)

tion is a term in ballistics to describe the angle which the vertical plane, including the axis of the projectile, makes with the vertical plane holding the tangent to the trajectory.

In biology, orientation is the adjustment of an organism or its parts to its environment.

Oriente. Largest of the six provinces of Cuba, with an area of 14,211 sq. m. In the S. it is mountainous and heavily wooded. Mount Pico Turquino (8,400 ft.), the highest mountain in the island, is in this province. In the N. there is a flourishing fruit industry served by a group of ports, with steamer connexion with New York. Santiago, the capital, and Guantanamo are situated on great landlocked harbours surrounded by mountains. Santiago is 600 m. from Havana, with which it is connected by the Cuba rly. and also by a good motor road. Pop. 1,142,629.

Oriente. Region of Ecuador. Formerly a province, it was divided in 1925 into the two provinces of Napo Pastaza and Santiago Zamora. It includes territory on the Peruvian frontier, the exact demarcation of which has long been in dispute. More than half the region is uninhabited. Area 219,095 sq. m. Pop. est. 295,000

Orient Line. British steamship company. Founded in 1877 to provide a service between London

Orient Line flag, blue cross on white

and Australia, it became the Orient Steam Navigation Co. in 1878. It now has services from London (Tilbury Dock) to Port Said, Aden, Colombo, Freemantle, Adelaide, Melbourne, Sydney, and Brisbane. Its head offices are 7 and 11, Bishopsgate, London, E.C. The names of its steamers all begin with O. There were eight in 1939, but four were lost in the Second Great War, soon after which two 31,000-ton vessels were built.

Oriflamme (Fr., golden-flame). Sacred standard of the French kings. It was kept by ecclesiastics, and was supposed to have been the cloak of a saint, some say the blue mantle of St. Martin; according to others, it was red. It was destroyed in battle. The second oriflamme, kept at the abbey of St. Denis, was red with yellow flames, and had streamers. It was raised by the French at Agincourt, its last appearance. See Flag.

Oriflamme. 5-pointed French royal standard

Origen or **ORIGENES** (c.185-254). Greek father of the Church. Born at Alexandria, son of Leonidas, a Christian martyr, he was educated by Clement and Pantaenus. He taught in the catechetical school at Alexandria, where he founded a theological school, but was banished and degraded to the status of a layman. Teaching at Caesarea, he was imprisoned during the Decian persecution, 250, and died at Caesarea or Tyre. A voluminous and learned writer, whose orthodoxy was questioned, he wrote, in Hexapla, a polyglot of the O.T., the first textual criticism of the Bible. Origen also wrote commentaries and other exegetical works, a defence of Christianity, Against Celsus, and aimed at adapting Greek philosophy to the needs of Christian theology. He ranks among the early Fathers.

Original Seceders. Body of Scottish Presbyterians formed in 1842 from the remnants, or Auld

Lights, of both burgher and anti-burgher parties of the Secession Synod unabsorbed into the Church of Scotland or United Presbyterians. The Original Seceders opposed the use of instrumental music in public worship, and favoured national establishments of religion based on the Solemn League and Covenant. See Auld Lights; Church of Scotland.

Original Sin. Term for the mystical Christian doctrine that man inherits sin by descent from Adam. It was defined by the council of Trent, and is regarded as being implied in Ps. 51, v. 7; Rom. 5, vv. 1-2; and, combined with the doctrine of divine grace, in 1 Cor. 15, vv. 21-22. See Atonement; Fall, The; Free Will; Grace.

Originating Summons. In English legal procedure, a summons returnable before a master or a judge, when no writ has been issued. An inexpensive proceeding, it is used in many cases relating to trusts and other matters where a legal decision is necessary, though the facts are not in dispute. Thus, if executors or trustees are in doubt about the construction of a claim in a will or settlement, they ask the court to interpret it by originating summons.

Origin of Species, THE. Book by Charles Darwin published Nov. 24, 1859, with the full title *On the Origin of Species by the Means of Natural Selection*. The theory was first clearly conceived by him in 1839. He was engaged on an extensive presentation of the subject, when Alfred Russel Wallace (*q.v.*) sent him an essay showing that he also had independently reached much the same conclusions. This led Darwin to publish an abstract of his larger work as originally planned. See Darwin; Darwinism.

Orihuela. Town of Spain, in Alicante prov. Situated on a plain called the Garden of Spain, the town is on the Segura river and is backed by a rocky ridge, the Cerro de Oro, 15 m. by rly. N.E. of Murcia. The bishopric dates from 1265. There are tanneries, corn and oil mills, and textile factories. This was the Orcelis of the Goths, who here made a last stand under Theodorici. In 713 it was captured by the Moors, who called it Origiuela, and in 1265 recovered by the Christians. Pop. 42,500.

Orillia. Town and holiday resort of Ontario, Canada. It stands on Lake Couchiching, 86 m. N. of Toronto, and is served by C.N.R. and C.P.R. Steamers go from here to places on Lake Simcoe. The scene of Leacock's *Sunshine*

Sketches of a Little Town, Orillia is also a manufacturing centre. Pop. 9,798.

Orinoco. River of S. America. It rises in the Sierra Parima in a mountain gorge which divides Brazil from Venezuela. Starting towards the N.W., it flows round these mts. in a great curve, thence E. to the Atlantic Ocean. S. of Mt. Duida the river gives off a strong flowing stream, the Casiquiare, which joins the Rio Negro and thus connects the Orinoco with the Amazon. The right-bank tributaries, all from the Sierra Parima, are the Ventuari, Caura, and Caroni; those of the left bank, Guaviare, Meta, and Apure, flow across the llanos from the Colombian Andes.

Between the mouths of the Guaviare and the Meta the main stream makes the falls of Maipures and Atures 36 m. apart, which prevent the passage of boats between the navigable stretches above and below them. About 160 m. from the sea the Orinoco delta begins, upwards of 50 channels distributing its waters into the Gulf of Paria or direct to the Atlantic Ocean. Ocean steamers reach Ciudad Bolivar 200 m. from the ocean, where the river is tidal. Its length is 1,600 m.

Oriole (*Oriolidae*). Family of passerine birds, natives of the Old World. About the size of a thrush, they are richly coloured with yellow, olive green, and black; have strong bills, short legs, and long wings, and construct hammock-like nests, which are suspended between two forking branches. The golden oriole (*Oriolus oriolus*) of Asia, S. Europe, and N. Africa is a regular visitor to Great Britain on migration, and would probably nest here but for the fact that it is usually shot on sight. The cock is golden yellow with the exception of the wings and the middle of the tail, which are black. In the hen the upper parts are yellow-olive and the pale under parts are streaked with brown. Mainly insectivorous, the birds consume berries in the autumn. The so-called orioles of the U.S.A. are not related, but belong to the family Icteridae.

Orion. In Greek mythology, a famous giant and hunter. Falling in love with Meropë, daughter of

Oenopion, king of Chios, he obtained from her father the promise of her hand, provided he cleared the island of wild animals, which was supposed to be an impossible task. Orion duly performed it; but Oenopion made him drunk and put out his eyes as he lay asleep. Having recovered his sight by following the advice of an oracle, Orion took vengeance upon Oenopion. He was slain by Artemis with her arrows for attempting to violate her; or was killed by a scorpion bite as punishment for boasting about his prowess as a hunter. After his death Orion was placed among the stars.

Orion. In astronomy, one of the constellations. Lying on the celestial equator, S.E. of Taurus, it contains the three famous stars, Rigel, Betelgeux, and Bellatrix. The constellation as a whole is one of the brightest in the sky. It contains a large number of variable stars and the great Orion nebula.

Orissa. A state of India. It includes the area where the predominant language is Oriya, and has area 32,198 sq. m. and pop. (1950 est.) 14,410,000. It contains the S. part of the Chota Nagpur plateau, and includes the lower valley and the delta of the Mahanadi and the greater portion of the Brahmani tributary. All the coast of Orissa is in the division of Cuttack, between Madras on the

S. and Bengal on the N. Cuttack Chowdwar is the capital. Orissa was conquered by the British in 1803. Long attached administratively to Bihar, it was made an autonomous province in 1936 and a state in 1950. Hindus are in a large majority. Rice growing and milling employs 80 p.c. of the pop. Silver filigree work is famous.

Consult Orissa in the Making, B. C. Mazumdar, 1925.

Oristano. City of Italy, in Sardinia. Almost in the middle of the Gulf of Oristano, on the W. coast, it has rly. and steamer connexion with the other chief towns of the island, has important potteries, and trades in wheat, wine, and fish.

Oristano, GULF OF. Arm of the Mediterranean Sea. It is almost in the middle of the W. coast of Sardinia, 10 m. long and 5 m. wide, and receives the Oristano river, which has a course of 80 m. It forms a harbour for Oristano city.

Oriole. Specimen of the golden oriole

Orizaba. City of Mexico, in the state of Vera Cruz. It is 70 m. S.W. of Vera Cruz, on the rly. to Mexico City, with which there is also road and air connexion. Situated in a fertile valley, more than 4,000 ft. alt., it is a centre of the sugar trade, and produces tobacco. Its textile factories and breweries are among the best equipped in Mexico. Pop. 47,542.

Orizaba, PICO DE. Highest peak in Mexico. Known to the Aztecs as Citlaltepētl (star mountain), it is situated 25 m. N. of the city of Orizaba, and rises to a height of 17,400 ft. An extinct volcano, its last noteworthy eruption occurred in 1566.

Orjonikidze. Name of two towns in the U.S.S.R., so named in honour of the politician Orjonikidze (v.i.). One, in the Ukrainian S.S.R., has a pop. of 88,246. The other, in the N. Ossetian A.S.S.R., lies on the upper reaches of the river Terek on the N. slopes of the Caucasus Mts. Pop. 127,172. At its approach the Germans suffered Nov. 19, 1942, a decisive defeat, being forced back with severe losses (5,000 killed) on Nalchick. This was the turning point of the war in the Caucasus, and saved the Grozny oil field from falling into enemy hands.

Orjonikidze, GREGORI (d. 1937). Russian politician and administrator. Born in Georgia, he was early prominent in revolutionary activity, and in 1908 was exiled to Siberia. The following year he reached Paris, later returning to Russia to assist Lenin. Again exiled to Siberia, he was liberated during the Bolshevik revolution of 1917 and joined the Red army as director of operations on the W. and S. Caucasian fronts. In 1930 he was commissar of heavy industries in connexion with the first five-year plan. He died at Moscow on Feb. 21, 1937.

Orkhon Inscriptions. Ancient stone records S. of Lake Baikal in the Orkhon valley, Outer Mongolia. Discovered in 1889, the principal monument is four-sided, and bears tribal records in Chinese and old Turkic, incised in 733 in an alphabet derived from an Aramaic source. A later inscription, dated 805, was made under Uigur direction. These and others prove that the Turkic and Uiguric peoples of that time were predatory mounted nomads, having no settled town life, but with some cultural elements absorbed from the adjacent populations. The inscriptions have an important bearing on Finno-Ugrian origins. Although

presenting some resemblances to runes, they have no Scandinavian relationships. See Rune.

Orkney Causeway. Barriers constructed early in the First Great War between the Orkney Islands, which, combined with block-ships, closed the channels into Scapa Flow, making the anchorage safe against submarines. In 1943 these causeways were surfaced and within a year had become first-rate traffic roads linking the islands. They were constructed mainly of concrete blocks, but were not designed as permanent structures and soon began to sink into the sea.

Orkney Islands. Group of islands off the N. coast of Scotland. Pentland Firth, 6 m. wide, divides them from the mainland. The total area is 376 sq. m., and they form a county of Scotland. Islands and islets number altogether about 90, but only 30 are inhabited. Pomona, or Mainland, is the largest. Others are North and South Ronaldsay, Stronsay, Hoy, Flotta, Rousay, Westray, Sanday, Shapinsay, Burray, and Eday. Kirkwall on Pomona is the capital and largest place. Stromness is the only other town. With the Shetland Islands the Orkneys send one member to parliament. Pop., est. 21,400.

The surface is mainly flat, except on the west coast of the larger islands and in Hoy, although there are hills in Pomona. Lochs Harry and Stenness, both in Pomona, are the largest of a number of lakes. The chief industries are agriculture and fishing. The former includes the raising of oats and barley, and the rearing of cattle, sheep, and pigs. The cultivators of the land are mainly crofters. Scapa Flow (q.v.) is between Pomona and Hoy.

The Orkneys were known in early times as the Orcaades. In the 9th century they were conquered by the Norsemen, and made dependencies of Norway and Denmark. In 1468, when Christian I of Denmark married his daughter to James III of Scotland, he handed over the islands to Scotland as security for a dowry, but this was not paid, and the islands became definitely Scottish. On several are remains left by the Picts.

The use of Scapa Flow by the fleet made the Orkneys of great importance during both Great

Orkney Islands. Map of the island group off the north coast of Scotland

Wars. In the Second, A.A. defences were installed, and flying boats of Coastal Command were based there. The channels into Scapa Flow were controlled by the previously erected Orkney Causeway (q.v.) and by the sinking of block-ships against submarines.

Orlando. Ital. form of the name Roland (q.v.). It is that of the leading male character in Shakespeare's *As You Like It*. Orlando, youngest of three sons of Sir Rowland de Boys, driven from home by his brother, meets Rosalind, falls in love, and marries her.

Orlando, VITTORIO EMMANUELE (b. 1860). Italian statesman. Born at Palermo, May 19, 1860, he became professor of constitutional law there in 1883. Entering parliament in 1898, he was minister of education 1903-05, of justice 1907-09 and 1914-16, and then of the interior, 1916. Prime minister in 1917, he acted virtually as dictator in Italy. At the peace conference of 1919, he, Lloyd George, Clemenceau, and Wilson were known as the Big Four. Orlando withdrew from the conference over the question of Fiume, and on his decision to compromise, his ministry fell in 1919. He was ambassador to Brazil in 1920, and on his return at first supported fascism, but turning against it in 1925, resigned from parliament. In 1943 he again took his seat in the chamber, but retired from politics in 1947 to mark his opposition to the peace treaty.

Orle (late Lat. *orlum*, small border). In heraldry, a border round a shield, but not touching the edges. It is one of the sub-ordinaries. Small charges may be borne in orle, i.e. as a border.

Orléanais. One of the provs. into which France was divided before the Revolution. It lay

Orkney arms

around the city of Orléans, on both banks of the Loire. The Pagus Aurelianensis of the Romans, it was from the earliest times part of the domain of the kings of France.

Orléanists. Name of the political party which supports the claim of the family of Orléans (*q.v.*) to the throne of France. The supporters of Philippe d'Orléans (1674–1723), of Philippe Égalité, and of Louis Philippe represent its earlier phases. Under the Third Republic it fused with the Legitimist party in 1873, the comte de Chambord being recognized as Henri V. The Orléanists suffered a setback in popular support by the papal encyclical of 1892, which urged French Catholics to rally to their existing political constitution. On the death of Louis Philippe Robert, duke of Orléans (1869–1926), his cousin Jean, duke of Guise (1874–1940),

became heir to the claim. He was succeeded by his son, the count of Paris (b. 1908).

Orléans. Island of Quebec, Canada. It is in the St. Lawrence river, 30 m. N.E. of the city of Quebec. It covers 69 sq. m., and is visited by pleasure seekers.

Orléans. French city. Capital of the department of Loiret, it stands on the right bank of the Loire at its northernmost point and on the Orléans canal. It is a rly. junction for Paris (60 m. N.), the

Second Great War. The 15th century church of S. Aignan has a 9th century crypt. The hôtel de ville (1442) is now a museum, as are dwellings connected with Agnes Sorel and Diana of Poitiers, but the Joan of Arc museum was destroyed in the Second Great War. Earlier fortifications gave way to beautiful boulevards. A musical academy and a botanical garden are among the city's amenities.

Orléans arms

Orléans has textile, engineering, shoe making, glass, and electrical industries, besides factories for food-stuffs and preserves. Its place in French esteem far exceeds its rank by

Loire ports Nantes and St. Nazaire, and Bordeaux. One of France's oldest cities, before Caesar's time it was the centre of the Celts of Gaul, deriving its later name from the Roman emperor Aurelian. The outstanding building is the cathedral of the Holy Cross, reconstructed under Henry IV after its destruction by Calvinists in 1562, the only Gothic cathedral built in Europe after the Middle Ages; its N. tower was damaged by shell fire in the

pop., which is 70,240. This is due to its historical rôle; it saw the first national council of the Franks in 511, had a university from 1309 to 1790, was capital of the Bourbon line of Orléans from 1344, and above all was liberated from the English by Joan of Arc in 1429 (*see next entry*). Her memory is preserved in an equestrian statue and the Croix de la Pucelle, a cross on the left bank of the Loire. The edict of Orléans, 1561, first gave liberty of worship to the Huguenots, and here two years later Francis of Guise was assassinated.

In the Franco-Prussian War Orléans fell to the Prussians Oct. 11. 1870. During the Second Great War the Germans took it again in June 17, 1940, and it remained in the occupied zone of France until freed by armoured columns of the U.S. 3rd army, Aug. 17, 1944.

Orléans, France. 1. Hôtel de Ville, built in 1442. 2. West front of the 17th century cathedral of Ste. Croix. 3. House of Agnes Sorel, a favourite of Charles VII. 4. General view from the left bank of the Loire

Orléans, SIEGE OF. English failure during the Hundred Years' War. The English were rapidly conquering France, and on Oct. 12, 1428, their force, about 5,000 strong, under the earl of Salisbury, appeared before Orléans. An assault was attempted, but it was a failure, and Salisbury having been killed, a blockade was decided upon. The besiegers, however, were not numerous enough to encircle the city completely, and the siege dragged on until April. By then Joan of Arc appeared, and having entered Orléans, she led the garrison in a series of attacks on the English positions. One after another these were taken, until on May 4, 1429, the besiegers, under Suffolk, were forced to abandon the enterprise.

Orléans, HOUSE OF. Branch of the house of Bourbon (q.v.). The first duke of Orléans was a younger son of Philip VI, and the second was Louis, son of Charles V. The poet, Charles of Orléans (v.i.), succeeded the latter, and his son became king as Louis XII in 1498. The title then lapsed, to be revived in 1626, when Gaston, son of Henry IV, was made duke. The next holder was Philip, son of Louis XIII, whose descendants still hold the title, although it is not officially recognized in France. Philip's son was the regent Orléans, and from him it passed to Louis Philippe, who became king in 1830. The king's son was Ferdinand, duke of Orléans, and the latter's grandson was Louis Philippe, duke of Orléans. Louis' father had claimed, on the death of the count of Chambord in 1883, the headship of the Bourbons, and to this claim the son succeeded in 1894. He died without issue in 1926, when a cousin, Jean, duke of Guise, became head of the house and pretender to the kingship of France. On his death in Morocco, Aug. 25, 1940, he was succeeded by his son Henry, count of Paris. See Legitimists. Consult House of Orléans, M. Coryn, 1936.

Orléans, CHARLES, DUKE OF (1391-1465). French poet. Son of that duke of Orléans who was

Charles,
Duke of Orléans

murdered by the Burgundians in 1407, he married his cousin, Isabella, widow of Richard II of England, in 1406. In joint command at

1415, he was taken prisoner and not ransomed till 1440, when he returned to France. He ranks as the greatest of the late French medieval poets. His works comprise about 100 ballads and songs, and about 400 rondeaux, marked by delicacy and charm and the nostalgia of an exile. Charles died at Amboise, Jan. 4, 1465.

Orléans, GASTON, DUKE OF (1608-60). French prince. Son of Henry IV, Jean Baptiste Gaston was born April 25, 1608. He was made duke of Anjou and then duke of Orléans, and was no sooner of age than he began his career as a rebel against the existing political order; until 1638, when Louis XIII had a son, he was heir to the throne. Richelieu was his special antipathy, but plot after plot only resulted in the discomfiture and exile of the prince. Several times he succeeded in returning, and in 1643, when Louis died, had a position of responsibility, but the outbreak of the Fronde recalled him to more congenial occupation. After changing from side to side, he was exiled from Paris, and died at Blois, Feb. 2, 1660.

Orléans, HENRI PHILIPPE MARIE, PRINCE OF (1867-1901). French traveller. Eldest son of Robert, duke of Chartres, and thus a member of the royal family of France, he was born in Surrey, Oct. 16, 1867. He made his mark as a traveller and did much exploring in Asia and Africa. He found the sources of the Irawadi, and discoveries in Tibet gained him the medal of the Paris geographical society. Some public remarks about the conduct of Italian soldiers in Abyssinia led to a duel between him and the count of Turin, a member of the Italian royal family. The prince died in Assam, Aug. 9, 1901.

Orléans, HENRIETTA ANNE, DUCHESS OF (1644-70). English princess, third daughter of Charles I and Henrietta Maria. She entered in this work as Henrietta.

Orléans, LOUIS PHILIPPE JOSEPH, DUKE OF (1747-93). French nobleman, better known as Philippe Egalité. Born at St. Cloud, April 13, 1747, he was son of Louis Philippe d'Orléans and cousin of Louis XVI. He served in the navy, succeeded to the title in 1758, and became known for his

dissipated life and democratic ideas. Bitterly disliked by Louis and Marie Antoinette, he supported the claims of the third estate, 1789, entered the national convention, 1792, and voted for the execution of Louis. Arrested in April, 1793, he was acquitted of conspiracy at Marseilles, but was tried again at Paris, and guillotined Nov. 6.

Orléans, LOUIS PHILIPPE ROBERT, DUKE OF (1869-1926). Claimant to the crown of France. Born at Twickenham, Middlesex, Feb. 6, 1869, son of the count of Paris (1838-94), he was educated at the Collège Stanislas, Paris. Exiled by the law of 1886, he entered Sandhurst, 1887, and served with the 60th Rifles in India. In 1890, having gone to Paris to claim the right of performing a Frenchman's military duties, he was sentenced to two years' imprisonment, but was soon released. In 1896 he married the archduchess Maria Dorothea of Austria. An experienced traveller, he published *Une Croisière au Spitzberg*, 1905, and *Chasses et Chasseurs Arctiques*, 1911. On March 28, 1926, he died at Palermo. See Orléans, House of.

Orléans, PHILIP I, DUKE OF (1640-1701). French soldier. Son of Louis XIII and Anne of Austria, he was born at St. Germain, Sept. 21, 1640, and bore the title of duke of Anjou until 1661. He married in 1661 Henrietta, daughter of Charles I of England, and in 1671 Charlotte Elizabeth of Bavaria. He fought in Flanders, 1667, in Holland, 1672, and was in command at the victory over the prince of Orange near Cassel, 1677. He incurred the jealousy of Louis XIV by his military successes, but was present at the sieges of Mons, 1691, and Namur, 1692. He died at St. Cloud, June 9, 1701.

Orléans, PHILIP II, DUKE OF (1674-1723). Regent of France. Son of Philip, duke of Orléans, and so a near kinsman of Louis XIV, he was born Aug. 4, 1674. As a soldier he served in Flanders, Italy, and Spain. He was prominent among those who, after a succession of deaths in the royal family, tried to seize the reins of government in view of the king's approaching end. Louis XIV named him in his will as president of the council of regency for the young Louis XV, but Orléans wanted more than this titular office, and, assured of popular support, boldly seized the supreme power and ruled France from 1715 until his death, Dec. 23, 1723, although Louis XV came of age Feb. 15, 1723.

Philippe Egalité,
Duke of Orléans
After Reynolds

Orléans introduced domestic reforms, struck hard at the influence of the Jesuits, and in other ways showed a desire to do well for France. But he was not the man to cope with the state of affairs; the finances were in chaos, and the schemes of John Law (*q.v.*) made matters worse. In foreign affairs the regent was hostile to Spain. Orléans was a dissolute man in a dissolute age, and his name is almost a byword for excesses of every kind. Yet he had marked abilities, loved music, studied chemistry and philosophy, and both as an orator and a soldier was more than mediocre.

Philip II,
Duke of Orléans
After J. B. Santerra

Orlikon Gun. Automatic gun of Swedish invention adopted by the Royal Navy and merchant navy as an anti-aircraft weapon. Mounted on a turntable, it fired 500 rounds of 20-mm. ammunition per min. to an effective range of 5,000 ft.

Orloff. Name of a Russian family. Its first prominent member was Grigorei (1734-83). Having

distinguished himself in the Seven Years War, he attracted the favourable notice of the grand duchess Catherine, and was the leading spirit in the conspiracy to

G. I. Orloff,
1734-83

place this princess on the throne in 1762. He afterwards lost favour at the court, chiefly owing to the rise of Potemkin, and died mad.

His brother, Alexis (1737-1809), began life as a simple soldier. He was a man of great courage and audacity, and was one of the assassins of Peter III in 1762. He was created an admiral in 1768 and defeated the Turks at Chesme. In 1796 he was exiled by Paul I. His nephew, Grigorei Vladimirovitch (1777-1826), was a scholar, who chiefly devoted himself to history, politics, and literature. With him died the legitimate male branch of the family. Alexis Fedorovitch (1787-1861) distinguished himself in the Napoleonic wars. After concluding the treaty of Adrianople, Sept. 14, 1829, he went as a plenipotentiary to Constantinople, and in 1833 persuaded the sultan to

sign the peace of Unkiar-Skelessi. His son, Nikolai Alexievitch (1827-85), after distinguishing himself at the siege of Silistria in 1854, became ambassador at Brussels, Paris, and Vienna. See Gatschina.

Ormesby. Parish in Stokesley rural district, since 1913 part of Middlesbrough. The chief building is the Norman church of S. Cuthbert while the Hall is a capacious mansion. The iron, steel, and chemical works of Tees-side have extended here and brought a pop. est. at 3,000. Ormesby has a rly. station. This is also the name of one of the Norfolk Broads.

Orme's Head, GREAT AND LITTLE. Promontories, 4 m. apart, on the coast of N. Wales, in the

Orme's Head, North Wales. View of the Great Orme from the pier at Llandudno

N.E. of Carnarvonshire. Llandudno is on the bay between them. The Little Orme is a limestone height rising sheer from the sea, and its caves can be reached only by boat. The Great Orme is flat topped, a road specially constructed in 1879 encircles it, and a funicular rly. gives access to the summit. A lighthouse with group occulting light is 325 ft. above high water.

Ormolu (Fr. *or*, gold; *moulu*, ground). One of the brass alloys. It generally consists of copper 58 parts, zinc 26, and tin 16, and is employed in the preparation of small statues, candlesticks, and other articles, and as the basis of a form of enamel work. In the latter, a design is chiselled in the metal and the cavities are filled with enamel material, which is fused into a solid mass with the metal by heating. Such enamel is styled *émail cloisonné*. The art has long been practised by the Chinese. See Louis Style.

Ormonde. English racehorse. Bred at Eaton, Chester, in 1833. by the duke of Westminster, he was unbeaten and won 15 races, including the 2,000 Guineas, Derby, and St. Leger. During the Jubilee

festivities in 1887 Ormonde was brought to Grosvenor House and fêted. After his racing career he went to Argentina, and eventually to California, where he died in 1904. His skeleton was set up in the Natural History Museum, S. Kensington, and his stock proved vigorous and successful.

Ormonde, EARL AND MARQUESS OF. Irish titles, held by the family of Butler. The 1st earl was James Butler (c. 1305-37), who married a granddaughter of Edward I. James, 2nd earl (1331-82), and James, 4th earl (d. 1452), each held the post of governor of Ireland. The 5th earl, James (1420-61), came to England, was created earl of Wiltshire in 1449, was high treasurer in

1455 and 1459, but fell with the Lancastrian party. His two brothers, the 6th and 7th earls, were ambassadors in the service of the English crown. On the death of the latter in 1515 the title fell into abeyance. In 1538 the title was resumed by Piers Butler, cousin of the last earl. Thomas (1532-1614),

grandson of Piers, was the 10th earl, and a Protestant, aiding Elizabeth in repressing the rebellion in Munster. His kinsman, James (*v.i.*), the 12th earl, was made marquess in 1642, and duke in 1661. (See Kilkenny.)

The dukedom was lost when the 2nd duke was attainted in 1715, but on his death in 1745 his brother called himself earl of Ormonde. In 1791, after a period during which there was no earl, a relative, John Butler, was declared earl. For his son the marquessate was revived in 1816. It became extinct in 1820, but was revived in 1825. In 1949 it came to James (b. April 25, 1893), 6th marquess, who is also earl of Ossory, Viscount Thurles, Baron Ormonde in the U.K. peerage, and the hereditary chief butler of Ireland.

Ormonde, JAMES BUTLER, 1ST DUKE OF (1610-88). Irish royalist. Born Oct. 19, 1610, he was brought up under James I's wardship, succeeded to the earldom in

1st Duke of
Ormonde
After Kneller

1632, and became a valuable supporter of Wentworth in Ireland, 1634-40. From 1641 he kept the disaffected Irish in check by his able generalship, and was made lord-lieutenant, 1644. During 1644-46 Ormonde had to face the double opposition of the Catholic rebels and of the parliamentarians; the terms of a peace with the latter forced his withdrawal from Ireland, 1647. He returned, 1648, but after defeat retired to France, 1650. Faithful to Charles II in exile, he became duke of Ormonde in 1661, and was lord-lieutenant 1662-69 and again 1677-84. He died July 21, 1688. *Consult* Life, W. A. H. C. Gardner, 1912.

Ormonde, JAMES BUTLER, 2ND DUKE OF (1665-1745). Irish soldier. Grandson of the 1st duke, he

2nd Duke of Ormonde
After Kneller

was born in Dublin, April 29, 1665, and succeeded to the dukedom in 1688. He supported the accession of William of Orange, under whom he fought at the Boyne, 1690, Steenkerk, 1692, and Landen, 1693. Lord-lieutenant of Ireland, 1703-07 and 1710-13, he also commanded the English armies in Flanders, 1712. There he obeyed secret orders to remain inactive, was relieved of his generalship, 1714, and impeached as a supporter of James Stuart, 1715, his estates being confiscated by the crown. Thereafter he lived abroad, commanded the Spanish fleet organized against England, 1719, and died Nov. 16, 1745.

Ormskirk. Urban dist. and market town of Lancashire, England. It is 12 m. by rly. N.N.E. of Liverpool. The church of SS. Peter and Paul, mainly Perpendicular, has a tower and spire side by side; it contains the burial vault of the Stanley family, whose former seat, Lathom House, is near. The town has a 17th century grammar school. The chief industries are brewing and brassfounding. Ormskirk is noted for its gingerbread. Market day, Thurs. Pop. 21,300.

Ormulum. Book of metrical paraphrases of the Gospels, with commentary. It was written by Orm or Ormin, an Augustinian monk of N.E. Mercia, late in the 12th or early in the 13th century, and was first printed by R. M. White in 1852; new ed. R. Holt,

1878. A copy in MS. is in the Bodleian at Oxford.

Ormuz, STRAIT OF. Winding passage between the Gulf of Oman and the Persian Gulf. See Hormuz.

Ormuzd, ORMAZD, OR AHURA MAZDA. In Zoroastrian mythology, a being, or principle, representing

Ormuzd fighting the spirit of darkness in the form of a winged lion. From a relief found at Persepolis

light and goodness. He was the elder of the two emanations from the Eternal One; the second being Ahriman, the spirit of Evil. They are regarded as ever working against each other, every good thing created by Ormuzd at once receiving its equivalent ill from the other, but in the end the victory of Ormuzd is assured.

Ornain. River of France, a tributary of the Marne. It rises near Neuville, in the dept. of Haute-Marne, and flows past Ligny and Bar-le-Duc. Its chief affluent is the Saulx, and its length is 75 m.

Ornament. Embellishment added to the appearance of a person or object for the sole purpose of gratifying the eye. In design, the inclusion or addition of ornament is irrespective of the primary purpose of the object designed; or, alternatively, the purpose of the object may be purely ornamental—hence the once-common division of things into “useful” and “ornamental,” with many gradations between in which the two qualities are combined. Certain forms of ornament are classical (e.g. egg and dart ornament in architectural mouldings, Greek fret patterns), others traditional, others again the expression of the craftsman’s exuberance or his pride in his work. Traditional ornament makes wide use of formal pattern, following well-established laws concerning rhythm, repetition, contrast, etc.

Ornament is most acceptable when judiciously used to relieve bare surfaces (as with wallpaper), to provide contrasts, or to enrich the general effect; but no amount of it will serve to make beautiful an object that is intrinsically ugly, nor should it be something extra “applied” to the object, but rather an integral part of the designer’s original conception.

The overloading of objects (e.g. architecture, furniture, dress) with ornament in the 18th and 19th centuries, combined with the debasement introduced by machine-made ornament, led to a 20th century revulsion against its use. Designers sought to please the eye by the inherent beauty of shape or sheer fitness for purpose of an object; and public taste, shocked at first by the starkness of architecture, furniture, etc., denuded of the traditional frills, gradually accustomed itself to the new standards. It would not be true to say that the 20th century has discarded ornament; but it has at least begun to keep it to its proper place after generations of misuse. See Aesthetics; Functionalism.

Ornament. In anthropology, the embellishment of the human body. Originating in a remote past, in some instances for amuletic protection, it is in universal use, especially for self-display, tribal discrimination, or ceremonial distinction. It is applied to the person by adhesion, entanglement, insertion, or encirclement. Adhesive ornament includes the application of paints and unguents to skin and hair, a practice traceable to Palaeolithic Europe. Neolithic Crete used pottery stamps for printing coloured designs upon the skin. Body-painting, still widespread, is effected by mineral pigments and such vegetable extracts as the Ancient British woad. Andamanese smear themselves with earth and lard, and draw lines therein with the fingers. Fijians bleach the hair with lime; Kavi-rondo negroes wear white clay stockings; Tibetan women form designs with seeds embedded in starch paste upon the cheeks.

Ornaments that encircle the body or its parts are of most importance, because they gave rise to clothing in all its forms. Headbands developed, not only into garlands and diadems, but also into protective headgear. Necklaces, originally thongs and grasses, sometimes plaited, bore perforated berries, shells, and teeth, at first often amuletic. The purpose was afterwards associated with pen-

dants, such as the rats' ears enclosed in Etruscan gold lockets or the bright beetles reproduced as durable scarabs in ancient Egypt. Necklets of human teeth and bones occur in Melanesia. Girdles and belts, which preceded waist-cloths and skirts, acquire decorative forms in African cowry-strings and bead-strings, the tinkling attachments of Bronze-age Europe and Patagonia, and the buckles of civilized dress. *See* Celt, colour plate, Dress; Earring; Jewelry; Lip-Ornament; Mutilation; Nose-Ornament; Ring.

Ornaments. In music, notes which could be dispensed with, without rendering the melody or the harmony incomplete or unintelligible. This definition includes passing notes, appoggiaturas, acciacaturas, mordents, syncopations, shakes, trills, and turns. often also scales and arpeggios.

Ornaments. Term for all articles used in, and subservient to, divine worship. Ornaments of the church include the altar or communion table, paten, chalice, vessels for wine and water, font, pulpit, Bible, Book of Common Prayer, etc.; of ministers, alb, chasuble, cope, surplice, rochet, pastoral staff, mitre, etc. In the Anglican Church, images, crosses, flowers, banners, etc., are allowable as decorations. The question as to what is permitted according to the Ornaments Rubric in the English Book of Common Prayer has involved much controversy and litigation, but generally most of the ornaments used in 1549 are regarded as legal. Much of the controversy centres in the distinction between decorative and symbolical use. *See* Ecclesiastical Law; Ritual Ritualism; Vestments.

Orne. River of France. It rises near Sées and flows through Normandy into the English Channel. It is navigable for vessels of from 10 to 12 ft. at spring tides. Towns on its banks are Argentan, Écouché, and Caen. There is a canal from Caen to the sea. The length of the Orne is 94 m.

Orne. Dept. of France. It is an inland region of Normandy, having an area of 2,371 sq. m. and a pop. of 273,159. It has a number of hills, chiefly in the centre, but few in excess of 1,000 ft. high. The rivers include the Orne, which crosses the dept., Eure, Dives Touques, Sarthe, and Mayenne. The dept. is noted for its horses. Dairy farming is carried on, cattle are reared, fruit is cultivated, and cereals, including wheat and barley, are grown. Some of the land is

covered with forest. Alençon is the capital; other places are Argentan, Domfront, Montagne, Sées, and Flers. Before the Revolution, Orne was partly in Normandy and partly in Alençon and Perche. There was much fighting here in the summer of 1944. *See* Europe, Liberation of.

Ornitholestes (Gr. *ornis*, bird. *lestes*, robber). Extinct dinosaur. The animal was one of the smallest and most active of the dinosaurs and lived principally upon birds. *See* Dinosaur.

Ornithology (Gr. *ornis*, bird. *logos*, word). Science and study of birds. *See* Bird; Migration; and under the names of birds.

Ornithorhynchus (Gr. *ornithos*, of a bird; *rhynchos*, beak). Generic name for the platypus or duck-bill, one of three animals forming the zoological order Monotremata or Prototheria. These animals are the most primitive living mammals, and in several anatomical details show a marked resemblance to the reptiles. They are oviparous and have a common urino-genital anal opening, the cloaca. There are no mammary teats in the female, but the milk exudes locally through pores in the skin of the abdomen. Comparatively little is known of the habits of these animals, which are found in parts of Australia and Tasmania, but they live in pairs in burrows constructed in the banks of streams. Each burrow has two openings, one above and one below the surface of the water, and in the breeding season two eggs are laid in the nesting chamber. It is uncertain whether the mother hatches them. The animals are about at night, when they feed upon aquatic worms and insects. They swim and dive, but move awkwardly upon land. *See* Duckbill.

Orobanchaceae. A family of leafless herbs, root parasites. They are natives of temperate and tropical countries, particularly of Europe and Asia. The tuberous, fleshy, or scaly rootstock is attached by rootlets to the rootlets of its host, and the stout, scaly stem ends in a spike or spray of flowers. There are generally four or five sepals and a gaping tubular corolla. There are about 12 genera and 150 species. *See* Broomrape; Toothwort.

Orogeny (Gr. *oros*, mountain). Type of earth movement which results in the upheaval of mountain chains. It is confined to long, relatively narrow belts in the earth's crust—orogenic belts—such as the Alpine-Himalayan chains, or the mt. ranges of N and S. America

The interruption or termination of a prolonged period of quiet sedimentation by a mountain building episode is termed an orogenic revolution. *See* Earth Movement.

Orographic Rain. Rain produced by the dynamic cooling of moist air which is caused to rise on meeting high ground in its path. With the falling atmospheric pressure accompanying the ascent, the air expands and falls again as precipitation. Because of orographic rain, as distinct from rain of the cyclonic type, the hilly districts of the British Isles in the N. and W. are in general much wetter than the Midlands and S.E.

Orography (Gr. *oros*, mountain; *graphein*, to write). Science devoted to the geological and physical study of mountains and the mountain systems of the world. *See* Mountain.

Orontes, AXIOS, OR NAHR EL ASI (the rebellious river). River of Syria. It rises near Baalbek and the source of the Leontes, and flows N. between the Lebanon and Anti-Lebanon ranges. Emerging to the plains, it expands into the small lake of Homs or Kades, and then continues N. between rocky walls until it turns abruptly W. and S.W. and flows across the plains of Antioch to the shore of the E. Mediterranean. S. of Hama the valley is followed by the rly. from Aleppo to Beirut and Damascus. Length, 240 m.

Oropesa Float. Device for sweeping sea mines of the contact type. It consists of a hollow float in the shape of an elongated pear which is attached to the sweeping vessel by a wire and streams out at an angle. The wire, serrated to shear through the mine's mooring cable, is kept down to the required depth by a multi-plane kite. *See* Mine.

Oropus. In ancient Greece, a strong seaport on the Euripus, on the borders of Attica and Boeotia. After belonging alternately to Athens and the Boeotian league, with intervals of independence, after 146 B.C. it became a Roman provincial town, being again restored to the Athenians by Antony or Augustus. The town was celebrated for the sanctuary of Ampharaus (*g.v.*), a god of healing.

Orotava. Town of Tenerife, Canary Islands. It is near the N. coast, in a beautiful valley, and is a health resort. Bananas, potatoes, wine, and cochineal are exported.

Oroya. Town of Peru, in Junin dept. It lies 137 m. E.N.E. of Callao and is on the highroad

over the Andes from that seaport to Pucallpa. Here is the copper smelting works of the Cerro de Pasco corporation, which employs many foreigners. Pop. 15,000.

Orpen, SIR WILLIAM (1878-1931). British painter. Born in Dublin, Nov. 27, 1878, he studied

Sir William Orpen,
British painter
Elliott & Fry

at the Slade school, and began to exhibit at the New English art club in 1899. Elected A.R.A. in 1916, and R.A. in 1919, he was at first chiefly attracted by interior subjects, but developed into one of the outstanding portraitists of his day. A fine draughtsman, crisp and direct in his brushwork, and evincing a lively satirical humour in his treatment of a subject, he was led by love of bright colour into occasional over-brilliance. His portraits in the Tate Gallery include those of Dame Madge Kendal, Sir William McCormick, and his own wife. An official war artist on the Western front, 1917, he went on to paint scenes at the Paris peace conference. His many war pictures may be studied at the Imperial War Museum. They evince a strong sympathy for the fighting soldier. Orpen recounted his experiences in *An Onlooker in France, 1917-19*, published 1921. Knighted 1918, he died Sept. 29, 1931. A memoir by P. G. Konody and S. Dark appeared in 1932.

Orphan (Gr., destitute). Child or minor deprived by death of father, or father and mother. In the U.K. the lord chancellor is the general guardian of all orphans. The *Widows', Orphans', and Old Age Contributory Pensions Act* of 1925 introduced pensions of 7s. 6d. a week, under the national health insurance scheme, for children under 14 who had lost both parents. A widow's pension was converted to an orphan's pension on her death if the child was still under the specified age. The allowance, paid to the guardian, was increased to 12s. weekly by the *National Insurance Act* of 1946. See *Children, Law about*.

Orpheus. In Greek mythology, son of the muse Calliope. He was famed for his extraordinary skill with the lyre, bestowed upon him by Apollo. So compelling was his music that not only the beasts of the field but even trees and rocks followed the sounds of his lyre.

He accompanied the Argonauts in their expedition to the Black Sea, and lulled to sleep the dragon which guarded the Golden Fleece. On the return of the expedition, he settled in Thrace, and there his wife Eurydice (q.v.) died of a serpent bite. Her memory remained with Orpheus and he consistently repelled the advances of the Thracian women, who in revenge for his contemptuous treatment tore him to pieces. The muses set his lyre among the stars. Tradition represents Orpheus as a poet as well as a musician.

Sir William Orpen. *Le Chef de l'Hôtel Chatham*, the painting exhibited at the Royal Academy Exhibition of 1921 and later presented by the artist to the R.A. as his diploma picture

Orphism. Term for the mystical doctrines associated with the brotherhood reputed to have been founded by the Thracian Orpheus, and first mentioned by Ibycus 530 B.C. The Orphic rites in which they were engaged were closely connected with the worship of Dionysus. The sect, which continued into Roman times, believed in original sin and transmigration of souls, abstained from certain foods and bloody sacrifices, practised purification rites, and were at a later period associated with the sect of Pythagoreans.

Orpiment (Lat. *auri pigmentum*, gold pigment). Native form of arsenic. Chemically it is arsenic trisulphide (As_2S_3), or yellow sulphide of arsenic. It occurs as lemon-yellow masses in the oxidised portions of arsenic veins and is often associated with antimony minerals. It is worked in Transylvania, Kurdistan, and elsewhere; it also occurs as a deposit from some hot springs, and as a sublimate from volcanoes at Naples. Realgar, or arsenic disulphide, is called red orpiment and is used in fireworks.

Orpington.

Urban dist. of Kent, England. It is 14 m. S.E. of London and virtually a suburb, being the terminus of an electric rly. The river Cray rises here, and in the district are large areas under fruit and vegetables. All Saints' church mainly E.E. has some old brasses. At Orpington in 1873 Ruskin set up a printing establishment. The last German rocket fell here on March 27, 1945. Orpington gives its name to a co. constituency. Pop. 58,000

Orpington.

Name given to certain domestic fowls. The claim made for them

that they constitute a distinct breed is disputed. Their name arose from the fact that the Black Orpington was raised by W. Cook of that place, who stated that he raised it from crossings of the Black Plymouth Rock, the Langshan, and the Minorca. The Buff Orpingtons are said to have been bred from Cochins crossed with ordinary farmyard fowls, and selected until the type was fixed. Orpingtons are excellent general purpose fowls, both good layers and good table birds. There is also a white Orpington. See *Fowls colour plate*.

Orpington. Cock of the white variety of the breed

Orr, Sir John Boyd (b. 1880). British expert on nutrition, who in 1949 was created Baron Boyd-Orr.

Lord Boyd-Orr,
British expert,
on nutrition

Born Sept. 23, 1880, in Ayrshire, he took a medical degree at Glasgow university. During the First Great War he served in the R.A.M.C., winning the D.S.O. He sat on committees on fat stock, milk, and cattle for the ministry of Agriculture, and on nutrition for the ministry of Health. Director of the imperial bureau of animal nutrition, he was knighted in 1935. He was professor of agriculture at Aberdeen, 1942-45, and chancellor of Glasgow university, 1946. Independent M.P. for Scottish universities, 1945, he retired on taking up appointment as director-general of the United Nations food and agriculture organization, 1946; he resigned that post in 1948. He was awarded the Nobel peace prize, 1949. The author of the article Food and Nutrition in this Encyclopedia, he published *Food, Health, and Income*, 1936; *Food and the People*, 1944.

Orrell. Urban dist. of Lancs, England, adjoining Wigan on the W. There are two rly. stations, while the Leeds and Liverpool canal passes along the N. boundary. A cotton mill provides employment, but the dist. is mostly agricultural and residential. Pop. 8,600.

Orrery. In astronomy, a device or framework for exhibiting the motions of the planets about the

Orrery made by Benjamin Martin,
c. 1770
Science Museum, S. Kensington

sun. It is so called from the 4th earl of Orrery, for whose instruction one was first made in the 18th century. See *Planetarium*.

Orrery, Earl of. Irish title borne by the family of Boyle since 1660. Roger Boyle (1621-79),

1st earl, was a younger son of the 1st earl of Cork. Born April 25, 1621, he was educated at Trinity College, Dublin. As Baron Brighthill, he fought for Charles I in 1642, but for the parliamentarians in 1647, and as a general in Ireland under Cromwell in 1650. Though he had been in the Protector's council, he secured Ireland for Charles II and was created earl of Orrery in 1660, and lord president of Munster, 1660-68. He died Oct. 16, 1679. His romance, *Parthenissa*, appeared in 1654; his *Treatise on the Art of War* in 1677; and he wrote poems and tragedies.

John, the 5th earl, succeeded to the earldom of Cork in 1753, and since then the two titles have been united. See *Cork, Earl of*.

Orris Root. Dried rhizome of the Florentine iris (*I. florentina*), which gives off a strong violet-like odour causing it to be extensively employed by perfumiers. "Essence of violets" is prepared from it, and it forms the basis of "violet powder" and other toilet powders. It is chewed to disguise offensive breath, and it possesses emetic and cathartic properties. Some of the orris-root of commerce is obtained from *Iris pallida*. Both species are natives of the Mediterranean region. See *Iris*.

Orsay, Alfred Guillaume Gabriel, Count d' (1801-52). French dandy. Born in Paris,

Sept. 4, 1801, he served as lieutenant of Louis XVIII's bodyguard, and in 1822 formed an intimate friendship with the 1st earl and countess of Blessington, with whom he travelled in Italy. In 1827 he married Lady Harriet Gardiner, daughter of the earl's first marriage. After Blessington's death in 1829, d'Orsay lived with the countess at Kensington, and their house became famous as an intellectual and social centre. D'Orsay was of fine appearance, and a brilliant conversationalist. With Lady Blessington he left for Paris, bankrupt, in 1849, and was appointed director of fine arts shortly before he died on Aug. 4, 1852. See *Beaconsfield, Earl of*; *Houghton, 1st Baron*.

Orsborn, Albert William Thomas (b. 1886). General of the Salvation Army. Born Sept. 4,

1886, he came from Toronto, where both his parents were pioneer members of the Salvation Army. He became an officer himself at 19, held administrative posts in New Zealand and in the Salvation Army international training college, and was territorial commander for Scotland and Ireland. Salvationists knew him for "war-songs" and poetry in their periodicals. Awarded the C.B.E. in 1943, he was British commissioner of the S.A. from 1940 and succeeded G. L. Carpenter as general in 1946.

Orsha. Town of White Russia S.S.R. It stands at the junction of the Dnieper and Orshitsa, 50 m. by rly. N. of Mogilev, and is an important rly. centre.

It trades in grain and timber and has ironworks. The Germans seized it in July, 1941, and built it up as a strong defence point. The 3rd White Russian army recaptured it in a dual attack from the E. and the N.W., June 27, 1944.

Orsini, Felice, Count (1819-58). Italian revolutionary, born at Meldola, Romagna. He became an advanced liberal, and in 1844 was sentenced to life imprisonment for his connexion with the revolutionary party. Liberated under the amnesty of Pius IX, 1846, he was a member of the government of Rome during the republic of 1849, and on its fall became an indefatigable agitator. Regarding Napoleon III as the incarnation of the spirit of reaction, Orsini made his way to Paris, and on Jan. 14, 1858, threw a bomb at the emperor and empress as they drove to the Opéra. They escaped injury, but ten people were killed and 150 wounded by the explosion, Orsini among them. He was arrested and on March 13 executed.

Orsk. Town of the R.S.F.S.R. In Chkalov region, it is 155 m. S.E. of that town (formerly Orenburg). Near the junction of the rivers Or and Ural, it is on the border of Asia, in the Ural industrial zone. Concerned with oil refining, it is the terminus of a pipe-line to Guriev on the Caspian. There are nickel and chrome deposits, and brick, tallow, and soap works. Orsk was originally a fortress of the so-called Orenburg line, set up against Kirghiz inroads. Pop. 65,799.

Felice Orsini,
Italian revolutionary
After Vintner

Count d'Orsay,
French dandy

After R. J. Lane, R.A.

Orsova. Two towns of Rumania, known as Old and New, and formerly in the S.W. corner of Hungary. Pop. 8,528. Here the Carpathians terminate against the Danube, and 5 m. downstream are the Iron Gates; parallel with them the Cserna flows S. to the Danube, and Orsova marks the confluence of the two streams. The rly. from Budapest follows the Cserna and Danube valleys past Orsova station $2\frac{1}{2}$ m. from the town. Close to the station Kossuth buried the Hungarian crown in 1849. Old Orsova stands on the W. bank of the Cserna. New Orsova, on the E. bank, was a Turkish fortress. See Rumania. *Pron.* Orshöva.

Ortegal. Cape on the N.W. coast of Spain, one of the most northerly points of the Spanish seaboard. It is known for the naval engagement, also called the battle of Cape Ferrol, that took place off here between the British and the French, Nov. 4, 1805. The action consisted of a successful attack by Strachan, in command of three line-of-battle ships and four frigates, upon four French ships of the line. These vessels had escaped from Trafalgar, and with their capture the French fleet was destroyed. See Trafalgar.

Ortega y Gasset, JOSÉ (b. 1883). Spanish philosopher. A humanist writer, he became professor of philosophy and literature at Madrid university. Before the Spanish Civil War he was a deputy and leader of a parliamentary group. He left Spain after Gen. Franco's victory and lived in Buenos Aires. His chief works are *El Tema de Nuestro Tiempo*; *La Rebelión de las Masas*; *Aurora de Nuestro Tiempo*.

Orthez. Town of France. It stands on the Gave de Pau in the dept. of Basses-Pyrénées, 25 m. N.W. of Pau. There is a 13th century tower, part of the destroyed castle, an old church with a remarkable choir, and a modern town hall. The industries include the manufacture of cotton, paper, and leather, milling, and an agricultural trade. Orthez was in the 13th century the capital of the viscounts of Béarn. With Béarn it became part of the lands of the counts of Foix, and here Gaston Phoebus held his splendid court, vividly described by Froissart. There was a university here in the 16th century; the building is now a factory. It was a centre of Calvinistic teaching, and Protestants are still numerous in the town. The river is here crossed

by two bridges, one 14th cent. Pop. 6,000. *Pron.* Ortay.

Orthez, BATTLE OF. One of the concluding actions of the Peninsular War, Feb. 27, 1814. After manoeuvring for some days round Orthez, the British under Wellington had forced the Gave de Pau river, when Soult took up a position near the Dax-Pau main road. Wellington immediately made dispositions to cut off his retreat. An attack on the French right early in the morning failed, but a boldly conceived and brilliantly executed assault on the left, effected by wading through marshes reputed to be impenetrable, was completely successful, and the French were driven back in confusion. Hill had cut off their main retreat along the Pau road, but by skilful strategy Soult effected his escape.

Orthite OR ALLANITE. In mineralogy, a member of the epidote group of minerals consisting of a complex hydrated silicate of calcium, aluminium, iron, and the cerium metals. It occurs as brown to black crystals or grains in certain granites, syenites, or diorites and their metamorphic equivalents; occasionally as large segregations in pegmatitic deposits.

Orthoceras (Gr. *orthos*, straight; *keras*, horn). Genus of fossil nautiloid cephalopods. They are distinguished

Orthoceras. Specimen of *O. undulatum*

by their straight horn- or cone-shaped shells, the exterior of which is smooth or striated, and the interior divided into chambers by partitions. The fossil is important, as it serves as one of the index fossils, and was very common in Palaeozoic limestones. It is found in deposits from Silurian to Triassic times. The surviving nautilus is descended from the fossil orthoceras.

Orthochromatic Photography. Process by which the relative values of coloured objects as seen by the eye are recorded in monochrome more correctly than by the use of ordinary plates. Ordinary photographic emulsions are sensitive only to blue and violet light; hence greens, yellows, and reds are not

adequately represented, being recorded almost as black. An improvement is effected by combining dyes with the emulsion so that it becomes proportionately more sensitive to green and yellow, such an emulsion being known as orthochromatic (or isochromatic). Its sensitivity can be balanced still further by filters to accord more nearly with that of the human eye, which is extremely sensitive to light of yellow-green colour. Orthochromatic materials are much used for snapshots, landscapes, and some portraiture. Emulsions sensitive to all colours of the visible spectrum are called panchromatic. See Colour Filter. Emulsion; Photography.

Orthoclase (Gr. *orthos*, straight; *klasis*, fracture). In geology, a potassium aluminium silicate or potash feldspar. It is a constituent of many crystalline rocks, e.g. granite porphyry, gneiss, etc.; has a lustrous glassy white, light yellow, green or red colour; and crystallises in the monoclinic system. It is widely distributed, but workable deposits are found only in granitic pegmatites, mainly in the U.K., U.S.A., and Manchuria. Many varieties are cut and polished for gemstones, e.g. moonstones and sunstones; and it is useful in the ceramic trades.

Orthodox Eastern Church. Alternative name for the Holy Orthodox Catholic Oriental Church, also known as the Greek Church (*q.v.*).

Orthodoxy (Gr. *orthos*, right; *doxa*, opinion). Term commonly used for soundness of religious belief, but applicable in other spheres of thought. Its use assumes the existence of some standard by which opinion can be tested; but this standard differs considerably in the various sections of the Christian community. The Christian Church as a whole is agreed upon the fundamental doctrines of the Gospel; and these form the real test of orthodoxy.

Shades of belief or thought that are not four-square with orthodoxy are called heterodox; while any teaching which directly contradicts the orthodox faith, or is plainly inconsistent with it, is called heresy. The Greek Church, which claims to have been pre-eminent in conserving the primitive faith, styles itself the Holy Orthodox Church. See Christianity.

Orthogenesis. This zoological term, proposed by Eimer in 1895, has been variously used by later workers. To some it has implied no more than evolution by

definite and successive variations in a given direction, as contrasted with indefinite variation; but many have used the term with some implication of causation, the direction of evolution being supposed to be dependent upon some internal factor, or at least to be independent of environment. Orthogenesis has received most sympathetic attention from palaeontologists, and, since their material is often too incomplete to afford a basis for final conclusions, the term can be used to indicate the nature of the phenomena observed, than as an explanation of the mechanism involved. An example is found in the oyster-like *Gryphaea* in whose later stages there are changes thought to be out of harmony with environment and which may lead to extinction. See Evolution.

Orthogonal Projection. A projection made by lines drawn at right angles to the plane on which the projection is made. A plan is an orthogonal projection on a horizontal plane; it is the shape that would be traced out by lines drawn from the boundaries of the object at right angles to the horizontal plane. In an orthogonal projection the length of a straight line when projected varies according to the angle at which it is inclined to the plane. The orthogonal projection of a square diminishes in width as the angle increases, until finally, when the square is at right angles to the plane of projection, the latter becomes a straight line. The orthogonal projection of a circle inclined to the plane of projection is an ellipse, the minor axis of which diminishes as the angle of inclination of the circle increases.

Orthography (Gr. *orthos*, correct; *graphein*, to write). Term generally used to signify correct spelling. It is also more precisely used to mean the exact representation of the sounds of a language by written signs. The ideal of "Write as you speak" has never been realized, for various reasons. The numerous shades of sound would require too many corresponding signs; pronunciation constantly changes, whereas spelling is more conservative; certain words are wrongly spelt in accordance with a supposed derivation (thus, *island* has nothing to do with *isle*); imported foreign words are sometimes altered, sometimes not (compare *fancy* and *phantom*). Italian and Spanish come nearest the ideal; English and French are most remote from it.

Orthohydrogen. Hydrogen of which the rotational quantum number of the atoms is odd. It is thus in contrast to parahydrogen, for which it is even. At ordinary and higher temperatures the ortho-type is three times as numerous as the para-type, but this tendency is reversed as lower and lower temperatures are reached.

Orthopaedics (Gr. *orthos*, straight; *pais*, child). Strictly, the treatment and correction of deformities in children, but the term has acquired a more general application. Orthopaedic hospitals and surgeons undertake the treatment of deformities and injuries of many kinds.

Orthoptera (Gr. *orthos*, straight; *pteron*, wing). An order of insects undergoing incomplete metamorphosis, the fore wings of which are linear, rather narrow, and leathery. They protect the large hind wings folded beneath them. More than 20,000 species are known and about 32 inhabit Great Britain. They include cockroaches, crickets, grasshoppers, locusts, mantises, and their allies which are referred to under separate headings. Many species, especially cockroaches, occur as fossils in the oldest rocks.

Orthoptics. (Gr. *orthos*, straight; *optikos*, of sight). System of exercises devised for the correction of certain pathological conditions of sight, or of malposition of the eyeball, resulting from imbalance of the eye muscles which regulate position and correlation.

Ortigueira. Watering-place of N.W. Spain, in Corunna prov., 23 m. N.E. of Ferrol. It stands on the E. shore of the Ria de Santa Marta, an almost landlocked inlet between capes Ortegal and de Vares. The harbour is shallow, and is used mostly for the fisheries and coasting trade. Pop. 21,600.

Ortler OR ORTLER SEITZE. Alpine peak in N. Italy, in the Trentino. The highest point in the E. Alps, 12,802 ft. alt., it rises S. of the valley of the upper Adige, S.E. of the Stelvio Pass, with Mte. Cevedale to the S.E. The ascent

was first made in 1804, the route from Sulden was discovered, 1865.

Ortolan (*Emberiza hortulana*). Bird of the bunting family. A summer migrant to Europe, spending the winter in Africa, its plumage is reddish brown, streaked with black on the upper parts, with a yellow throat and greenish breast and head. It nests on the ground, and feeds on insects and various seeds. It occurs very occasionally in S. England during the autumn months. The ortolan is greatly valued as a table delicacy, and large numbers are netted in S. Europe and fattened upon grain.

Ortona. Town of Italy, in Chieti prov. It is situated on the Adriatic Sea on a headland with a quay on the shore below, and is on the coast rly. 12 m. S.E. of Pescara. The cathedral and a ruined castle were noteworthy buildings. There is considerable trade in wine. Destroyed by the Turks in 1566, Ortona has suffered from earthquakes and has lost much of its earlier importance as a port. Ortona was entered by Canadian units of the British 8th army, Dec. 20, 1943; but the Germans were not driven out until Dec. 28, the town being left in ruins, which were full of mines and booby-traps. Civilian casualties of the fighting were heavy.

Oruro. Dept. and town of Bolivia. The dept. lies on the W. of the state between Chile and the main range of the Andes. It contains Lake Poopo and part of the Desaguadero which connects that lake with Lake Titicaca. The whole dept. is at an alt. exceeding 12,000 ft. and is arid and wind-swept. Tin is the chief mineral, the silver mines being nearly exhausted. Llamas and alpacas are kept, their wool being the chief product. The

Ortolan. Bird of the bunting family

Oruro, Bolivia. Government palace in the Plaza 10 de Febrero

town is a mining centre with an important school of mines; it is the chief rly. centre in the country, being connected with La Paz, Antofagasta, and Cochabamba. Its local industries include the manufacture of boots and alcohol. Area, 20,000 sq. m. Pop., dept., est. 199,800; town, est. 50,000.

Orvieto. A city of Italy, in Terni. It is built on a perpendicular, isolated rock near the Tiber, 60 m. N.N.W. of Rome. It trades in locally-produced wine. The superb cathedral, an excellent example of Italian Gothic, was begun in 1295, and is rich in sculptures, pictures, and mosaics. The museum, founded 1296, houses medieval works of art, and Etruscan and prehistoric antiquities. The Well of S. Patrick, adjacent to the citadel, has two spiral planes round the shaft which the water-carrying asses ascend and descend. The tombs in the Etruscan Necropolis date from the 5th century B.C. The town occupies the site of Volsinii, one of the twelve capitals of the Etruscan League, and was destroyed by the Romans in 280 B.C. It escaped serious damage in the Second Great War when the Allies passed through it without fighting June 14, 1944.

Orwell or GIPPING. River of Suffolk, England. Rising to the W. of Stowmarket, it flows S.E. to the North Sea. From its source to Ipswich it is known as the Gipping. The Orwell proper is an estuary, and extends for 11 m. from Ipswich to Harwich, where it merges with the Stour estuary.

Orwell, GEORGE. Nom-de-plume of the British writer Eric Arthur Blair (1903–1950). Born in India, he was a King's Scholar at Eton, served with the Indian imperial police in Burma during 1922–27, but returned to England and eventually settled down as a schoolmaster in the early 1930s. In 1936 he joined the Republican forces in the Spanish Civil War. He was for a time literary editor of Tribune, but was more noteworthy as an independent Socialist who turned his satirical wit impartially on the right and the left. *Burmese Days* (1934) described his early experiences; *The Road to Wigan Pier* (1937) dealt with unemployment; *Animal Farm* (1945) brilliantly satirised the dictatorial aspects of Soviet Communism; *Critical Essays* (1946) subjected various writers and publications to a keen and intelligent scrutiny; *Nineteen Eighty-Four* (1949) was a satirical prophetic novel. He died Jan. 20, 1950.

Oryx (Gr., pickaxe). Genus of large antelopes. It includes about four species, which occur in Africa, Arabia, and Syria. They have long

Osage Orange. Spray of foliage, with fruit, of this North American tree

and bushy tails and are distinguished by their long, ringed horns, which are nearly straight. See *Gemsbok*.

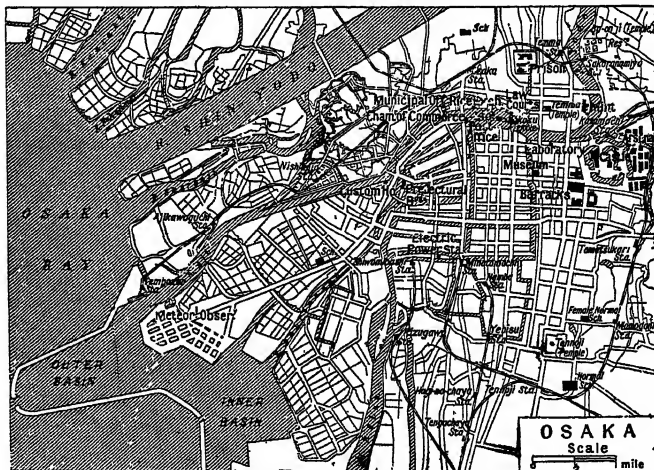

O.S. Abbreviation for old style, i.e. of reckoning dates. With the Julian year of 365½ days the date of the year did not actually correspond with the annual progress of the earth round the sun. In 1582, therefore, Pope Gregory XIII introduced a new calendar, the main feature of which was the addition of ten days to the existing date, i.e. Oct. 5 became Oct. 15. This was called the new style, and was soon adopted by the Roman Catholic countries, but less promptly by the Protestant ones. Great Britain did not make the change until 1752, when the difference between the two styles amounted to eleven days. It was ordered that Sept. 3 of that year should be reckoned as Sept. 14.

Discrepancies in dates of birth, deaths, etc., are sometimes due to a confusion between the two styles. See *Calendar*; *New Year's Day*.

Osage Orange (*Maclura aurantiaca*) OR Bow-wood. Small tree of the natural order Urticaceae, native of N. America. The stems are spiny, and the leaves oval to oblong-lance-shaped, and shiny. The flowers are inconspicuous and yellowish green. The individual fruits are small nutlets buried in the enlarged fleshy calyx; but a great number of them grow together, forming a multiple fruit, 3 ins. to 4 ins. in diameter, globular and yellowish green. The elastic bright orange wood was used by the Indians for making bows. It is much planted for hedges.

Osaka. City of Japan, in Honshu. It covers 8 sq. m. on the alluvial plain at the mouth of the Yodo and at the head of Osaka Bay. The temperature ranges from 27° F. to 100° F. A commercial and manufacturing city, its chief buildings of interest are the temples of Hokoku and Temma and the Japanese mint. Osaka Castle, 2½ m. distant, dates from 1584. The walls were built of granite stones, some 40 ft. long and 10 ft. high, but the superstructure was almost entirely destroyed by fire in 1868.

More than 7,000 factories (many of them small) produce 60 different classes of articles, of which the chief are cotton textiles, iron and metal goods, refined metals, leather goods, ships, glass-ware, confectionery, and patent medicines. There are many distilleries and breweries. Osaka is a great exporting centre for textiles, refined

Osaka. Plan showing the principal buildings and the harbour works of this Japanese seaport

Osaka, Japan. Ramparts of the castle built by Toyotomi Hideyoshi in 1584

sugar, and straw goods, especially in the trade with China and Korea. There are four exchanges for rice and cereals, stocks, cotton, cloth, and oils; the rice and cereal exchange regulates prices.

The city owes its prosperity to Toyotomi Hideyoshi, who built the castle and made his capital here. After the Toyotomi family lost power, Osaka retained its commercial importance, although Tokyo (Yedo) became the political capital. Kawamura Zuiken, in three years, 1684-87, constructed canals and embankments which secured the buildings against the floods of the Yodo. Its pop. in 1940 was 3,252,340, when it ranked 9th among the cities of the world. It was the object of heavy attacks from the air during the Second Great War.

Osborne, DOROTHY (1627-95). English letter writer. She was the daughter of Sir Peter Osborne, a royalist who held Guernsey for the king, and met Sir William Temple (*q.v.*) in 1648, becoming his wife in 1655. During their long courtship they maintained a correspondence, her share in which has been preserved and constitutes one of the outstanding contributions to English epistolary literature. She died at Moor Park, in Surrey, and was buried in Westminster Abbey in 1695. *See The Letters of Dorothy Osborne*, ed. E. A. Parry, 1888; rev. ed. 1903.

Osborne
After Sir Peter Leely

Osborne Case. Legal decision of the house of lords in 1909 which declared it to be illegal for British trade unions to make levies on their members for political purposes. Osborne had objected to a levy made on him by his union, the

Amalgamated Society of Railway Servants, for the purpose of making a payment to a Labour M.P. This decision led indirectly to the introduction of payment of members of the house of commons in 1911. The law was modified by the Trade Union Act, 1913, which permitted a political levy but exempted any member of the union who gave notice that he had objections to contributing. *See Political Levy.*

Osborne College. Former establishment for training cadets for the British navy. Opened Aug. 4, 1903, it was situated in the grounds of Osborne House, Isle of Wight. After passing the entrance examination, cadets under 13½ years of age went to Osborne for 2 years, passing thence to the Royal Naval College, Dartmouth. The college was closed in 1921, and the staff transferred to Dartmouth. *See Naval Cadet.*

Osborne House. Mansion in the Isle of Wight built for Queen Victoria. It is 1½ m. from E. Cowes,

Osborne House, Isle of Wight. Main front of the residence of Queen Victoria

and, commanding a fine view of the Solent, is surrounded by an estate of about 3,000 acres. In 1845 the queen bought about 2,000 acres from Lady Isabella Blachford and the house, in the Palladian style, was built by Cubitt. It was a favourite residence of the queen, who died here in 1901. There are other residences, Barton Manor and Osborne Cottage, on the estate. In 1902 Edward VII presented the house and estate to the nation. Part of it was devoted, at his wish, to a convalescent home for officers, but the royal apartments remained untouched, and are shown to visitors. The Medina flows through the estate, for which there is a rly. station at the neighbouring village of Whippingham.

Osbourne, LLOYD (1868-1947). American novelist. He was born at San Francisco, April 7 1868,

and educated at Edinburgh university. On the death of his father, his mother Fanny (née van der Grift) married R. L. Stevenson, and Osbourne, who lived with them in Samoa, where he was U.S. vice-consul, made a reputation by collaboration with his stepfather. Together they wrote *The Wrong Box*, 1889; *The Wrecker*, 1892; *The Ebb Tide*, 1894. Osbourne's own novels include *Love the Fiddler*, 1903; *The Kingdoms of the World*, 1911; *Wild Justice*, 1922; *The Grierson Mystery*, 1928; *Peril*, 1929. He collaborated with Austin Strong in plays, *Little Father of the Wilderness*, and *The Exile*. He died May 23, 1947. Stevenson's *Treasure Island* was dedicated to Osbourne.

Lloyd Osbourne, American author

Oscans, OSCO, OR OPICOL. Ancient Italian race, speaking a language akin to Latin, and inhabiting a considerable portion of central and S. Italy.

Oscar. Popular term for U.S. film award, instituted 1931, by the American Academy of Motion Picture Arts and Sciences. It takes the form of a statuette conferred annually in recognition of outstanding achievements in films. "Oscars" are given annually to the most successful actor, actress, director, camera man, and scenario writer of the year. The origin of the term is variously given, but remains obscure. *See Film.*

Oscar I (1799-1859). King of Norway and Sweden, 1844-59. He was born in Paris, July 4, 1799, the son of Marshal Bernadotte, and was created duke of Södermanland on his father's election as crown prince of Sweden, 1810. He was educated at Upp-
sala, and carefully trained as heir presumptive. In 1823 he married Josephine Beauharnais, granddaughter of the Empress Josephine.

Oscar I, King of Norway and Sweden

Oscar I, King of Norway and Sweden

He proved a liberal and strongly anti-German monarch, and granted freedom of the press. He died July 8, 1859.

Oscar II (1829-1907). King of Norway and Sweden. He was born in Stockholm, Jan. 21, 1829, the third son of Oscar I. He entered the Swedish navy as a boy, completed his education at Uppsala, and in 1857 married Princess Sophia of Nassau. He opposed repeated attempts to separate Norway from Sweden made by the Radicals of Norway from 1880, and more than once before the separation of 1905 averted civil war. He used the pen-name of Oscar Fredrik to write in prose and verse, notably a Military History of Sweden. His biography of Charles XII was translated into English, 1879, and his collected writings were published in 7 vols., 1885-1902. He died Dec. 8, 1907.

Oscar II, King of Norway and Sweden

Oschersleben. Town of Saxony-Anhalt, E. Germany, in the fertile Magdeburg plains, 20 m. W. of Magdeburg, on the Bode. It is an ancient town, being the seat of the archbishops of Magdeburg, but many of its old buildings were destroyed by frequent fires. In the 19th and early 20th centuries it was an industrial centre with engineering, textile, and food factories. After the Second Great War it was in the Russian occupation zone. Pop. (1950) 22,400.

Oscillation. Periodic movements of a body or quantity about some average position or value. The conception is of fundamental importance in the whole domain of physics, in engineering, astronomy, biology, and even in economics. Some unification of these diverse types of periodic phenomena is made possible by general mathematical treatment, and various relations and analogies can be found to interlock the examples in different sciences.

The simplest type of periodic motion is simple harmonic (*q.v.*), in which the time period of repetition of a cyclic motion is constant and independent of the amplitude. In the ideal case such a motion is maintained without loss of energy, but in practice some form of dissipation is present; in an electrical circuit it will be the energy lost by heat in the electrical resistance, while in a

mechanical system friction will be the cause. Under these conditions the motion is said to be damped, and a certain amount of stimulus is required to maintain the oscillation; in an electrical circuit this source of energy will come from an applied E.M.F.

If this energy supply is contained within the vibrating system, the oscillations are said to be self-maintained; if the supply is external, they are forced. A particular phenomenon, known as resonance, takes place if the frequency of the applied force coincides with the natural frequency of the system. The amplitude of the motion in these circumstances may build up to large values; this is why marching troops fall out of step when crossing suspension bridges.

A particular type of vibration often met in nature is the relaxation oscillation, and its characteristic feature is a building up of the amplitude to some optimum value followed by an almost instantaneous decay, this sequence of events being repeated within a definite periodic time. In sharp contrast with simple harmonic oscillations, the amplitude of a relaxation system does not exhibit resonance at all. Hence, whereas in simple harmonic motion automatic synchronisation occurs only in a limited region of frequencies near resonance, a relaxation system when subjected to an external periodic force can easily be brought into synchronisation over the frequency range of an octave. Again, when an alternating sinusoidal E.M.F. is applied to a non-linear circuit element it gives rise to currents whose frequencies are multiples of the applied frequency; by contrast, a relaxation system exhibits a frequency which is a sub-multiple of the applied frequency. Examples of relaxation oscillations are heartbeats, flapping of a flag in wind, and periodic flashing of a neon tube.

B. W. B. STEPHENS, Ph.D.

Oscillograph. Instrument for demonstrating visibly the nature of the fluctuations of an alternating electric current. The current to be tested passes through a small coil suspended in the field of an electro-magnet energised by a current of constant intensity. The fluctuations and reversals of current in the coil make it swing to and fro. A beam of light is reflected by a tiny mirror attached to the coil on to a second mirror moving synchronously with the coil, but on an axis at right angles to that of the coil; and thence on

to a fixed screen. The spot of light traces out "wave" curves compounded of the two different motions of the mirrors; and these curves are repeated so rapidly that, owing to the persistence of vision, they appear as continuous lines of light on the screen. These graphs may be recorded on light-sensitised paper or film, inserted in rolls which pass through at a regular speed and which provide a permanent record of the fluctuations. A more sensitive instrument is the cathode ray oscillograph, which uses a stream of electrons with small inertia and is thus able to respond to extremely rapid variations. See Cathode Ray Tube.

Osh. Town of Kirghiz S.S.R. It is in the prov. of Oshsk, 55 m. N.E. of Marghilan, on the river Ak-bura, and is said to have been founded by Alexander the Great. There is a trade with China.

O'Shaughnessy, ARTHUR WILLIAM EDGAR (1844-81). British poet. Born in London, March 14, 1844, he obtained a post in the British Museum in 1861. Afterwards he became an assistant in the natural history department. He died Jan. 30, 1881. His works include *Epic of Women*, 1870; *Music and Moonlight*, 1874; and the posthumous *Songs of a Worker*. A well-known ode is that beginning *We are the Music Makers*, set to music by Elgar. With his wife, Eleanor Marston, whom he married in 1873, he wrote *Toyland*, 1875, children's stories.

Oshawa. Town of Ontario, Canada. It stands on Lake Ontario, 32 m. N.E. of Toronto, and is served by the C.N.R. and C.P.R. It is connected by electric rly. with Toronto. It has a harbour and some major industries, including the main plant of General Motors. Pop. 26,875.

O'Shea, KITTY (1846-1921). Respondent in the Parnell divorce case. Katherine Page Wood married William O'Shea in 1867, but, after the birth of their third child in 1874, husband and wife drifted apart. Her attachment to C. S. Parnell (*q.v.*) led to O'Shea's challenging Parnell to a duel; the quarrel, however, was resolved, and in 1881 Mrs. O'Shea separated from her husband and lived at Eltham with a wealthy aunt. Here Parnell frequently visited her until in 1890 Capt. O'Shea obtained a divorce on the ground of his wife's adultery with Parnell. The scandal that resulted broke Parnell's political career. Mrs. O'Shea married him in 1891, and survived him until Feb., 1921.

Oshkosh. City of Wisconsin, U.S.A., the co. seat of Winnebago co. It stands on Lake Winnebago, 80 m. N.N.W. of Milwaukee, and is served by rlys. and steamers. Lumber products, carriages, wagons, machinery, furniture, tobacco, and flour are among its manufactures. It was originally named Athens, but in 1870 the name of a local Indian chief meaning "claw" or "brave" was substituted. The city was four times rebuilt after fires, 1859-75. Pop. 39,089.

Osier (*Salix viminalis*). Shrub or tree of the family Amentaceae. A native of Europe and N. Asia, it forms either a bushy shrub or a tree 30 ft. high, growing in wet places. The long, straight branches, used for wickerwork, are polished when mature. The leaves are narrow-lance-shaped, the edges waved but not toothed, and silvery beneath. The catkins, which mature before the leaves, are golden yellow. The purple osier (*S. purpurea*) does not attain the tree form, and its slender tough twigs have red or purple bark. Several other willows are grown as osiers by keeping the trunk cut close to the ground, and so inducing a plentiful annual

growth of long slender rods. The osiers are cut in spring, when the bark peels easily, leaving the rods white. See Basket.

Osijek. This town of Yugoslavia is described under its alternative name of Eszék.

Osimo. City of Italy, 8 m. S. of Ancona. It is the ancient Auximum, colonised by the Romans in 157 B.C. Part of the old wall still exists, and there are Roman antiquities from the site of the ancient forum in the Palazzo Pubblico. The cathedral, slightly damaged by shell-fire during the Second Great War when the 8th army entered it July 2, 1944, contains 13th century sculptures.

Silkworm breeding is the most important local industry.

Osiris. Egyptian deity. Originally the local god of Busiris, his worship developed during the Old Kingdom at Abydos, where he was traditionally interred. From being considered a virtuous benefactor, whence Egypt obtained her law and agriculture, he became by assimilation with Ra, a sun-god. He was also identified with other gods, e.g. with Apis as Serapis and with Khons the moon-god. The son of earth and sky, he

was brother and husband of Isis, and father of Horus. His brother Set, god of darkness, put him in a coffin which he threw into the Nile, and afterwards cut his body into 14 pieces and scattered them through Egypt, but Isis collected and scattered them through Egypt, but Isis collected them with one exception, and either buried them separately or resuscitated Osiris by incantations. He was thus god of resurrection and eternal life, and judge of the dead. The righteous soul became an Osiris. As lord of the underworld he appears with a mummified body, wearing a plumed crown, and associated with ideas concerning the after life. Ptolemaic temples were erected to him at Canopus and Karnak. See Amenti; Egypt; Isis; Serapis.

Osler, Sir William (1849-1919). British physician. Born at Bondhead, Canada, July 12, 1849, he was educated at McGill university, London, Berlin, and Vienna. He held university appointments at McGill (1874), Pennsylvania (1884), Johns Hopkins (1889), Oxford (1905). Created a baronet in 1911, Sir William Osler wrote widely and authoritatively on nearly every aspect of medicine. He died Dec. 29, 1919. His books include *Principles and Practice of Medicine*, 14th ed., 1942. *Consult The Great Physician*, E. G. Reid, 1931.

Oslo. The capital of Norway, called Christiania 1624-1924. Picturesquely placed at the head of Oslo Fjord, it was named after King Christian IV of Denmark and Norway, who refounded it in 1624, after the destruction by fire of the old city of Oslo founded by Harald Sigurdson in 1048. Built of wood, Christiania suffered frequently from fires; since 1850 brick and stone have been used. The fortress of Akershus, besieged by

Osier, in winter, showing long straight branches

Osiris as the moon-god

From a statue in the British Museum

Oslo, Norway. Plan of the Norwegian capital at the head of Oslo Fjord

Oslo arms

the Swedes in 1310, by the Danes 1531-33, and again by the Swedes in 1567 and 1716, is now an arsenal and prison. There are old and new bishop's palaces, a royal palace (1821-28), houses of parliament (1866), law courts, a university (1853), a town hall (1931-50), and three museums. The old name Oslo was revived in 1924.

The harbour, formed by two creeks, is generally locked by ice for two or three months during the winter. Shipping and allied trades form the staple industries, but manufactures of paper, leather, soap, matches, linen and woollen goods, tobacco, yarn, spirits, and glass are also engaged in. The motive power for the various factories is derived from the waterfalls of the Akers. The chief exports are wood-pulp, timber, butter, margarine, matches, nails, condensed milk, dried fish, paper, tobacco, hides, seal-skins, ice, and paving stones. It is one of the most valuable ports in the country. There are several fine parks, and a summer palace in one of the many growing suburbs. Oslo has regular steamer communication with several British ports, Amsterdam, and Antwerp, and regular air services with Copenhagen, London, Prague, Frankfurt, and Marseilles. Good roads and several rlys. connect it with Sweden. Pop. 289,000.

On April 9, 1940, without a declaration of war, German warships disembarked troops in the vicinity of Oslo, while troop-carrying planes landed at the airport. The government and royal family moved to Hamar, and by the afternoon the Germans were in possession of the city. Allied aircraft attacked military targets at Oslo during the German occupation, but little damage was done to the city itself. British and Allied delegates arrived at Oslo, May 8, 1945, to receive the capitulation of the German forces in Norway. The Norwegian government returned May 31, the king arriving June 7.

Oslo Convention. Agreement signed on Dec. 22, 1930, by the govts. of Netherlands, Belgium, Luxemburg, Norway, Sweden, and Denmark, for a greater measure of free trade and a lowering of tariff barriers and exchange restrictions between the signatories. The same powers were parties to The Hague agreements (*q.v.*). Finland adhered to the Oslo Convention, Feb. 8, 1933.

Oslo Diet. Semi-vegetarian diet devised by the Norwegian ministry of Health in 1938. It

was adopted by the British ministry of Food in 1942 and given experimentally to a number of school children, their condition being compared with that of a similar number of normally fed children. A typical Oslo meal consisted of a salad of grated raw vegetables, butter, wholemeal bread, fresh fruit, eggs, and milk. Food rationing prevented the Oslo diet from becoming more than experimental in the U.K.

Osman or **OTHEMAN** I (1259-1326). Founder of the Ottoman empire. Born in Bithynia, he succeeded to the leadership of his clan in 1288, and gradually conquered the surrounding Turkish and Tartar tribes. Assuming the title of sultan in 1299, he founded the Osmanli or Ottoman dynasty. *See* Ottoman; Turkey.

Osman Abu Bakr Digna (d. 1926). Dervish chieftain. A Haden-doa slave dealer at Suakin, he was made governor of Eastern Sudan by the Mahdi (*q.v.*), captured Sinkat and Tokar in 1883, and defeated Baker Pasha's troops at El Teh, Feb. 4, 1884, being himself defeated there by General Graham, Feb. 29, and also at Tamai, March 13. Holding the country round Suakin, he was a continual menace to the Sudan. Captured by the British in 1900, he was imprisoned. He died in Dec., 1926.

Osmanthus fragrans. Evergreen shrub of the family Oleaceae, native of Japan and China. It has toothed, lance-shaped, opposite leaves, and yellowish-white, four-lobed, fragrant flowers. The Chinese use the flowers to scent tea.

Osmiridium. Natural alloy of the two rare metals of the platinum group, osmium and iridium. In some places the alloy is found with gold dust, in the form of pale, steel-grey grains. As it is very infusible, heavy, and insoluble in gold, it can be separated easily by simply melting in a cone-shaped crucible, when the heavy alloy settles at the bottom of the cone. Because of its great hardness and resistance to wear, it is used for watch pivots, parts of fine instruments and ships' compasses, and for tips of fountain pen nibs, etc. *See* Iridosmine.

Osmium. A rare metallic element of the platinum group and

the heaviest of all known substances. It was discovered in samples of platinum ore by Smithson Tennant in 1803. Its chemical symbol is Os, and it is one of the transitional elements of the third long period of the periodic table, with tungsten, rhenium, iridium, and platinum. It has an atomic number, 76; atomic weight, 190.2; density, 22.48 gr. per c.c.; resistivity, 9.5×10^{-6} ohm cm; melting point about 2,700° C.; crystal form, close-packed hexagonal, with lattice constants $a=2.7298$ and $c=4.3104$.

The metal, bluish-white in colour with a high lustre, is usually found associated with platinum, and is extracted by a complex process during the refining of the platinum metals. Less important sources are osmiridium and iridosmine, which are natural alloys, recovered from certain ores, such as the gold deposits of the Witwatersrand in S. Africa. It is extremely hard and infusible, being harder than glass and quartz, but it has few uses in industry, owing to the difficulty of working it and its rapid oxidation at high temperatures. The powdered metal can be compacted into a solid and sintered at 2,000° C., under a controlled atmosphere, and it can be plated on to certain of the base metals, such as nickel, copper, brass, or steel, in the form of rod, wire, tubes, and sheet. Osmium was at one time used for the filaments of electric light bulbs. One of its chief uses is as a catalyst, particularly in hydrogenation processes. When heated in air, it forms at 950° C. a poisonous and irritating tetroxide, volatile at 100° C. *See* Osmiridium; Platinum; Powder Metallurgy.

Osmosis (*Gr. osmos*, pushing, impulsion). Physical term. It relates to the flow of a solvent through a semi-permeable membrane by virtue of the existence of osmotic pressure (*v.i.*). The phenomenon plays an important part in animal life, plant physiology, and chemistry. If fruit or vegetables are placed in a sugar or salt solution, liquid may pass out through the skin with consequent shrivelling. On the other hand if placed in fresh water the skin becomes stretched from the inward passage of water.

Osmotic Pressure. Pressure exerted by the particles of a substance in solution. If the solution is dilute and the substance does not dissociate, then it exerts a pressure equal to the

Osman Digna,
Dervish chieftain

gas pressure it would exert if it were a gas at the same temperature, and occupied the same volume. For a non-electrolyte in dilute solution, the osmotic pressure, temperature, and volume obey the ordinary gas laws.

Osmund (d. 1099). English bishop and saint. Count of Sees in Normandy, he accompanied the Conqueror to England and was created earl of Dorset. He is said to have been also chancellor of England. He embraced the religious life, and in 1078 was made bishop of Salisbury, where he built a cathedral at Old Sarum about ten years later. He wrote a Life of S. Aldhelm, and had considerable skill as a copyist and bookbinder. He died in 1099, and was buried in his own cathedral at Old Sarum. Canonised in 1457, his remains were removed to the new cathedral.

Osmunda. Genus of ferns, the most important of which is the royal fern (*q.v.*).

Osmundaceae. A family of Pteridophyta, consisting of two genera only, *Osmunda* and *Todea*. They have creeping rootstocks, and the sporangia are not covered by a pellicle (indusium), and the spore-capsules split into two valves by a vertical fissure, there being no "ring" as in the other ferns. The spores contain chlorophyll, and soon perish if they do not immediately find conditions favourable for germination.

Osnabrück. City of W. Germany, in the *Land* of Lower Saxony. It stands on the Hase, 70 m. W. of Hanover, linked with the Mittelland canal by a branch waterway. Before the Second Great War it possessed many valuable historical buildings, including the huge cathedral, reconstructed after a fire in 1254, the Gothic church of S. Mary (14th–15th century), S. John's church (13th century), the Benedictine convent church (12th century), and the town hall, built between 1487 and 1512. The bishopric was founded by Charlemagne in 783. The town was a prominent member of the Hanseatic League, and its last sovereign was George III's son, Frederick, duke of York. It became a part of Hanover, and merged with Prussia in 1866. Pop. (1950 est.) 97,000. Bombed repeatedly and badly damaged by Allied aircraft during the Second Great War, it was captured by the British 1st commando bde., April 5, 1945, and after the war it lay in the British zone of occupation, coming within the region of Niedersachsen.

Osorno. Town and volcano in Chile. The town is the capital of the prov. of Osorno, 50 m. S.E. of Valdivia on the rly. from Puerto Montt to Santiago, in the middle of an important agricultural and industrial dist. It has trade in cereals, flour-mills, and distilleries. The volcano, 8,725 ft. alt., lies 40 m. S.E. of the town W. of the lake Todos los Santos.

Osorrei. Town of Rumania, sometimes known as Maros Vársárhely, Targul Mures, or by its German name Neumarkt. It stands on the Maresul (Maros) in Transylvania, 80 m. by rly. from Cluj (Kolozsvár), and is the capital of Szeklerland. It contains the Teleki Library and the Szekler National Museum. There are timber and petroleum industries, and sugar, tobacco, tiles, spirits, and pottery are manufactured. Pop. 44,946.

Osprey (Lat. *ossifraga*, bone-breaker). Bird of prey (*Pandion haliaetus*), known also as the fish-

Osprey. Species of the bird found in Australia

ing hawk. It is about 2 ft. long, the back and wings are dark brown, the crown of the head and the throat whitish, and the under parts white. It is found in nearly all parts of the world, except in deserts and near the Poles, but is rare in Great Britain and was last recorded as breeding in 1908 in a secluded district in N. Scotland. The nest, a very large structure of sticks lined with moss, is usually built in a tree, but where trees are scarce may be made on the ground or on the ledges of cliffs. It is always found near water, as the bird's food consists entirely of fish. The osprey soars to great heights, watching for its prey, on sight of which it darts down with great speed and seizes it with its claws. The so-called osprey plumes of commerce were taken from a species of aigrette (*q.v.*).

Ossa. Mountain of Greece, in Thessaly. It rises E. of the river Peneus, and with its neighbouring height of Pelion (*q.v.*) is separated from Olympus by the vale of Tempe. The chief peak is 6,398 ft. high, and now known as Kissavos.

Osservatore Romano (The Roman Observer). Only daily newspaper published within the Vatican city. It was founded 1890 and is an Italian language paper. It publishes the Vatican court circular and much ecclesiastical news. General news, comments, and articles do not necessarily represent the official point of view of the Church, yet are assumed to be consistent with the attitude of Vatican circles. It circulates among parish priests and missions all over the world, but since the end of the First Great War it has also been sold by the newsagents of Italian cities and of the capitals of R.C. countries. As the Fascist control of the Italian press grew tighter, it became the only paper in Italy providing independent news and comment. In the late 1930s its circulation soared into hundreds of thousands. Mussolini's regime protested and the paper suppressed its comments on foreign affairs.

Ossetia. Part of the R.S.F.S.R. situated in the Middle Caucasus, on both slopes of the Dariel Pass. N. Ossetia is an A.S.S.R., and S. Ossetia is a province of the Georgia S.S.R. The people, known as Ossets, are tall, frequently light-eyed and blond-haired, and of Iranian speech. Their beliefs in primitive animism were maintained more persistently than in any Aryan people outside India.

Ossett. Mun. bor. of Yorkshire (W.R.), England. It stands near the Calder, 3 m. from Wakefield, with a rly. station. The town is mainly concerned with the textile trade and coal mining, but there are also engineering factories. The fine church of Holy Trinity is modern. At South Ossett are mineral springs. Ossett was made a bor. in 1890, the municipality including Gawthorpe. Market day, Fri. Pop. 14,000.

Ossian (Ir. *Oisín*). Irish hero and bard of the 3rd century. The son of Finn Mac Cumhal, he is traditionally the great poet of the Gaels, and is himself a prominent figure in hundreds of ballads and tales from the 12th to the 18th century. His fame spread to the Scottish Highlands. He fled after the Fenian defeat at Gabhra in 293. A variant of a widespread fairy tale relates that he was lured away

Ostend, Belgium. Left, the Kursaal and Digue promenade before the Second Great War. Right, reconstructing the latter after the German occupation. The site of the Kursaal, destroyed by Germans, is on the extreme left

by the daughter of the king of the Land of Youth, where he spent 300 years, and on his return became old and decrepit. Meeting S. Patrick, he recounted the events of the past to him. See Finn; Gaelic Language and Literature; Macpherson, J.

Ossietzky, CARL VON (1889–1938). German pacifist. He was born at Hamburg, Oct. 3, 1889, and was early prominent in the German pacifist movement. In 1928 he became editor of the Berlin weekly *Die Weltbühne*. He published detailed accounts of various infringements of the Versailles Treaty, and was sentenced to 18 months' imprisonment for treason. Oct. 23, 1931. Released under amnesty in 1932, he was later sent to a concentration camp by Hitler. He was awarded the 1935 Nobel peace prize, and as a result of this Hitler decreed that no German was in future to accept a Nobel prize. In consequence of ill-treatment, Ossietzky died of tuberculosis, May 4, 1938. After the Second Great War his journal was revived and edited in Berlin by his widow.

Ossification. Formation of bone. Natural ossification is the process by which the cartilage formed in the developing organism *in utero* is gradually converted into bone, and the primitive tissue of the skull is formed into the bones of the skull. Ossification also occurs in the process of repair of fractured bones, a mass of new bony tissue called callus being formed between and around the broken surfaces. In certain diseases of the joints ossification of tissue occurs, and in extreme cases the articular surfaces may become firmly united, and all movement in the joint lost. See Bone.

Ossington, JOHN EVELYN DENISON, VISCOUNT (1800–73). British politician. Born at Ossington, Nottinghamshire, Jan. 27, 1800,

and educated at Eton and Christ Church, Oxford, in 1823 he became Whig M.P. for Newcastle-under-Lyme. He was Speaker of the house of commons, 1857–72, when he retired and was created Viscount Ossington. The title became extinct on his death, March 7, 1873. The Speaker's Commentary on the Bible was brought out at his suggestion.

Ossipevsk. Town of Ukraine S.S.R. Formerly known as Berdichev, it is 120 m. W.S.W. of Kiev on the Brest-Litovsk rly. An important junction and industrial centre, its chief trade is in grain, cattle, and horses. In the treaty of demarcation between the Poles and Lithuanians in 1546, the town was assigned to Lithuania. It fell to Russia by conquest in 1768. During the Second Great War it was occupied by the Germans early in their 1941 campaign, and recaptured by the Russians Jan. 5, 1944, after five days' violent fighting. Pop. 66,306.

Ossory. Name of an old Irish kingdom. It existed for nearly 1,000 years, falling to pieces just before the English conquest of Ireland in the 12th century. It was part of the modern province of Leinster, roughly that now covered by Offaly, Leix, Kilkenny, and Carlow. In 1527 Piers Butler, afterwards 8th earl of Ormonde, was created earl of Ossory, and the title is still borne by the marquess of Ormonde.

Ossovietz. Town and fortress of Poland, also known as Oswiec. It is on the river Bobr, 30 m. N.W. of Bielystok. Its position in the valley of the river, dominating railways and important roads, rendered it of strategic importance during the First Great War. It was besieged by the Germans from Sept. 25 to Oct. 2, 1914, and again during Feb. and March, 1915, but the Russian garrison held it until the general Russian retreat in August.

Ostade, ADRIAN VAN (1610–85). Dutch painter. Born at Haarlem, he studied under Frans Hals (*q.v.*), and spent the whole of his life at Haarlem, dying there April 27.

A. van Ostade. A peasant scene, portrayed by this Dutch genre painter

1685. A prolific painter of peasant genre, he was influenced in turn by Adrian Brouwer and Rembrandt. His brother Isaac (1621–49) painted landscapes.

Osteitis. Inflammation of compact bone. The term osteomyelitis is used when the central or medullary cavity of the long bone is involved. The commonest cause is injury to the bone, with or without an open wound. An acute inflammation of the bone sometimes occurs in children, and may follow scarlet and other fevers. Chronic inflammation may follow an acute attack of inflammation or tuberculosis or syphilis. Penicillin and the sulpha drugs have altered the treatment and outlook.

Ostend (Flemish, *Oostende*). Town of Belgium, in the prov. of W. Flanders. It lies in flat country on the N. Sea coast, 14 m. W. of Bruges, with which it is connected by rly. and canal. Ostend is the principal sea-bathing resort of Belgium, attracting visitors from many countries, and possesses a large kursaal, racecourse, theatres,

and many other attractions. The digue, which forms the chief promenade, stretches to Mariakerke, 3 m. to the W. It harbours the principal fishing fleet of the seaboard, is a seaport of importance with cross-Channel service to Dover, and is the terminus of express lines to many parts of Central Europe. Its oyster-beds are famed, and there is a local lace industry. The town is mostly modern. The hôtel de ville is an early 18th century building on the Place d'Armes; the large modern Gothic church of S. Peter and S. Paul was built in 1907. The Parc Léopold, with ornamental water-lilies in the centre of the town.

Ostend is recorded as connected by canal with Bruges as early as 1284; as a port and fishing harbour it dates from the 16th century. It suffered severely in the long siege of 1601-4, when it was captured by the Spanish general Spinola. Its fortifications were demolished in 1865. In the First Great War it was occupied by the British until Oct. 14, 1914, when the Germans captured it and converted it into a naval base. On April 22, 1918, an expedition set out from Dover to block the harbours of Ostend and Zeebrugge, but was foiled by a change of wind which dissipated the smoke-screen. A second attempt was made on the night of May 9-10. A cruiser was filled with concrete, and her captain attempted to push into the harbour and scuttle her in the entrance. The attempt was not completely successful, and the Germans were able to keep open a channel about 30 ft. wide. (See Keyes, Baron; Vindictive.)

In the Second Great War the Germans bombed Ostend on May 28, 1940, and took it the next day. As a seaplane base and potential invasion port it became a target for the R.A.F., and was bombarded by units of the Royal Navy, Feb. 11, 1941. The Canadian 18th armoured bde. entered it Sept. 8, 1944, the Germans having left.

Ostend Company. Trading company with headquarters at Ostend and stations on the Indian coast, established in 1717 for eastern trade, under the patronage of the emperor Charles VI. Its success aroused the jealousy of England, the Netherlands, and others, which united to force its dissolution. In 1727 the emperor suspended its Charter, and the company ceased to exist in 1731.

Osteology (Gr. *osteon*, bone; *logos*, science). Science pertaining to bones. See Bone; Skeleton.

Osteopathy (Gr. *osteon*, bone, *pathos*, suffering). Term used for a disease of a bone. It also refers to the treatment of bone disorders by a process of manipulation. The U.S.A. is the home of the skilled osteopath, but many registered medical practitioners in Great Britain have graduated in this branch of knowledge. There can be little doubt that adjustment of an unbalance of the bony framework of the body may result in the alleviation or cure of many pathological conditions. See Bone.

Ostergötland or **LINKÖPING**. Län or co. of Sweden. It lies between the Baltic and Lake Vätter (Wetter) and contains many lakes, of which the largest is Lake Sommen. The river Motala drains a fertile plain. Cheese is the main farm product, and there are copper and iron mines. Linköping is the chief town and rly. junction. Area, 4,266 sq. m. Pop. 332,933.

Osterley. Residential suburb of London. Situated in the boroughs of Heston and Isleworth, Middlesex, it is one m. N.E. of Hounslow and is served by London Transport's Piccadilly-Hounslow line. It takes its name from the mansion of Sir Thomas Gresham (1519-79). This was rebuilt for Francis Child, the banker, by Robert Adam, and later became the seat of the earl of Jersey. The only remains of the original house are the Elizabethan stables. An offer, 1946, of the estate to the National Trust was withdrawn 1948; but in 1949 the Trust accepted the gift of Osterley house and 140 acres of the park. The house was leased to the Ministry of Works as a public museum, and was placed in the charge of the Victoria and Albert Museum.

During the Second Great War the grounds were used as a battle school for the Home Guard.

Osterode. Tn. of Lower Saxony, W. Germany, in the Harz mountains, on the river Söse, 20 m. N.E. of Göttingen. Its ancient buildings have included the church of S. Giles, built 724 and destroyed and rebuilt in the 16th century; a castle dating from the early 12th century; and various warehouses,

etc., used in the medieval corn trade. Its main industry has been the manufacture of textiles. After the Second Great War it was in the British zone. Pop. (1939) 7,882; (1949) 14,200.

Osterode (Pol. Ostrodá). Town of Poland, in the prov. of Masuria. It is 22 m. W. of Allenstein (Olsztyn), on lake Drewenz. It was formerly a centre of the timber and brick trade of the neighbourhood. It lies in the part of the former German prov. of E. Prussia taken over by Poland in 1945. Pre-war pop. 16,583.

Ostersund. Town of Sweden. Situated on the E. side of Lake Storsjö, in the län or county of Jämtland, it is joined with the island of Frösö by a bridge 1,420 ft. in length. It is a centre for the timber trade. Pop. 17,782.

Östfold. County of Norway. Its western coast forms part of Oslo fjord, and it is bounded on the E. and S.E. by Sweden. It is the smallest of Norwegian countries except Vestfold. Mainly agricultural, it has a somewhat milder climate than other parts of southern Norway. The chief towns include Fredrikstad, Sarpsborg, and Mysen. Östfold has an area of 1,614 sq. m. Pop. 175,915.

Ostia. Ancient port of central Italy, 14 m. S.W. of Rome, said to have been founded by Ancus Marcius. It was the port of Rome and

Ostia, Italy. The ruins of the semi-circular theatre with the remains of the temple beyond, which formed part of this ancient port of Rome

stood on the S. arm of the Tiber. The old town was covered by sand in the course of centuries; its excavation started in the late 19th century. It was a city of c. 100,000 inhabitants, closely knit with the life of Rome itself.

An early Roman fort of c. 330 B.C. was the nucleus around which Ostia developed. A grain-importing port in the 3rd century B.C.,

under Sulla it was given new walls; a Republican temple and other buildings have been found. Because of the silting-up of the S. arm of the Tiber, Claudius built in A.D. 42 a new harbour $2\frac{1}{2}$ m. to the north, Portus Ostiae or Portus Augusti, with lighthouse and moles. Trajan (100-106) added a new hexagonal basin. But the main town retained its commercial importance until the 4th century.

Medieval Ostia was founded in 830 by Gregory IV close to the ancient town. The Castello was built 1483-86, but its prosperity disappeared when the N. arm of the river was reopened in 1612.

The excavated buildings of Roman Ostia include the forum with capitolium and basilica; baths; theatre; with an adjoining square where mosaics in the surrounding arcades mark the offices of trading corporations from all over the world of the day, e.g. the S. of France, Carthage, and Alexandria; grain warehouses; shops; temples; and a Christian church of the time of S. Augustine. Specially important are the large urban *insulae* or house blocks with great apartment houses of which 3rd and even 4th storeys can be traced.

Ostland (Ger., eastland). Name given by the Germans to the territory set up by them in July, 1941, comprising part of N.E. Poland, White Russia, and the Baltic states of Estonia, Latvia, and Lithuania. Alfred Rosenberg was made Reichsminister for Ostland and the Ukraine, and Heinrich Lohse was appointed Reichscommissar for Ostland, with headquarters in Kovno.

Ostmark, Dm. Name given by National Socialist Germany to the country of Austria on its incorporation into the German Reich, March 13, 1938. The name means East March. See Austria.

Ostraca (Gr., hard shells). Inscribed potsherds and stone slabs, principally from ancient Greece and Egypt. The British Museum contains one of those whereby Themistocles was ostracised in 471 B.C. The name has been transferred to the pottery fragments and limestone slabs, employed in Egypt for ephemeral ink-records. Many thousands have been collected, bearing Aramaic, Greek, Egyptian, and Coptic records ranging from 400 B.C. to A.D. 900. At the Arab conquest three Christians copied the Greek gospels on numbered potsherds, whereof 20 remain. See Graffiti.

Ostracism. Political practice introduced by Cleisthenes at

Athens in 508 B.C., and subsequently employed in other Greek states. Once a year every Athenian citizen had the privilege of writing on an oyster-shell (*ostrakon*) the name of any statesman whom he thought it would be desirable to send into exile. In the event of there being 6,000 votes adverse to any statesman, the decree of banishment, or ostracism, as it came to be called, took effect. The period was first for 10 years, and subsequently for five. It did not involve any loss of civic rights, and the victim could be recalled before the end of his term of exile. Noted Athenians who suffered ostracism were Miltiades, Themistocles, Aristides, Cimon, and Alcibiades, by the last of whom the practice was abolished. See Greece.

Ostracoda. A class of small crustaceans. The body is unsegmented and enclosed in a bivalve carapace from which the head does not protrude. They swim by means of their antennae, which are jointed and have brush-like terminations. In some species the eggs are carried about in the shells, and in others are laid on water plants. Most of them live in the sea, but a few species are found in fresh water, as the common cypris of British ponds. They are all carnivorous and play an important part as scavengers.

Ostrava Moravska. Town of Moravia, Czechoslovakia. It was formerly in Austria and was then known as Mährisch-Osttau (Moravian Ostrava). It is situated 19 m. E.S.E. of Troppau, on the E. bank of the Ostrawitz, a tributary of the Oder, and the centre of an important industrial area. Owing to its position on a leading coalfield, it has numerous iron-works, blast furnaces, and coke ovens. Its manufactures include soap, petroleum, chemicals, and candles. Among its institutions is a mining academy. Pop. 175,639.

During the Second Great War, when Ostrava Moravska was in German occupation, it was attacked from the air by the Allies. Ukrainian and Czechoslovak troops liberated it April 30, 1945.

Ostrer, ISIDORE (b. 1889). British financier. One-time senior partner in the banking house of Ostrer Bros., he was for a time proprietor of the Sunday Referee newspaper, and until 1941 chairman of the Gaumont-British picture corporation. He wrote extensively if unorthodoxly on economics. His brother Mark was a leading figure in the British film industry, chairman or managing

director of many companies including Gaumont-British and Gainsborough. Another brother, Maurice, also on the board of most of these companies, produced films, including *We Dive At Dawn*, 1942; *The Man in Grey*, 1943.

Ostrich (*Struthio camelus*). Largest living bird. Found wild in Africa, Arabia, and Iraq, it is

Ostrich. Specimen of the African ostrich
Gambier Bolton, F.Z.S.

usually placed in the super-order Palaeognathae, the breastbone lacking the keel to which the strong flight muscles of most birds are attached. The wings of the ostrich are small and useless for flight. A fine specimen stands nearly 5 ft. high at the back, and its neck accounts for about 3 ft. more. In the male the plumage of the body is black, with white plumes on the wings and tail, that of the female being grey. The neck is covered with down. The legs, which are long and strong, and part of the thighs, are bare, and the feet have only two toes—a feature peculiar to these birds. The head is relatively small, and is broad and flattened. The beak is short and broad, and the gape very wide.

Ostriches are found in open country, especially desert. Their speed when running with outspread wings exceeds that of any mammal; but their habit of running in great circles enables a well-mounted hunter to get within shot by cutting them off. They feed mainly on grass and leaves, but are practically omnivorous, and will swallow small mammals, birds, or reptiles. The cock bird, in the breeding season, runs with three or four hens, which lay in a common nest consisting of a shallow hole in the sand scraped by the cock. There are usually about 20 eggs in a nest, but the birds often lay a few round it which fail to be hatched.

During the day the eggs are usually left to the heat of the sun,

but the cock incubates them at night. In cooler weather he sometimes sits during the day as well, and is then relieved by the hens while he goes in search of food. The birds are extremely wary, and make off at the least alarm; but a male bird, if cornered, is a dangerous foe, as he can strike terrible blows with his powerful legs. The flesh of the ostrich, except when young, is unfit for food, but the eggs are highly prized by the natives.

Owing to the value of its plumes the ostrich was formerly hunted to extermination in many districts, but the same cause has now saved it from extinction. The establishment of ostrich farms dates from about 1867, and has now developed into an important industry in S. Africa, Australia, the U.S.A., Algeria, and Argentina; but attempts to introduce it to Europe have not proved very profitable.

The birds are given a free run over a large extent of open ground, and pick up most of their food. The plumes are taken usually three times in two years, the birds being driven into small enclosures and hooded to keep them quiet. The feathers are then cut 2 ins. from the sockets, which causes little or no pain to the birds. See Australia; Cassowary.

Ostrog. Town of Ukraine S.S.R. It is in the region of Volynsk, on the river Goryn, 120 m. N.E. of Lvov. There is trade in corn, wool, leather, timber, and sugar. Here the first complete old Slavonic translation of the Bible was issued in 1581.

Ostrogoths. Eastern branch of the Gothic people. It was formed of those Goths who remained in their homes on the Dnieper when the others, who were called Visigoths, moved W. in the 3rd century. The Ostrogoths, under Hermanaric, ruled eastward to the Don, and their supremacy was recognized far to the N.; but they were overthrown by the Huns, after whose fall they began a new era of conquest. Their power was at its highest under Theodoric. See Belisarius; Goths; Hermanaric; Rome; History; Theodoric; Totila; Visigoths.

Ostrolenka. Town of Poland. It stands on the Nareff and the Nareff rly., 20 m. S.W. of Lomza. Agriculture, hunting, and fishing are the chief occupations of the dist., where much amber has been found. Here the Russians were defeated by the French in 1807,

and the Poles by the Russians in 1831.

Ostrovsky, ALEXANDER NIKOLAEVITCH (1823-86). Russian dramatist. Son of a lawyer, he was born at Moscow, March 31, 1823, and educated at the university there. He worked as a clerk at Moscow's juvenile court and commercial court, an occupation which provided him with material for many of his 50 plays, between 1847 and 1886. The first of his plays to attract attention was *The Bankrupt*, 1850, which was banned until 1860. It was later renamed *It's All a Family Affair*. Of plays dealing with the lives of the *petit bourgeois* the best-known included *Everyone in his Own Place*, 1853; and *The Storm*, 1860 (translated into English by C. Garnett in 1898). He also wrote several historical dramas. He became director of the Moscow Theatre and the school of dramatic art, both of which he helped to found. He died May 28, 1886. English versions of his plays, e.g. *Wolves and Sheep*, *Larissa*, *It's All a Family Affair*, and *The Diary of a Scoundrel*, have been produced in London.

Ostuni. City of Italy, in Apulia. It is 22 m. by rly. N.W. of Brindisi. The cathedral has a Gothic façade; the town library contains a valuable collection of antiquities.

Ostwald, WILHELM (1853-1932). German chemist, born at Riga (now in Latvia S.S.R.), Feb. 2, 1853. He was professor of physical chemistry at Leipzig, 1887-1906, and in 1909 was awarded the Nobel prize for chemistry in recognition of his experimental work mainly in the sphere of electro-chemistry. His discovery that oxides of nitrogen could be formed by oxidising ammonia proved of great value to German manufacturers of explosives in the First Great War. His works included textbooks on general chemistry and inorganic chemistry. He died April 4, 1932.

His son, Wolfgang Ostwald (b. June 27, 1883, at Riga), studied at Berkeley university, Calif., U.S.A., lectured on biology at Leipzig, and held there from 1922 the first chair in colloidal chemistry. This

branch of science, which resulted chiefly from the work of Thomas Graham, was fully developed only by Ostwald, whose books on it became international standard works.

Ostwald's Process. Method of oxidising ammonia to form oxides of nitrogen from which nitric acid and nitrates are made. Wilhelm Ostwald, while professor of chemistry at Leipzig, worked out a process in 1900 by which a mixture of ammonia and air is passed over a catalyst, consisting of platinum with a specially prepared surface. The use of this process and the modifications developed during the First Great War enabled Germany to continue making explosives after the Allies had cut off the import of Chilean nitrate.

Ostyak or **OSTIAK.** Tartar name, meaning barbarian, for three primitive tribes in W. Siberia. The Ugra, of Finno-Ugrian stock and speech, numbering perhaps 18,000, inhabit the Ob and Irtysh banks between Tobolsk and Tomsk. The Samoyedic Ostyak, northward to the Taz basin, are properly Samoyeds. The Yenisei Ostyak, a few hundreds, preferably called Yeniseians or Tubas, are aboriginal fishers and hunters, retaining an archaic Tibeto-Chinese dialect. Shamanism prevails in all the tribes.

Osuna. Town of Spain, in the prov. of Seville. It is built on a hill on the edge of the plain of the Guadalquivir, 51 m. E. of Seville. Woollens, soap, and hats are manufactured. The castle and Gothic collegiate church crown the hill. The castle has been, since 1562, the seat of the dukes of Osuna, of whom the third, Pedro, 1579-1624, achieved military distinction under Philip III; the church was built in 1534 on a Moorish substructure. The town was captured from the Moors in 1240. The university, founded 1549, was suppressed in 1820. Pop. 17,700.

Oswald (d. 642). King of Northumbria and saint. A son of King Ethelfrith of Bernicia, he passed some years in exile, being at one time in Iona. Returning to Northumbria, where a British king had killed his brother, he crushed the invaders near Hexham in 635 and became king of both Bernicia and Deira. On Aug. 5, 642, he was defeated and killed at Oswestry by Penda, king of Mercia. Oswald is chiefly known for his efforts to promote Christianity, one of his acts being to found the bishopric of Lindisfarne. He made his kingdom for a short time the most powerful in the land.

Wilhelm Ostwald,
German chemist

Canonised, Oswald has a festival which is celebrated on Aug. 5.

Oswald (d. 992). English prelate. A nephew of Archbishop Odo of Canterbury, who educated him, he went to France and became a monk, but was recalled about 959 and made bishop of Worcester. He founded Ramsey Abbey, Hunts, and became arch-

Lawrence to meet Wolfe at Quebec; in 1766 Sir William Johnson received here the submission of Pontiac; and it was captured by the English in 1814.

Oswego Tea (*Monarda didyma*) OR BEE BALM. Perennial herb of the family Labiatae, native of N. America. It has square, somewhat hairy stems, and opposite, oval-lance-shaped, bristly leaves, which have a mint-like odour. The bright scarlet, two-lipped, tubular flowers are arranged in one or two whorls. The bracts beneath the flowers are coloured red. The folkname indicates a use that is sometimes made of its leaves.

Oswell, WILLIAM COTTON (1818-93). British hunter. Born at Leytonstone, April 27, 1818, he entered the East India Company's service in 1837, and spent ten years at Madras, where he developed a gift of acquiring native languages and became a skilful elephant catcher. Visiting South Africa for his health, he spent two years exploring and hunting, accompanying Livingstone in 1849 on the journey in which Lake Ngami was discovered. Oswell hunted much big game during this expedition, as also in 1851, when he and Livingstone discovered the Zambezi. After wanderings through N. and S. America, 1855-56, he settled in England, where he died May 1, 1893.

W. C. Oswell,
British hunter

Oswestry. Mun. bor. and market town of Shropshire, England. It lies 17 m. by rly. N.W. of Shrewsbury. Historical associations start in 642, when Oswald of Northumbria was slain here by Penda of Mercia. The town grew up round a monastery; it had a Norman castle, now destroyed, to watch the Welsh border; and was made a corporate town in the 12th century. The chief building is S. Oswald's

Oswestry, Shropshire. Parish church of S. Oswald, restored 1893-94

church, restored in the 19th century. There are a town hall, corn market, and grammar school. Locomotives and wagons, agricultural machinery, and aluminium goods are made, and malting and tanning carried on. Market day, Wed. Pop. 9,754.

Oswiecim OR AUSCHWITZ. Town of Polish Silesia, 33 m. W. by S. of Cracow. During the Second Great War it was captured Jan. 27, 1945, by the Russians, and found to have been the site of the worst of all German "extermination camps." With space for 250,000 inmates, this group of camps had gas chambers which could kill thousands daily, and a crematorium which could dispose of 280,000 corpses a month. It is estimated that nearly a million men, women, and children were destroyed there at Himmler's orders during 1939-45 by "cyclone" gas, which killed within 10 minutes; victims were sent into the chambers in herds, having been stripped of clothes, rings, gold teeth, hair, and any artificial limbs. Doctors carried out experiments on inmates of the camp, e.g. in sterilisation of women, artificial infection with cancer, outside the range of civilised practice. Joseph Kramer (q.v.) was at one time commandant. Rudolf Hoess, who later commanded, was executed April 15, 1947, and the camp was turned into a museum. *Pron.* Os-we-ett-sim. See Concentration Camp.

Otago. Largest province of South Island, New Zealand. It has Canterbury prov. on the N.E. and Westland on the N.W., and stretches to the Southern Ocean, including the old prov. of Southland. In the N.W. it is mountainous, containing a section of the Southern Alps, from which drains the river system of the Clutha connected with the lakes Wakatipu, Wanaka, and Hawea. The rainfall varies greatly: in the W. it exceeds 100 ins. annually; near Dunedin, the capital, it is 30 ins.,

Oswego Tea. Stem with leaves and flower whorls of the N. American herb

bishop of York in 972, but still retained charge of the diocese of Worcester. An energetic prelate and a great encourager of learning, he died Feb. 29, 992.

Oswaldftwistle. Urban dist. of Lancashire, England. It is 3 m. E. of Blackburn, on the rly. and the Leeds and Liverpool Canal. The chief industries are the making of cotton goods, chemicals, paper, and pottery, while around are stone quarries and coal mines. The district of Peelford is known for its association with the Peel family. Pop. 12,090.

Oswego. City of New York, U.S.A., the co. seat of Oswego co. It stands at the mouth of the Oswego river on Lake Ontario, 36 m. by rly. N.N.W. of Syracuse, and is served by the New York Central and Hudson River and other rlys., and by the New York State Barge Canal, of which it is a terminus. A port of entry, it has a good harbour with accommodation for large vessels, and carries on a trade in coal, lumber, and grain. Manufactures include starch, corn-flour, pumps, engines, boilers, tools, woollen goods, hosiery, matches, and boxes. A fall of 84 ft. in the Oswego river furnishes water power. Pop. 22,062.

Founded in 1724, Oswego was incorporated in 1828, and became a city in 1848. An important strategic point during the various American wars, it was fortified in 1755, but captured and demolished by Montcalm in 1756. In 1759 Amherst left here with 10,000 men on his journey down the St.

Oswestry arms

and between Queenstown and Amaru is the driest part of New Zealand, a semi-desert with less than 20 ins., where irrigation is essential. Wheat and oats are grown and sheep are reared. Gold is dredged from the Clutha gravels. Rlys. connect Dunedin with Christchurch, Bluff, and the Clutha. The estuary at Dunedin is called Otago Harbour. Otago university is at the capital.

Settlement began in 1848, when a number of Scots landed under the auspices of the Free Church of Scotland. Southland prov. was separated from Otago in 1861, in which year gold was discovered at Gabriel's Gully. Provincial administration ceased in 1875. The first shipment of frozen meat left Port Chalmers in 1882. The area of Otago is 25,220 sq. m. Population 214,213.

Otalgia (Gr. *otos*, of the ear; *algos*, pain). Ache or pain in the ear. Application of glycerine and carbolio or other dehydrating substance may relieve distress until the cause is found and cured.

Otaru. Seaport of Japan, in Hokkaido. Shut in by hills, N., W., and S., the town faces the sea on the E.; the harbour is protected on the N.W. by a small pen., to which a long breakwater has been added. A business centre and a seaport, it has considerable trade with Honshu, Karafuto (Sakhalin), and Asiatic Russia. Close by are the Temiya coal pier and the Takashima marine products experimental station. The port is on the main rly. line of Hokkaido, 20 m. N.W. of Sapporo, the capital, and 159 m. N. of Hakodate. In 1872 it was a fishing village with 4,000 inhabitants. Pop. (1939), 153,587.

Otavi. Mining centre of Damara-land, S.W. Africa. It is connected by rail with the coast at Swakopmund and Walvis Bay. In the neighbourhood are rich deposits of copper and lead, worked by the Otavi Mining and Railways Co. at 5 centres—Tsumeb, Guchab, Great Otavi, Asis, and Otavi Valley.

Otello. An opera by Verdi. Founded on the Shakespearean tragedy *Othello* (*q.v.*), the libretto by Boito was set in 4 acts, and the music composed by Verdi. Considered one of his finest operatic feats, it was produced at La Scala, Milan, Feb. 5, 1887. Its first performance in England was at the Lyceum Theatre, London, July 5, 1889, and it was first sung in English by the Carl Rosa Company in 1895. Rossini composed an opera of the same name, first given at Naples in 1816.

Otford. Village of Kent, England, 2½ m. N. of Sevenoaks. The Pilgrims' Way runs by towards Wrotham. The Romans encamped along the banks of the Darent, and Offa, king of Mercia, fought a victorious battle here. Dane's Hollow commemorates a battle fought by Canute. There are impressive ruins of a Tudor palace where Henry VIII stayed on his way to the Field of the Cloth of Gold; this palace, rebuilt by Warham, was one of the 16 houses of the archbishops of Canterbury from Becket to Cranmer. Otford has a rly. station. Pop. 1,314.

Othello, THE MOOR OF VENICE. Tragedy by Shakespeare. It presents the story of Othello, a noble Moor in the army of Venice, and the poisoning of his mind against his faithful wife Desdemona, daughter of a Venetian senator, by the evil cunning of his trusted ancient (standard-bearer), Iago, one of Shakespeare's outstanding villains. Othello kills his wife by smothering her; then, convinced of Iago's perfidy, kills himself.

The play, the most symmetrical of Shakespeare's tragedies, is mainly domestic. It was written about 1604, acted at Whitehall, Nov. 1, 1604, and printed in quarto 1622 and 1630, and in the first folio of 1623. Based on Cinthio's *Hecatommithi*, iii, 7, and in 5 acts, its text varies, but as usually printed it contains 3,324 lines, including 541 of verse, 2,672 of blank verse, and 86 pentameter rhymes. Most leading Shakespearean actors have essayed the part of Othello; but apart from Edmund Kean, at Drury Lane, May 5, 1814, and Henry Irving, who alternated the parts of Othello and Iago with Edwin Booth, at the Lyceum, 1881, the outstanding modern interpreters of the Moor were Italian—Salvini, at Drury Lane, 1875; and Grasso, at the Lyric, 1910. See *Desdemona*; *Iago*.

Otho, MARCUS SALVIUS (32–69). Roman emperor, born April 23, 32. He was sent as governor of Lusitania in 58 for refusing to divorce his wife at Nero's command. He joined Galba in the rising against Nero, but, disappointed at not being designated as Galba's successor, took advantage of the latter's unpopularity to form the conspiracy which resulted in his murder. Otho was proclaimed emperor Jan. 15, 69, but Vitellius was also proclaimed by the legions in Germany. The rival forces met at Bedriacum, where Otho was defeated, and on April 16 he put an end to his life.

Otira Gorge. Pass in the Southern Alps, New Zealand. Connecting the provinces of Canterbury and Westland in South Island, it rises to a saddle, Arthur's Pass, 3,030 ft., between peaks, of which Mt. Barron on the S. has an alt. of 5,660 ft. Since 1866 the gorge has been crossed by a road made in the days of the boom of the Westland gold diggings and since used by coaches. A tunnel 5½ m. in length was cut, and a rly. runs through the gorge.

Otitis. Inflammation of the organ of hearing. It may attack the outer ear, the middle ear, or the internal ear, and in all cases it produces deafness. In the two former conditions the trouble is known as conduction deafness; in the latter as nerve deafness. These two varieties can easily be distinguished by holding a vibrating tuning-fork opposite the ear. When the note is just inaudible in this position, the end of the fork is placed on the bone behind the ear. If it is again heard, conduction deafness is indicated; otherwise nerve deafness.

External otitis is an inflammation of the skin of the outer ear. There is some discharge from the skin of clear fluid containing scales, which are moistened and loosened by the discharge. The deafness is slight. There is some pain, but more often considerable itching in the ear, which should be heated with soothing disinfectants.

Otitis media is an inflammation of the middle ear. It may be a dry or moist inflammation without the formation of pus (catarrhal otitis media), and occurs more often at or past middle life, and in rheumatic subjects. The condition is aggravated by any catarrh of the nose and throat, which should be carefully treated if present. Should the inflammation attack the mastoid process it may spread to the brain. As it may attack the brain indirectly, with fatal consequences, its prevention and cure are of real importance. Children with enlarged tonsils and adenoids should have them treated early. Great care should be taken to keep the nose and throat clean during an attack of scarlet fever or measles. Inflammation of the mastoid, indicated by pain, tenderness, and sometimes swelling behind the ear, demands urgent operative treatment. The introduction of penicillin and the sulpha group has altered the treatment. See *Ear*.

Otley. Market town and urban dist. of the W. Riding of Yorkshire, England. It stands on the Wharfe

Otranto, Italy. Ruins of the castle built, about 1450, by Alphonso of Aragon

10 m. N.W. of Leeds by rly., and has good bus services to Leeds and Bradford. The chief building is the restored Perpendicular church of All Saints, containing monuments to the Fairfax family, whose seat, Denton Park, is in the neighbourhood. There is a grammar school founded in the 17th century. The town has an agricultural trade and manufactures machinery and leather goods. In the vicinity are stone quarries, and overlooking the town to the immediate S. is the Chevin Hill, 925 ft. At one time Otley sent two members to parliament; now it joins with Pudsey to elect one. Market day, Fri. Pop. 11,020.

Otley arms

Otoliths. Ear stones, or chalky concretions in the inner ear of many animals. They occur in vertebrates in the fluid of the internal ear, and their function is that of an organ of balance. They are best seen in the fishes, where they are often large and porcelaneous, as in the cod tribe. They occur in many vertebrates and some molluscs.

Otomi. Group of American Indian tribes in the Mexican states of Guanajuato, Hidalgo, and Mexico (nomads). They number perhaps 200,000, not counting the allied Mazahua, and Chichimeo. Small, dark, roundish-headed, they represent the primitive inhabitants of the Anahuac plateau, who were driven into the uplands by the Nahuas (Aztec) invaders, and still preserve their pre-Toltec culture.

Otranto. City of Italy, in the prov. of Lecce, Apulia. It is on the S.E. coast on the strait of the same name, 45 m. S.E. of Brindisi, with which it is connected by rly. It was destroyed by the Turks in 1490. The cathedral contains a remarkable mosaic pavement of 1166; the church of San Pietro has Byzantine frescoes. The castle, built by Alphonso of Aragon and strengthened by Charles V, gives its name to a romance by Horace Walpole, published in 1764. In the Second Great War the city, with the rest of the Otranto pen., was occupied by Allied troops without opposition by Sept. 12, 1943.

Otranto, STRAIT OF. Outlet of the Adriatic Sea between S. Italy and Albania. It is 40 m. wide; a cable connects the ports of Otranto and Valona. During the First Great War, British drifters guarded the mines and anti-submarine nets laid there. Two attacks were made on the drifters, July 9, 1916, and May 15, 1917; many were lost.

Otsu. City of Japan, in Honshu. Situated on the S. shore of Lake Biwa, 10 m. by rly. E.S.E. of Kyoto, it is a centre for the local hemp industry. Pop. 58,000.

Ottakar or **OTTOKAR.** Name of two kings of Bohemia. Ottakar I, who belonged to the family of the Premyslides, seized Bohemia 1192-96, but had to fight hard for recognition. He took part in the contest for the German throne between Otto IV and Philip of Swabia. By 1222 he had gained Moravia. Dying in 1230, he was succeeded by his son Wenceslaus.

Ottakar II, a grandson of Ottakar I, began to reign in 1253. He had already made himself duke of Austria, and led a faction against his father. By force of arms he added to Bohemia the duchies of Styria and Carinthia, and in 1273 had a good chance of being chosen German king. Rudolf of Hapsburg, however, was preferred, and war broke out. Ottakar was beaten and compelled to surrender all his lands save Bohemia and Moravia. Trying to recover them, he was killed in battle, Aug. 26, 1278.

Ottawa Rima. The standard measure of Italian heroic verse. It is a stanza of eight iambic pentameter lines, the first six of which rhyme alternately, while the last two are a couplet with a third rhyme. Byron's Don Juan is the classic English example.

Ottawa. River of Canada, tributary of the St. Lawrence. It rises in the lakes in the W. of the prov. of Quebec, and flows W. to Lake Temiscaming. Turning E., it forms the boundary between Ontario and Quebec, passes the cities of Ottawa and Hull, and joins the St. Lawrence by two branches at Montreal. Its length is 780 m. It is partly navigable, and has been made more so by the construction of short canals. Its several falls, notably the Chaudière and Rideau, supply water power for electricity. The Rideau Canal connects it with Lake Ontario. Its chief tributaries are the Gatineau, Lièvre, Coulonge, Madawaska, and Rideau; most of them are lumbering streams.

Ottawa. City and capital of Canada. It is in Carleton county, Ontario, at the point where

Ottawa, Canada. Plan of the capital city of the Dominion

the Rideau joins the Ottawa, 116 m. W. of Montreal, and is served by C.N.R., C.P.R., and the New York Central rly. Electric lines run through the city and connect it with its suburbs and with Hull on the other side of the Ottawa.

The fine parliament house was burned down in 1916, but was rebuilt. The prominent feature of the new building is its great Tower of Peace, in which is a memorial chamber, commemorating Canada's 60,000 soldiers who gave their lives during the First

Ottawa arms

Great War. In 1921 a replica of the chair in the British house of commons was formally presented by Lord Ullswater, ex-Speaker. The national museum, art gallery, observatory, and Rideau Hall, the official residence of the governor-general, are notable buildings. There are R.C. and Anglican cathedrals, many churches and schools, a university (*v.i.*), and fine parks.

Largely a residential city, Ottawa is also a centre of the lumber industry, and there are manufactures of machinery, flour, paper, etc. The falls near the city provide plentiful water power. The town was founded about 1829 as a residence for British engineers who were working in the neighbourhood, and was called Bytown. In 1854 its name was changed to Ottawa, an Indian name, and its importance began when it was selected as capital on the inauguration of the dominion in 1867. Pop. 163,690.

Ottawa, UNIVERSITY OF. Canadian educational institution at Ottawa. An R.C. establishment, it is conducted by the Oblate Fathers of Mary Immaculate. It was incorporated in 1849 as the college of Bytown, the old name of Ottawa. In 1861 it became the college of Ottawa, and in 1866 a university. Its chief departments are arts, philosophy, and theology, and it is equipped with museums, laboratories, and a library.

Ottawa Agreements. Imperial preference agreements concluded at the Ottawa conference of 1932, and ratified by Great Britain in the Ottawa Agreements Act. The mother country undertook to admit dominion and Indian imports duty-free; maintain the 10 p.c. duty on timber, canned and fresh fish, canned meat, leather, lead, zinc, etc., from foreign sources;

and impose new or increased duties on commodities such as dairy produce, fruit, meat, wheat, and tobacco, in which one or other dominion was specially interested. Dominion and Indian governments imposed protective duties on manufactured products, especially iron and steel, from places outside the Empire. A clause was inserted, avowedly aimed at the U.S.S.R. "dumping" programme, providing that if the preferences were being frustrated by "state action" of any foreign country, steps would be taken to ban the import from that country of the goods concerned. The Anglo-Russian trade agreement was accordingly denounced. The Ottawa agreements were vigorously criticised by free traders as a retrograde step, and led to the resignation from the British govt. of Liberals under Sir Herbert Samuel and of Viscount Snowden. *See* Imperial Preference.

Ottelia. Small genus of aquatic perennial herbs of the family Hydrocharitaceae. They are

Ottelia. Flowers and heart-shaped leaves of the aquatic herb

natives of tropical and subtropical regions. They have submerged and floating leaves (the latter heart-shaped) and six-partite flowers. *O. indica* is used as a potherb in India.

Otter (*Lutra*). Aquatic carnivorous fur-bearing mammal, belonging to the family Mustelidae. Widely distributed, being found in Europe, Asia, and America, it is usually about 2 ft. long in body with a tail 18 ins. long, and is cat-like in general form. It has thick brown fur, of considerable commercial value, especially in the American species. The feet are webbed, and the long flattened tail assists in swimming. Otters are not uncommon in secluded waters of Great Britain; but the havoc they work among the fish, of which they kill more than they need, causes them to be remorse-

Otter. Common British species of the aquatic mammal
W. S. Berridge, F.Z.S.

lessly persecuted. They live in burrows in the river banks, but frequently descend to the sea, where they feed upon molluscs, crustaceans, and fish.

Otter hunting, which was an organized sport in the time of Henry II, takes place from May to Oct., the only form of hunting carried on during summer in the U.K. It is conducted on foot with otter-hounds (*q.v.*), of which there are many packs in England and Wales, and a few in Scotland.

Otterburn. Village of Northumberland, England. It is 31 m. N.W. of Newcastle-upon-Tyne, on the Rede, in Redesdale. There is a modern church, S. John the Baptist. Otterburn Tower occupies the site of an ancient one. Pop. 361. The village is famous for the battle fought between the Scots and English, Aug. 19, 1388. The invading Scots, under James, earl of Douglas, were retreating N. from Durham and encamped on a hill near Otterburn. They were attacked in moonlight by Sir Henry Percy (Hotspur) and his brother Ralph, both of whom were taken prisoner. Douglas was slain, but the Scots proved victorious. The ballad of Chevy Chase (*q.v.*) describes an otherwise unknown fight, often confused with this.

Otter Hound. Breed of dog descended from the old Southern hound of Great Britain. The true otter hound much resembles the

Otter Hound. Champion type of the breed of dog used in otter hunting

harrier in general appearance, but has large broad feet and a rough thick coat of rather greasy hair. Many so-called otter hounds are modified foxhounds. The otter hound possesses good scent and keen sight. It is a powerful swimmer and has great endurance, faces its quarry gamely, and is of a savage disposition. Its colour varies greatly, and its height should be 22 or 23 ins. See Dog colour plate.

Ottery St. Mary. Urban dist. and market town of Devon, England. It stands on the Otter, 12 m.

Ottery St. Mary, Devon. Parish church of S. Mary, with the tower of the south transept on the left
Frith

E. of Exeter, with a rly. station. It is noted for its beautiful church, S. Mary's, with two transeptal towers and other features of interest; one of the most magnificent churches in the country, it dates from the 13th and 14th centuries. Ottery was the birthplace of Coleridge. The grammar school at which he was educated was pulled down in 1884. Ottery figures in Pendennis as Clavering St. Mary. Market day, alternate Tues. Pop. 4,000.

Otto I, THE GREAT (912-973). German king and Roman emperor. He was born Nov. 23, 912, son of Henry the Fowler, whom he succeeded in 936. At first virtually little more than duke of Saxony, he ended by restoring the empire of Charlemagne.

Even in Saxony Otto was confronted by opposition, developed by his brother Henry and his half-brother Thankmar into a formidable conspiracy, in which the dukes of Lorraine and Franconia were also concerned. Having crushed this at Andernach, Otto proceeded to get the great duchies, as far as possible, into the hands of his relatives, with even worse results. His son Ludolf in Bavaria and his son-in-law Conrad in Lorraine organized another great conspiracy, in the course of which

Otto himself was taken prisoner in 952; but by making promises which he at once broke, he gained freedom and finally crushed the rebels at Regensburg. Otto conducted a short and successful war against the king of France about the possession of Lorraine, secured his people from external foes, and made a landmark in medieval history by his great victory over the Magyars on the Lechfeld in 955. Before his death the rulers of Bohemia, Poland, and Denmark all did homage to him.

In 951 Otto went to Italy, and Berengar, sometimes called king of Italy, did homage to him; but his position there was dubious until a second visit, when he was then crowned emperor in Rome by the pope, Feb., 962. He did much for the organization of the Church, giving responsible posts to ecclesiastics. He was twice married, his

first wife being Edith (d. 946), daughter of the English king, Edward the Elder, and his second the widow of Lothair of Italy. Otto died May 7, 973.

Otto II (955-983). German king and Roman emperor. Son of Otto the Great by his second wife Adelaide, he was crowned king when only six, and joint emperor in Rome in 967. In 973, on his father's death, Otto became ruler of Germany and Italy, but his ten years' reign was spent in warfare, by which he lost Lorraine to the French. Otto, who died in Rome, Dec. 7, 983, married Theophano, daughter of the East Roman emperor Romanus II.

Otto III (980-1002). German king and Roman emperor. He succeeded his father Otto II at the age of three, and was trained by his Greek mother Theophano to despise the Germans. Crowned by Pope Gregory V, his cousin, in Rome, May 21, 996, Otto endeavoured to revive the ancient conception of the Roman empire. He checked German ascendancy by strengthening the Poles and Hungarians, suppressed the revolt of the Roman Crescentius, whom he put to death 998, and made his tutor Gerbert pope as Sylvester II, 999. He was driven from Rome by the Italians. Died Jan. 23, 1002.

Otto IV (1174-1218). German king and Roman emperor. The second son of Henry the Lion, duke of Bavaria and Saxony, and of Matilda of England, after the death of the emperor Henry VI he was elected German king at Cologne, June 9, 1198, by the Guelph party, in opposition to Philip of Swabia. On Philip's murder in 1208 Otto was elected emperor, and crowned in Rome, Oct. 4, 1209, but in the next year was placed under the ban for seizing papal territory, and was deposed by the Hohenstaufen party, who set up Frederick II. Otto was beaten at Bouvines by the French, 1214. He died May 19, 1218.

Otto I (1848-1916). King of Bavaria. Born April 27, 1848, second son of Maximilian II, he became king on the death of his elder brother Louis II on June 13, 1886. He had, however, been insane for ten years, and his uncle, Prince Luitpold, acted as regent until his death in 1912, when it was decided to depose the king as incurably insane, in favour of his cousin Louis III. Otto died Oct. 3, 1916.

Otto I (1815-67). King of Greece. Born June 1, 1815, the second son of Louis I, king of Bavaria, he was

Otto I,
King of Greece

invited, in accordance with the London protocol of May 7, 1832, to accept the throne of liberated Greece, Feb. 6, 1833. In 1836 he dismissed the unpopular Bavarian Armansperg, who had been chief of the council of regency during his minority. The revolution of Sept., 1843, compelled the king to call a national assembly charged to draw up a constitution, but this step failed to secure a stable government. His difficulties were increased by a brief rupture of relations with Turkey in 1847. Military plots against the monarchy in 1861-62, failed, but on Oct. 21, 1862, an insurrection led to the abdication of Otto, who retired to Bavaria. He died at Bamberg, July 26, 1867.

Otto (b. 1912). Austrian prince and pretender to the throne of Austria-Hungary. Francis Joseph Otto of the house of Hapsburg-Lorraine became crown prince when his father Charles succeeded to the throne in 1916. When Charles abdicated after the First Great War, Otto accompanied him into Switzerland, and later, after

his father's two unsuccessful attempts to regain the throne, went to Madeira. After Charles died, April 1, 1922, Otto moved to Spain, and later to Belgium. In the Second Great War he went to the U.S.A., but returned to Europe in 1944. Monarchists both in Austria and in Hungary looked on him as their rightful king.

Otto, NICHOLAS (1832-1891). A German engineer. Born at Deutz, June 10, 1832, he studied engineering and devoted his energy to developing the internal combustion engine. In 1794 Robert Street, an associate of James Watt, had made a primitive type of gas engine which Otto used as the basis of his own experiments. In 1876 he produced the first engine working on the four-stroke cycle, the fuel used being coal gas. It was first publicly exhibited at the Paris exhibition in 1878. It is generally agreed that Otto's was the first practical engine, and from it have been developed the power units which made possible the motor vehicle and the aeroplane. Otto died Jan. 26, 1891. See Internal Combustion Engine.

Ottoman. Kind of couch or divan without back or arms. Of Turkish origin, it became fashionable in England about 1800. One form was a long box with a cushioned lid, another form had a head and foot rest.

Ottoman. Name of the dominant Turkish people. It is derived from Osman, who about 1290 became the leader of a tribe living under the protection of the Seljuks. Having won a great reputation as a fighter, he declared himself independent, and is regarded as the founder of the Turkish or Ottoman Empire, for his tribe, known as the Ottoman Turks, entered on their career of conquest, and in 1453 planted themselves at Constantinople (Istanbul). See Turkey.

Otto of Roses, OR ATTAR OF ROSES (Arab. *yir*, perfume). Essential oil extracted from rose petals by distillation with steam. The oil separates in the receiver. Perfume of roses has always been highly appreciated; there are many references to it in ancient literature and mythology. In early times it appears to have been used mainly in unguents prepared by an extraction of petals with oils or fats; sesame oil was specially valued for this purpose. Rosewater, obtained by distilling the petals with water, was perhaps originally produced in Persia. The value of the essential oil which

rose to the surface does not appear to have been realized until 1600.

Production of otto was established in Bulgaria in 1710 with flowers (*Rosa damascena*) from Asia Minor. By 1750 Bulgaria had become the chief source of supply, and it has maintained its position, though cultivation has extended to France. During 1927-37 Bulgarian annual production was some 10,000,000 kilos of flowers, yielding about 200 kilos of otto, France being the largest buyer. The main rose growing area extends about 100 m. along the southern slopes of the Balkans. The French industry is mainly around Grasse, where the chief species cultivated is *R. centifolia*. In France rosewater is the chief product, whereas in Bulgaria the otto is more important.

The composition of otto of roses is complex, the principal constituent being *l. citronellol*, 45-55 p.c. The odour is subtle and varies according to the flowers used and the methods of extraction. Chemical analysis gives no satisfactory indication of quality; olfactory examination alone supplies the information required by the perfume maker. *Consult* Perfumes, Cosmetics, and Soaps, W. A. Poucher, 1941.

Ottumwa. City of Iowa, U.S.A., the co. seat of Wapello co. It stands on both banks of the Des Moines river, 76 m. by rly. W.N.W. of Burlington, and is served by the Chicago, Milwaukee and St. Paul and other rlys. Industries include the manufacture of iron and steel, agricultural implements, wagons, flour, paper, cigars, bricks, and tiles. It has several meat packing houses, and carries on a large trade

in agricultural produce and coal. Ottumwa was settled in 1843, as the result of a peace treaty with Indians under Chief Ottumwa, who is buried outside the town. It became a city in 1857. Population 31,570.

Otway, THOMAS (1651-85). English dramatist. He was born at Trotton, Sussex, March 3, 1651, and educated at Winchester and Christ Church, Oxford. In 1675 appeared his first play, the tragedy of *Alcibiades*, which had some success chiefly owing to the fine acting of Mrs. Barry, with whom Otway fell in love. Her

Thomas Otway, English dramatist

cruel treatment of him drove him first into the army and a campaign in Flanders with a cornet's commission, and latterly to a life of degrading dissipation. He died in utter destitution, April 14, 1685. Otway's best-known play is the great tragedy, *Venice Preserved*, 1682, in which he shows himself a master of pathos and passion. Another fine tragedy is *The Orphan*, 1680. He also wrote several comedies, of which the most interesting is *The Soldier's Fortune*, 1679. *Consult* Works and Life, ed. T. Thornton, 1813.

Oubain or G-STROPHANTHIN. Crystalline glycoside obtained from the seeds of *Strophanthus gratus*, a plant which grows in Sierra Leone and the Cameroons. The name oubain was first given to a substance isolated from the wood of *Acocanthera oabain*. It is more poisonous than strophanthin (*q.v.*).

Oubiette (Fr. *oublier*, to forget). Medieval term for a pit or well constructed in the masonry of a castle dungeon, and used for the close confinement of prisoners. Oubiettes were also used for the secret disposal of prisoners' bodies. See Castle.

Oudenarde OR AUDENARDE. Town of Belgium. In the prov. of E. Flanders, it is 10 m. S. by W. of Ghent, and is built on both sides of the Schelde. Its chief building is the town hall, a beautiful 16th century edifice with a tower in five storeys, reputed the finest hôtel de ville in Belgium after that of Brussels. The chief churches are S. Walburga's and Notre Dame. Pop. approx. 7,000.

Oudenarde, BATTLE OF. Fought July 11, 1708, between the British and their allies and the French.

Oudenarde, Belgium. The 16th century town hall, on the N. side of the Grande Place

The former had a small garrison in Oudenarde, which was being attacked by a French army under Vendôme. This occupied a position behind the Norken, a tributary of the Schelde. Marlborough decided to fight at once. He sent an advance body across the Schelde, and the opening encounters took place just across that river while the rest of the allied force was crossing it.

The allied crossing had not been completed when the duke of Burgundy, who shared the command with Vendôme, ordered his army forward, and in the angle formed by the Schelde and the Norken the main engagement was fought out, chiefly by the infantry. A French attempt to disorganize the allies before they were in order of battle failed, and the French found themselves half encircled. A turning movement made by some Dutch troops against the French right completed their discomfiture. The left wing withdrew in good order and covered the withdrawal of the rest, and a rout was averted by the oncoming of night. The allied army—British, Hanoverian, Prussian, and Dutch—was perhaps 30,000 strong, and lost about 3,000 killed and wounded. The French, who numbered perhaps 40,000, lost 15,000, including prisoners. *See* Spanish Succession, War of the.

Oude Rijn. River of the Netherlands, one of the branches of the lower Rhine. At Utrecht the Kromme Rijn divides into the Vecht and the Oude Rijn (Old Rhine), the latter flowing W. through the provs. of Utrecht and S. Holland to reach the North Sea at Noordwijk. *See* Leyden; Rhine.

Oudh. E. portion of the United Provinces of Agra and Oudh (now called Uttar union), India. It lies between Nepal and Vindhya union and between Agra and Bihar. Lucknow is the capital. In ancient days a flourishing kingdom, later successively under the sway of the Afghan and Mogul emperors, it became independent about 1732. In 1856 Dalhousie deposed the king of Oudh, and his territory was incorporated in what were then called the North-Western provinces. Its area is 24,071 sq. m. Pop. 14,114,470. *See* United Provinces.

Oudinot, CHARLES NICHOLAS (1767–1847). French soldier. Born at Bar-le-Duc, April 25, 1767, he entered the army in 1784, but soon retired. On the outbreak of the Revolution he rejoined, becoming a general in 1794. As chief of staff to Masséna, he added greatly to his

reputation, was made inspector-general of infantry, and sat in the chamber of deputies. In 1805, in command of his division, the grenadiers, Oudinot had a large share in the victory of Austerlitz; he was also at Friedland, and for his conduct at Wagram Napoleon made him a marshal. Having been governor of Holland, 1810–12, he was in the Russian campaign and at Leipzig, but in 1814 he went over to the Bourbons, to whom he remained faithful during the Hundred Days. In 1823 Oudinot led an expedition into Spain. He died Sept. 13, 1847. Napoleon made him duke of Reggio, and other honours were given to him by Louis XVIII. His son Charles, duke of Reggio (1791–

Marshal Oudinot, French soldier

1863), in 1849 was in charge of the French army that took Rome and restored the temporal power of the pope.

Oudtshoorn. Town of the Cape Province, S. Africa. It stands on the Grobelaars river, a tributary of the Olifants, 277 m. by rly. W. of Port Elizabeth. The chief buildings are several churches, chamber of commerce, public library, drill hall, hospital, and theatre. Oudtshoorn is the centre of a prosperous agricultural district in which fruit, vegetables, cereals, and tobacco are grown and ostriches and pigs are reared. In the Second Great War there was a school of the Empire air training scheme. To the N., 18 m. away, are the Congo Caves, perhaps the finest stalactite caverns in the world. Pop. approx. 17,000.

Oughter. Lough or lake of Eire. In the N. of Cavan, Ulster, it contains a number of small islands. It is fed and drained by the river Erne, and measures 4 m. in length and 3 m. in breadth.

Ougrée. Town of Belgium, in the prov. of Liège. It lies on the right bank of the Meuse, 2½ m. S.W. of Liège. It has busy metal and coal industries, and is a centre of the Liège-Seraing industrial area.

Ouida. Pen-name of Marie Louise de la Ramée (1839–1908). British novelist. Born Jan. 1, 1839, at Bury St. Edmunds, she was the daughter of Louis Ramé, a teacher of French. She began to write at about 20 under the influence of Harrison Ainsworth, and produced some 40 flamboyant

Ouida

novels, including *Strathmore*, 1865; *Under Two Flags*, 1867; *Moths*, 1880; *The Massarenes*, 1897; also short stories and essays of merit.

At one time she enjoyed great popularity, but her vogue diminished, and she died in poverty at Viareggio in Italy, Jan. 25, 1908. Ouida had intellectual gifts and the faculty of telling an interesting story. She was passionately devoted to animals. *Pron.* Wee-da.

Ouija (Fr. *oui*, yes; Ger. *ja*, yes). Apparatus used in occult experiments. It is a board on which the alphabet and various conventional signs are written, and is used for receiving automatic messages. *See* Planchette; Spiritualism.

Oulton. Village of Suffolk, England. It lies 2 m. W. (inland) from Lowestoft and has a rly. station. S. Michael's church shows remains of Norman work. Borrow lived for many years in the village, which has a pop. of 4,644. Oulton Broad is a stretch of water visited for yachting and angling. The full name of the mun. bor. is Lowestoft and Oulton Broad. Lake Lothing extends between Oulton village and the North Sea.

Oulu. District of Finland. It is in the N. and has an area of 21,887 sq. m. It is bounded W. by the gulf of Bothnia, which separates it from Sweden; E. by Russia; and N. by Norway. Pop. 327,422. The capital town, also called Oulu, has a pop. of 32,270.

Ounce. Measure of weight. In Great Britain it is the 12th part of a pound troy, and the 16th part of a pound avoirdupois. A fluid ounce is a measure of capacity, and equals one avoirdupois ounce of distilled water at 62° F. The ounce troy contains 480 grains, and the ounce avoirdupois 437½ grains.

Ounce or SNOW LEOPARD (*Felis uncia*). Species of leopard. Found in the mountainous districts of Central Asia, it reaches a length of 7 ft. and differs from the true leopard in its long woolly fur, whitish-grey colour, large spots, and arched skull. It never descends to the plains, and preys upon wild sheep and goats. *See* Leopard.

Oundle. Urban dist. and market town of Northamptonshire, England. On the Nene, 30 m. from Northampton and 13 m. from

Peterborough, it has a rly. station. The chief building is the church of S. Peter, a fine old edifice with a lofty spire and some interesting architectural features. The Talbot Inn was built partly from materials brought from Fotheringhay. Brewing is an industry. There is an agricultural trade. Oundle was a market town before the Norman Conquest, and a place of some importance through the Middle Ages, though it never secured incorporation. Market day, Thurs. Pop. 3,100.

Oundle School. English, public school. It was founded under the will of Sir W. Laxton, lord mayor of London, who, dying in 1556, left some property in the city of London to the Grocers' Company for the purpose. It was a country grammar school until the 19th century, when, the estates having greatly increased in value, the Grocers' Company began to enlarge it, and many new buildings were erected from 1883 onwards, and in 1930 it was incorporated by royal charter. Its most famous headmaster (1892-1922) was F.

Oundle School, Northamptonshire. Main buildings of the school governed by the Grocers' Company of London

W. Sanderson (*q.v.*). There is now accommodation for 625 boys in 12 houses. The buildings include chapel, great hall, and library, and there are 100 acres of playing fields, as well as a school farm and gardens. The foundation also supports another school, the Laxton School.

Our Dumb Friends' League. British society for the encouragement of kindness to animals. Founded in 1897, it had, fifty years later, 49 local branches, and maintained an animals' hospital in Belgrave Road, London, S.W.1, and a home for lost dogs in North London. A fund started in 1900 provides 2,000 free dog licences to poor persons. Eight shelters for stray animals are maintained in London. A junior branch incul-

cates the principles of kindness to animals in the young. The head offices are at Grosvenor Gardens House, London, S.W.1.

Ourisia. Small genus of perennial herbs of the family Scrophulariaceae. Natives of S. America and New Zealand, they have large, notched leaves, springing from the rootstock, and long tubular flowers with acutely lobed mouths.

Our Mutual Friend. Charles Dickens's thirteenth and last completed novel. It was published in monthly parts (May, 1864-Nov., 1865), with illustrations by Marcus Stone. In its remarkable range of scenes and characters it presents a rich picture of, and implicit commentary upon, English life of the period. It is especially memorable for its London riverside scenes and those of parvenu society. The characters include two of Dickens's most appealing heroines, Bella Wilfer and Lizzie Hexham; the pompous Podsnap; the newly-rich Veneerings; Mr. Boffin, the "golden dustman"; the fortune-hunting Lammles; and a powerful study of repressed passion in the schoolmaster, Bradley Headstone.

Ouro Preto. Town of Brazil, in Minas Geraes. It occupies the slopes of a mountain, and wheeled traffic is impossible in its streets. It was founded in 1699 and called Villa Rica from gold mines, which are still worked, as are deposits of

iron and manganese. There are shoe factories and textile mills. It was the capital of the state until superseded in 1897 by Bello Horizonte. It contains a school of mines, and the oldest theatre in Brazil, and has rly. connexion with Rio de Janeiro. Pop. 60,000.

Ourthe. River of Belgium. Rising E. of Gouvy, it flows through the prov. of Luxembourg, first W. then N., and joins the Meuse near Liège, which was the capital of a French dept. called Ourthe under Napoleon I. The Aisne, Amblève, and Vesdre are tributaries. Its total length is 103 m., and it is navigable for a distance of about 36 m.

Ouse. Name of several English rivers. It is a Celtic word meaning water, the same root being in Esk.

Ourisia. Foliage and flower spike of the perennial herb

Ouse. River of Sussex, England. It rises in the county between Horsham and Cuckfield, and flows mainly S. past Lewes, where it cuts through the S. Downs to the English Channel at Newhaven. Its length is 30 m., of which about 25 are navigable for small vessels.

Ouse. River of Yorkshire, England. It is formed by the Ure and the Swale, which unite near Boroughbridge. Thence, as the Ouse, it flows past York, Selby, and Goole to the Trent, with which it unites at Faxfleet, below Goole, to form the Humber. The length is 60 m., and it is navigable to York, 45 m. from its mouth. Its chief tributaries are the Nidd, Wharfe, Aire, Don, and Derwent. See Humber.

Ouse, GREAT. River of England. It rises near Brackley in the S.W. of Northamptonshire and flows, mainly E., through Buckinghamshire, Bedfordshire, Huntingdonshire, Cambridgeshire, and Norfolk to the Wash, 2½ m. below King's Lynn. Its chief tributaries are the Ivel, Cam, Lark, Ouzel, and Little Ouse, and its length is 158 m. It is navigable to Bedford; other places on its banks include Stony Stratford, Huntingdon, and King's Lynn. Two artificial channels, called the old and the new Bedford rivers, cut off a large bend of the Ouse between the E. border of Huntingdon and Downham Market. The last 3 m. of its course is another artificial channel. It is tidal for 16 m. The extensive drainage system is controlled by a board with headquarters at Cambridge. As a result of disastrous flooding in March, 1947, the Great

Ouse Catchment Board considerably extended this work.

Outboard Motor. Power unit attached to the stern of a small boat. It is generally of the two-stroke type, and is a completely self-contained unit incorporating propeller, rudder, and fuel tank. It is generally of from one to three h.p. See Motor Boat.

Outer Mongolia. This independent republic of Asia is described under Mongolia.

Outlawry. Exclusion from the protection of the law. It used to take place when anyone wilfully avoided the execution of process in the king's courts. He was civilly dead, his property was forfeited, and he could acquire no rights. At one time, he could be killed at sight; but the right of slaying outlaws early passed away. Outlawry was abolished in civil proceedings in 1879 and in criminal proceedings in 1938.

Outline of History, THE. Book by H. G. Wells, prepared originally with editorial assistance from Ernest Barker, Sir H. H. Johnston, Sir E. Ray Lankester, and Gilbert Murray, and first issued in fortnightly parts, 1919-20. Expressly intended as a corrective to the academic method of teaching history, it emphasised the sweeping perspectives of the story of mankind in a fresh and stimulating way, though both the general view and many of the detailed judgements, expressed and implicit, are strongly coloured by the author's prejudice. The book had an immense sale, and as a result of its success "outlines" of every kind became a popular form of British and American publication throughout the inter-war years.

Outram, Sir James (1803-63). British soldier and administrator. Born at Butterley Hall, Derbyshire, Jan. 29,

1803, he joined the East India Company in 1819. He took part in the British campaign in Afghanistan, 1839, was at the capture of Ghazni, and rode in disguise

After T. Briggsstock

from Kalat to Karachi, over 350 m. In 1843 he defended Hyderabad against a strong force of Baluchis. He was appointed chief commissioner of Oudh, and in 1857 commanded the Persian expedi-

Oval, Kennington. Air view of the Surrey County Cricket Club ground, scene of many test matches

tion. In the Indian Mutiny he joined Havelock on Sept. 15, helped to relieve the residency at Lucknow, and held it until relieved by Sir Colin Campbell. He was made lieutenant-general and a baronet in 1858, and is known as the Bayard of India. Outram died March 11, 1863, and was buried in Westminster Abbey. See Indian Mutiny; consult Lives, F. J. Goldsmid, 1880; L. J. Trotter, 1903.

Outrigger. Light boat, sometimes used for racing. Its rowlocks are supported by brackets, rigged out, or projecting from the sides. See Boat; Canoe.

Ouzel. Name for several birds of the thrush family (Turdidae). They are represented in Great Britain by the ring-ouzel (*Turdus torquatus*). This is a large moorland blackbird, with a white crescent across its breast. It is a migrant, reaching England from Africa in April, and leaving again in autumn. Its nest, eggs, and habits are much like those of the common blackbird. The water-ouzel or dipper, a member of the family, is more like a wren, having a short tail. See Dipper.

Ovaherero. Collective name of the Herero people of the coastal plains of S.W. Africa. They speak a Bantu dialect. Formerly they were called Cattle Damaras. Their name is sometimes improperly extended to the Hill Damaras, who have Hottentot characteristics and speech. See Hereros.

Oval, THE. Ground of the Surrey county cricket club. It is on the W. side of Kennington Park Road, London, S.E., has a tube station on the Northern Line,

and covers about 9 acres of the site of the park of Sir Noel Caron, a Dutch ambassador to England in the 17th century. Opened as a cricket ground, April 16, 1846, it is held on a lease from the duchy of Cornwall. The final test match of any rubber between England and a touring team is played at the Oval, which has given its name to test match grounds in Australia. It was at one time the centre of the old Surrey cycle race meetings. See Kennington.

Ovambo OR OVAMPO. Negroid people of S.W. Africa. Numbering some 60,000, in the fertile Ovamboland steppes N.E. of the Hereros, they are distinguished from their allied people by scantier dress, more peaceable disposition, and agricultural pursuits. Their tribes occupy scattered groups of palisaded homesteads, with granaries and chicken-houses on pile supports. Their two Bantu dialects, Ndonga and Kwanyama, are spoken also in S. Angola.

Ovamboland OR AMBOLAND. Country of South-West Africa. Inhabited by the Ovambos, it is situated on both sides of the boundary, between Angola and the South-West Africa Protectorate, mainly in the latter. The native pop. is estimated at 150,000, and the area is about 16,000 sq. m. The country is arid, with no running streams except the Cunene in the extreme N. Many natives own cattle. Before the British occupation in 1915 the only Europeans in the country were Finnish and Rhenish workers with the missionary societies, the Germans in 1906 closing the country to

travellers and settlers. See South-West Africa.

Ovar. A town of Portugal, in Beira prov. It stands near the N. end of the lagoon of Aveiro, 21 m. by rly. S. of Oporto, and 15 m. N. of Aveiro. It has fisheries, and trades in timber, onions, wine, cereals, and vegetables. Pop. 12,700.

Ovary. Gland in the female. It produces the microscopic ova or cells, which, after fertilisation by the spermatozoon, develop into new individuals. Its substance also secretes at puberty those chemicals which give rise to secondary female characteristics, physical and psychic. The ovaries are two in number, and are situated in the pelvis, one on each side of the uterus. Each gland is oval in shape, and in the human being about $1\frac{1}{2}$ ins. in length.

The ovary consists of fibrous tissue crowded with rounded cells and vesicles called Graafian follicles. A follicle enlarges and ultimately bursts, thus releasing a ripe ovum. This process is known as ovulation, and occurs about every four weeks in the adult. The ovum, after being set free, enters the Fallopian tube, where fertilisation, if it occurs, takes place. If the ovum is not fertilised, the lining of the uterus prepared for its reception peels off and passes into the menstrual flow. Removal of the ovaries (ovariotomy) after puberty leads to cessation of menstruation and to atrophy of the uterus and breasts, with loss of interest in the sexual life. Ovaritis or oöphoritis is inflammation of the ovary.

In botany, the ovary is the base of the pistil, containing the carpel or carpels, in which are the ovules or rudimentary seeds. See Flower.

Ovation (Lat. *ovare*, to rejoice). In ancient Rome, a minor celebration of victory accorded to a successful general who was not considered worthy of a full triumph. See Triumph.

Oven. Chamber made of brick, stone, or iron, and heated either from without or within, so that articles can be baked. When it is part of a coal-fired kitchen range the heat is external, the fire being to one side, and the other sides surrounded with flues through which the heat passes. Internal heating is afforded in a gas oven by rows of gas jets; in an electric oven by elements or by electronic means; in a brick oven by a fire burnt until the heat is sufficient, when the ashes are withdrawn, the food inserted, and the door closed. Ovens are used in making

pottery, in metallurgy, and chemical operations. See Furnace; Kiln.

Oven Bird. Popular name for the genus *Furnarius* of S. American birds, resembling tree-creepers, of which there are some 20 species. The name is derived from the oven-like nest constructed by some of the species. In the U.S.A. the golden-crowned water-thrush, *Seiurus aurocapillus*, a kind of wood-warbler, is called oven bird.

Over. At cricket, a group of consecutive deliveries by one bowler from one end of the pitch. In early days there were four balls to the over; from 1889, five; from 1900, six, except that in 1939 the eight-ball over was tried experimentally. In Australian cricket there were six balls to the over from 1887 and eight from 1918. No bowler may deliver two overs in succession in the same innings.

Over. Locality in Cheshire, England, part of the urban dist. of Winsford. It stands on the Weaver, 4 m. W. of Middlewich, with a rly. station, Winsford and Over. It has a salt industry, and sheep and cattle fairs. [S. Chad's is a 16th century church. Pop. 7,336.

Overbeck, JOHANN FRIEDRICH (1789-1869). German artist. He was born at Lübeck, July 4, 1789, and received his early education in art at the academy of Vienna, which he entered in 1806. In 1810, however, he was expelled and went to Rome, where he joined the R.C. Church, although a descendant of a long line of Protestant pastors. He became the leader of a school of painters known as the Nazarenes, who held that the life of the artist, like his work, must be simple. Overbeck lived in an old monastery on the Pincio, and, because of his religious views, refused to work from the living model. He died at Rome, Nov. 12, 1869. Consult Lives, H. Atkinson, 1882; W. Howitt, 1886.

Overbury, SIR THOMAS (1581-1613). English poet and essayist. Born at Compton Scorpion, Warwick, and educated at Oxford and the Middle Temple, his works include the poem *A Wife, Characters or Witty Descriptions of the Properties of Sundry Persons* (his best work), and *Crumbs Fal'n from King James's Table*, which were edited by E. F. Rimbault, 1856. He was an asso-

ciate of Robert Carr (later earl of Somerset), for opposing whose marriage with the countess of Essex he was imprisoned and poisoned, Sept. 15, 1613. See Somerset, Earl of.

Overdraft. Borrowing from a bank, by drawing in excess of the credit balance of a current account within a specified limit. An account having an overdraft limit may fluctuate from being in credit to the highest debit balance permitted, and is thus a favourite method of borrowing by traders and others who can use any funds which they may have in hand for even the shortest time to reduce the interest cost of their borrowing, interest in such cases being calculated on a day-to-day basis.

Overheads. Term used in business and by accountants to denote expenses that pertain rather to the business as a whole than to any single transaction or part of the production, e.g. rent, rates, fire insurance, lighting, heating, postage, stationery. It does not, however, apply to the cost of goods or materials or the wages paid to workmen for manufacturing them into saleable goods. An important problem of cost accounting is to devise methods by which allowance can be made for overhead expenses when estimating the total cost of producing goods or carrying out work.

Overijssel. Alternative spelling of the Dutch prov. entered under Overysse in this work.

Overland Route. Popular term for the quickest way between Great Britain and India. It runs overland through Paris, Lyons, the Mt. Cenis Tunnel, Modena, and Brindisi; thence by steamer to Port Said, and through the Suez Canal and Red Sea to Bombay. The average time taken is 20 days.

Overload. In electrical engineering, the amount of load or work imposed on an electric generator or motor over and above that which it was designed to carry or to perform economically. The effect of an overload on an electric motor is to reduce speed, lessen the counter electromotive force, and, by permitting an undue quantity of current to pass through the windings, to overheat them and possibly destroy their insulation.

Overlord, OPERATION. Code name given to the invasion of the Continent by Anglo-American forces, June 6, 1944. See D-day; Europe, Liberation of.

Overlying. Suffocation of an infant by pressure against the mother or other person while in

Sir T. Overbury,
English poet
After N. Whittock

bed. The infant mortality from this cause has greatly declined in the 20th century. Under the Children and Young Persons Act, 1933, where a child under 3 has died while in bed with some person over 16, it is presumed that that person has been guilty of the offence of neglecting the child if he or she was under the influence of drink when he or she went to bed.

Overreach, SIR GILES. Character in Massinger's play, *A New Way to Pay Old Debts*, 1625-26. An upstart, envious of the caste from which his birth excludes him, he seeks to marry his daughter to a nobleman and so triumph over those whom he has ruined financially, but who still rebuff him. Overreached, he loses his reason. His prototype has been found in Sir Giles Mompesson (1584-1651).

Overseas Food Corporation. See N.V.

Over-Seas League. Organization founded in London by Sir Evelyn Wrench in 1910. In 1948 it had a membership of 58,000. Its aims were to arouse interest in British Commonwealth affairs and problems; to provide places all over the world where British subjects could meet;

Over-Seas
League
badge

and to promote migration within the Commonwealth. World h.q.: Over-Seas House, Park Place, St. James's Street, London, S.W.1.

Overseer. This term was specifically applied to the unpaid officials formerly appointed each year in every parish in England and Wales to make provision for its poor. Their office was instituted in 1601. Appointments were made from a list of householders resident in the parish. Their duties included the making and levying of poor-rates, and the preparation of valuation, voters', and jury lists. In 1927 their powers and duties were transferred to the town councils or other rating authorities.

Oversoul. A term used by R. W. Emerson to express the idea of God as the supreme spirit which animates the universe. He compares the oversoul to the atmosphere which embraces the earth in its bosom; it is the absolute unity, in which each man's particular being is contained and made one with all the others.

Overton, ROBERT (1609-1668). English soldier. Son of an E. Riding landowner, he fought in the civil war on the parliamentary side, was made governor of Hull, later of Edinburgh, and helped in the sub-

juration of Scotland. Later his ambiguous attitude led to a life of almost constant imprisonment, first by Cromwell, then, after the Restoration, as a suspected fifth monarchy man. Milton described his exploits in *Defensio Secundo*.

Overtones. In a vibrating system the lowest frequency of response is termed its fundamental. Integral multiples of this frequency are known as overtones or harmonics.

Overture. Musical composition for instruments, intended originally as an introduction or opening of an opera, suite, oratorio, or play.

Handel modelled his overtures on Lully's, Bach based his concertos on the Scarlatti overture. Later, with the growth of sonata form, the overture developed on similar lines, and many of the opera overtures of Mozart, Beethoven, Weber, and the early Wagner are symphonic or sonata movements, some of them foreshadowing the works which they preceded either by employing the same themes, or merely by inducing an atmosphere. Concert overtures are on similar lines, but independent of any opera or play, such as Mendelssohn's *Fingal's Cave* and Schumann's *Bride of Messina*.

Overysse, or **OVERIJSSSEL**. Province of the Netherlands. With an area of 1,300 sq. m., it adjoins the provs. of Friesland, Drenthe, and Gelderland, its W. frontier being that of Germany, its E. being the Yssel Meer. It consists mostly of flat marshy country, with moors, fens, and woods. Sheep and cattle are reared and dairy produce is important. The Yssel, Vecht, and Regge are the chief rivers. Zwolle is the capital. Pop. 623,504.

Ovid (43 B.C.-A.D. 17). Roman poet, whose full name was Publius Ovidius Naso. He was born on March 20, 43 B.C., at Sulmo (mod. Sulmona), in the country of the Paeslign. As he was intended for the legal profession, his father took him to Rome, where he studied under the most famous rhetoricians of the day. He showed great promise as a lawyer, and held some minor official positions, but he felt that poetry was his profession. At the age of 27 he wrote the tragedy of *Medea*, unfortunately lost, of which Quintilian speaks in the highest terms. With an increasing reputation and enjoying the favour of Augustus, in A.D. 9 he was suddenly "relegated" (see *Exile*) to Tomi, now Constanta, on the Euxine. The reason has never been explained. He himself attributes it to one of

his poems (probably *The Art of Love*) and to an indiscretion. Unable to obtain remission of his sentence, he died at Tomi.

His extant poems, all except the *Metamorphoses* written in hexameters, fall into three classes:

(1) *Erotic*. These include *Heroides*, a collection of fictitious love-letters, written by the heroines of legends to their lovers or husbands; *Amores*, the varied experiences of a lover, written round an entirely imaginary Corinna; *Medicamina Faciei*, *Cosmetics* or the *Art of Making-up*, an account of various toilet devices; *Ars Amatoria*, the *Art of Love*, with instructions for gaining and retaining the affections of a lover or mistress; *Remedia Amoris*, *Remedies for Love*, apparently a kind of recantation of the *Art*.

(2) *Mythological*. These are: *Metamorphoses*, his most famous work, an account of all the myths involving changes of form from the beginning of the world to the transformation of Caesar into a star; *Fasti*, a poetical calendar, giving an account of the heavenly phenomena, the Roman festivals, and their origin; originally intended to be in 12 books, corresponding to the number of months in the year, it was interrupted by Ovid's banishment, only six books, published after his death, being completed.

(3) *Poems of Exile*: *Tristia*, *Lamentations*, and *Epistulae ex Ponto*, *Letters from Pontus*, in which he bewails his lot, and endeavours, by somewhat undignified appeals, to induce the emperor to allow him to return.

Bibliography. Works, 9 vols., 1821; 5 vols., 1825; Eng. trans. H. T. Riley, 1851-52; Ovid, A. J. Church, 1880; Post Augustan Poetry, H. E. Butler, 1909; *The Art of Love*, trans. into English verse, B. P. Moore, 1935; selected works of Ovid, ed. J. C. and M. J. Thornton, 1939.

Oviedo. Maritime prov. of Spain. It corresponds with the ancient Asturias, which was its official name until 1833 and is still often used, and it occupies the N. slopes of the Central Cantabrian Mts. as far as the Bay of Biscay. The Narcea, Nalon, and Navia drain the slopes and provide water-power for the local industries, textiles, and glass-making. In the Nalon valley is the best coalfield in Spain. The mountainous S. impedes communications; the road and rly. to Madrid traverse the Pajares Pass, the other rly. skirts the coast and connects the ports of Gijón and

Aviles with Santander. Sugar-beet is a valuable crop. Its area is 4,206 sq. m. Pop. 862,345.

Oviedo. City of Spain, capital of the prov. of the same name. Situated on the edge of a fertile

Oviedo, Spain. Church of S. Miguel de Lino, now a national monument

plain where sugar-beet is extensively cultivated, it has national ordnance factories and manufactures of textiles, leather goods, chocolate, and matches. The cathedral, rebuilt 1388–1528, was one of the finest in Spain; it was severely damaged 1936. The church of S. Miguel de Lino or Lillo, built by Ramiro I in the 9th century, is a cruciform building and noteworthy for its carving. The university dates from 1604. During the Spanish Civil War the city was captured by Gen. Franco's troops, July 24, 1936, but resistance by Asturian miners went on. Pop. 86,724.

Oviparous (Lat. *ovum*, egg; *parere*, to produce). Obsolete term applied to those animals that deposit their eggs so that embryonic development takes place outside the mother's body.

Ovule. Botanical term, applied to the structure which normally after fertilisation becomes the seed. The outer part of an ovule consists of integuments which become the seed coat or coats, and in which an aperture, the micropyle, forms a channel for the entry of the pollen tube. At pollination time the micropyles of gymnosperm ovules are exposed so that pollen can alight on them. Angiosperm ovules are enclosed in ovaries so that the pollen tube must grow through the stigma and into the ovary to reach them. Within the integument(s) there is a nucellus (*q.v.*) enclosing during early stages of ovule development a cell which is haploid in contrast to the diploid structures around it. This cell in most gymnosperms grows into a female prothallus,

near the micropylar end of which several reduced archegonia, each with one egg cell, arise. In angiosperms the female gametophyte is the embryo sac.

Owari or **BISHIU.** Prov. of Japan, in Honshu. It is bounded S. by Ise Bay on the E. coast. It consists almost entirely of a fertile plain, the chief area in Japan for the production of rice, wheat, and barley. Horseradish has been dried and exported in large quantities. Poultry rearing is an important occupation. The local clay gave rise to the ceramic industry, which began at Seto village in 1297. Nagoya is the chief town.

Owen, JOHN (1616–83). English Puritan. He was born at Stadthampton, Oxfordshire, educated at Oxford, and became an Independent minister, going as chaplain with Cromwell to Ireland in 1649. Two years later he was appointed dean of Christ Church, Oxford, and in 1652 vice-chancellor of the university. At the Restoration he was expelled from office; but Charles II allowed him to minister to an Independent congregation in Leadenhall Street, London. He died Aug. 24, 1683.

Owen, SIR RICHARD (1804–92). British scientist. Born at Lancaster, July 20, 1804, and educated at Edinburgh, he entered the museum of the Royal College of Surgeons, London, 1826. Ultimately he became its curator, a post he held until 1856, when he was appointed superintendent of the natural history department of the British Museum. In 1836 he had been selected for the first Hunterian professorship of comparative anatomy. He is regarded as the greatest anatomist in the history of the science. He was made a K.C.B. 1884, and died Dec. 18, 1892.

Owen, ROBERT (1771–1858). British social reformer. Born at Newtown, Montgomeryshire, May 14, 1771, at 19 he was managing a cotton mill with 500 hands. In 1800 he became manager of and partner in the New Lanark Mills, and put into practice on a large scale the ideas which he had already imported into the management of workpeople. His main principle was that the best work can only be expected from happy,

prosperous, and educated employees. With the aid of Jeremy Bentham, he converted his business into a philanthropic trust for his workpeople, the capital being allowed a fixed remuneration of five p.c. The colonies established by Owen—at Orbiston, in Lanarkshire, and at New Harmony, Indiana, U.S.A.—were unsuccessful and involved him in heavy financial losses. By 1828 he had completely severed his connexion with New Lanark, and devoted the rest of his life to the exposition of his socialistic theories. He died Nov. 17, 1858. His works include *A New View of Society*, *A New Moral World*, and an *Autobiography*. See *Co-Partnership*; *Socialism*; *consult* *Lives*, L. Jones, 1890; F. Podmore, 1906; G. D. H. Cole, 1930.

Owen, WILFRED (1893–1918). British poet. Born at Plas Wilmot, Oswestry, Mar. 18, 1893, he was by some critics considered the most promising of the young poets of his day. He served throughout the First Great War in the infantry on the western front, being killed Nov. 4, 1918, one week before the armistice. Editions of his works were published in 1920 and 1931. The *MSS.* of his poems, the most significant of which expressed a passionate lyrical protest against the horrors of the war, and showed the influence of Keats, were presented to the British Museum, 1934.

Owen Falls Dam. Hydro-electric project to harness the waters of the White Nile, near its source in Lake Victoria, Uganda. The four-fold cataract of Owen Falls, 65 ft. deep, is 2½ m. downstream from Ripon Falls, where the river leaves the lake, and is close to the town of Jinja. The scheme was first envisaged in 1935, and a report was made to the Uganda govt. in 1947. The consent of Egypt having been obtained, work was begun in 1949. The first stage (construction of the dam and installations of turbines producing 90,000 kW.) was to be completed in 1953; further turbines, increasing the output to 150,000 kW, were to be installed by 1960. The project was expected to hasten the industrialisation of Uganda and to benefit Egypt by giving control of some of the flood waters upon which her agriculture depends. The raising of the level of Lake Victoria and the disappearance of Ripon Falls (to be ultimately destroyed by blasting) are elements in the scheme. The cost was estimated at £12 million, of which £4 million was to be contributed by Egypt.

Sir Richard Owen, British scientist

Owens, JOHN (1790 - 1846). British merchant. He was born in Manchester, where he amassed a large fortune, the residue of which, amounting to £96,000, he left in trust for the foundation of a college, with the proviso that no theological tests should be required. Owens College was accordingly founded and opened in 1851. See Manchester University.

John Owens.
British merchant.
From a medallion by
G. T. Woolner, R.A.

Owensboro. City of Kentucky, U.S.A., the co. seat of Daviess co. It stands on the Ohio, 115 m. by rly. S.W. of Louisville, and is served by Louisville and Nashville and other rlys. A considerable river trade is carried on, chiefly in tobacco, the processing of which is the city's main industry. Other industries are the manufacture of carriages and wagons, timber products, electric bulbs, and radio valves. Oil is obtained in the neighbourhood, and cattle-rearing is an important feature of the surrounding countryside. Owensboro was settled in 1797 and chartered as a city in 1866. Population 30,245.

Owen Sound. Town and port of Ontario, Canada. On Owen Sound where the Sydenham river falls into Georgian Bay, and 110 m. from Toronto, it is served by the C.N. rlys. and the C.P.R., and is a port for steamers to the Great Lakes and the St. Lawrence. Population 14,002.

Owl. Order of nocturnal birds of prey (*Strigiformes*). They are externally distinguished by their large heads and the radiated ruffs of feathers around the large eyes. Owing to their loose, outstanding plumage, most owls look much larger than they really are. They are noted for their silent flight and their keenness of vision at night. They feed mainly on small rodents. Twelve British species are known.

The barn owl (*Tyto alba*) is the best known in the U.K. and is common nearly everywhere except in the towns. Its plumage is tawny yellow above, with white face and under parts. In its nocturnal hunting it never wanders far from its abode, often a church tower or hollow tree. It utters a strident and discordant scream, from which it is sometimes known as the screech-owl. The long-eared

owl (*Asio otus*) is about the same size, but darker, with erect tufts of feathers above the eyes. It is gregarious, lives in dense pine woods, varies its diet of small birds with insects, and generally breeds in the deserted nest of a crow or magpie.

The short-eared owl (*Asio flammeus*) is yellowish brown, with a buff face and short tufts of dark feathers on the head. It has a smaller head and is less owl-like in appearance than the other species. A migratory bird, it visits Great Britain chiefly in winter, breeding in the N. of England and in Scotland, where it nests on the ground on moors. It is not strictly nocturnal, and feeds upon rodents and small birds.

The tawny owl (*Strix aluco*), often called the brown or wood owl, is larger in size, with reddish brown plumage above, and reddish white barred with brown below, and is not uncommon in most wooded districts of England and Scotland, but is not native in Ireland. This is the species that utters the well-known hooting cry. It makes its home in hollow trees.

Owl. 1. Long-eared (*Asio otus*).
2. Short-eared (*Asio flammeus*)
W. S. Berridge, F.Z.S.

sional visitants to Great Britain. See Eggs colour plate; Feather.

Owyhee. River of Oregon, U.S.A. Its headstreams rise in Nevada and Idaho, and after their junction the river flows in a general N. direction to the river Snake. Its length is 370 m.

Ox. Word of Anglo-Saxon origin, used for the male of the different species of the Bovidae. Oxen is one of the few existing forms of the old plural *en*. From

the Middle Ages the ox has been extensively used for ploughing and hauling. See Bovidae; Cattle.

Oxalic Acid ($\text{H}_2\text{C}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$). A solid organic acid first prepared from wood sorrel (*Oxalis acetosella*), in which plant it occurs as the acid potassium oxalate. The acid is made on the commercial scale by Dale's process, which consists in fusing sawdust from soft woods, with a mixture of caustic potash and soda, or by heating sodium formate, made synthetically from caustic soda and carbon monoxide. The acid is largely used in calico printing and dyeing, and in the preparation of formic acid and synthetic dyes. It bleaches straw and flax, and cleans brass and other metals.

Ox-Bow. Name of a kind of lake. In their flood-plain courses, rivers meander to such an extent

Ox-Bow. Diagram illustrating how a meandering river may (1) increase its meander (2) cut through the loop as in 3, and eventually flow straight, forming an ox-bow lake (4)

that great loops are formed. Eventually the river cuts through the neck of the loop and straightens itself, leaving a horseshoe-shaped backwater, which becomes a cut-off or ox-bow lake when the deposition of silt blocks up the ends. Ox-bow lakes may reach 5 m. in diam. in the lower valleys of such rivers as the Mississippi. See Lake.

Oxenham, JOHN. Pseudonym of a British writer. W. A. Dunkerley (d. 1941) was educated at Old Trafford school and Victoria university, Manchester. He abandoned a commercial career for writing, publishing in 1898 *God's Prisoner*, a novel. His verse, in style a reflection of Whitman and Carpenter, in sentiment religious and idealistic, enjoyed a vogue during the First Great War; his Hymn for the Men at the Front was reputed to have sold 8,000,000 copies. His popular works included *Bees in Amber*; *A Little Te Deum*; *Christ and the Third Wise Man*, 1934; *Wide Horizons*, 1940. He died Jan. 23, 1941. Consult Scrap-books of John Oxenham, E. Oxenham, 1946.

Oxenstierna or **OXENSTJERNA**. Name of Swedish family, frequently referred to as Oxenstiern. The

most distinguished member was Axel (v.i.), but others were Bengt Gabrielsson (1623-1702), who defended Thorn against the Poles, was chancellor under Charles XI, and represented Sweden at the congress of Nijmegen; and Gabriel Thureson (1641-1707), ambassador at the congress of Ryswick, who lost influence by his conversion to Catholicism. John Gabriel (1750-1818) was a poet and a scholar.

Oxenstierna OR OXENSTJERNA, AXEL GUSTAFSSON, COUNT (1583-1654). Swedish statesman. Born at Fanö, June 16, 1583, he studied theology in Germany, served Charles IX in diplomatic missions, and became chancellor under Gustavus Adolphus, 1611. He accompanied the king on the Russian campaigns, negotiated the treaty of Stolbova, 1617, and was governor-general of Prussia during the Swedish occupation. He opposed Swedish participation in the Thirty Years' War, but ably supported his king in Germany, acted as regent after his death, 1632, and became

a pivot of the Protestant alliance throughout the struggle. He negotiated the Danish treaty in 1645, and unsuccessfully opposed the abdication of Christina of Sweden. He died Aug. 28, 1654. *See* Sweden: History; Thirty Years' War.

Ox-eye Daisy (*Chrysanthemum leucanthemum*).

Ox-eye Daisy or Dog Daisy

Dog-daisy, perennial herb of the family Compositae. A native of Europe and N. and W. Asia, it has spoon-shaped, deeply cut leaves, and daisy-like flower-heads, 2 ins. across. The rays are pure white, the disk-florets yellow. This is a common weed of meadows and pastures in the U.K.

Oxford. City, co. bor., and co. town of Oxfordshire, England. It is on the Thames, here called the Isis, which sweeps round the W. and S. of the city, and is here joined by the Cherwell. It is

63 m. by rly. and 54 m. by road W.N.W. of London. At Carfax, the centre of the old city, four streets meet:

High Street, one of the most picturesque thoroughfares in Europe, Cornmarket, Queen Street, and St. Aldate's.

Across Magdalen Bridge, at the other end of the High Street, are modern suburbs. In N. Oxford, at Summertown, are numerous villas. The chief industries are steel pressing, motor works, and catering for members of the university; there are also breweries and a big cattle market.

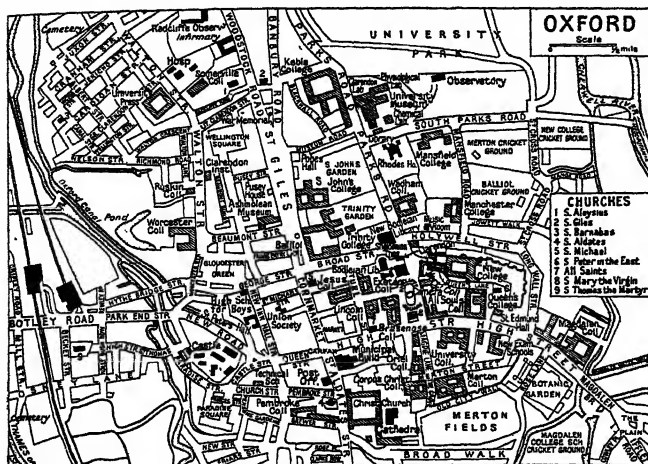

The partly Norman cathedral, formerly the priory church of S. Frideswide, is included in Wolsey's foundation of Christ Church. Other interesting churches are the university church of S. Mary the Virgin (damaged by fire in 1946), S. Peter in the East, S. Giles, S. Barnabas, S. Aldate, and S. Michael. All Saints is the city church. Apart

Oxford. Plan of the university city showing position of the colleges and churches

from the colleges, museums, libraries, and other university buildings, the chief edifices are the municipal buildings, the castle, and the high school for boys. There are extensive remains of the old town walls.

Although Oxford owes so much of its prosperity to its university, it was important before that was founded. It was certainly so under the later Anglo-Saxon kings, and its position on the Thames was such that the Normans fortified it strongly. It received its first charter of incorporation about 1100. Mand was besieged here by Stephen in 1142, and the Provisions of Oxford were drawn up by the Mad Parliament in 1258. Charles I, when driven from London, made Oxford his headquarters, and Charles II called a parliament here in 1681. The bishopric was founded at the Reformation.

The city is governed by an elected council, but three aldermen and nine councillors represent the university. This divided authority, which originated about the 14th century, has not always worked as amicably as it does today. The city sends one member to parliament; from 1295 to 1885 it sent two. The municipal waterworks date from 1615. In 1928 the city boundaries were extended, taking in the urban district of Headington and the Morris motor works at Cowley. A movement was started to prevent the surroundings from being spoiled by building. There is also the Oxford Preservation Trust. Pop. est. 103,570.

Oxford, EARL OF. English title held successively by the families of Vere and Harley. The great Norman family of Vere was represented in the time of William the Conqueror by Aubrey de Vere, the holder of extensive lands. In 1133 his descendant was made lord great chamberlain, and the earls of Oxford held that office until 1625. In 1142 another descendant was made earl of Oxford.

Robert, 9th earl (1362-92), was made duke of Ireland. He was a close friend of Richard II, and lost his honours, but the title was restored to his descendants, one of whom, John, 12th earl, was executed as a Lancastrian in 1462. His son, John, 13th earl (1443-1513), was also a prominent Lancastrian. Edward, 17th earl (1550-1604), was a typical Elizabethan, a gallant and writer of verse, also a spendthrift. Henry, 18th earl, died in 1625, when the great chamberlainship passed from the Veres. Aubrey, 20th earl, died in 1703, and the title became extinct.

In 1711 the statesman Robert Harley was made earl of Oxford. He was succeeded by his son Edward (1689-1741), who had no sons. The 3rd earl was therefore a cousin, Edward (d. 1755), in whose line the title remained until the death of Alfred, the 6th earl, in 1853, when it became extinct until revived in a slightly different form in 1925 for the 1st earl of Oxford and Asquith (*q.v.*). See Vere.

Oxford, ROBERT HARLEY, 1ST EARL OF (1661-1724). English statesman. Born in London,

Dec. 5, 1661, he entered parliament in 1689. Coming soon to the fore, he carried through the Triennial Bill, 1694. He was Speaker 1701-05, and in 1706 was appointed a commissioner for the union with Scotland, and secretary of state for the southern English statesman department. By this time he had obtained influence over Queen Anne.

1st Earl of Oxford, English statesman After Kneller

Assisted by his cousin, Abigail Hill, afterwards Lady Masham (*q.v.*), he destroyed the Marlborough interest, and in 1710 became chancellor of the exchequer and virtual prime minister. Despite the jealousy of the high Tory ministers and the bitter opposition of Marlborough and Godolphin, secret negotiations with France were begun in 1711, and the peace itself was signed two years later. Early in 1711 Harley had been created earl of Oxford and made lord high treasurer.

In 1714 Bolingbroke, disappointed by Harley's refusal to further his schemes for a restoration, began to plot against him, and persuaded Anne, a month before she died, to dismiss her minister. The next year Harley was impeached for concluding the French treaty, and was committed to the Tower, where he remained until 1717, when the impeachment fell through, though he was omitted from the Act of Grace. Harley died in London, May 21, 1724. A man of wide literary tastes, in 1705 he began the collection of books and MSS. which is famous as the Harleian MSS. (*q.v.*), preserved in the British Museum. *Consult* Life, Roscoe, 1902.

Oxford and Asquith, HENRY HERBERT ASQUITH, 1ST EARL OF (1852-1928). British statesman.

1st Earl of Oxford and Asquith, British statesman

Born Sept. 12, 1852, at Morley, Yorks, he was educated at the Moravian School, Pudsey, the City of London School, and Balliol College, Oxford, to which he won a classical scholarship. At Oxford he was Craven scholar and president of the Union, and was made fellow of Balliol. Called to the bar at Lincoln's Inn, 1876, he

was for a time a university extension lecturer and a contributor to *The Economist*. His reputation was made by his work as junior counsel for the Irish Nationalist party during the Parnell commission, 1889.

Meanwhile in 1886 Asquith had won E. Fife as a Gladstonian Liberal, and he held the seat uninterruptedly until 1918. When the Liberals came to power in 1892 Gladstone appointed him home secretary. During his three years in that office he was responsible for the strengthening and reorganizing of the factory inspectorate, including the establishment of women inspectors, and for the re-establishment of the right of public meeting in Trafalgar Square. On Rosebery's retirement from the Liberal leadership in 1896, Asquith supported him, and during the S. African War became a conspicuous figure (with Grey and Haldane) in the Liberal Imperialist group. He was the most formidable antagonist of Chamberlain's tariff reform agitation, 1903-05. In Campbell-Bannerman's administration of 1905 he became chancellor of the exchequer. While in that office he laid the foundation of the old age pensions scheme, and distinguished for the first time between earned and unearned income for the purpose of taxation.

Eight Years as Premier

On Campbell-Bannerman's retirement, April, 1908, Asquith succeeded to the premiership, which he held continuously until Dec., 1916. The rejection by the upper house of the 1909 budget led to the prolonged conflict between the house of commons and the house of lords which dominated home politics for the next few years. For the narrow Liberal victories in the two resulting general elections of 1910 Asquith's own prestige was largely responsible; and he displayed high skill and courage in carrying the Parliament Act of 1911, by which the lords' absolute veto was reduced to a suspensory one. It was at one stage in the progress of this measure, in Aug., 1911, that he was howled down and refused a hearing in the house by an unruly section of his opponents, who accused him of being a traitor for having secured the king's consent to create new peers sufficient to ensure the passing of the measure. It was also at this period that he used with great effect the phrase "Wait and see"; originally uttered as the warning to his

opponents of a strong man who had made up his mind, the words were later unfairly quoted against him to suggest a dilatoriness in his own decisions.

Asquith had personal conduct of the negotiations which ended the coal strike of 1912, and was then called to face the angry passions aroused by the introduction of the Irish Home Rule Bill. The Ulster leaders, under Carson, threatened open revolt. Asquith strove to reach an agreed solution. His compromise giving the northern counties of Ireland exemption from Home Rule for five years was rejected by Ulster, and the threatened resignation of Army officers at the Curragh in the spring of 1914 led him to take on the additional office of war secretary. Whether or not he could have prevented civil war was left for ever in doubt by the sudden European crisis and the outbreak of the First Great War.

In the earliest months of that conflict, Asquith's speeches, firm in tone, and noble in temper, did much to win respect abroad for British policy and aims, notably his statement at the Mansion House, Nov., 1914: "We shall never sheathe the sword, which we have not lightly drawn, until Belgium has recovered all or more than she has lost." But in the months that followed the conduct of the war began to be criticised, notably the lack of suitable munitions, and in May, 1915, Asquith acceded to Conservative demands by forming a coalition govt., in which he remained prime minister. Further serious dissensions within the cabinet culminated in Lloyd George's proposal for an inner war cabinet from which the premier should be excluded. On Asquith's rejection of this, Lloyd George and others resigned, a move which led to Asquith's own resignation, and his supersession by Lloyd George, Dec., 1916.

In the 1918 election Asquith, as an independent Liberal, was defeated by a Conservative supporter of Lloyd George. The latter, when forming his new govt., was prepared to offer Asquith the office of lord chancellor. This was refused, but Asquith hoped to be allowed an important place in the delegation to the peace conference. Lloyd George, however, refused this. In 1920 Asquith was returned at a by-election for Paisley, and resumed his leadership, first of the independent Liberal opposition, then in 1923 of a superficially reunited Liberal op-

position. After the 1923 election, holding the balance between the Conservative and Labour parties, he elected to unseat the Baldwin govt., and to be thereby directly instrumental in setting up the first Labour govt. In the same year, he brought about the defeat of the Labour govt., but lost his seat at the general election following.

In 1925 he was created earl of Oxford and Asquith, and in 1926 resigned his leadership of the Liberal party, after further disputes with Lloyd George. He died Feb. 15, 1928, succeeded in the title by his grandson, Julian.

His contribution to British political life included a fine intellect, sound judgement, intense probity, and a reasoned philosophy of government. He was a man of great dignity and extraordinary magnanimity.

His autobiographical writings were *Fifty Years of Parliament*, 1926, and *Memories and Reflections*, 1928. He also wrote *The Genesis of the War*, 1923; and his collected speeches were published 1927. An official *Life*, by J. A. Spender and Cyril Asquith, was published 1932. His *Letters to a Friend*, ed. D. McCarthy, appeared in two series, 1933 and 1934. Asquith was twice married, first in 1877 to Helen Melland, who died in 1891, secondly in 1894 to Emma Alice Margaret (Margot) Tennant (v.s.). See Asquith, Anthony; Asquith, Herbert; Asquith, Raymond; Liberal; Lloyd-George, 1st Earl; Parliament Act.

Oxford and Asquith, EMMA ALICE MARGARET (Margot), COUNTESS OF (1864-1945). British

The Countess of Oxford and Asquith (Margot), British writer

writer. Sixth daughter of Sir Charles Tennant, she married in 1894 H. H. Asquith, later 1st earl of Oxford and Asquith (v.s.). She was one of the most brilliant and witty hostesses of her day, a member in her youth of the politico-literary coterie known as the "Souls." In 1922 she enjoyed a big success with a frank and lively *Autobiography*. Later publications included *Places and Persons*, 1925; *Lay Sermons*, 1927; *More Memories*, 1933; and a novel, *Octavia*, 1928. She died July 28, 1945. Anthony Asquith (q.v.) was her son.

Oxford and Cambridge Club. London social club. Founded in 1830, Lord Palmerston being among its originators, its first house was in St. James's Square, where it remained until a fine building was erected in 1838 by Sir Robert and Sydney Smirke, at 71-76, Pall Mall. Membership is restricted to men educated at either of the two universities.

Oxford English Dictionary. Dictionary of the English language published by the Oxford University Press. Begun in 1884, it was completed in 1928; the final edition, with a supplement devoted to words coined too late for inclusion in the main work, was published in 1933. The editors were Sir James Murray, Henry Bradley, Sir William Craigie, and Dr. C. T. Onions. The 13 vols. contain 16,400 pages covering 414,825 words, not only of modern English but also of the obsolete English of Chaucer, the Bible, and Shakespeare; of 240,165 main words in the dictionary, 52,464 are obsolete and 9,731 are alien. The cost of production was £300,000. The work is universally regarded as the ultimate authority on English. A Shorter Oxford English Dictionary of 2,500 pages was projected in 1902, but not published until 1933. The Concise Oxford Dictionary, adapted by F. G. and H. W. Fowler, was first pub. 1911, and the Pocket Oxford Dictionary in 1924.

Oxford Group. Evangelical movement founded in Oxford by Dr. Frank Buchman (*q.v.*) in 1921. Leaders were trained at various British and American universities, and by 1928 the crusade to convert the world from militant materialism to practical Christianity was launched. The name Oxford Group was first applied when eight students visited S. Africa in 1928.

The movement received the blessing of such figures as the archbishop of Canterbury, Lord Bennett, J. H. Hofmeyr, Bishop Berggrav, and Gen. Chiang Kai-shek. It taught that its followers must undergo a "change of heart," to be achieved by setting aside a period in the early morning (the "quiet time") in which they listened for the guidance of God. By 1937 the movement had spread to over 50 countries. Adverse criticism was aroused by the somewhat flamboyant personality of Buchman, and by the conversion of the movement into an association under the Companies Act in 1939; also because several prominent members declared in favour

of pacifism at a time when that was not a popular doctrine in England. The practice of public confession was also criticised.

In 1938 Buchman launched his Moral Rearmament campaign from East Ham town hall. During the Second Great War he toured the U.S.A., Canada, and Australia, and in 1941 the method of spreading the light by dramatic presentations was introduced. In 1946 the group bought the Westminster Theatre, London, but its productions did not attract much attention. It has offices at 4, Hay's Mews, London, W.1. See Moral Rearmament.

Oxford House. E. London community centre. Founded as an Anglican university settlement by members of Oxford university in 1884, the house in Mape Street, Bethnal Green, was later recognized by the local education authority as a community centre. It runs clubs for men, women, and children of all ages. There is residential accommodation for some 20 men and women, including the full-time staff of club leaders, etc. During the university vacations, courses are run in neighbourhood work and social background for students entering various professions. Contact is maintained with two daughter settlements, University House and S. Margaret's House, the latter for women only.

Oxfordian Beds. In geology, name given to the lowest subdivision of the Upper Jurassic rocks. They are typically developed in Oxfordshire, England, and are found in most districts from Dorset to Yorks. See Jurassic.

Oxford Movement. Name given to the movement for reforming the life and worship of the Church of England that began at Oxford in 1833. At that time the Church in general was in the state of lethargy into which it fell during the 18th century, and a number of Oxford men conceived the idea of making it more vigorous and powerful by increasing the number of services, reminding the clergy of their varied duties, and rendering it more than a mere adjunct of the state. An essential feature was the restoration of some of the ceremonial of worship that had fallen into disuse since the Reformation, and it was here that strong opposition was aroused. It was also called the Tractarian Movement because its aims were set forth in Tracts for the Times, a volume by various writers first published in 1834, while the adherents of the movement were called High

Churchmen or, by their foes, Ritualists. See Church of England; Keble; Newman, J. H.; Pusey; consult The Oxford Movement, R. W. Church, 1891; Secret History of the Oxford Movement, W. Walsh, 5th ed. 1899.

Oxfordshire. South Midland county of England, known sometimes as Oxon. Its area is 749 sq. m. Of very irregular shape, it is bounded on the S. by the Thames. In the S.E. are the Chiltern Hills, reaching up to 700 ft., and near Oxford are some lesser heights. Spurs of the Cotswolds enter the county, but the rest of it is undulating or flat. The chief rivers, tributaries of the Thames, are the Windrush, Cherwell, Thame, and Evenlode.

Oxfordshire is an agricultural county, producing barley, wheat, oats, and various vegetables, while cattle, sheep, and pigs are reared. Paper is made in several villages. The co. is served by main rlys. and the Oxford Canal. Oxford is the county town; other places of note are Banbury, Henley-on-Thames, Chipping Norton, Bicester, Thame, and Witney. The county contains historic and picturesque places such as Woodstock, Burford, Bampton, Dorchester, once the centre of a great bishopric, Blenheim, Great Tew, Nuneham, and Goring. Broughton and Shirburn castles are two great houses.

Of religious houses there are remains at Dorchester, Godstow, and elsewhere. There are beautiful churches at Bloxham, Langford, Iffley, and Adderbury. Herein, too, are the remains of Wychwood Forest. The co. elects two M.P.s, the county constituencies being Henley and Banbury. Before the Norman Conquest Oxfordshire was part of Mercia. Later it was ravaged by the Danes and was made into a county. Many historic events took place at Oxford, and during the Civil War there was much fighting. Pop. 209,621.

LITERARY ASSOCIATIONS. Among writers born in the county may be mentioned Sir Henry Maine, at Caversham Grove; George Rawlinson, at Chadlington; Maria Edgeworth, at Black Bourton; Charles Reade, at Ipsden. Of Islip, Robert South (1634-1716) and William Buckland, the geologist, were rectors. At South Leigh, John Wesley preached his first sermon, 1725.

Oxfordshire. Seal of the county council

Oxfordshire. Map of the South Midland county of England, famous for its pastoral beauty and historical associations

Woodstock gives its name as title to one of Sir Walter Scott's novels, much of the action of which takes place in the county. At Woodstock, too, centre the many stories of Fair Rosamond, who is buried at Godstow. At Henley, Shenstone is supposed to have written his famous lines on an inn. Pope stayed at Stanton Harcourt, Bablock-Hythe and other places around Oxford are associated with Matthew Arnold's Scholar Gypsy. Kelmscott, on the Thames side near the Gloucester border, was for some time the home of William Morris, and there he is buried. The Victoria History of the co., ed. W. Page, appeared in 1907.

Oxfordshire and Buckinghamshire Light Infantry. Regiment of the British army. It was originally the 43rd and 52nd Foot, raised in 1741 and 1755 respectively, the two being united as the Oxfordshire and Buckinghamshire Light Infantry in 1881. The 43rd served under Wolfe at the capture

of Quebec in 1759 and in the West Indies. Both it and the 52nd fought in the American War of Independence. The 52nd served for many years in India, fighting in

Mysore and elsewhere, before going to Spain in 1800. In 1801 the two, together with the 95th, were placed under Moore and reorganized as the first British regiments of light infantry. Their deeds as the famous light division in the

Oxford and Bucks Light Infantry badge
Peninsular War are immortalized in Napier's History. At Waterloo the 52nd repulsed the Old Guard. The regiment was engaged in the Kaffir War, 1851-53, and a detachment was on the Birkenhead when she was wrecked in 1852. It won honour during the Indian Mutiny, served in New Zealand, 1864-66, and in the Tirah campaign of 1897. In the S. African War the regiment was at the relief of Kimberley and at Paardeberg.

Seventeen battalions were raised for service in the First Great War and earned the battle honours: Mons; Ypres, 1914, '17; Langemarck, 1914, '17; Nonne Bosschen; Somme, 1916, '18; Cambrai, 1917, '18; Piave; Dorian, 1917, '18; Ctesiphon; Kut. In the Second Great War battalions served in Europe, Burma, N. Africa, and Italy, suffering particularly heavy casualties at Salerno. The regimental depot is at Oxford.

Oxford Street. London thoroughfare. It runs W. from New Oxford Street, a link with Holborn, to join the Bayswater Road at the Marble Arch, W. Where it crosses Regent Street is Oxford Circus. New Oxford Street, opened in 1847, covers the site of the "rookery" of S. Giles. Oxford Street, named after Edward Harley, earl

of Oxford, early in the 18th century, was formerly Tyburn Road, being part of the route from the Old Bailey to the gibbet at Tyburn (q.v.). In the 20th century it became one of the main shopping centres of London's W. end. The Princess's Theatre (q.v.) was at No 152. In Oxford St., called by him a "stony-hearted step-mother," De Quincey met the Ann of his Confessions.

Oxford Street, London. View of this busy shopping thoroughfare looking west from New Bond Street

Oxford University. Senior of the two ancient English universities, dating from the reign of Henry II. Its development began about 1167, when foreign born scholars were driven from Paris. In 1214 came the first university charter, whereby the townsmen undertook to pay to the university a small tribute which still survives. There was much rioting between town and gown during the 13th and 14th cent.; but the university, supported by church and king, grew steadily stronger.

Oxford University arms

By 1546 Henry VIII had handed over Wolsey's property and buildings, licensed in 1525 as Cardinal college, to the dean and canons of the cathedral, which was and is part of Christ Church (The House). In 1571 the university was incorporated by Act of parliament. The statutes made by Archbishop Laud, chancellor of the university, and introduced in 1636, were amended in 1760 after a great struggle. The constitution was again revised in 1854, and in 1877. In 1871 religious tests were abolished. The royal commission of 1919, and the statutory commission which followed, led to the receipt of an annual Treasury grant.

The colleges, halls, and societies are independent corporations. The colleges (other than new foundations) make financial contributions to the university. To become a member of the university ("matriculate"), it is necessary first to be admitted by a college, hall, or society. These are: University (1249); Balliol (1263); Merton (1264); Exeter (1314); Oriel (1326); Queen's (1340); New College (1379); Lincoln (1427); All Souls (1438); Magdalen (1458); Brasenose (1509); Corpus Christi (1520); Christ Church (1546); Trinity (1554); S. John's (1555); Jesus (1571); Wadham (1612); Pembroke (1624); Worcester (1714); Hertford (1740); S. Edmund hall (1317). New foundations are: Keble (1870); S. Peter's hall (1928); S. Catherine's society (non-collegiate body) (1868); two permanent private halls, Campion and S. Benet's; Nuffield (1937); St. Anthony's (1950). The recognized societies of women students are Lady Margaret hall (1878); Somerville (1879); S. Hugh's

(1886); S. Hilda's (1893); S. Anne's society (formerly society of Oxford home-students) (1879).

The head of the university is the chancellor, usually some illustrious non-resident member; the acting head is the vice-chancellor, a chosen head of one of the colleges, nominated annually by the chancellor and usually holding office for three years. Two proctors, elected annually by the colleges in turn, are responsible for the discipline of the university. From 1604 to 1945, the university returned two members to parliament.

The governing bodies are: the hebdomadal council (five ex-officio members and 18 elected members), through which all legislative proposals must pass; the congregation of the university (most members of which are resident graduate teachers or on the administrative staff), in which is vested nearly all the legislative power; and convocation (all masters and doctors on the books, but retaining few duties). The curators of the university chest manage finance. The general board of the faculties supervises the studies and examinations of the university and the work of the 14 faculty boards.

Degrees are given in arts, divinity, law, medicine, music, letters, science, and philosophy. Normally an undergraduate takes an arts course of three or four years leading to the B.A. degree. For this he must pass three examinations: responsions (from which he can secure exemption); the first public examination—an intermediate examination in the candidate's subject; the second public examination—either a final honour, or a final pass, school. At the end of seven years from matriculation a B.A. may be admitted to the degree of M.A. without further examination. There are research degrees for those who have already been admitted to a first degree.

University property in Oxford includes the Bodleian library, the Ashmolean museum, the Sheldonian theatre, the university observatory, under the direction of the Savilian professor of astronomy. There are 89 professorships; many are ancient chairs, the oldest being the Lady Margaret professorship of divinity (1502). Five Regius professorships, divinity, medicine, civil law, Hebrew, and Greek, were founded by Henry VIII. In 1937 Lord Nuffield founded four medical professorships.

In 1914 there were 4,025 undergraduates; in 1938–39, 6,659; in

1948, about 8,000. Many social activities and sports are offered by university and college clubs. The Union society provides weekly debates; the Oxford university dramatic society (O.U.D.S.) is famed. The events held every year against Cambridge university (*q.v.*) entitle the participants to a "Blue" (*q.v.*). See also separate entries under the colleges and other institutions of the university.

Bibliography. Oxford and its Story, C. Headlam, 1912; History of the University of Oxford, Sir Charles Mallet, 1924; Oxford—its place in National History, J. A. R. Marriott, 1933; Degrees by Degrees, A. M. A. H. Rogers, 1938; Oxford, C. Hobbhouse 1939; Oxford University Handbook (annually).

Oxford University Press. Oldest institution of its kind in the world. It has been continuous since 1585, and the Bible section since 1675. Printing was carried on in the Sheldonian theatre from 1669 to 1713, and the Clarendon Building in Broad Street until 1830, when the press removed to extensive premises in Walton Street. The type foundry is the oldest in England.

The associated name of the Clarendon Press dates from 1713, when, from the profits of Clarendon's History of the Rebellion, new offices were erected. The London publishing house is at Amen House, Warwick Square, London; the paper mill at Wolvercote, near Oxford. There are branches in Glasgow, Melbourne, Cape Town, New York, Toronto, Bombay, and Madras.

Oxidation. Term used in chemistry to describe a process whereby oxygen is given to another substance, or is made to remove hydrogen from a substance. Examples are the interaction between sulphurous acid and hydrogen peroxide when oxygen is given to the former substance, or the oxidation of sulphuretted hydrogen when hydrogen may be removed. The converse of oxidation is called reduction. Many important reagents are used in organic chemistry to effect oxidation, *e.g.* nitric acid, potassium permanganate, potassium dichromate and sulphuric acid, chromium trioxide and glacial acetic acid. See Oxygen.

Oxides. Compounds of elements with oxygen. Except fluorine and the inert gases, all elements form at least one such compound, and some two and even more. With electro-negative

elements (metals), oxygen forms basic oxides, and with electro-positive elements, acidic oxides. Between the extremes there is a fairly continuous series, and intermediate oxides may behave as

Oxlip. Leaves and flower-spray; inset, roots

either acidic or basic compounds according to conditions. Oxygen itself being electro-positive, where more than one oxide is formed, the higher tends to be more acidic; thus chromous oxide (Cr_2O_3) is basic, forming salts with acids, e.g. chromous sulphate, $\text{Cr}_2(\text{SO}_4)_3$, with sulphuric acid; whilst chromic oxide (CrO_3) is acidic, forming salts with bases, e.g. potassium chromate (K_2CrO_4) with potassium oxide. As to sulphur, both oxides SO_2 and SO_3 are acidic, but sulphuric acid, the former, is much stronger than sulphurous acid.

As an example of an intermediate (amphoteric) oxide, alumina (Al_2O_3) may be taken. With strong bases such as soda (NaOH) it forms salts (aluminates), which are, however, readily decomposed on diluting with water. The hydrated oxide precipitated is readily soluble in acids to form salts, e.g. aluminium sulphate $\text{Al}_2(\text{SO}_4)_3$. Carbon monoxide (CO) is neutral, but the higher oxide CO_2 is definitely acidic. Similarly with nitrogen, the lowest oxide (NO) is neutral, the next (N_2O_3) forms the weak nitrous acid (HNO_2), whilst the higher oxide N_2O_5 forms the strong nitric acid, HNO_3 .

PEROXIDES. Some of the higher oxides, e.g. BaO_2 , are unstable, readily decomposing on heating or on dilution with water. They then liberate oxygen gas, leaving the lower oxide (e.g. BaO).

OXIDE ORES. Many important metals exist in nature as oxides. The various oxides of iron, varying in colour from yellow and pale green to purple and black, occur almost everywhere and are mainly responsible for the range of colours

exhibited by earths, sands, and rocks. The most useful natural iron oxide ores are the haematites (Fe_2O_3) and spathic iron ore. Other naturally occurring metallic oxides of industrial importance are cuprite (copper ruby ore), zincite (zinc oxide, ZnO), and cassiterite or tinstone (SnO_2).

Oxlip (*Primula elatior*). Perennial herb of the family Primulaceae. It is a native of Europe and Siberia. In England it is restricted to the counties of Bedford, Cambridge, Suffolk, and Essex. Its flowers are similar in size and colour to those of the primrose with short individual stalks springing from the top of a stout, tall stem like that of the cowslip. The garden flower commonly called oxlip is a hybrid between primrose and cowslip.

Ox-Pecker or **RHINOCEROS BIRD** (*Buphaga*). Bird found in Africa. It is dull brown above and light brown beneath, and about the size of a starling. Insectivorous, it gets its name from the habit of settling on the backs of the ox and rhinoceros to search for parasitic insects.

Oxus. Ancient name of the river now the Amu-Daria (q.v.).

Oxyacetylene Blowpipe or **TORCH.** Instrument used for mixing and burning oxygen and acetylene gases together. It produces an intensely hot flame, used

Oxyacetylene Blowpipe. Diagrams illustrating the main features of A, the blowpipe, and B, gas cutting blowpipe

in oxyacetylene welding and gas cutting. The maximum flame temperature is about $3,130^\circ\text{C}$. The gases are mixed in the desired proportions either by mechanical control of the volume of the gases, supplied at equal pressures, or by dynamic control, using relatively high pressure oxygen blowing at high velocity to pick up low pressure acetylene. For most purposes the supply of oxygen is only 40 p.c. of that required for complete combustion, so that the inner part of the flame envelope is reducing in character. The main features are shown in the diagrams.

For welding, the blowpipe flame is used to heat and/or melt the metal joint faces to a suitable temperature for a metallic union to be made between them.

Oxychlorides. Metallic chlorides which also contain oxygen. They are formed when certain metallic chlorides are added to water, e.g. when bismuth chloride (BiCl_3) or antimony chloride (SbCl_3) is added to water, the oxychloride, BiOCl or SbOCl , is produced. Zinc chloride also forms an oxychloride on keeping, or on evaporating a solution of the salt. Some substances such as ferric chloride (FeCl_3), cupric chloride (CuCl_2), and bismuth chloride (BiCl_3), yield oxychlorides when heated in dry air. Magnesium oxychloride or Sorel cement is a strong binding agent.

Oxygen. Most widely distributed of the chemical elements, having the chemical symbol O, atomic number 8, atomic weight 16. It is a colourless, odourless, tasteless gas, and exists in the free state in the atmosphere, of which it forms about 21 p.c. by volume. Oxygen also occurs in enormous quantities in the combined state: eight-ninths, by weight, of water consists of oxygen, and oxides form a large part of the earth's crust. Oxygen is essential to life and combustion.

Oxygen was discovered in 1774 by Priestley, who called it "de-phlogisticated air," and simultaneously by Scheele (1742-86), a Swedish apothecary, who named it "empyreal" or "fire-air." Lavoisier, regarding it as the essential constituent of acids, gave it the name oxygène (acid-former).

The gas was first liquefied in 1877 by Caillaud and Pictet, and in liquid form is pale blue.

The methods of preparing oxygen are as follows:

(1) By heating mercuric oxide (HgO) or red oxide of mercury in a glass retort, Priestley's method.

(2) By strongly heating manganese dioxide (MnO_2) in an iron retort. One-third of its oxygen is given off, a lower manganese oxide (Mn_2O_3) being formed. Other compounds like lead dioxide (PbO_2), barium peroxide (BaO_2), and chromium trioxide (CrO_3), lose part of their oxygen when heated in the same way.

(3) When potassium chlorate (KClO_3) is heated it gives off its

oxygen, but in order to obtain the evolution of oxygen at a lower temperature it is mixed with one-eighth its weight of manganese dioxide. This is the method usually followed in the laboratory, and was employed for making large quantities of oxygen before the discovery of cheaper processes.

(4) When barium peroxide (BaO_2) is heated it gives off an atom of oxygen, and yields the lower oxide (BaO). This process has been used on a large scale for the preparation of oxygen, the advantage being its economical working. It is known as the Brin process, and was originally patented in 1880. The barium monoxide which is formed also has the property of absorbing oxygen when heated to a dull redness in the air. Hence, by alternately forming and decomposing the barium peroxide, the same quantity of barium salt can be used over and over again.

(5) The preparation of oxygen from liquid air depends upon the fact that the two chief constituent liquid gases, nitrogen and oxygen, evaporate at different temperatures, nitrogen being more volatile. Methods of separating them are worked on a large scale. Liquid air was first prepared by Sir James Dewar, and the apparatus for making it on a large scale was devised by Hampson.

(6) Other methods of preparing oxygen may be summarised. The peroxides or perborates of sodium or other alkalis give off oxygen when moistened with water, especially if they are previously mixed with a catalyst. This method is employed for producing oxygen under the name of "oxylith," and also in preparing tablets and salts used for oxygen baths. When a concentrated solution of bleaching powder to which a little cobalt oxide has been added is heated, oxygen is given off. Oxygen is also evolved from peroxide of hydrogen, especially when it is acidified with sulphuric acid and a solution of potassium permanganate is added gradually.

PRACTICAL USES. The main use of oxygen in the medical field is in connexion with oxygen therapy and anaesthetics. It also assists breathing, where necessary either at high altitudes or at great depths. For medical use it is supplied normally in small cylinders, but large hospitals may have a pipe line installed. Oxygen is applied in the industrial field for welding and cutting. In the former, the high temperature of the

flame when used with a fuel gas such as acetylene, coal-gas, hydrogen, or propane, allows of oxy-acetylene welding, brazing, flame cleaning, flame hardening, flame softening, and flame spinning. The oxygen cutting apparatus is described below. The element is supplied for industrial use either (a) in liquid form and by means of evaporators converted to gas and passed to points of use by pipelines; or (b) compressed in steel cylinders of various sizes.

Oxyhydrogen Flame. A type of flame produced by burning a mixture of oxygen and hydrogen gases in a blowpipe similar to that used for oxyacetylene (*q.v.*). The temperature of the flame is about $2,800^\circ \text{C}$. at its hottest point. The flame has a limited use for welding such materials as aluminium, when the proportion of hydrogen is considerably in excess of that required for perfect combustion, so that a reducing envelope is formed. The intense white light given off when such a flame is allowed to play on a cylinder of lime is known as a limelight or Drummond light.

Oxymoron (Gr. *oxus*, sharp; *moros*, foolish). Figure of speech, usually rhetorical, in which an effect is achieved by an apparent contradiction in terms. An example is in Francis Thompson's *Hound of Heaven*:

In faith to Him their fickleness to me;
Their traitorous truensness and their loyal deceit.

Oxyrhynchus. Ancient town near Behnesa, on the Bahr Yusuf, Upper Egypt. The Egyptian name was Permazet. The oxyrhynchus ("sharp-snouted") fish (*Mormyrus*) was venerated in the vicinity. In the 5th century the town had 12 churches, 10,000 monks, and 12,000 nuns. See *Agrapha*.

Oxytropis. Genus of perennial herbs and shrubs of the family Leguminosae. They are natives of Europe, Asia, and N. America. The leaves are divided into two rows of leaflets. The flowers are pea-like, purple, white, or pale yellow, grouped in spikes or sprays.

Oyama, IWAQ, PRINCE (1842-1916). Japanese soldier, born in Satsuma. He visited Europe during the Franco-Prussian War, and in the civil war of 1877 led a brigade of the imperial army. During the war with China, 1894-95, he commanded the 2nd army, whose exploits included the taking of Port Arthur and Wei-hai-wei. In the Russo-Japanese War, 1904-05, now marquess and field-marshal,

he was in chief command. His skilful conduct of operations, notably at the battles of Liao-Yang, Shaho, and Mukden, brought him the title of prince in 1907. The year before he had received the British order of merit. He died Dec. 12, 1916.

Oyapoc. River of S. America. It rises in the Tumac Humac Mts., and flows N.E. to the Atlantic Ocean, forming the frontier between Brazil and French Guiana. On its upper course are the Matouchi Falls, while rapids interfere with navigation. Its length is 280 m. Oyapoc village, 25 m. inland, trades in rubber, balata, and gold.

Oyer and Terminer. Anglo-French legal term meaning to hear and determine. In England courts of assize sit by virtue of the commission issued by the king to the persons therein named, one of whom, at least, is always a judge, to hear and determine all causes, and to deliver all gaols of the prisoners there awaiting trial for all treasons, felonies, and misdemeanours. Sometimes special commissions are issued, as when there have been serious riots.

Oykell. River of Scotland. It forms part of the boundary of Ross and Cromarty with Sutherland, rising in Loch Ailsh, and flowing E.S.E. into Dornoch Firth at Bonar Bridge. Its valley forms a highway through the hills of N. Scotland at its narrowest. Ben More rises N. of the source. Between Cassley Bridge and Oykell Bridge a battle was fought c. 1397 between Macleods of Assynt and Mackays of Sutherland. Montrose in 1650 escaped up the Oykell valley after his last battle at Corbisdale.

Oyster. Name generally applied to a wide variety of bivalve molluscs, but in a true zoological sense only to bivalves of the genus *Ostrea*. About 100 living and 500 fossil species from the Triassic age to the present day have been described. Probably some of these are varieties and not separate species; many descriptions relate only to the shape of the shell and not to the animal within.

Oysters are marine animals occurring in temperate, sub-tropical, and tropical regions in numerous localities throughout the world, frequently near the seashore in fairly shallow water. The flat or European oyster (*O. edulis*) occurs in suitable places on the Atlantic coast of Europe, including the British Isles. Its shell consists of two subcircular valves, of which the right is almost flat and the left saucer-shaped. They are

joined by a hinge ligament, at the slightly pointed part of the valve, and a single adductor muscle which pulls the valves together. The shell has an outer layer of conchyolin and two inner ones of calcareous material, the exterior presenting a rough and ridged appearance while the interior is of a pearly substance.

The young oyster becomes attached to a rock or other shell and in natural conditions remains so for most of its life. In order to obtain regular shells, cultivated oysters are freed from their attachment and grown on firm sea beds. But the attached mode of life has led to the loss of the muscular foot, typical of bivalves. The shell is lined by the bi-lobed mantle, enclosing the mantle cavity within which are the gills. By ciliary action these produce a current of water which passes into an inhalant chamber, through spaces in the gills, which so act as a sieve to food particles; then to an exhalant chamber, thence to the exterior. The food, almost entirely minute plant life, is transferred to the mouth by various ciliated tracts of the gills.

O. edulis may be male, female, or hermaphrodite. The sex usually changes several times during the life of one individual, that from female to male taking place in a few days just after spawning, its counterpart in the following spring. Spawning occurs in early summer; many eggs are extruded into the mantle cavity where they remain for about ten days. The larvae are originally white, but as their shell grows they become dark. The young are discharged into the sea as free-swimming individuals and are distributed by tidal currents over a wide area. They remain in this state for 10-14 days, then drop to the bottom to become permanently attached to a hard object by the left valve of the shell.

Three kinds of oysters are normally sold on the English market: the American (*O. virginica*) from N. America; the Portuguese (*O. angulata*) from the mouth of the Tagus; and the European (*O. edulis*) from France, Holland, and beds at Whitstable and Colchester in the U.K. The oyster pop. of Europe considerably declined during and after the Second Great War. Consult Oyster Biology and Oyster Culture, J. H. Orton, 1939.

Oyster Bay. Health resort and residential town of New York, U.S.A., in Nassau co. It stands on a picturesque, well-sheltered bay

on the N. coast of Long Island, and is served by the Long Island rly. and a line of steamers plying to New York city. Theodore Roosevelt lived on Sagamore Hill, overlooking the town. Pop. 5,000.

Oyster Catcher OR SEA PIE (*Haematopus ostralegus*). British shore bird belonging to the plover

Oyster Catcher. Specimen of this British shore bird
W. S. Berridge, F.Z.S.

tribe. The head and upper parts are black and the under parts white, while the long and straight beak is reddish orange. It is found about all the more rocky parts of the coast, and feeds upon molluscs, crustaceans, and marine worms.

Oystermouth. Watering-place of Glamorganshire, Wales, part of the borough of Swansea since 1920. It stands near Mumbles Head. 5 m. S.S.W. of Swansea, and is the terminus of a branch rly. Culture of oysters is an industry, although less extensive than formerly. There was a Roman station near, and a castle was built at Oystermouth soon after 1100. The site and ruins of the castle were given to the town by the duke of Beaufort in 1923.

Ozark Mts. (Fr. *Bois aux arcs*, wood for bows). Wooded plateau of the U.S.A. Lying between the Missouri and Arkansas rivers, it occupies a large portion of the states of Arkansas and Missouri, and penetrates into Oklahoma and Kansas, its average height being from 1,500 ft. to 2,000 ft. The Ouachita Mts., S. of the Arkansas, are an extension of the Ozarks.

Ozobrome Process. Method of making carbon prints, now virtually superseded by the Carbro process. Ozobrome prints were called ozotypes.

Ozoena OR ATROPHIC RHINITIS. Affection of the nose characterised by the formation of crusts which have an unmistakable penetrating odour. The patient is unaware of this, as his sense of smell is lost. The condition is difficult to treat.

Ozokerite. Naturally occurring hydrocarbon wax. It is

usually dark brown and often contains mineral matter and sometimes oil. It is associated with petroleum, and the most famous source is at Borzslaw in Poland, where it was mined on a large scale from 1870 to 1900, the output subsequently declining. Ozokerite is a residual product from seepages of waxy petroleum. When refined it is a white to yellow, hard, microcrystalline wax known as ceresin and used in polishes, electrical insulation compounds, etc.

Ozone (O_3). Gas with a peculiar odour somewhat resembling that of dilute chlorine. It was observed in 1785 that when an electric spark is passed through oxygen a distinct odour is apparent, but it was not until 1840 that the production of a definite gas—ozone—was proved. It is a form of oxygen containing three atoms in the molecule against two atoms in a molecule of ordinary oxygen. The gas readily changes into ordinary oxygen, but has distinct properties. Contrary to popular belief, the familiar smell of the seashore is not due to ozone, but to decaying marine vegetation. Ozone is produced on a large scale by the discharge from an electrical machine in oxygen or air. It is also formed by the action of cathode or ultra-violet rays on oxygen.

There is little ozone in the lower layers of the atmosphere, but it is comparatively plentiful at heights of 15-20 m. Information regarding the vertical distribution of ozone is provided by examining, at intervals throughout the day, the ultra-violet light coming down from the zenith sky and by the spectroscopic examination of sunlight. Ozone plays an important part in determining the thermal structure of the upper atmosphere, e.g. it is generally acknowledged that the high temps. of the region extending 25-40 m. above the sea are due largely to the absorption of solar radiation by ozone.

When ozone is strongly compressed an indigo-coloured liquid is obtained. Ozone is one of the most powerful oxidising agents known, and this property is utilised in a number of ways, e.g. for purification of air; for medicinal use in tuberculosis and whooping cough; sterilising drinking water; bleaching waxes, fats, fabrics, and yarns; "ageing" wood for musical instruments; oxidising or thickening oils; maturing wines and spirits; and sweetening foul beer casks.

IN the course of its history the name of this letter has changed much less than its form. The Phoenician alphabet (1000 B.C.) included a letter *𐤀* to fulfil much the same function as the modern letter *p*. The Phoenician name for it was *pē*, meaning mouth. Possibly it was based on an Egyptian hieroglyph resembling a shutter, which later was simplified to *𓆎*. The resemblance between a shutter and *𓆎* the position of the lips in pronouncing the *p* sound may have some connexion. The earliest Greek forms

turned the hook of the Phoenician *pē* either way *𐤁*, and the second of these developed *𐤁* into the classic Greek *pi*, *π*, with its familiar minuscule *π*. The *pi* is not to be confused with the Greek *rho* or *R*, which, though a direct derivative from earlier forms of that letter, closely resembled a modern *P* in shape (see *R*).

The extension of the hook of *pē* into the complete semi-circle which distinguishes the *P* of the Roman alphabet is first recognizable in the early Latin forms of about 800 B.C.

P Sixteenth letter of the English and Latin alphabets.

It is a voiceless labial or lip-sound. Its normal sound is that in *peck*, although in some words it is mute before another consonant, as in *psalm*, *ptarmigan*. *P* is intrusive between *m* and *t*, as in *empty*. The combination *ph* in words derived from the Greek is pronounced *f*, as in *philology*; in *apophthegm* and *phthisis* it is not heard. See Alphabet; Phonetics.

Paardeberg, BATTLE OF. Fought between the British and the Boers, Feb. 18, 1900. Cronje with a force of Boers was holding the entrenchments at Magersfontein, while French, with the main army of Lord Roberts behind him, marched to cut him off from Bloemfontein. This move forced Cronje from his camp, and, with 5,000 men and many women and children, he was soon marching by the side of the Modder to the Orange Free State. Near Paardeberg Hill the British came in touch with him, and while the cavalry and infantry were drawing nearer, the Boers entrenched themselves in the dry bed of the Modder. On Feb. 18 they were attacked from both sides, but when night fell the British infantry had lost heavily, and the Boer position was untaken. The attack was not renewed, but starvation did its work, and on Feb. 27, 4,000 Boers surrendered. The British, with 15,000 men in the field, lost 1,262 killed and wounded. See South African War.

Paarl. Largest inland town of Cape Province, S. Africa. It stands on the Berg river, 36 m. N.E. of Cape Town, with which it is connected by rly. In the surrounding district the vine and tobacco are grown; other industries are granite quarrying, fruit canning, and the building of wagons and carriages. The town, which extends for about seven m. along the river bank, was founded by the Dutch before 1700. The name means pearl. Pop. 26,485, of whom 10,860 are white. To the W. of the town is the Paarl Mt., on which are three gigantic boulders.

Pabna. District and town of East Bengal, Pakistan. Before the partition of 1947 it was in Rajshahi div. of Bengal. The dist. is in the corner between the Brahmaputra and the Padma distributary of the Ganges. Two-thirds of the area is cultivated, rice and jute being the chief crops. The town stands on the left bank of the Padma. Area of dist., 1,836 sq. m. Pop., dist., 1,705,072; town, 23,500.

Pabst, GEORG WILHELM. German film director. He was early connected with the theatre, turning to films in 1923. His pictures were distinguished by unusual lighting effects and camera angles during a period of photographic experiment in the European studios. His psychological presentation of character was at its best in *Kameradschaft*, 1931, and *The Secrets of the Soul*, directed jointly with Freud. Later films included *The White Hell of Pitz Palu*; *Don Quixote* (with Chaliapin and George Robey); *A Modern Hero*, 1934 (the first which he directed in the U.S.A.).

Georg W. Pabst, German film director

Paca or SPOTTED CAVY (*Caelogenys paca*). Rodent mammal. Related to the agouti, it is found in Central and S. America. Its fur is brown with rows of white spots along the sides of the body. It is about 2 ft. long, and in form suggests a rabbit without the characteristic ears or the long hind limbs. It lives in burrows, and does great damage to the crops.

Paca or Spotted Cavy, S. American rodent related to the agouti
W. S. Berridge, F.Z.S.

Pace (Fr. *pas*, from Lat. *passus*). Linear measure, representing the distance traversed by the foot from the place where it is taken up to where it is set down in walking. The Roman pace, measured from the heelmark of one foot to the mark where it next touched the ground, was equivalent to two modern paces and contained 5 Roman feet each of about 11.64 English ins. A thousand paces equalled one Roman mile.

The pace in the 20th century has been principally used as a measure for military marching. The British army pace, defined as the distance from the heel of one footstep to the heel of the next, is 30 ins. for quick time and 40 ins. for double-time marching. The U.S. army equivalents are 30 ins. and 36 ins.

Pace-Making. The term denotes setting the speed in certain athletic events. The pacer in running and cycling on tracks follows instructions to enable the principal for whom he acts to win a race or beat a record. Faster times are usually made when a pacer is employed, especially in cycling, where the pacer (often a motor-cyclist) acts incidentally as a wind-screen for the principal.

The word pacer is also applied to a horse whose method of progression is the pace, i.e. both off legs strike the ground in unison alternately with both near legs. Although the pace resembles the trot, there is a difference, the trotter covering ground by striking with off fore and near hind legs at the same time.

Pachacamac. Ruined city of Peru. It stands on the coast, about 20 m. from Lima. It was the sacred city of the Yuncas and had a temple, evidently a large and magnificent structure, of which some ruins remain. The temple was the centre of worship of the great creator-god Pachacamac, sacred even in Inca times. Other ruins are of later sacred buildings erected by the Incas. The city was plundered by Pizarro, and the site has been excavated by the university of Pennsylvania. The pre-Inca

creator-god Pachacamac was adopted as the Inca god of earth quakes.

Pachino. Coast town of Italy, in S.E. Sicily. It is situated in the prov. of Syracuse, 5 m. N.W. of Cape Passero and 13 m. by road S. of Noto, and was captured undamaged by Royal Marines during the Second Great War on July 10, 1943, the day of the Allied landings in Sicily.

Pachisi (Hind. *pachis*, twenty-five). Indian game for four players played on a board with counters and dice, of which a parlour equivalent exists in Great Britain under the name of Ludo.

Pachmann, VLADIMIR DE (1843-1933). A Russian pianist. Born at Odessa, July 27, 1848, he studied at Vienna conservatoire, and made his debut in Russia in 1869. On his first appearance in London in 1882, he displayed that complete mastery of technique which made him world-famous. As an interpreter of Chopin he was for long unsurpassed, his performances being marked by super-sensitive touch and delicacy of feeling. Later eccentricities, such as his refusal to perform except in Chopin's cloak and the pantomimic expression of his childlike enthu-

Vladimir de Pachmann, Russian pianist

siasms and aversions, did not deter music-lovers from enjoying his unique gift of interpretation. Died Jan. 7, 1933.

Pachmarhi. Hill station and sanatorium of the Deccan, India, in the Madhya union. Situated on the Mahadeo range, separating the Godavari from the Nerbada valley, it is 3,500 ft. above mean sea level, and is the seat of government of the Madhya union during the hot weather. Its name is sometimes applied to the Mahadeo range. Pop. 6,704.

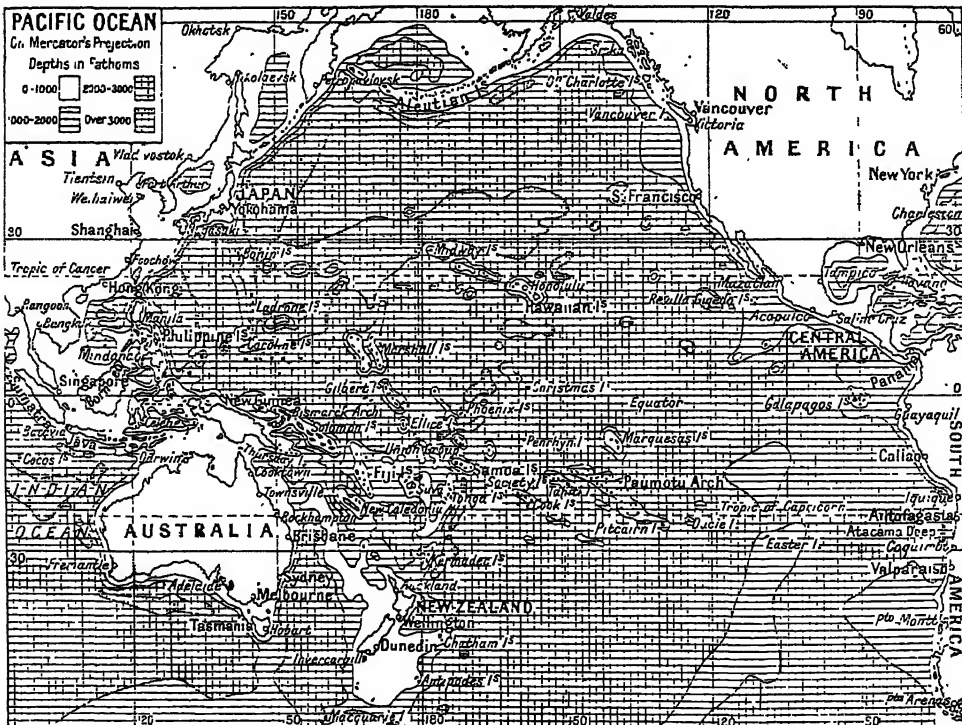

Pachuca. City of Mexico, capital of the state of Hidalgo. Known also as Hidalgo, it is situated among mts. at an alt. of 8,150 ft., 57 m. N.E. of Mexico City, to which there is a modern highway and a daily air service. It is in Mexico's greatest silver-mining district. Pop. 52,452.

Pachydermata (Gr. *pachys*, thick; *derma*, skin). Obsolete name given by Cuvier to those

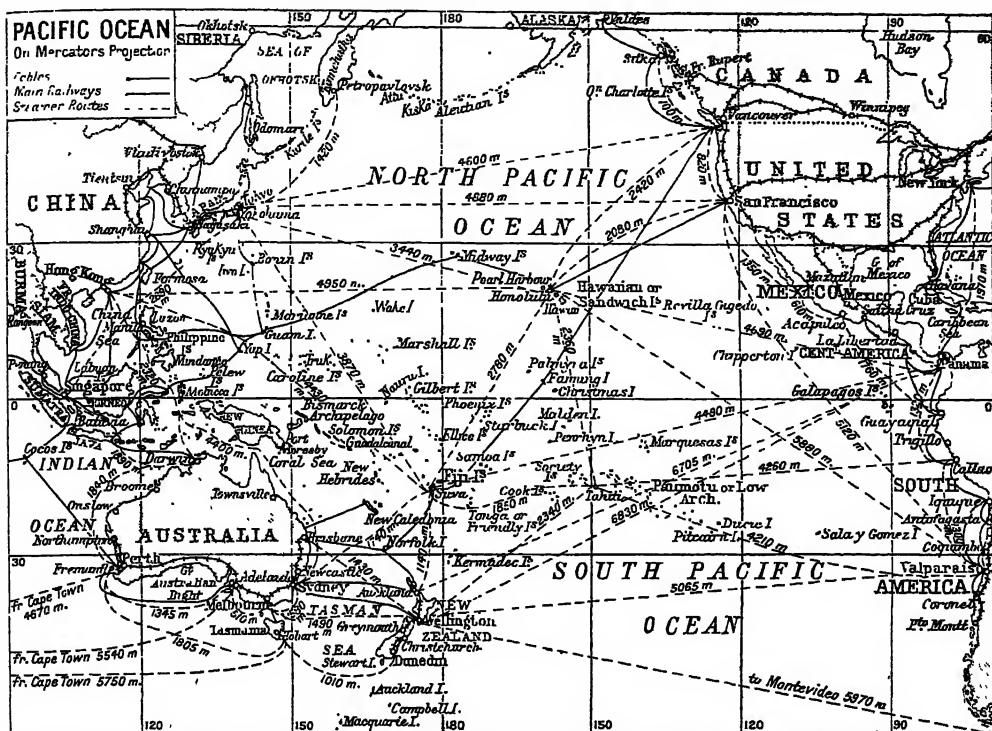

ungulate mammals having thick skins, such as the elephant and rhinoceros. See Ungulata.

Pacific Cable. There are two submarine telegraph cables in the Pacific. One, a British cable connecting Bamfield, Canada, via Fanning I. and Suva, Fiji, with Brisbane, Australia, and Auckland, N.Z., was laid in 1902 by the Pacific Cable board representing the govts. of the U.K., Canada, Australia, and N.Z. Its total length is more than 16,650 nautical m. The two cables, between Bamfield and Fanning I.—3,470 nautical m.—are the world's longest sections of submarine cable. Landlines across Canada connect the system with British trans-Atlantic cables; across Australia with the Indian ocean cable system. The system passed in 1929 to Imperial and International Communications Ltd., renamed Cable and Wireless Ltd. in 1934, which was taken over by the British govt. in 1947.

The other cable, between San Francisco and Japan, touches Hawaii, Midway I., Guam, Manila, Shanghai to Japan by the Bonin Is. A branch line runs from Guam to Yap, whence lines radiate to Japan and Indonesia.

Pacific Ocean. Map showing the varying depths of the ocean and the ridges on the ocean bed from which the majority of the South Sea islands rise

Pacific Ocean. Map showing the steamship routes and distances, and cables between Asia, Australasia, and America

Construction as far as Guam dates from 1903. The cable is owned by the Commercial Pacific Cable co. whose forerunners built up one of the Midway Is. out of an atoll. See Midway Islands.

Pacific Fleet. British fleet of the Second Great War. Based on Sydney, N.S.W., Australia, it included an Australian squadron. News of its formation was released Dec. 10, 1944, though the appearance of British warships in the Pacific had been announced from Tokyo in Nov. Its c-in-c. was Admiral Sir Bruce Fraser, and his flagship H.M.S. Howe; other major units were the battleships King George V and Duke of York, the aircraft carriers Formidable and Illustrious. See Pacific War.

Pacific Ocean. The largest of the five oceans of the world. It extends over an area of some 64,000,000 sq. m. In the N. it is linked with the Arctic ocean through the narrow Bering St. between Alaska and Siberia, while to the S. it merges widely with Antarctic waters. The W. boundary separating it from the Indian ocean is a line running from the Malay pen. through Sumatra, Java, Australia (Cape Londonderry), Tasmania, and then along

the meridian of 147° E. to Antarctica. Its E. boundary is the W. seaboard of N. and S. America and a line drawn from Cape Horn to the S. Shetland Is. in Antarctica.

It is the deepest of the oceans, with a mean depth of about 2,300 fathoms. The sea floor of the Pacific is characterised by two large submarine elevations or ridges, a W. Pacific ridge composed of several shorter ridges, often rising above sea level to form groups or chains of islands and traceable from Japan to Antarctica, and an E. Pacific ridge running from Central America to the S. and W. and reaching Antarctica in the long of New Zealand. These two ridges roughly divide the Pacific into a number of ocean basins. Particularly characteristic of the W. Pacific are deep depressions or trenches, most having a depth of more than 4,000 fathoms and occurring in regions which are centres of volcanic and seismic activity. Very great depths of water have been recorded in the W. Pacific, e.g. Nero deep off Guam I., 5,269 fathoms, a deep off Mindanao I., 5,348 fathoms, and a deep off Japan, 5,441 fathoms.

Within the tropical regions of the Pacific the great N. and S.

equatorial currents run E. following the line of the Equator; while the counter-equatorial current flows between them in the opposite direction. In the N.W. Pacific another warm current system, the Kuro Siwo, runs N.E. from Formosa, close to the Japanese coast, and then continues E. as the N. Pacific current. From the N. and S. the cold subarctic and subantarctic waters drift towards the equatorial region along the W. coasts of N. and S. America, the latter forming the Humboldt (or Peru oceanic) current.

Coral reefs and atolls abound in the shallower parts of the tropical Pacific wherever physical conditions, notably temp., favour their growth, e.g., the Great Barrier reef off Queensland.

Pacific Star. Campaign star awarded to personnel of the British armed forces who served in the Pacific ocean during the Second Great War. The bands of colour on the ribbon, from left to right, are; broad red, narrow dark blue, broad green, narrow yellow, broad green, narrow light blue, broad red. Entry into the operational zone was sufficient to qualify for the award. See Campaign Stars: Medal prtre.

THE PACIFIC WAR, 1941-45

Air Chief Marshal Sir Philip Joubert, K.C.B., D.S.O.

An account from Pearl Harbour, Dec. 7, 1941, to Japan's surrender, Aug. 14, 1945, of hostilities in the Pacific Ocean area. Fuller details of some of the actions will be found under particular areas—see e.g. Iwo Jima; Leyte; New Guinea; Okinawa; Philippines. See also Burma Campaign, 1941-45.

The Second Great War in the Pacific, which began on Dec. 7, 1941, with the attack by Japanese aircraft on the U.S. Hawaii naval base of Pearl Harbour, was in fact simply an extension of the campaign Japan was already waging against China, described in this work under China-Japan Conflict and Manchuria. Strategically the war situation in late 1941 looked most favourable to Japan's imperial ambitions. Great Britain was hard put to it to maintain her very existence owing to the intensity of the German submarine campaign; France was in German occupation; Russia appeared to be in extremis; and the U.S.A., not yet at war, was so weak in a military sense that the attack on Pearl Harbour put the U.S. fleet virtually out of commission for several months. Japanese occupation of Guam (Dec. 13), Wake I. (Dec. 23), and the Philippines followed rapidly, in spite of the gallant resistance of the U.S. garrisons, whose last stronghold in the Philippines, Corregidor, held out till May 6, 1942. On Dec. 8, 1941, the Japanese invaded Malaya; they sank H.M.S.S. Prince of Wales and Repulse on the 10th; Hong Kong fell to them on Christmas Day; by the end of Jan., 1942, they had seized Borneo, and had invaded Burma.

Japanese Reach the Solomons

On Feb. 14, 1942, Sumatra was attacked; on the 15th Singapore fell; and on the 19th Darwin, in N. Australia, suffered its first air attack. In Java, invaded on the 28th, the Dutch surrendered March 9. The British evacuated Rangoon on March 7, and the whole of Burma by May 15. The Japanese attacked the islands flanking Australia's N. coast in Jan., seizing Rabaul in New Britain and Kavieng in New Ireland (both in the Bismarck archipelago) on Jan. 23. On March 8 they landed at Lae and Salamaua in New Guinea; on March 10 they landed at Buka in the Solomons.

But the war at sea was not going too well for them, and to achieve their ends, control of sea communications was essential. The battle of the Coral Sea, May 4-9, forced the Japanese to call off an

intended seaborne attack on Port Moresby in S. New Guinea; and the abortive attack on Midway, June 3-6 (which cost the Japanese 20 of their invasion fleet of 80 for the loss of the U.S. aircraft carrier Yorktown and one destroyer) marked the end of Japanese seaborne attack on new objectives in the S. Pacific. But they had now begun an advance northward; they seized Attu, June 13, and Kiska, June 21, in the Aleutians. Weather, difficulties of supply, and an unexpectedly vigorous reaction by U.S. forces drove them to surrender on Attu on May 29, 1943, on Kiska Aug. 15. For the rest of the war the Japanese did not get nearer to the American mainland than their own Kurile Is., which suffered frequent attack from the air during the later stages of the war.

Australia Saved

Major naval operations against Port Moresby had become impossible, but that place was essential to the Japanese air force if it was to control the sea for an invasion of Australia. An attempt to take Port Moresby overland was held by the Australians, Sept. 15, only 32 m. from the town.

During the early summer of 1942 the Japanese had been busy constructing sea and air bases in New Guinea and the Solomons and bringing in troops; but while the Australians were still retreating in New Guinea, U.S. Marines on Aug. 7 began the first major Allied counter-offensive in the Pacific with landings on Tulagi, Guadalcanal, and other islands in the Solomons. The landings were a complete surprise, and initial resistance was weak; but during the night of the 8th-9th already Japanese naval forces engaged the Allied screening force off Savo I. and sank four heavy cruisers—the Australian Canberra and the U.S. ships Quincy, Vincennes, and Astoria; and although by Aug. 10 the U.S. forces were in effective control of the smaller islands, the fight for Guadalcanal was long and bitter.

By Jan. 23, 1943, the Australians had driven the Japanese out of Papua (British New Guinea), and by Feb. 10 Guadalcanal was free of the invader. It was not,

however, until June, 1944, that joint Australian and U.S. operations gave the Allies, despite isolated groups of Japanese in the interior, control of the whole of New Guinea. The capture of Biak I., May 27-June 20, 1944, in the Schouten Is. off N.W. New Guinea, marked an important point in the S.W. Pacific campaign, for it lies 860 m. from Darwin in Australia, and less than 800 m. from Mindanao in the Philippines. The capture of Morotai in the Moluccas followed, Sept. 14-17, 1944, the Japanese garrisons in the other Molucca Is. being bypassed. Further landings in the Solomons had secured New Georgia, Villa Lavella, and other islands during the summer; and from Nov., 1944, the Australians took over all operations in the S.W. Pacific, where fighting was to continue in Bougainville (Solomons), Borneo, and elsewhere until the surrender of Japan.

Central Pacific Operations

While the advance in the S.W. Pacific was progressing towards the Philippines, decisive operations were developing in the central Pacific. The British Ellice Is. were never attacked by the Japanese, and during the winter of 1942-43 were developed as an advance Allied base for the "island-hopping" campaign which was being planned. Landing craft of a type designed as a result of experience on Guadalcanal began to arrive in the Pacific. Carrier-based air attacks on the Japanese-occupied British Gilbert Is. began in Aug., 1943, and continued until on Nov. 20 landings were made on Makin I., conquered next day, and on Betio I. in Tarawa atoll, conquered only after a violent three-day battle; but by the 25th, U.S. forces were in control of the Gilberts.

By the end of Dec. four airfields, three suitable for heavy bombers, had been developed, and the scale of U.S. shore- and carrier-based air attack against the Marshall Is. (under Japanese mandate) to the N. was steadily mounting. The Japanese air forces there had been doubled in strength, but they were unable to prevent this development, although they lost many aircraft in their attempts to do so. On Jan. 29, 1944, after raids on 20 consecutive days, the attack on the Marshalls began: 700 aircraft flying from 12 carriers bombed Kwajalein, Roi, Maloelap, Taroa, and Wotja simultaneously. By the evening, of the estimated

130 Japanese aircraft in the Marshalls, not one remained operational. The undefended Majuro atoll was seized Jan. 31; by Feb. 22 control of the Marshalls had passed to the U.S.A.

The U.S.A. now held anchorages and bases over 2,000 m. W. of Hawaii from which amphibious expeditions could be prepared, land areas on which airfields capable of accommodating every type of aircraft could be made, and submarine bases 1,300 m. nearer the enemy's trade routes than Midway, the former anchorage. Under this threat the Japanese reorganized their naval forces. Their first mobile fleet was withdrawn to Singapore or to home waters, the c.-in.-c., Admiral Koga, remaining at Pelew with his flagship. The third fleet (the carrier force) reorganized into three divisions, one of which underwent training in the Singapore area, the other two in the Inland Sea, was reassembled at Tawi Tawi off N. Borneo in May.

Fast Allied carrier forces carried out a series of raids over a wide area. For example, on March 29-31, a U.S. task force operating against the Pelew (or W. Carolines—under Japanese mandate) and neighbouring islands destroyed some 150 enemy aircraft and sank 100,000 tons of naval and merchant ships, including eight tankers, besides damaging shore installations. U.S. losses totalled 25 aircraft; no U.S. ship involved received any damage.

The steady progress of the Allies in the central and S.W. Pacific gave assurance of protection from serious interference by the enemy, in the next Allied advance, against the Mariannes Is., which with the exception of Guam, a U.S. possession, had been mandated to Japan in 1919 and provided bases and airfields guarding communications between Japan and the Carolines, the Philippines, and other Japanese held territories. Landings in the Mariannes on June 15 were preceded by a heavy attack by sea and air forces. By Aug. 7 U.S. forces were in control of Saipan, Guam, and Tinian. Rota they bypassed. In Japan, the fall of Saipan on July 9 produced great alarm. The inner defensive line of the empire was now breached, and U.S. naval and air forces were bombarding and attacking the Bonin Is., part of the homeland itself. On July 18 Tojo, the prime minister, resigned, and a new govt.

was formed whose thoughts were turning towards peace. As yet, however, no open move to end the war was made.

The progress of the two-pronged Allied advance towards the Philippines—from the S.W. and from the central Pacific—had reached a point where the Carolines and Pelews were a dangerous salient between the two forces. Truk, the principal enemy base there, was under constant attack, but its reduction or neutralisation was the next move in the advance towards the Philippines and Japan itself. Attacks by land- and carrier-based aircraft on enemy aircraft and shipping from the Bonins to the Philippines produced weak enemy reaction on Mindanao. In the Visayan Is. in the central Philippines, over 600 aircraft and a number of merchant ships were destroyed. On Sept. 6 strong forces of carrier-based planes attacked the Pelew Is. preparatory to a landing on the 14th by U.S. Marines on Peleliu I. Babelthuap, largest of the Pelews, was bypassed; but by Oct. 1 U.S. forces were in possession of Peleliu and three other islands of the group and could dominate the whole of the Carolines. With the Mariannes, the Pelews, and the Moluccas under their control, the Americans were ready for their invasion of the Philippines.

Japan's Dwindling Resources

Japan's military strength was still considerable. Though she lacked air power, her army was numerous and her fleet strong. She could draw on Manchuria for army reinforcements. Her southern resources area was threatened; but essential supplies, including oil, were still reaching the homeland under cover of the Philippines, Formosa, and the inner island chain. Once she lost the Philippines, this slender thread of commerce would be snapped. If her fleet remained in the S. it would get oil, but no ammunition; if it based itself on the homeland ammunition would be available, but insufficient oil for prolonged operations. The Japanese naval staff decided on a gambler's throw in defence of the Philippines.

The U.S. campaign to recover the Philippines opened with concentrated attacks during Oct. by carrier-borne aircraft on targets in Mindanao and Luzon, the Ryukyu Is., and Formosa. On Oct. 14 and 15 China-based B.29 aircraft (Super-fortresses) also

struck at Formosa. The first attack on the Ryukyu on Oct. 9 was a complete surprise. Some thousand enemy aircraft were destroyed in these attacks for the loss of some 100 U.S. planes.

Allied Landing at Leyte

The air assault was switched to Leyte in the central Philippines 48 hrs. before a powerful U.S. force landed there on Oct. 20, instead of, as the Japanese had expected, on Mindanao, southernmost of the islands. The landing was the signal for the Japanese combined fleet, which had been avoiding action for two years, to challenge the Allied navies. The first diversion attack force, comprising the main battleship and cruiser strength, was ordered from Singapore to Brunei bay in Borneo, while the submarines were directed to Leyte. On the 18th, the second diversion attack force at Amami-o-Shima was ordered to the Pescadores off the W. of Formosa. The weakened carrier force, composed of four carriers partially equipped with aircraft, two carrier-battleships without any aircraft, three light cruisers, and ten destroyers, grandiloquently named the main body, sailed S. from the Inland Sea.

The first reports of Japanese naval movements came Oct. 21 and 22 from U.S. submarines cruising off Borneo, Palawan, and Luzon, which sank two and damaged another of the heavy cruisers of the first diversion attack force. This, sailing from Brunei towards the central Philippines, split into two, one part moving through the Sulu sea, the other through the Sibuyan sea. U.S. carrier air attack on both parts began on the 23rd; in the Sibuyan sea, damage caused compelled the enemy to retire to the westward. Meanwhile the Japanese shore-based aircraft attacked the U.S. carriers in strength, sinking the Princeton (10,000 tons). On the night of the 23rd-24th, the force from the Sulu sea attempted to pass through the Surigao straits; in the ensuing action U.S. surface forces sank two battleships and three destroyers; only one damaged cruiser and a destroyer escaped, the cruiser to be sunk by aircraft the next morning.

The second diversion attack force, which was following in support, delivered an abortive attack, in which the flagship and a cruiser suffered damage, and then withdrew. Meanwhile the U.S. carrier force, steaming N. at high speed, intercepted the main

body on Oct. 24, and sank all four carriers and two other ships without damage to one U.S. ship. The part of the first diversion attack force which had withdrawn westward under air attack advanced again and, despite its losses in the Sibuyan sea, passed through the San Bernardino strait (between Luzon and Samar). It then turned S. and off Samar encountered a group of U.S. escort carriers and destroyers. In the ensuing action most of the Japanese heavy ships were badly damaged, two cruisers were sunk, and a destroyer was left adrift. The Japanese retired to the Sibuyan sea, where they were again heavily attacked next day. During this phase of the battle Japan's newest battleship, the 42,000 ton *Musashi*, was sunk, as well as three destroyers. Three more cruisers which escaped were sunk later by attack from the air.

The most decisive sea battle of the Second Great War was over, and the Japanese fleet had virtually ceased to exist as a fighting force. The gambler's throw had failed. But the U.S. naval forces had taken a hammering during the battle and after by attacks from aircraft in charge of *kamikaze* (suicide) pilots.

The Leyte landing meanwhile was making slow progress against fanatical opposition; but by Dec. 25 organized resistance in the island ceased. In her attempts to reinforce Leyte, Japan lost 164,000 tons of shipping. On Dec. 15 U.S. troops made an almost unopposed landing on Mindoro I. at a point only 75 m. S. of Manila. Enemy resistance was quelled by the 29th. The Philippines had been virtually cut in two, and the U.S. forces were ready for their attack on Luzon. They landed in Lingayen gulf under MacArthur's personal command on Jan. 9, 1945; on Feb. 4 they reached Manila without fighting another battle. By the 6th the city was under U.S. control, except for the ancient walled city, Intramuros, across the Pasig river, where the Japanese fought suicidally until the 24th. Bataan was overrun and Corregidor seized on the 16th. The U.S. forces now dominated the Philippines once more (although isolated groups were still fighting in Mindanao and the Luzon mts. when Japan surrendered), and Japan was cut off from her short-lived empire in the S.

The hoped-for China-based air assault by B.29 aircraft had been greatly hampered by the Japanese

advance towards Yunnan in 1944 which deprived the U.S. air forces in China of seven valuable and well-developed airfields (*v.i.*). Moreover the difficulties of maintaining General Wedemeyer's striking force in China from E. Bengal had proved greater than had been anticipated. The Ledo road was not completed until Jan. 23, 1945; the oil pipe line from Calcutta was still being laid; and supplies carried by air across the mts. of N.E. Burma were inadequate.

British Fleet in Pacific

The build-up for the final Allied assault was, however, proceeding apace. A British Pacific fleet based on Australia was formed in Dec., 1944, to serve under the U.S. naval c.-in-c. or, where appropriate, Gen. MacArthur; and a British E. Indies squadron based on Colombo operated against positions in the Japanese-occupied Andamans and Netherlands E. Indies, while its submarines took toll of Japanese shipping in the Malacca strait. As the German naval threat diminished, British first-line war vessels and a vast train of merchant ships were transferred to Pacific waters, where the fleet took part in a number of attacks in support of the main drive towards Japan.

Iwo Jima was selected as the point for a landing in the Bonin Is. Japanese fighters operating from its airfields were intercepting B.29 bombers in passage from their base in the Marianas. Moreover possession of those airfields, which were within fighter range of the Japanese mainland, would mean that bombers raiding that mainland could be given fighter support, and could in emergency land at Iwo Jima on their return journey. The landing, made on Feb. 19, 1945, after a fierce three-day bombardment to which the enemy had scarcely replied, met much stiffer opposition than had been anticipated; but organized resistance ceased on March 16.

Ten days later U.S. forces landed on the Kerama Retto, a group of islets almost in the centre of the long chain of the Ryukyu Is., which lie between the Japanese mainland and Formosa, and are a part of Japan proper. Landings on Okinawa, key island of the group, began on April 1, after a tremendous preliminary bombardment. This was the largest amphibious operation attempted in the Pacific: 1,200 ships, 560 carrier-borne aircraft, and nearly half a million troops took part directly in the operation. The U.S. fast carrier force (80 ships and 900

aircraft), the British carrier force (20 ships and 250 aircraft), the 21st bomber command U.S.A.A.F., and the Far East air force acted in support.

Japanese naval reaction to the landings began in the evening of April 6 when a force described by Tokyo radio as a suicide force and composed of the 45,000 ton battleship *Yamato*, the light cruiser *Yahagi*, and eight destroyers—the poor remnant of the first diversion attack force—left the Inland sea to intercept the Okinawa landings. Next morning it was located by air reconnaissance, and at mid-day the U.S. fast carrier force attacked some 50 m. off Kyushu. At 14.23 the *Yamato* capsized and blew up; the cruiser and four destroyers were sunk. The remaining destroyers, after suffering damage, fled back to Sasebo; 380 U.S. aircraft took part in this attack, of which 10 were lost from A.A. gunfire. There had been no air opposition.

The battle for Okinawa proved the toughest in the Pacific. By his incredible fanaticism the Japanese soldier held out until June 21 against an invader who held absolute command of the air, had the equivalent of two armoured divs., an overwhelming strength in artillery plus the powerful guns of the combined Allied fleet, and an unlimited superiority in men, equipment, and supply.

Bombardment of Japan

After the fall of Okinawa, from sea and air the Allies showered blows on Japan itself. The first naval bombardment of the Japanese mainland came on July 14, when Kamaishi, port and industrial centre 275 m. N.E. of Tokyo, was shelled without response. Both before and during the bombardment some thousand carrier-borne aircraft ranged over a wide area of N. Honshu and Hokkaido, meeting no opposition. Next day Muroran was blasted from 1,000 yds. range. The heaviest naval bombardment of the war was carried out on the 17th by a combined U.S. and British fleet against a 70 m. stretch of the Honshu coast N. of Tokyo. Battleships approached within 24 m., cruisers and destroyers steamed close inshore. More than 2,000 tons of shells were poured into the industrial centres in the area. Bombardments by day and by night were frequent until a last one, on the Kuriles, on Aug. 13.

The first air attack on Japan was delivered on April 18, 1942, when Tokyo was bombed by air-

craft led by Col. Doolittle (*q.v.*) from the U.S. carrier Hornet. On June 15, 1944, came the first attack on Japan by land-based aircraft when B.29 bombers of the U.S. 20th A.A.F., flying from bases in China, bombed Yawata steelworks; it was followed by other raids on industrial and naval targets on July 7 and 29, Aug. 10 and 20, Oct. 25, Nov. 11 and 21, after which this U.S. air force had to retire to India owing to the Japanese advance in China. But by then a B.29 base had been established on Saipan in the Marianas, and on Nov. 24 Tokyo had its second raid of the war, the first of a series of mounting strength on both the capital and great industrial centres such as Yokohama, Nagoya, Osaka, and Kobe. Carrier-borne aircraft joined in the assault, on July 24 and 28, 1945, for instance, attacking two battleships, three carriers, and five cruisers and other vessels, all sunk or severely damaged. On July 27 B.29 aircraft dropped leaflets on eleven towns—centres of war production or transport—warning them that they would be targets for heavy air attacks; six were bombed the next day. By Aug. 5, 31 towns had been warned, and ten of them heavily bombed.

On Aug. 6 the first atomic bomb was dropped on Hiroshima (*q.v.*); on Aug. 9 the second on Nagasaki. Japan could no longer hold out. If the dropping of the atomic bombs did not bring about Japan's final downfall, they gave her rulers, in a situation so desperate that in all probability surrender could not in any case have been long delayed, a reason for accepting on Aug. 14 the full Allied terms of surrender.

Pacifism, or **PACIFICISM**. Attitude which rejects war, even to the extent of rejecting active or material resistance to aggression. It goes back to such medieval attempts at replacing warfare by international law as the *truga Dei*, and the plans for a union of nations made by King Podiebrad of Bohemia and Henry IV of France and his chancellor Sully. It is a fundamental of the Quaker and Mennonite religious systems and is based by these bodies on their reading of the N.T. The first peace society, founded in London, 1816, was soon followed by an American one. A French society was founded 1867 and a number of societies were formed in many parts of the world from then on. Victor Hugo (France), Cobden, W. T. Stead (U.K.), Bertha von Suttner (Aus-

tria), Alfred H. Fried (Germany) were among active advocates of peace. The creation of the Nobel peace prize, 1896; the world peace conferences, the first of which assembled in Paris, 1889, and established 1891 the international peace bureau in Berne (moved 1919 to Geneva); and Carnegie's peace endowment, 1910, fostered these movements.

While membership of peace societies was small, the indirect influence of pacifism has been considerable. During the First Great War the right of a man to object on grounds of conscience to participating in war was officially recognized in the U.K. The setting up of the League of Nations and of The Hague international courts seemed to mark the attainment of the aims of the pacifists. German generals, *e.g.* von Schönaich and von Deimling, and professors, *e.g.* F. W. Förster and L. Quidde, Victor Basch and d'Estournelles de Constant in France, La Fontaine in Belgium, and numerous R.C. leaders, *e.g.* Marc Sangnier, encouraged by papal encyclicals, proclaimed active pacifism.

The Geneva Protocol, 1924, the Kellogg Pact, 1928, and various disarmament conferences were attempts to establish a practical and international pacifism. In 1928 a war resisters' international was formed; and in 1936 an international peace campaign was organized to coordinate pacifism through the League of Nations.

Pacifism (as distinct from the common longing for peace) has been strongest in countries such as Great Britain and the U.S.A., where the general acceptance of a right to freedom of belief leads to the acceptance, even if reluctantly, of conscientious objection to military service as to other social usages. In dictatorships pacifism has been condemned and its supporters persecuted. *See* Conscientious Objector; International Law; Kellogg Pact; League of Nations; Peace Pledge Union, etc.

Packfong or **PAKTONG** (Chinese *pai-t'ung*, white copper). Alloy of nickel-silver type, used for many centuries by the Chinese for tableware and ornamental work. It was probably made by mixing the product of smelting nickeliferous copper ores with that of smelting zinc ores. Its composition was: nickel, 32–41 p.c.; copper, 28–40 p.c.; zinc, 16–37 p.c.; iron, 0–2.6 p.c.

Pack-horse. Horse employed in the carriage of goods. This method of transport is common

where the roads are not available for wheeled traffic, especially in mountain districts. In Great Britain pack-horses remained in use until the 18th century, especially for carrying wool.

Pactolus. Ancient brook in Lydia, famous for the gold found in its sands in classical times. It is believed to be the modern Sarabat (*q.v.*).

Padang. Town and seaport of Sumatra, Indonesia. Situated nearly in the middle of the W. coast, it is the terminus of a rly. line to the interior, and has considerable trade from the neighbouring highlands and islands. The harbour is 3 m. S. of Emmahaven, which supplies coal from the Ombilin coalfield. — Coffee, copra, tobacco, gum, and hides are exported. Pop. 51,976. Together with its harbour, it was the object of a number of attacks by British carrier-borne aircraft in 1944 and 1945 while Sumatra was in Japanese occupation.

Padaung. Township of Burma, in the Promé dist. The town is principally one long street along the right bank of the Irawadi on the road from Promé into Arakan. Pop. 57,500. *See* Burma.

Paddington. Met. bor. of the co. of London. Between Marylebone and Kensington, it is intersected by the Harrow Road and a branch of the Grand Union Canal. It includes the terminus of the old G.W.R., completed 1856, and the dists. of Maids

Paddington arms

Vale and Bayswater, with the busy shopping centre of Westbourne Grove, named after the Westbourne stream, which was used to form the Serpentine (*q.v.*). In addition to the town hall, enlarged in 1906, the bor. contains S. Mary's hospital, founded 1845; a lock hospital and mental hospital, workhouse and infirmary, municipal baths, and technical institute. In the churchyard of S. Mary's, Paddington Green—the parish church, 1788–1845, after which it was superseded by S. James's—are the graves of Sarah Siddons, Benjamin Haydon, and Joseph Nollekens. Westbourne Park Baptist chapel is associated with the work of Dr. Clifford.

The open spaces include a recreation ground of 27 acres, and the old cemetery of S. George's, Hanover Square, in which Sterne was buried and from which his

body is said to have been exhumed by body-snatchers. Notable residents of Paddington have included, in addition to Sarah Siddons, Robert Stephenson, Browning, the 1st Baron Coleridge, J. O. Hobbes, Herbert Spencer, and Sir Rowland Hill. The manor, anciently attached to Westminster Abbey, was given by Edward VI to the bishops of London, an episcopal connexion recalled by the names of several thoroughfares, e.g. Bishop's Bridge Road. Two members are returned to parliament. Pop. 127,450.

Paddle Steamer. Vessel driven by paddle wheels. The first steam vessels were propelled by paddles, which are still in wide use for river, channel, and lake steamers, particularly where the water is comparatively shallow. Two systems of paddles are known; in one the paddles or blades are rigidly attached to the framework of the

wheel; in the other the blades are free to turn through a certain angle and are operated by eccentric gear, as the wheel turns round, in such a way as to imitate in effect the feathering of an oar. They are known as feathering wheels. Special steamers have been built with a single, wide paddle wheel placed at the stern, for use in rivers where very shallow water occurs.

Paddy (Malay *padi*, rice). Rice in the husk. Paddy is the form used throughout the East, but in America it is known as *baddy*. Fields of growing rice, and very low-lying fields, are called paddy fields. The Java sparrow, which feeds on rice, is called the paddy bird, and a paddy pounder is a machine for husking rice. See Rice.

Paderborn. German town in N. Rhine-Westphalia. It stands at the source of the Pader, 50 m. by rly. S.W. of Hanover. One of the oldest German cities, it was a bishopric under Charlemagne, and

the seat of his diet in 777. Partly rebuilt after fire in 1875, it was devastated by bombs in the Second Great War. The cathedral, evolved upon Charlemagne's foundations in the 11th to 13th centuries, was not irreparably damaged, nor was the S. Bartholomew chapel of the same period; but the town hall (1416) and the Franciscan and Jesuit churches were lost. Paderborn is the seat of an archbishop, has a philosophical and theological academy, sanatoria connected with its alkaline spa, and cement, printing, and engineering industries. A Hanseatic town from 1295 and capital of an ecclesiastical principality, it passed in 1813 to Prussia. Armoured units of the U.S. 1st army overcame S.S. troops with tank support here in desperate fighting March 30–April 2, 1945, in the course of operations to isolate the Ruhr. Pop. (1939) 37,272.

Paddle Steamer. 1. Diagram of oscillating engine directly connected with crank, A, on paddle-wheel shaft, thus driving feathering wheel. Engine cylinder, B, oscillates on centre trunnion, as shown by dotted lines. 2. A pleasure paddle steamer. 3. Stern wheel steamer

Paderewski, IGNAZ JAN (1860–1941). Polish pianist and statesman. Son of a farmer, he was born at Kwrylowka, Russian Poland, Nov. 18 (6, o.s.), 1860. He showed exceptional musical gifts, and studied at the Warsaw conservatoire (where he became professor at 18) and with Leschetizky in Vienna. A teacher at Strasbourg, he did not appear as soloist until he was 27; he made

his début in Vienna, came to London in 1890, and next year achieved sensational European success. Romantic appearance as well as unfamiliar technique placed him in the front rank of pianists, and he made repeated tours of Europe and the U.S.A. His position as composer was established by an opera, *Manru*, 1901. Some of his other works were the popular minuet in G, symphony in B minor, songs, and pianoforte pieces.

Arduently patriotic, he flung himself into charitable work on behalf of Polish victims of the First Great War. In 1916 he lectured on Polish history in the U.S.A., and when that country declared war he organized the training of Poles in Canada. He sought help in the U.K. in constituting the new Polish state, of which he was premier and foreign minister in 1919, signing the Versailles treaty. In opposition to Pilsudski, his government was defeated and, retiring from politics, he went to Switzerland and eventually California, and resumed his musical career. He reappeared to give recitals in England, 1925 and 1933, and in 1936 was in a film, *Moonlight Sonata*. When the Polish govt. was driven into exile in 1939, Paderewski, then living in the U.S.A., helped to raise funds and recruits for the Polish forces. He died June 29, 1941.

His art was a reflection of his highly emotional temperament, but brilliant technique placed it above the merely spectacular. As a politician he displayed energy and qualities of leadership just when they were demanded. He was knighted in 1925 for services to the British Legion, but did not use the title. There are lives by C. Phillips and R. Landau, both 1934; and the Paderewski Memoirs were edited by M. Lawton, 1939.

Padiham. Market town and urban dist. of Lancashire, England. It stands on the Calder, 3 m. N.W. of Burnley, with a rly. station. The chief building is S. Leonard's church, an old foundation rebuilt in the 19th century. The industries include the manufacture of cotton, while coal mines and stone quarries are worked in the neighbourhood. Market day, Fri. Pop. 10,000.

Ignaz Jan Paderewski,
Polish pianist

Padua, Italy. 1. Loggia del Consiglio, an early Renaissance building. 2. Sant' Antonio church and statue of Gattamelata. 3. Market place and Palazzo della Ragione.

Padilla, JUAN DE (c. 1490-1521). Spanish insurgent. Born at Toledo, he entered the army as a youth, and in 1518 placed himself at the head of a popular movement against the subsidy granted by the cortes to Charles V. With a considerable body of armed men he seized Joanna, the king's mother, and with his insurgent army marched to Valladolid, but despite various successes he was defeated at Villalar, made prisoner, and executed, April 23, 1521.

Padishah. Eastern title. It has been applied to the shah of Persia, the sultan of Turkey as ruler of the Ottoman Empire, the Great Mogul, by Indian natives to the sovereign of Great Britain as emperor of India, and by Orientals generally to European monarchs. The Persian *padshah* signifies lord king.

Padstow. Urban dist., town, and seaport of Cornwall, England. It stands on the N. coast, near the estuary of the Camel, 12 m. N.W. of Bodmin, with a rly. station. The church of S. Petrock is an old building, and S. Enodock's church has a Norman font. Padstow has a little shipping and fishing, and a trade in agricultural produce. It is also a pleasure resort. There was a monastery at Padstow, its foundation being ascribed to S. Petrock. The name is a corruption of Petrock's Stow. Market day, Sat. Pop. 1,929.

Padua (Ital. *Padova*). Prov. of Italy, in the N.E., in Venetia. It forms part of the Venetian plain and is crossed by the Adige, Brenta, and Bacchiglione. Wheat, rice, wine, and silk are produced.

Padua (Ital. *Padova*). City of Italy. It stands on several branches of the Bacchiglione, just above its confluence with the Brenta, 22 m. W. of Venice, for which it is the rly. junction. A

triangular walled city, it occupies a strategic position of the Venetian plain. In ancient days it was the chief town of Venetia, was the birthplace of Livy, and was sacked by Alaric and Attila. Nearly all the ancient monuments have disappeared. The university, founded in 1222, was a famous institution in the Middle Ages. Many streets are bordered by arcades; the Renaissance cathedral and the 13th century church of Sant' Antonio, before which

Padua arms

stands Donatello's equestrian statue of Gattamelata, the soldier of fortune, are notable. The Madonna dell' Arena contains frescoes by Giotto and Mantegna. Padua has some manufactures and a trade in agricultural produce.

All but two of the frescoes by Mantegna in the Eremitani church were lost when that building was destroyed by bombing from the air March 11, 1944. This was probably the greatest individual loss to Italian art during the Second Great War.

Paducah. City of Kentucky, U.S.A., the co. seat of McCracken co. A port of entry and headquarters for coal barge shipments on the Mississippi, it stands at the junction of the Tennessee and Ohio rivers, 170 m. S.E. of St. Louis, and is served by rlys. and river steamers. It is a leading tobacco and strawberry market. Pop. 33,765.

Paean. In ancient Greece, name for a hymn. Originally a hymn of supplication against plague, so called from Paean or Paeon, a god of healing, sometimes identified with Apollo, the

paean became a song of thanksgiving, used at festivals of Apollo.

Paeligni. Tribe occupying the Apennine uplands east of Lake Fucinus during the early Roman age. Their ethnic origin and primitive culture resembled those of the Marsi (*q.v.*), in whose war (91-89 B.C.) they shared, establishing in their fastness Corfinium, a short-lived republican capital. Another of their towns, Sulmo, was the birthplace of Ovid.

Paestum. Ancient city of Italy. It stands on the Gulf of Salerno, 24 m. by rly. S.S.E. of the city of Salerno. Founded by Greeks from Sybaris c. 600 B.C., and originally called Poseidonia, it became a Roman colony in 273 B.C. In the time of Augustus it was celebrated for its roses. Later of little importance, it became Christian, and in the 9th century was deserted by the inhabitants, after its destruction by the Saracens. Guiscard despoiled the deserted city of its monuments and sculptures. There are remains of three Greek Doric temples, which escaped damage in the Salerno battle of the Second Great War. These are the Temple of Neptune, 197 ft. long, 80 ft. wide; the so-called Basilica; and the Temple of Ceres. All three probably belong to the 6th century B.C. The city was surrounded by a wall partly preserved, and there are remains of a Roman amphitheatre and temple. When troops were digging a gun

emplacement during 1943 they found remains of a prehistoric cemetery. The area was wired in, and after the war further excavations were made by the Naples museum authorities.

Pagan. Term synonymous with heathen. In classical Latin *paganus*, i.e. inhabitants of *pagi* or villages, who might be employed for occasional military service, were con-

Paestum. Ruins of the ancient Greek colony in Southern Italy: top, Temple of Neptune, an example of 8th century B.C. architecture; below, the so-called Basilica, dating from the 6th century B.C.

trasted with *milites* or professional soldiers. When the Christians were described as soldiers of the faith, the indifferent masses were regarded as civilians or non-combatants. Hence the term pagan was applied to all non-Christians, except Jews and Mahomedans, who were at first considered an heretical sect. In the Middle Ages the term *Paynim*, through Old French from Lat. *paganismus*, was applied indifferently to heathen and Mahomedans, falsely thought to be idolators. See *Gentiles*.

Pagan. Township of Upper Burma, in Myingyan dist. It is situated on the left bank of the Irawadi, at the N. end of the Pegu Mts. Until the end of the 13th century Pagan was the capital and a fine city with numerous pagodas; it is now almost deserted, although a new township has grown up near by. Here on Feb. 14, 1945, British troops crossed the Irawadi and liberated Pagan intact.

Paganini, Nicolo (1784-1840). Italian violinist. Born at Genoa, Feb. 18, 1784, he made his first public appearance when nine years of age. The development of his unique gifts as a violinist was largely due to his own efforts. He left his home in 1798 and began a

Nicolo Paganini, Italian violinist

wandering career, gaining fame as a violinist of extraordinary powers. In 1828 he extended his tours beyond Italy, visiting Vienna, Berlin, Paris, and England.

In 1833 he returned to Paris. He died at Nice, May 27, 1840.

His weird appearance, dissolute youth, powers as an executant, and methods of bewildering musicians reveal him not only as a genius, but also as something of a charlatan, and this combination of qualities has given rise to many extravagant stories about him. He composed pieces for the violin, including some caprices which have been arranged for the piano by both Schumann and Liszt. Brahms wrote variations for piano and Rachmaninov a rhapsody for piano and orchestra on a theme of Paganini. *Consult* Life, J. Pulver, 1936; The Condemnation of P., A. Vinogradou, 1946.

Page. In feudal times, a youth of gentle birth in training for esquireship and knighthood, who acted as assistant to an esquire in attendance on a knight and his lady. Pages were trained in arms, armory (or heraldry), and the amenities of life, including the chase, music, and dancing, also receiving such instruction in the Humanities as was deemed necessary for persons of gentle birth. The order survives in the pages of honour attached to European courts, youths who are trained at the expense of the sovereign, are allotted certain duties, and are usually given commissions in the household regiments or sovereign's bodyguard. In the U.K. the sovereign has his pages-in-waiting. In hotels and large private houses young male attendants called pages are employed on light duties. In the U.S. senate and house of representatives the attendants are known as pages. See *Feudalism*.

Page, Sir Earle CHRISTMAS GRAFTON (b. 1880). Australian statesman. Born in Grafton, New South Wales, Aug. 8, 1880, he studied at Sydney high school and university, and became a surgeon. During the First Great War he served in France and Egypt. He was elected to the Australian

parliament in 1919, and was Commonwealth treasurer, 1923-29; minister of Commerce and deputy prime minister, 1934-39; and minister of Health, 1937-38. Leader of the Country party, he was on four occasions acting prime minister. On the sudden death of J. A. Lyons, April 7, 1939, he became prime minister, but a fortnight later resigned in favour of R. G. Menzies. In Sept., 1939, he resigned the leadership of his party, being opposed to cooperation with the United Australia party in a national government under Menzies's premiership; but he joined the national government, Oct. 27, 1940, as minister of Commerce. In 1941-42 he was special Australian envoy to the British war cabinet, and in 1942-43 a member of the Australian war cabinet. He was minister of health in the coalition govt. of 1949. A privy councillor in 1929, he was created G.C.M.G. in 1938 and C.H. in 1942.

Sir Earle Page, Australian statesman

Page, Sir Frederick Handley (b. 1885). British aeroplane designer. Born at Cheltenham, he was trained as an electrical engineer, and in 1906 began experimenting in aeronautics. He built a number of gliders to test his theories, and in June, 1909, established the first aircraft factory in the U.K., the same year producing his first aeroplane, the monoplane Bluebird. In 1912 he opened a factory at Cricklewood. In 1915 he put into production the first twin-engine bomber, since when his firm has specialised in the heavy multi-engine aircraft. After the First Great War he turned to civil aviation and designed a 20-seater aeroplane with which he inaugurated the London-Paris service in May, 1919. With the merging of Handley Page Transport into Imperial Airways in 1924, Page

began the design of multi-engined aircraft for the Imperial routes.

In 1927 Page greatly advanced aircraft safety and manoeuvrability by inventing the slotting wing, now standard on most aircraft. His contributions to aerodynamical design and efficiency placed him in the front rank of aeronautical science. During the Second Great War, when his company owned an experimental aerodrome at Radlett, Herts, there were produced large numbers of heavy bombers including the Hampden, Hereford, and Halifax, over 6,000 of the last-named being used by the R.A.F. Vice-chairman of the air registration board since 1937, Sir F. H. Page was president of the Royal Aeronautical Society, 1945-47. He was knighted 1942. See *Aeroplane*.

Page, WALTER HINES (1855-1918). American editor and diplomatist. Born at Cary, N. Carolina, Aug. 15, 1855, he was educated at Randolph-Mason College, Va., and at Johns Hopkins university. After seven years in control of *The Forum*, he became in 1898 editor of the *Atlantic Monthly*, and in 1900 founded *The World's Work*, issued by the publishing firm of Doubleday, Page and Co., in which he was a partner. He edited it until 1913, when he was appointed ambassador to Great Britain. During the period of American neutrality in the First Great War his enthusiasm for the Allied cause brought him into frequent conflict with President Wilson, but he remained at his post until Aug., 1918, when failing health compelled his retirement. He died at Pinehurst, N. Carolina, Dec. 21, 1918.

Pageant. A word originally meaning the stand on which mysteries and other dramatic performances were given. Gradually it was extended to the performance, and has been used to describe an unusual display, especially one in which a sequence of many scenes or episodes on a large spectacular scale treat a single broad theme, with a final tableau and grand march past. Open-air pageants of local history, presented lavishly with enormous casts, were a fashionable summer entertainment in the ten years immediately preceding the First Great War.

Paget. Famous English family. Its first prominent member was William Paget, an official of the city of London, who lived about 1500. His eldest son, William Paget (1503-63), served Henry VIII in various ways, becoming a secretary

of state. He was also a high official under Edward VI and Mary, and having been created, in 1549, Baron Paget of Beaudesert, died June 9, 1563.

The title passed in turn to Paget's sons, Henry and Thomas, and then to other descendants. Henry, the 7th baron, was made earl of Uxbridge in 1714, but this title became extinct in 1769, when the main line of the family failed. It was restored in 1784 for Henry Paget, who had inherited the estates and the barony, while his son Henry, the 2nd earl, was made marquess of Anglesey in 1815 in recognition of his services at Waterloo. Many other members of the family were famous either as soldiers or as sailors.

Paget, SIR BERNARD CHARLES TOLVER (b. 1888). British soldier. Paget was born on Sept. 15, 1888, and educated at Shrewsbury and Sandhurst. He served in the First Great War and was commandant of the Staff College, Camberley, 1938-39. In April,

1940, Paget was in Norway, commanding the British land forces in the Trondhjem-Aandalsnes area. He was appointed c.-in.-c., South-Eastern Command, in 1941 and became c.-in.-c., home forces, in the following year. Paget was responsible for the training of home defence troops, and those going overseas before 1944 as well as the greater part of 21st army group, introducing realistic methods of training and founding the system of battle schools. In Dec., 1943, he was made c.-in.-c., Middle East, retaining this appointment until his retirement in 1946. He was principal of Ashridge College, 1946-49. Created a K.C.B. in 1942.

Paget, SIR JAMES (1814-99). British surgeon and pathologist. Born at Yarmouth, Jan. 11, 1814, he studied at St. Bartholomew's hospital, London, and became demonstrator in the hospital in 1839. His lectures, 1847-52, as professor of anatomy at the College of Surgeons, after-

Sir James Paget,
British surgeon
After Millais

wards published in book form, became a standard text-book. In 1871 he was made a baronet, and in 1875 pres. of the Royal College of Surgeons. He died Dec. 30, 1899.

Pagliacci, I. Opera in 2 acts by Leoncavallo. The libretto (by the composer) is reputed to have been founded on an actual incident. First produced at the Teatro del Verme, Milan, May 21, 1892, 1 *Pagliacci* was presented at Covent Garden the following year. The opera was first performed in English by the Rouseby company at Leicester in 1893. It is known in Germany as *Bajazzi*, and in France as *Paillasses*.

Pagoda. Term in European use denoting a tower-like structure in India and E. Asia. A 16th century Portuguese corruption either of *dagoba*, a stupa or tope, or of Pers. *but-kadah*, an idol-temple, it designates in India temples with pyramidal towers. In Burma it denotes the Buddhist *paya* or *sedī*, a bell-shaped structure with conical finial, often gilded. The most venerated are at Rangoon, Mandalay, Prome, and Pegu. The Siamese *phra* is bell-shaped, with slender annulet spire, as at Phra Pathom, Ayuthia, or pyramidal, with domed cylindrical turret, as at the Wat-ching in Bangkok. The Japanese square timber-built *gojunoto* retains the Korean form, with an odd number of roofs.

Pagoda. This 16th cent. pagoda at Soochow, China is 250 ft. high

China perhaps derived its earliest towers, as at Sian-fu, the oldest extant, from the Babylonian square seven-storied *ziggurat*. The later Chinese *taa* became octagonal, with an odd number of storeys; for instance three in the Temple of Heaven at Peiping; seven at Ningpo; nine in the Porcelain Tower at Nanking, which was destroyed in 1854. The Kew Pagoda, 10-storied, erected 1761, follows the Chinese pattern.

Pagoda Tree (*Sophora japonica*). Tree of the family Leguminosae. It is a native of China and Japan. The long bluish-green

leaves are divided into about a dozen oval leaflets, and the small cream-coloured flowers are lavishly produced in large clusters. The Chinese obtain from the flowers a fine yellow dye, used for dyeing the silk robes of the mandarins.

Pago Pago. Natural harbour on the S. coast of Tutuila, one of the Samoan Islands. Called also Pango Pango, it belongs to the U.S.A., which has used it as a naval station since 1839. Its right to do so was established by treaty in 1872, and later was allowed to lapse, but in 1889 the right of the U.S.A. to the island of Tutuila was recognized by the Berlin General Act. The town is the seat of administration for American Samoa, where an American naval radio station is maintained. The harbour is the crater of an extinct volcano.

Pahang. State of the Federation of Malaya. It has a long coast on the S. China Sea, lies between Johore on the S. and Kelantan and Trengganu on the N., and is separated from them by high mts. It consists almost entirely of the basin of the Pahang.

Pahang was an independent Malay state until 1888, when it came under British suzerainty; and joined the Federated Malay States in 1895. It is sparsely populated. Pekan at the mouth of the Pahang is the seat of the sultan; Kuantan, farther N., is connected by road with Kuala Lipis. The state is traversed by the rly. from Gemus to Tumpat on the N.E. coast of Kelantan. Its area is 13,820 sq. m. Pop. 221,800.

Pahlavi or **PEHLEVI** (Pers. *Pahlav*, Parthian). Name of a cursive script of Aramaic origin used in writing Persian during the Sassanian period. The name is also often used for the Persian language of the same period, otherwise called Middle Persian.

Pahlevi. Family name of the rulers of Persia. See Mohammed Riza Shah Pahlevi; Riza Shah Pahlevi.

Paiforce. Allied force formed in Persia and Iraq, Aug., 1942. It comprised the British 10th army (only a small group), a large Polish army formed from prisoners taken by the Russians in 1939 and later released, and the Iraqi army. Its main task was to safeguard the Persian oilfields. Paiforce (the name was derived from the initials of Persia And Iraq command) saw no fighting, but under exacting conditions undertook heavy constructional duties and was responsible for the despatch to Russia through the Anglo-American sup-

ply lines of more than 4,000,000 tons of material.

Paignton. Urban district and watering place of S. Devon, England. It stands on Torbay, 3 miles from Torquay, with a station on the British rlys. W. region. The chief building is the Perpendicular church of S. John. The Bible Tower is part of the old palace of the bishops of Exeter. It is so called because here Miles Coverdale prepared his translation of the Bible. The attractions include spacious sands and zoological gardens. Pop. 26,000.

Pain (Lat. *poena*, punishment). State of distress, bodily, mental, or both. Physical pain may usually be regarded as a danger signal, showing that some physical condition is wrong, though not necessarily in the place in which the pain is felt. The severest forms of mental pain are grief, shame, and acute anxiety. When they are connected with deep moral fears they can be so intolerable that the mind gets rid of them by repression (*q.v.*).

All healthy beings strive to avoid mental pain, since it invariably gives rise to resentment even when this is not consciously felt. This resentment may change into bitterness or hostility.

The self-infliction of pain, sometimes to the point of torture, is a widespread habit in human beings, and under the name of asceticism has played an important part in human history. Biologically and psychologically, pain is an evil, though when associated with great effort, laborious toil, deep sympathy, etc., the results may on the whole be good. See Pleasure.

Pain, BARRY ERIC ODELL (1864-1928). British author. Born Oct. 22, 1864, and educated at Sedbergh School and Corpus Christi College, Cambridge, he turned early to literary work, and became known as a writer of humorous stories, sketches, and parodies. In a Canadian Canoe appeared in 1891, and among his many subsequent works the Eliza sketches were outstanding (Eliza, 1900; Eliza Getting On, 1911; Exit Eliza, 1912). Also popular were The One Before, 1902; and Stories in Grey, 1912. He died May 5, 1928.

Paine, THOMAS (1737-1809). British publicist and politician. Born at Thetford, Norfolk, Jan. 29, 1737, son of a small farmer and staymaker, he tried various occupations, including that of excise-man. Dismissed in 1774, he met

Franklin in London the same year, and, apparently under his advice, emigrated to America. Settling in

Philadelphia, Paine issued in 1776 a pamphlet entitled *Common Sense*, putting the case for independence, which, according to Washington, had great influence on the colonists. He fought in the U.S. army, and received a government appointment, which he lost.

In 1787 Paine returned to England and issued *The Rights of Man* as a counterblast to Burke's *Reflections on the French Revolution*. The work made a great sensation and Paine was indicted in 1792, but escaped to France, where he had an enthusiastic reception. Subsequently he fell foul of Robespierre, was imprisoned and narrowly escaped the guillotine, but was released in 1794 on claiming American citizenship. The first part of *The Age of Reason* had been finished just before his arrest; the second followed in 1795. The book was an attack upon revealed religion from the point of view of the 18th century deists, accompanied by all the vigour and occasional brutality which characterised Paine's writings. He died in New York, June 8, 1809. The standard biography is by M. D. Conway, 1892.

Painlevé, PAUL (1863-1933). French statesman. Born in Paris, Dec. 5, 1863, and educated at the École Normale Supérieure, he became professor at Lille and later at the Sorbonne, being well known as a mathematician, scientist, and philosopher. Appointed professor of mechanics and engineering at the École Polytechnique, 1904, he became interested in aviation. Painlevé entered the chamber of deputies as a Socialist in 1906, and was soon chairman of the navy committee. He concentrated the fleet in the Mediterranean, thus necessitating an understanding with Great Britain. Early in the First Great War he held administrative posts, and in 1915 became minister of public instruction.

Thomas Paine,
British author
After Romney

Paul Painlevé,
French politician

Resigning on a disagreement with Briand, he soon became minister of war under Ribot, and was responsible for the replacement of Nivelle by Pétain and for steps aimed at raising the morale of the rank and file. He succeeded Ribot as premier in Sept., 1917, but was forced to resign two months later.

In 1924 he was elected president of the chamber of deputies, but was defeated for the presidency by Doumergue. On Herriot's fall in 1925 he again became premier, but was criticised for half-hearted measures to save the franc and for his choice of the pacifist Caillaux as finance minister, so that his government fell. He was minister of war under Briand, 1926, and under Poincaré, 1926-29; and minister for air in 1932. He died Oct. 29, 1933. *A Life*, by E. Charles, appeared in 1925.

Paint. Pigment ground to a smooth paste in a medium which after application to the surface sets to a hard more or less elastic film. Such films are applied for both decorative and protective purposes and have been used from the earliest times. They may nowadays be classified as oil paints, water paints, emulsion paints, and bituminous paints. Preparations in which the medium is a solid (e.g. nitrocellulose) dissolved in a suitable solvent are described as lacquers (*q.v.*).

OIL PAINTS. This is the largest class. Unless otherwise specified, it is generally assumed that an oil paint is intended. Such paints contain (1) an oily medium, which may contain resinous substances to increase the gloss and hardness of the film; (2) driers, which accelerate the drying of the film; (3) volatile solvent (thinners), which reduce the paint to working consistency; (4) pigments, which give the necessary opacity and colour to the film; (5) extenders, which, although of little or no tinctorial value, contribute to the consistency of the paint and to the physical properties of the film.

The basis of oil media is usually linseed oil. Since about 1920, china wood oil has sometimes been used in conjunction with linseed. Properly refined linseed oil, when spread in a thin film, dries in 8 to 9 days. By the addition of small amounts of lead, manganese, or cobalt compounds, the drying time can be reduced to 8 hours under normal atmospheric conditions. When heated, linseed oil gradually thickens, eventually forming a tough leathery mass, and it is therefore possible to produce

an oil (stand oil) of any desired consistency. Stand oils dry slower than untreated linseed oil, but the films are more durable and glossy.

The volatile thinners determine the consistency of the paint. Turpentine, particularly American, was once considered the only really satisfactory thinner, but though its merits are still recognised, white spirit (a petroleum distillate) is much used. This was first introduced in 1885 as "Patent Turpentine," and it is now recognised as a paint ingredient, not merely a substitute for turpentine.

The use of pure colours of great tinctorial strength renders it both possible and necessary to use considerable quantities of substances which, though of little pigmentary value, act as bases for the expensive pure colour and contribute to the properties of the paint. Thus substances such as china clay and asbestine, being light and bulky, reduce the tendency of heavy pigments such as white lead to settle out, and of reactive pigments such as zinc white to form hard deposits, in ready mixed paint. Barytes, on the other hand, is a heavy substance, and being hard and crystalline adds bulk to the paint and increases the solid content and hardness of the film. In undercoats it gives a "tooth" to the film which improves the adhesion of subsequent coats. Few paints consist wholly of one pigment.

GLOSS PAINTS AND ENAMEL PAINTS. There is no definite line of demarcation between these. Enamel paints are the highest class and the medium consists largely of a varnish containing resins. The medium of gloss paint varies from linseed oil with a proportion of stand oil to a high proportion of thickened oils and including more or less resin. In both classes natural or synthetic resins may be used.

WATER PAINTS. The simplest type of water paint is a mixture of whitening with size solution. More satisfactory results are obtained by using good quality glue and pigments carefully selected to give the best results. Such paint eventually becomes practically insoluble in cold water, but still remains soluble in hot water. A water resistant paint can be made from casein. (*See Distemper.*)

EMULSION PAINTS. In these the medium may be described as an emulsion of a water and an oil medium, though a suitable substance is usually added to ensure stability of the emulsion. They are

largely used for decorative purposes, especially where a flat (*i.e.* dull) finish is desired.

BITUMINOUS PAINTS. These may consist almost wholly of bituminous substances dissolved in volatile solvent or be complex mixtures of the varnish type in which the bitumen wholly or partly replaces the resin. As with the ordinary oil varnishes, the properties of the product are much influenced by the methods of manufacture. Paints in which the medium consists essentially of bitumens in volatile solvent are rapid drying and are much used for metalwork, particularly where stove drying is possible. Paints in which oil is present in quantity are generally slower drying but give thicker and more durable film. Such paints are much used for protective paints on ironwork. Naturally the colour range is limited by the colour of the medium. Bituminous paints are largely used as ships' paints. *See Colour Mixing; Painting and Decorating; Pigments; Varnish.*

Painted Lady (*Vanessa cardui*). A butterfly of the family Nymphalidae and of nearly world-wide range. It is unable to survive the winter in Great Britain and its occurrence is due to migrants from N. Africa which produce a autumn generation of British-born individuals. In some years it is exceedingly abundant, in others scarce or absent. The caterpillar has short branched spines and lives on thistles and other plants, whose leaves it draws together with silk to form a shelter. *See Butterfly colour plate.*

Painters' or Painter-Stainers' Company, THE. London city livery company. In the 15th century a guild of S. Luke, it was granted charters in 1581 and 1685, and its minute books go back to 1623. Its freemen include Sir Peter Lely, Sir Godfrey

Kneller, and Sir Joshua Reynolds. The original hall, at 9, Little Trinity Lane, E.C., bequeathed to the company by Sir John Browne, serjeant painter to Henry VIII, was rebuilt in 1668, and enlarged in 1880 and 1916. The doorway is attributed to Grinling Gibbons. The old portion of the building was destroyed by German bombs in 1941. *Consult The History of the Painter-Stainers' Company*, W. A. D. Englefield, 1923.

PAINTING: THE ART OF THE PICTURE

* GORDON STOWELL, A.R.C.A. (Lond.)

This article deals with pictorial art. The craft of what is generally known as Painting and Decorating is treated separately under that heading. An historical account of the development of the artist's technical methods is here followed by a general survey of the great schools of painting, and a particular account of British painting from the 17th to the 19th centuries, then by a special section on Painting in the 20th Century. See also Art; Drawing; Landscape, etc.; under the heading Art in the entries on France, Germany, Italy, Spain, etc.; Dutch School; Flemish School; and entries on the world's great painters

The pigments of the artist's palette are essentially the same animal, vegetable, and mineral substances as those used in other forms of painting (see Pigments). They are applied to a surface usually but not invariably by brush, after mixture with a medium, e.g. water, linseed oil, egg tempera. For oil media the brushes most used are of hog-bristle; for water media, the more pliable sable. Until comparatively recent times it was the artist's practice to grind and mix his own pigments in the studio according to his needs, but artists' colours are now specially prepared by manufacturers, ready mixed to a stiff paste, with linseed oil or poppy-seed oil, and packed in metal-foil tubes. Those intended for water-colour work are still sometimes sold in small hard flat cakes, prepared with size or gum arabic, but are more usually softened with glycerine and sold in tubes or in china pans and half-pans. The artist using an oil medium will still choose to dilute or re-mix the pigments on his palette, sometimes with turpentine, according to his immediate needs. If he is using an oil medium, the surface on which he paints, canvas or wood, needs to be primed with a coating of size, usually mixed with white lead. Canvases are today usually obtainable already primed and stretched on a frame to give a flat surface. Water-colour paper is also usually stretched to prevent "cockling" by saturation during the process of painting.

Choice of Pigments

The artist's choice of the pigments he uses is governed by consideration of their durability, their colour, their comparative transparency or opaqueness, and the possible chemical action of one pigment upon another. The ready solubility in water of some pigments, e.g. prussian blue, crimson lake, is an obvious recommendation for their use in water-colour painting.

Other mediums used include fresco, distemper (gum), encaustic (wax, worked with hot tools), pastel, and gouache, or body colour (water colour made opaque by admixture with Chinese white).

Prehistoric and antique painting was done with coloured earths. In ancient Egypt, as in ancient Greece, distemper was widely used, but the later Greco-Egyptian painting, which survived into the 2nd century after Christ, also used encaustic. The work of the mere journeyman painters in the mummy portraits of this period suggests a wonderful level of accomplishment, but though the Greeks must have created paintings as great as their sculpture, they are lost to us. The Egyptians used outline and colour, but the Greeks took to filling in the outline for drawing with its own colour, thus creating the silhouette, as in their vases.

The craft as we know it today began with the early Italians. They painted in fresco on walls, and in tempera on panels of wood, over which canvas had been pasted, with a plaster ground over the canvas. Fresco is water-colour on freshly laid plaster, with no glue to hold it; the paint is driven over the newly-laid plaster, and becomes the surface as it dries. Thus it cannot be retouched or altered. In these primitive frescoes the outline was drawn, and the colours laid in flat coats. The early painters concentrated on line, colour, and composition in their desire to illustrate the teachings of the Church, and the discipline of the medium compelled fine draughtsmanship. With the dawn of the Renaissance came first a desire to give the objects depicted a more solid appearance with the help of simple light and shade. Masaccio was one of the first to mass light and shade. Then came Uccello and others with their discovery of the laws of linear perspective, and Mantegna with his great interest in the foreshortening of the human figure. Piero della Francesca was one of the earliest experimenters in aerial perspective, or the recognition of the effect of atmosphere in giving depth to pictorial representation. Later painters, culminating in Leonardo da Vinci, strove to present objects more and more skilfully as though seen in the round, through modelling by shading.

Meanwhile in the Low Countries the brothers van Eyck had per-

fectured a method of oil painting of which the secret is said to have died with them. They painted in oil on a white gesso ground. There are mentions of the oil medium in the 10th and 12th cent., and in the 14th cent. it was said to be in use among German artists. Probably it was developed more readily in the northern countries because the moist air was deleterious to fresco. In Italy the use of oil was confined to coloured glazes over tempera painting, until Antonello da Messina (it is said) introduced the Flemish method. It was quickly adopted, if only because it lent itself, as other media did not, to alteration and retouching. The medium certainly demands an infinitely less strict discipline, and there are many who date a decline in painting from its introduction. Michelangelo despised it as "fit only for women"; but Pollaiuolo, Perugino, Verrochio, Ghirlandaio, and da Vinci all used it.

Methods of Oil Painting

The Venetian painters, working in a moister climate, adopted oils with most enthusiasm. Two techniques prevailed in Italy; the Flemish method, followed by the Florentines, in which a smooth impasto was imposed upon a monochrome underpainting in brown and white, with solid paint for the lights and transparent for the darks to preserve their luminosity; and the Venetian method, in which the underpainting was in full solid impasto, to which transparent oil glazes were added. Titian and Tintoretto were among the first to represent objects as seen "in the large," omitting conflicting details and leaving the broad masses to impress the eye. Titian painted in tempera a solid monochrome of massed light and dark, then painted his superb colour over all in oils.

The first to use the "direct" technique, painting directly on the canvas in full solid colour without subsequent glazes, were the *tenebrosi*, i.e. Caravaggio and his followers working in Naples. This great change was introduced into Spain (by Ribera) and Holland early in the 17th century. Velasquez in Spain, and Rembrandt

and Hals in Holland were all masters of the "direct" method. Velasquez, by his masterly representation of the tone values due to the nature of light, may be looked upon as the first of the Impressionists.

Direct painting led to an appreciation not only of the representation of the appearance of objects but in the technique of brushwork, and a handling of the loaded paint which took pride in displaying, rather than concealing, the sweep and mark of the brush. Painting became more than satisfied to be, not an aping of nature, but a frank translation of nature into terms of individual brush-marks. Painting technique could henceforward be enjoyed for its own sake.

Painting in Water Colour

Water-colour painting, long practised in Japan, found its most notable expression in England, especially in the early 19th century. Used almost exclusively for landscape painting, first as an enhancement to topographical drawings in line, it was found to possess a soft limpid quality particularly suited to the representation of the English atmosphere. Its use in flat transparent washes of harmonious colour is best seen in the work of Cotman. On the other hand, Turner used it supremely well as a means to an end, and was no purist in technique so long as he achieved the desired effect; he did not hesitate to use transparent colour, opaque colour, and additional effects obtained by the use of charcoal, sponge, or pen-knife, all in the same picture. The range of water colour is necessarily limited. In comparison with oil painting, it is chamber music rather than a full orchestra. *Consult Materials of the Painter's Craft*, A. P. Laurie, 1910; *The Pigments and Mediums of the Old Masters*, A. P. Laurie, 1914.

SCHOOLS OF PAINTING. The accompanying table sets out the chief historical schools of painting. They are considered in detail in different parts of this Encyclopedia. For Italian, French, German, and Spanish painting, see under the sub-heading Art in the articles on Italy, France, Germany, Spain. See also Dutch School of Painting; Flemish School of Painting; Impressionism; Pre-Raphaelites, etc. The English and Scottish schools are dealt with below under the separate sub-heading British Painting.

The period of the historical schools may be taken as coinciding with the conception of painting as

the art of representing the visual truth, sometimes for its own sake, sometimes subserviently to other ends, e.g. religion, and combining this visual truth with harmonious and pleasing design. The balance between visual truth and beauty of design varies with individual artists as well as with particular schools. Thus, broadly speaking, the Italians strove after types and forms of idealised beauty, while the Northern schools, German, Flemish, Dutch, and English, found

their most congenial expression in the representation of the individual character of people and things, i.e. were more *naturalistic*.

Still generalising, the Florentine school developed from the painting of frescoes in churches, and many of their greatest paintings are of religious subjects and have therefore a certain decorative monumental quality which was not forsaken when the decorations were painted for the walls of palaces and great houses and the subject

PAINTING: MAIN HISTORICAL SCHOOLS AND PERIODS

SCHOOL	SUBDIVISIONS	LEADING ARTISTS
ITALIAN	<i>Byzantine School</i> , 9th to 12th century <i>Siena</i> , 14th century <i>Florence</i> , 14th to 15th century <i>Venice</i> , 15th to 18th century <i>Milan</i> , 15th century <i>Rome</i> , 15th to 18th century <i>Naples</i> , 16th century <i>Bologna</i> , 16th to 18th century <i>Padua</i> , 14th to 15th century <i>Genoa</i> , 15th to 17th century <i>Ferrara</i> , 15th to 17th century <i>Parma</i> , 15th to 16th century	Margaritone, Cimabue Duccio Giotto, Fra Angelico, Filippo Lippi, Filippino Lippi, Botticelli, Paolo Uccello, Masaccio, Michelangelo, Carpaccio, the Bellini, Titian, Giorgione, Tintoretto, Paolo Veronese, Guardi, Canaletto, Tiepolo Leonardo da Vinci, Bernardino Luini, Raphael, Perugino, Giulio Romano Salvator Rosa, Caravaggio Francia, the Caracci, Guido Reni Squarcione, Mantegna Giovanni Battista Paggi, Bernardo Strozzi Dosso Dossi, Lorenzo Costa Correggio
FRENCH	<i>Classic School</i> , 17th century <i>Louis Quinze and Louis Seize</i> , 18th century <i>Classic Revival</i> , 19th century <i>Romantic School</i> , including <i>Fontainebleau Group</i> , 19th century <i>Realistic School</i> , 19th century <i>Impressionist School</i> , 19th century	Claude Lorrain (Gellée), Nicholas Poussin Watteau, Fragonard, Boucher, Greuze, Chardin David, Ingres, Puvis de Chavannes Géricault, Delacroix, Millet, Corot, Diaz, Rousseau, Monticelli Courbet, Bastien-Lepage, Constant, Bonnat Manet, Monet, Degas, Sisley, Renoir, Berthe Morisot
GERMAN	<i>Cologne</i> , 14th to 15th century <i>School of Swabia (Colmar, Ulm, Augsburg)</i> , 15th to 16th century <i>Nuremberg</i> , 15th to 16th century	Meister Wilhelm, Stephan Lochner Martin Schongauer, Hans Holbein the Elder, Hans Holbein the Younger Dürer
SPANISH	<i>Madrid</i> , 16th to 17th century <i>Seville</i> , 16th to 18th century	El Greco, Velasquez, del Mazo Fernandez, Vargas, Herrera, Cano, Zurbaran, B. E. Murillo
DUTCH 17th century		Rembrandt, van Rijn, van Goyen, Hobbema, van Ruysdael, P. Potter, A. van der Velde, Cuyp, Hals G. Dou, Vermeer of Delft, de Hooch, Terburg, Jan Steen, Adriaen Brouwer, Metsu
FLEMISH 14th to 17th century		Hubert and Jan van Eyck, Hans Memling, Roger van der Weyden, Quinten Matsys, Mabuse, Rubens, Van Dyck
BRITISH	<i>17th century Portraitists</i> <i>18th century Portraitists</i> <i>Subject and Landscape Painters</i> , 18th to 19th century <i>Pre-Raphaelite School</i> , 1848-c.1900	Lely, Kneller Reynolds, Gainsborough, Romney, Raeburn, Lawrence Hogarth, Morland, Crome, Turner, Constable, Cotman, Wilkie, Watts, Millais Holman Hunt, Rossetti, Burne-Jones

matter was classical rather than religious. There is much in common between *The Last Judgement* of Michelangelo and the great decorations of Paolo Veronese.

The early Flemish and German schools, developing the oil medium more suited to the northern climate, painted altar-pieces rather than walls, and their paintings are therefore smaller and more intimate, as well as revealing the greater northern interest in individual character. Rubens and Van Dyck are in a class by themselves. Rubens, as one of the world's supreme painters, came near achieving the perfect blend of classicism and naturalism. In the Spanish school, religious subjects also predominate and the conventions are more rigid, until the emergence of Velasquez and his court portraiture. The Dutch school, little concerned with religion, developed the smaller "easel" picture to meet the taste of the rich merchants of the republic—portraits, landscapes, seascapes, scenes of everyday life—and evinced new skill in the representation and development of *chiaroscuro*.

French painting was largely eclectic until the time of Watteau, who, with his immediate followers, found congenial subjects in light fancies reflecting the mood of 18th century France. A return to severe classicism with David and Ingres accompanied the Napoleonic period, followed first by a romantic reaction, then by a reversion to realism, as expressed in the landscapes of the Fontainebleau group, e.g. Rousseau.

Influence of British School

The next inspiration came from England, which early in the 18th century had found its métier in portraiture; in the so-called "historical" subject picture as painted by Copley and West and later deadened out of all recognition by such Victorian painters as Maclise, until rescued by the short-lived revolution of the Pre-Raphaelites; and towards the end of the 18th century, in landscape. Constable and Turner, the latter reaching new heights of technical achievement in the representation of sunlight, often by the comparative elimination of almost everything else, had an enormous influence on the development in France of the Impressionist school, which in seeking to represent the effect of light upon an object rather than the object itself brought logical finality to the search after visual truth. From the time of the

Impressionists the French school consolidated the leading position it had steadily acquired during the 19th century. Subsequent developments in the art are described in the special section Painting in the 20th century. Consult *A History of Painting*, 8 vols., H. MacFall, 1911; *The Approach to Painting*, T. Bodkin, revised edn., 1946.

BRITISH PAINTING. Painting was a late development in England by comparison with Italy, the Netherlands, Spain, and even France, and the development of anything like a "school" with recognizable national characteristics began only as late as the 18th century. But there had already been founded a tradition in portraiture, fostered by the sojourn in England of Holbein, under the patronage of Henry VIII, and that of Van Dyck as court painter to Charles I. The influence of these two great masters, however, was unfavourable to the emergence of any indigenous spirit in painting. The earliest English portrait painters of any note were Samuel Cooper, the miniaturist; Lely, court painter to Charles II; and Kneller, painter of the beauties and celebrities of the reign of William III and Anne.

Hogarth and his Followers

The first great painter to break completely and deliberately with foreign influence and give utterance to the English genius by portraying the world around him in terms of his own comprehension was Hogarth, supreme painter of the human comedy, who painted the life of the people and recorded the manners and satirised the follies of his age. Yet his genius stands outside any mainstream of development. It had no immediate followers. Contemporaneously, a British school of portrait painters was arising, with Hudson and Allan Ramsay as its first leaders. It reached its culmination in the great trio who dominated English portraiture in the closing decades of the 18th century; Reynolds, Romney, and Gainsborough. The precepts of Reynolds, as given in his *Discourses* addressed to the students of the Royal Academy, were more questionable than his practice; for he preached a "grand manner" in painting based on the scholar's study of the Italian old masters, even in choice of subjects, but his own art was more akin to that of the Dutch school in its fidelity to what his own eyes observed, and in its emphasis on individual

character in portraiture. Gainsborough, who found favour at the court of George III, had never visited Italy, and paid homage to Van Dyck, but his own original genius shines out clearly in his superb portraiture.

Meanwhile there had been an awakening effort in landscape in the "topographical draughtsmen" of the style of Scott and Saundby, which eventually brought forth England's first great landscape painter, Richard Wilson. Gainsborough also held landscape to be his province rather than portraiture, and contributed prodigiously to its development in his portrayal of the English rural scene. Two painters from the American colonies, Benjamin West and Copley, created a native school of historical painting, while Cosway and Downman raised the art of portrait miniature to higher standards.

The Royal Academy

The founding of the Royal Academy in 1768 was the outward expression of this sudden surging of native genius. Reynolds was its first president, and Gainsborough, Wilson, and West were among the original members. From that time the story of British painting became closely identified with that of the Royal Academy, which has remained the strongest single influence in the art of the country. Against that influence there have been frequent revolts, but they have been revolts against an admitted authority; and if there was any merit in the revolt, sooner or later the authority has almost always overtaken and absorbed it. The number of English painters of the first rank who have successfully dissociated themselves from the Royal Academy is very small.

As the 18th century ended, there came to the front a younger group of portrait painters—Northcote, Beechey, Hoppner, Opie, Lawrence, and, towering above them all, the Scottish master Raeburn. Stubbs was painting sporting life, horses, and dogs. Morland recorded the life of the countryside, the tavern, the stables, the pursuits of rural folk. By the year 1800, all that was most vital in the world's painting was British. The landscape painters were creating pure impressions of nature in lyrical fashion. In Norwich, Crome was going direct to nature, developing from where the 17th century Dutch painters had left off. Girtin was playing a great part in changing the art of

water-colour drawing into that of water-colour painting.

In Turner the British race found its supreme genius in painting; in the realm of landscape the supreme artist of all time, the equivalent of Shakespeare in literature and Beethoven in music. He employed colour more poetically than it had ever been employed before. Constable, in pursuit of ways to depict even more faithfully and directly the English scene and even more the English weather, had a forceful influence on French landscape painting, as had the short-lived Bonington. Beside them may stand the landscape painters of the Norwich school, led by Crome and Cotman; the water-colourists Cox, De Wint, and Prout; and painters of the sea like Clarkson Stanfield. Landseer won deserved fame in painting animals, Wilkie in rendering Scottish home life.

The "Subject" Picture But this fine flowering died away, and British painting was in danger of becoming stereotyped, but for the new life given to it by the Pre-Raphaelites, led by Holman Hunt, Millais, and Rossetti. With all their faults (their greatest being a subservience to the manner as well as the spirit of the Italian painters), they brought back vitality by taking their canvases out of the studios into the open air. The Victorian tradition of "subject" paintings, intellectual and literary rather than visual in conception, like large-scale coloured book illustrations, also owed much to their influence. Frith (painter of Derby Day, The Railway Station, and Ramsgate Beach) was among the most successful painters of such works, and this was the aspect of Pre-Raphaelitism most clearly retained by Millais after the dissolution of the Pre-Raphaelite Brotherhood.

Out of the primitive academism of the Pre-Raphaelites, through the influence of Rossetti, there grew the aesthetic movement of the 'sixties, whose greatest exponent was Burne-Jones. Its conventions remained early Italian, and it has as little to do with the expression of national genius as had the classical academism of which first Leighton, then Poynter and Alma-Tadema, were leading representatives.

The rise of Impressionism in France had its inevitable echo in England, where Whistler, an American, combined the theories of Impressionism with the decorative quality of Japanese art and

exploited an exquisite gift for interpreting nature's twilight moods. The movement found many other sympathetic followers to apply the methods of Impressionism to the English scene, notably Wilson Steer and Sickert. By the end of the 19th century Impressionism was accepted, with headquarters at the New English Art Club rather than at the Royal Academy, but its ultimate inspiration remained French. The last native movement of the century was Scottish, centring on Glasgow and developed by George Henry, John Lavery, Arthur Melville, E. A. Hornel, and others. It owed something to the

early Impressionists, something to the growing regard for tonal relationship or "values" in painting, and a good deal to the eager spirit of independence. The riotous palette of Melville and the pattern painting of Hornel represented a marked advance in the decorative use of fresh, strong colour, which among English painters of the same period found its fullest expression in the work of Brangwyn. Consult British Painting from Hogarth's Day to Our Own, W. Grant, 1945; Introduction to English Painting, J. Rothenstein, 1947; An Outline of Eng. Painting, R. H. Wilenski, 1948.

PAINTING IN THE 20TH CENTURY

John Rothenstein, Ph.D., Director of the Tate Gallery, London Here, following the general article on the art of painting, is an account of the principal movements and influences which, developed since Cézanne, have affected the practice of painting in the contemporary world. See also Art, Contemporary, and illus.

The painting of the 20th century is distinguished by a weakening of tradition which is without precedent—a weakening regarded by a number of responsible critics as a prelude to dissolution. As a result of this waning of authority the arts have assumed a bewildering variety of forms.

At the beginning of the century a reaction against Impressionism was gathering force. Impressionism may be described, in one sense, as the culmination of an endeavour (which had been in progress since the Renaissance) to depict the commonly accepted truths of natural appearance as closely as possible. The power to describe form in its complexity and plenitude had been won. But to the following generation it seemed that this victory had been won at too great a sacrifice.

For this generation Cézanne—though the least didactic of men, who gave little counsel beyond the recommendation of a close study of nature—became the most influential painter of the age; his monumental but not unsensuous art proved to be a point of departure for the chief contemporary movements. These movements manifested in common, in despite of the advice of Cézanne, an ever more pronounced disregard for the commonly accepted truths of natural appearance. The new climate which they brought with them proved to be one in which not only the realistic tradition but all traditions tended to disintegrate.

In the 20th century movements in painting quickly lost their momentum and identity: the individual personality rather than the school

became more and more the sole intelligible field of study. This process of dissolution notwithstanding, it is still possible to distinguish certain general movements. The most persistent of these is one deriving from the uncompromising radical movement known as Fauvism, of which Henri Matisse (b. 1869) was the leader. The Fauves set themselves to create a frankly architectonic and decorative art. The architectonic derived from the severely structural elements in Cézanne, the decorative from the strong flat colour of Gauguin. But this radicalism rapidly went further, and resulted in an attempt to create an essentially geometric art without discernible reference to the visible world, an art of self-sufficient formal structures. The most uncompromising manifestation of this widely spread phenomenon was Cubism, of which the leaders were Georges Braque (b. 1881), Juan Gris (1887-1927), and Fernand Léger (b. 1881). The abstract art which Cubism tended ultimately to foster flourished in France and Spain, but it was less well adapted to express the less logical but intenser vision of the North. Under the original inspiration of Van Gogh and later of the Norwegian Edvard Munch (1863-1944), there grew up a movement known as Expressionism, distinguished by highly charged emotion, by frank preoccupation with human drama, and by a violent, strongly coloured method of painting. Munch, who is little known in England, exerted a widespread influence in Central Europe. It would be erroneous to over-stress the part played by race and

environment, however, in determining the character of an artist: thus Georges Rouault (b. 1871), the most powerful French painter of the age, may be said to be an Expressionist, while Germany gave birth, in Franz Marc (1880-1916), to a characteristic Cubist.

Picasso and Surrealism

There also emerged a third movement, in its essence intuitive and subjective. Pablo Picasso (b. 1881), who expressed himself in many different styles (he was prominent among the inventors of Cubism), is perhaps most typical as a subjective painter. Of all the revolutionary movements in the arts, this involves the most radical departure from the older traditions, for it renounces not only the representation of the appearance of things, but a concept even more fundamental, namely, rational modes of apprehension. Picasso has declared that he does not know in advance what he is going to put on the canvas, any more than he decides in advance what colours to use; that, while he works, he takes no stock of what he is painting; that he feels every time he begins a picture as though he were throwing himself into the void. Implicit in this statement is a total renunciation of the objective world, and a total turning inwards of the artist's vision, so that the contents of his own mind—his irrational fancies or his unconscious self—becomes the sole subject of his art. The art, entirely subjective, resulting from such an introversion may be described as one of free abstract symbolism. The influence of Freud in the creation of such an art is conspicuous.

Surrealism, a related but distinct development of subjective art, also derives directly from Freud. It is not, however, based exclusively upon the unconscious; it rather attempts, by the juxtaposition of dream imagery with meticulously rendered objects as observed by the conscious eye, to express, in all its variety and contradiction, the whole content of the mind. Loosely associated with this movement, but difficult to classify precisely, are Paul Klee (1879-1940), and Marc Chagall (b. 1887), both painters of poetic and highly personal fantasy.

During the earlier part of this period British painting cannot be said to have played an important part in the initiation of any of the successive movements by which the character of Western art has been determined, but all

of them have had significant exponents in Great Britain. Wilson Steer (1860-1942) and W. R. Sickert (1860-1942) were indebted to the Impressionists, J. D. Innes (1887-1914) and Augustus John (b. 1878) to Gauguin, Matthew Smith (b. 1892) and Duncan Grant (b. 1885) to the Fauves, Paul Nash (1889-1946) and Edward Wadsworth (b. 1889) first to the Cubists, later to the Surrealists. Surrealism and the abstract movements continue to exert an influence upon the younger generation, but their work, although it derives from the mainstream of Continental art, is not only highly personal but markedly national in feeling. During the Second Great War, when contact with the Continent was interrupted, the strong native spirit of romantic poetry asserted itself, stimulated by the emotional freedoms of contemporary European art.

The presence of this spirit in the work of Henry Moore (b. 1898), Graham Sutherland (b. 1903), David Jones (b. 1895), Edward Bawden (b. 1903), Eric Ravilious (1903-1943), John Piper (b. 1903), and Edward Burra (b. 1905) is sufficiently apparent. Its most obviously English expression is to be found in the work of Stanley Spencer (b. 1892), whose mural paintings in the memorial chapel of the Oratory of All Souls, at Burghclere, constitute one of the few major monumental works of art carried out in England during the present century.

The war had a further important effect upon British artists. They were, like other men, deeply moved by the spectacle of tragedy and ruin and struggle, and official patronage gave them every occasion to express their feelings and has even pointed the way to themes which have evoked in them an earnest response. As a consequence, many artists who might have seemed, before 1939, to have cultivated an esoteric vision, found, in their response to the war, a common ground of contact with the public, thus narrowing the lamentable rift which has tended to place the artist, increasingly immersed in theory or in personal idiosyncrasies, in a position of unprecedented isolation.

Painting and Decorating.

Painting is the application of paint for the protection from atmospheric action of the surface to which it is applied. Decorating is more specifically artistic in purpose. It includes the application of decorative washes and paints to

interior walls and ceilings, paper-hanging, stencilling, and decorative painting.

Various kinds of paint used for different purposes are described under Colour Mixing; Paint.

Brushes are of numerous types, but for fairly wide surfaces bevelled varnish brushes are best, and for narrow surfaces brushes called sash tools should be used. A special distemper brush should be used for applying distempers and colour washes. Good finishes can only be obtained with good quality brushes. After use they should be cleaned in methylated spirit and washed in warm soapy water. Surfaces must be clean and dry. Dirt causes harmful chemical action; moisture, too, may cause chemical action, and will certainly blister the paint film.

Old paint in bad condition is stripped with blow lamp and scraper, or a chemical stripper may be used. Bare wood, whether new or old, is glass-papered, and any holes or splits stopped with putty or special stopping. Loose or resinous knots are cut out and the holes plugged. Old paint in fair condition is washed down with weak soda or sugar soap, then with clean water, and if necessary rubbed with fine glass-paper to give a smooth surface. Iron and steel must have all rust and scale removed. Chisels, scrapers, and emery cloth are used for this.

The Three Coats

Standard practice is to use three coats: priming, under-coat, and finishing coat. The function of the primer is to cover or eliminate irregularities in the surface. On such surfaces as plaster and wood-work, apart from roughness, there is irregularity in the power of absorbing liquid media. The priming coat is therefore designed to satisfy these irregularities and to fill the pores of the surface, leaving a firm adherent coating of pigment which can, if necessary, be rubbed down and provide a secure foundation for the subsequent coat. The under-coat covers the surface and provides at once a foundation for the top coat and good adhesion to the primer. Paint films expand and contract with changes in temperature and humidity and considerable volume changes also occur during the drying and ageing of the film. Too great a difference in constitution between consecutive coats would result in corresponding great differences in such changes and consequent danger of separation. The design of coatings so as to provide a reasonably

graded change of properties from top to bottom is therefore an important matter.

A red lead paint is often used as a primer on wood and iron. Special primers are made for use on plaster surfaces, though new plaster does not take oil paint well. On old paint in good condition one coat of the same colour, after cleaning, is enough. For exterior work a finish of one coat of outside varnish is a good protective. Aluminium paint adheres well to metal; and is a good primer on both metal and wood; a special heat-resisting grade is made for painting radiators.

The application of paint by brush is too slow for use in mass production methods, and in many cases would not give such satisfactory results.

Dipping is suitable when the article is such that the paint can run off uniformly and also where the function of the paint is essentially protective, for the paint penetrates every part of the surface including those which the brush could not reach. It is used for such things as carriage and motor parts and is particularly adapted where drying is effected by stoving. The articles are hung on a travelling belt which carries them through the paint bath and thence through the drying chamber without further handling.

Flowing is used on large flat surfaces, e.g. the sides of wagons. The paint is applied at the top, flows over the surface, and drains into a trough from which it is pumped up for future operations.

Spraying is mainly used in the application of lacquers which dry entirely by evaporation, e.g. cellulose lacquers. It can be used also for applying oil paint. The paint is forced through a fine nozzle in the form of a spray. The paint thus impinges on the surface with considerable force and most of the volatile solvent is rapidly evaporated. This method, in conjunction with quick drying paints and lacquers, is capable of giving the rapid completion necessary to keep pace with the speed attained in other stages of mass production, as in the motor industry.

Graining is the imitation in paint of natural wood grain. Oak and mahogany can be imitated on cheap whitewoods. Usually a buff-coloured ground is applied to the priming coat, and is followed by the graining coat, of the colour of the wood to be imitated. Before the latter dries, it is brush grained with a dry brush or combed with

a steel comb. Grain figure should be imitated but not the knots, which are defects.

Staining is usually done in imitation of a hardwood. Thus, there are oak and mahogany stains. Water stains, though easily applied, raise the grain. Spirit stains are better, but show the joins. Oil stains are best. Both oil staining and graining should be finished with a coat of hard clear varnish. (See also French Polishing.)

For decorative work, egg-shell matt finishes, high gloss enamels, cellulose paints, plastic paints (giving a rough-textured finish, and manipulated with special brushes), and graining are widely used.

In decorating walls, oil paint on plaster and concrete surfaces may be attacked by free lime in the wall, especially in new work. Special plaster and wall primers are made to give protection from free lime. Asbestos-cement also needs a special primer.

PAPERHANGING. Suitable decorative paper can be applied to walls and ceilings with an adhesive. The plaster surface should be smooth and defects should be made good. On new plaster a coat of size should be given to stop the pores. Paste is sold ready-made for admixture with water, but a flour and starch paste is good. Wall paper is supplied in rolls or "pieces," $11\frac{1}{2}$ yds. by 21 ins. wide. Plain, patterned, and embossed papers are made. For small rooms, neat unobtrusive patterns and plain stipple embossed papers are usually preferred. On a bad surface a lining paper should be used, the wallpaper being pasted over it. Lining paper can be distempered if desired.

The paper is placed on a boarded trestle table for pasting. In placing it on the wall, the top right hand corner is attached first against the picture rail or a ruled line, the left hand corner is raised or lowered to bring the paper plumb, and the dry brush used to

press it on to the wall, working from the top downwards.

For attaching to ceilings, the paper is folded, concertina fashion, over a roll which is lifted with one hand while the end is attached with the other.

Joints are made to lap into the light, so that no shadow is cast by the outstanding edge. This is achieved by starting the papering nearest the largest window.

Lincrusta and other embossed materials are stiffer than paper, and can be oil painted if desired. The sheets are fixed in place with adhesives.

Paisiello, GIOVANNI (1741-1816). Italian composer. Born at Taranto, May 9, 1741, he studied at Naples and there began to compose. During 1776-84 he was in the service of Catherine of Russia, after which he returned to Naples, where for 12 years he was master of music to Ferdinand IV. He attended the court of Napoleon during 1802-03. He died June 5, 1816. Paisiello's 94 operas included *The Barber of Seville* (supplanted by Rossini's), and he composed church music.

Paisley. Mun. burgh, river port, and market town of Renfrewshire, and fifth town of Scotland.

Paisley arms

It stands on the White Cart, near its union with the Clyde, and is served by five rly. stations, being 7 m. W. of Glasgow. Renfrew airport is a mile distant. The old town is on the W. of the river and the new town on the E. The parish church is the abbey, restored to its former magnificence; it includes a chapel which contains tombs of some of the Stuarts. There are a town hall, municipal buildings, county buildings, observatory, free library, and museum. There is a grammar school of 1576 and a technical school.

Paisley, Renfrewshire. View of this old Scots town showing Paisley Abbey, which is also the parish church, and the Clark Town Hall

The chief industry is the manufacture of thread, for here are large mills of the firm of Coats. Other manufactures include dyeing, bleaching, distilling, and making carpets, chemicals, starch, soap, preserves, etc. Shipbuilding and engineering are carried on. There is a harbour, and owing to the deepening of the river large vessels can reach the town.

Originally called Passeleth, Paisley grew up around an abbey founded about 1160. With its extensive lands it was given to a layman at the Reformation. In 1488 it was made a burgh. About 1700 it began to be a manufacturing centre, famous shawls being made; but the introduction of cotton thread industry about 1810 laid the foundation of its real prosperity. In the "Paisley panic," Dec. 31, 1929, many children were killed in a cinema after an alarm of fire. Paisley is administered by a burgh council and has one M.P. Market day, Mon. Pop. est. 92,400.

Paithan. Town of Hyderabad, India, in Aurangabad dist. It stands on the Godavari, 30 m. S. of Aurangabad, on the border of Bombay state. One of the oldest cities of the Deccan, it formerly had a great reputation for its excellent silk goods. Pop. 12,500.

Pakenham, FRANCIS AUGIER PAKENHAM, 1ST BARON (b. 1905). British politician. Son and heir

Lord Pakenham,
British politician

presumptive of the 6th earl of Longford, he was born Dec. 5, 1905, and educated at Eton and New College, Oxford. He worked at first for the Conservative party, but developed Labour views while a lecturer, and from 1934 was student in politics at Christ Church, Oxford. During the Second Great War he was forced by ill health to resign an infantry commission, and was personal assistant to Sir William (Lord) Beveridge, 1941-44. He was made a peer in 1945, under-secretary for war in 1946, and next year chancellor of the duchy of Lancaster, with responsibility for administration of the British zone of occupation in German. In 1948 he became minister of civil aviation.

Pakistan. A self-governing dominion of the British Commonwealth. It came into existence on Aug. 15, 1947, with the transfer of

British sovereignty in India to the two newly created dominions of India and Pakistan. It consists of the provs. of Punjab (W. Punjab until 1950), capital Lahore; E. Bengal (including the Sylhet dist. formerly in Assam), capital Dacca, chief port Chittagong; N.W. Frontier, capital Peshawar; Sind, capital Karachi (capital also from 1948 of Pakistan); and Baluchistan. E. Bengal is often referred to as East Pakistan.

Bahawalpur and Khairpur, the Baluchistan states of Kalat, Las Bela, Kharan, and Mekran, and the N.W. Frontier states of Amb, Chitral, Dir, Phulera, and Swat acceded during 1947-48.

Total area, 360,000 sq. m. Pop. (est. 1950) 81,500,000.

The movement for Pakistan, originated by C. Ramat Ali of Cambridge University in the U.K. during the round table conferences of 1930-31, aimed at the creation of a separate sovereign state composed of the predominantly Muslim areas of the sub-continent of India, i.e. Punjab, Afghanistan and the N.W. Frontier prov., Kashmir, Sind, and Baluchistan, the name Pakistan, later interpreted as the land of the pure (Urdu *pak*, pure), being formed from the italicised letters. In 1940 the founder added Bengal, Assam, and Hyderabad to this list.

The movement at first attracted little attention either in India or in the U.K.; but in 1940 the Muslim league, under the leadership of M. A. Jinnah (q.v.), passed a resolution declaring that the Muslim league majority regions must be grouped "to constitute independent states."

Muslim opinion was far from unanimously in favour of the partition of British India, but Cripps's mission of 1942 failed chiefly because the Muslim league insisted on an independent Pakistan and the Congress party opposed partition. All later efforts to produce a scheme for the transfer of power to Indian hands proved abortive for the same reason until Lord Mountbatten, sent out as viceroy in 1947, persuaded the British govt. that transfer to a united India was impracticable.

Jinnah was appointed first govt. gen. of Pakistan, and on his death Sept. 11, 1948, Khwaja Nazimuddin, premier of E. Bengal, was chosen to succeed him. Drawing up of a constitution proceeded slowly. Appeal to the British privy council in civil cases was abolished in 1950. Prohibition was intro-

duced in Sind and W. Punjab in 1949, in E. Bengal in 1950.

Disputes with India over small parts of the boundary between E. and W. Bengal and E. Bengal and Assam were settled by a joint judicial tribunal under Swedish chairmanship Feb., 1950. For other disputes with India, see India, Republic of; Kashmir.

Pakokku. Dist. and town of Upper Burma, in the Magwe div. The dist., which covers 6,210 sq. m., lies N. of Minbu, W. of the Irawadi. Oil seeds, pulses and a little rice are grown. The Yenangyat oil fields yield petroleum. Pop. 559,871.

The town is on the right bank of the Irawadi, below the Chindwin confluence, and is the centre for the timber trade in logs floated down this tributary; there is also boat building. In Japanese occupation since May, 1942, it was recaptured by Gurkha and Indian troops, March 7, 1945. Pop. 30,000.

Palace of Peace. Building between The Hague and Scheveningen, designed to house the permanent court of arbitration created by the peace conference of 1899. In 1903 an endowment of £300,000 for its erection was made by Andrew Carnegie (q.v.), and the building, designed by the French architect Cordonnier, was begun in 1907 and inaugurated on Aug. 28, 1913, by the queen of the Netherlands in the presence of the representatives of 42 states. Its grounds cover 16 acres, and the building, in brick and stone in the Flemish-Dutch style, is about 260 ft. square. See Hague, The.

Palace Theatre. London playhouse, in Cambridge Circus, W.1. Planned as the home of British opera by D'Oyly Carte, it was designed by T. E. Colcutt, and opened as the Royal English Opera House, Jan. 31, 1891, the first production being Sullivan's *Ivanhoe*. A few months later Sarah Bernhardt gave a season. The interior was then altered, and the house reopened in 1892 as the Palace Theatre of Varieties. Maud Allan made her London debut here in 1908, and Pavlova in 1910. Herman Finck was musical director from 1900-21. During the First Great War light musical shows were introduced, and notable later successes were *No, No, Nanette*, 1925; *Anything Goes*, 1935; and a series of Hulbert-Courtneidge shows 1941-42. The theatre seats 1,380.

Palace Yard. OLD. Open space between the British houses of parliament and Henry VII's

Palace Yard, Westminster. The Old Yard, looking towards S. Stephen's Hall, with peers' entrance on right

chapel. Here Guy Fawkes and Raleigh were executed and Prynne was pilloried. Chaucer and Ben Jonson are believed to have lived in houses that once stood near. The statue of Richard Coeur de Lion by Marochetti was erected in 1860. The peers' and visitors' entrances to the houses of parliament are in Old Palace Yard. New Palace Yard is a railed-in space N. of Westminster Hall, forming the members' entrance to the house of commons. See Westminster.

Palacio Valdes, ARMANDO (1853-1938). Spanish novelist. He was born at Entralgo, Asturias, Oct. 4, 1853, becoming a journalist and editor of *Revista Europea*, in which his first essays appeared. His first novel, *El Señorito Octavio*, 1881, was followed by *Marta y Maria*, 1883; *El Cuarto Poder* (The Fourth Power), 1888; *La Hermana San Sulpicio*, 1889; *La Espuma* (Froth), 1892; *La Aldea Perdida*, describing his native region, 1902; *Los Carmenes de Granada*, 1928; *Tiempos Felices*, 1933. His fiction shows a deep love of nature and sympathy with the working people, and is sometimes satirical at the expense of the more frivolous members of society. He died in Feb., 1938.

A. Palacio Valdes.
Spanish novelist

Paladin (Lat. *palatinus*, belonging to a palace). Word, a variant of palatine, meaning a courtier or member of the royal household. It is known, however, especially because it was used for the 12 legendary figures—peers, as they are called—who are supposed to have gone with Charlemagne to Spain. Owing to the glamour that surrounded them the word was afterwards used for a knight

are presumably the descendants of ancestors which lived in an earlier period of the earth's history, and were themselves descended from still older types.

The vegetation of which we know most is that of the coal period. Palaeobotanical research has revealed the existence in the forests of the coal period of genera exhibiting a combination of characters which are now distributed among different families or groups. These extinct generalised types demonstrate a close affinity between certain groups which in their modern representatives show little indication of relationship.

The oldest rocks in the earth's crust contain no fossil plants, but their absence does not necessarily mean that there was no vegetation when the strata were in process of formation; probably both animals and plants existed, but such remains as were entombed in the oldest sedimentary rocks have been rendered unrecognizable, or completely destroyed in the course of the repeated foldings of the earth's crust. The most ancient undoubted plants so far discovered are more highly organized than one would expect of members of a primitive flora; their advanced stage of differentiation suggests that they were preceded by earlier phases of plant evolution.

There were no flowering plants in the forests of the carboniferous epoch, but many trees were members of the class Pteridophyta, which includes the ferns, club mosses (*Lycopodium*), and other genera, horsetails (*Equisetum*), and other types. Many of these plants had the dimensions of fairly large trees, and differed considerably both in size and their greater complexity of structure from their relatively small and herbaceous descendants at the present day. There were also many plants in the

of exceptional gallantry. See Palatine; Roland.

Palaeobotany (Gr. *palaios*, ancient; *botanē*, plant). Study of the plants of former ages. After the publication of Darwin's *Origin of Species* in 1859, the investigation of the remains of extinct animals and plants assumed a new significance. The plants of today

coal period, which in some respects presented a close resemblance to some existing ferns, but differed from them in certain characters, and, more especially, in the production of true seeds; these genera are included in the class Pteridosperms instituted for palaeozoic fern-like plants bearing seeds. The Pteridosperms are of special interest, because the production of seeds is now the monopoly of plants higher in the scale than the ferns and their allies. See Botany.

Palaeogene Deposits. In geology, name given to Older Tertiary deposits. See Tertiary.

Palaeogeography. Study of the distribution and changes of land and sea areas and variations in climatic conditions in past geological times. The character of the rocks laid down yields information regarding the conditions under which they were deposited—in shallow water, lakes, or as sand dunes, etc. The fossil content indicates changes in conditions, as well as dating the age of deposits, and relates the science to that of Palaeontology (*q.v.*).

Palaeography (Gr. *palaios*, ancient; *graphein*, to write). Study of ancient handwriting. It concentrates upon the forms of writing in inscriptions on plant materials, such as papyrus, vellum, and paper. That branch of it which concerns inscriptions on hard materials, such as stone, metal, and wood, is called epigraphy. With undated MSS., palaeography is often able to decide problems of date by considerations of style. It is also of decisive importance in determining the genuineness of documents.

Ancient MSS., mostly in the form of rolls, tablets, or books, sometimes occur on leaves, bark, linen, potsherds, and wood boards. The writing implements were pointed, split, or frayed reeds, stiles and quills, the hairbrush being of Chinese invention. The scripts tend to become running or cursive hands, as distinct from the stiffer and more formal characters demanded by the art of stone-chiselling. Hence the hieroglyphic characters of Egyptian stone inscriptions passed, even in the 1st dynasty, into hieratic, and in the XXVIth dynasty into demotic.

Greek palaeography is traceable through numerous examples, especially on papyrus and vellum, from the 4th century B.C. down to the introduction of printing into Europe. Beginning with uncial or capital letters, it passed into minuscule or small-hand. Of this

two styles were in use: book-hand, which displaced papyrus by vellum in the 4th century of our era, and non-literary cursive, which was employed for the ordinary business of life. Slavonic hands descend from 9th century Greek forms.

Latin palaeography is of wider importance, because it deals not only with Roman scripts, uncial and minuscule, but also with those national hands which grew out of them in every part of Europe. By 800 there emerged the Carolingian hand, greatly influenced by Alcuin of York's youthful familiarity with English writing. This became the standard calligraphy of W. Europe, as distinct from the rugged Germanic black letter, until the dissemination of the Italian hand during the Renaissance. The non-literary cursive and the court-hands, which developed side by side with the book-hands, are the precursors of the various modern systems of calligraphy, which in their turn are being affected by the growing use of the typewriter.

The methods of European palaeography have been utilised for the study of non-European hand-writings. Among these the most important are Hebrew, Syriac, Coptic, Arabic, Persian, Indian, Pali, and Chinese. See Anglo-Saxon Chronicle; Bible; Codex; Graffiti; Ostraca; Uncial; Writing. Consult History of the Art of Writing, W. A. Mason, 1921.

Palaolith (Gr. *palaios*, ancient; *lithos*, stone). Stone implement or weapon of the early Stone Age. Intermediate in workmanship between colths and neoliths, they were produced by chipping and flaking flints and other hard stones. Unpolished products were used as hand-axes, hammers, scrapers, borers, cutting tools, javelin heads, and saws. See Flint Implements.

Palaolithic. Term introduced by Lubbock, afterwards Lord Avebury, to denote the older phase of the prehistoric Stone Age civilization which preceded the use of metals. This phase was itself preceded by the Eolithic, characterised by the production of still cruder stone implements called colths, and was followed, after an intermediate or Mesolithic period coinciding with the end of the last ice age and the appearance of forest and forest fauna in Europe, by the Neolithic Age.

In prehistoric Europe and N. Africa evidence drawn from the development of style, the relative position of stratified remains, and their association with the bones of extinct animals, has enabled the

Palaolithic Age to be divided into six consecutive periods: Lower and Middle: Abbevillian (Chellean), Acheulian, Mousterian; Upper: Aurignacian, Solutrian, Magdalenian. Each is marked by characteristic types of flint working, and by an advancing growth of material achievement, fine art, including the impressive series of Magdalenian cave drawings in N. Spain and France, and of social organization.

The Palaolithic Age coincided with the Pleistocene geological era, and lasted for many thousands of years. Remnants of its type of culture survived up to the 19th century at the farthest land extremities of the earth, as in Tasmania and Tierra del Fuego. See Anthropology; Art: Prehistoric and Primitive; Man; Stone Age.

Palaologus. Name of a Byzantine family, which founded the last dynasty of East Roman emperors, lasting from 1261 to 1453. Michael VIII (1261-82), emperor of Nicea, overthrew the Latin empire, and recovered Constantinople from Baldwin II. A successful soldier and administrator, he in vain endeavoured to heal the schism between the Eastern and Western Churches. He was succeeded by Andronicus II and III (q.v.). John V (1341-91), who until 1355 had to acknowledge John Cantacuzene (q.v.) as emperor, was afterwards dependent upon the sultan of Turkey for his position. Manuel II (1391-1425), immediately after his accession, became engaged in hostilities against the Turks. Alarmed for the safety of Constantinople, which was being besieged by Bayazid, Manuel sought the aid of Western Christendom. In response to his appeal, an army commanded by the Roman emperor Sigismund set out to help him, but Bayazid gained an overwhelming victory at Nikopolis in 1396. Manuel then came to terms, but the capital was in constant peril until the defeat of Bayazid at Angora in 1402. From that time during the reign of Mohammed I, the son of Bayazid, Manuel was at peace.

On the accession of Murad II, Constantinople was again besieged, and Manuel, forced to agree to a humiliating treaty, retired to a monastery, where he occupied himself with the composition of theological works. John VIII (1425-48), to stem the threatened advance of the Turks, endeavoured to obtain help from the West by renewing the attempt to heal the ecclesiastical schism. An agreement was

actually concluded in 1438, but was rendered useless by the opposition of the Greek clergy and the people of Constantinople. The last representative of the family was Constantine Palaologus (q.v.), with whom the East Roman empire came to an end in 1453.

Palaontology (Gr. *palaios*, ancient; *onta*, beings; *logos*, science). Study of past life on the globe, especially as revealed by fossil remains. The term embraces the study of fossil plants, palaeobotany (q.v.), as well as of fossil animals, palaeozoology, but is often used of the latter alone. The description of the fossil organisms themselves is called palaeontography.

Palaontology subserves the invaluable purpose of establishing the relationship in time of the stratified rocks. Documentary evidence furnished by fossils shows that the earth's crust has passed through three great time-divisions or eras, called Palaeozoic, Mesozoic, and Cainozoic, to denote ancient, middle, and recent life respectively.

It has supported with overwhelming evidence the view propounded by Darwin that the history of life is one of orderly development. Life cannot be traced to its first beginnings, and many links connecting species with species, or class with class, are missing. But some remain however, such as Archaeopteryx, which helps to explain how reptiles developed into birds.

Geographical distribution of animals and plants is the result of migrations, often in remote geological time. The presence of opossums in S. America, all other pouched mammals being confined to the Australasian region, becomes intelligible when it is shown that marsupials originated in Europe, whence they spread to mesozoic America, probably reaching Australia over an Antarctic land-bridge. The lemurs of Madagascar are explained by an eocene land-bridge which connected the island with either Africa or India.

Study of fossil forms throws light upon the changes from epoch to epoch in the relation of land to water, variations of climate and rainfall, etc.; this is the study of palaeogeography. The presence of the hippopotamus in pliocene East Anglia betokens a tropical temperature; that of the woolly rhinoceros in the Thames valley later on proves sub-arctic conditions. Fresh-water organisms have enabled vanished lakes and

ivers to be mapped, while marine faunas in overlying beds point to forgotten seas.

Lastly, palaeontology yields interesting evidence concerning the physical history of man. The fossil bones of primeval man and his forerunners are rare. But when associated with those of mammals long extinct they enable valuable

Palais Royal, Paris. The main building of the old Palais Royal, now occupied by, and called, the Conseil d'Etat

conclusions to be drawn, not only concerning the great antiquity of the human race, but also concerning the environment in which man wrought out to a final issue the age-long struggle for the primacy of the world. *See* Evolution; Fossils; Geology; Stratigraphy; consult Textbook of Palaeontology, K. A. von Zittel and C. R. Eastman, vol. 1, 2nd ed. 1913, vol. 2, 1902; The Age of Mammals, H. F. Osborn, 1910; Invertebrate Palaeontology, H. L. Hawkins, 1920; Outlines of Palaeontology, H. H. Swinerton, 1947.

Palaeezoic. Name given to the era containing the earlier fossiliferous geological systems from the Cambrian to the Permian. The term includes the Cambrian, Ordovician, Silurian, Devonian, Carboniferous, and Permian periods, and rocks of these periods contain fossils of the earliest known forms of life. *See* Cainozoic; Mesozoic.

Palaephatus. Greek writer, under whose name is preserved a small work entitled Concerning Incredible Things. It contains a collection of myths, accompanied by allegorical interpretations. He is supposed to have been a native of Egypt or Athens, and to have lived in the 3rd century B.C. He has also been identified with Palaephatus of Abydos, a friend of Aristotle and the author of several historical works. The work was at one time a favourite schoolbook.

Palaestra (Gr. *palaistra*, wrestling school). Word used in various senses: (1) A place where Greek boys were taught gymnastic exercises; (2) part of the gymnasium reserved for wrestling bouts; (3) later, the gymnasium itself.

Palagonite. Dark yellowish-green alteration product of glassy basaltic lava. It usually occurs in ash or tuff beds, and also among the red clays on the bottom of the sea. It is found in Iceland, Sicily, and the Canary Isles.

Palais Royal. Palace in Paris. It was designed by Lemercier for Richelieu. The original building,

begun in 1629, consisted of an entrance front, with a courtyard enclosed by buildings behind it, continued in a main court, with gardens, now public, at the rear. During Richelieu's life it was known as the Palais Cardinal. The palace suffered from restoration, and in 1871 part of it was destroyed. It was subsequently the home of the Orléans family, and later housed the *Conseil d'Etat*.

Palamedes. In Greek legend, a hero who fought on the Greek side in the Trojan War, noted for his sagacity and inventiveness. He is not mentioned in Homer. Hated by Odysseus, he was put to death on a trumped-up charge of treachery. *Pron.* Palla-mee-deez.

Palamkotta, PALAMCOTTAI, OR PALAYAM-KOTTAI. Town of Madras state, India, in Tinnevely dist. An inland town, it is the dist. headquarters, an important road junction, and on the rly. line from Tuticorin and Madras to Travancore. Pop. 30,967.

Palanpur. Town and former state of India, the latter now merged in Bombay state. Its area (1,794 sq. m.) lies between Baroda and Rajputana, and is crossed by the rly. from Mehsana to Ajmer. Wheat, rice, and sugar-cane are grown. The town, 83 m. N. of Ahmadabad, is a rly. junction for the branch line to Deesa. Pop. of former state 315,855; town, 18,000

Palanquin OR **PALKI** (Skt. *paryanka*, a bed). Eastern conveyance for one person, in the form of a litter, borne on the shoulders of two, or more generally four men, by means of poles passed through rings at each end. Originally open,

it is now an enclosed box, with sliding panels or latticed shutters.

Palar. River of Mysore and Madras, India. It rises in Mysore, cuts through the E. Ghats and reaches the Bay of Bengal, 50 m. S. of Madras city. Usually all the water is used for irrigation, and none flows to the sea. It supplies the Kolar goldfields. The chief engineering work is the anicut or dam at Arcot. The length of the river is 230 m.

Palate. Roof of the mouth, separating the cavity of the nose from the mouth. It consists of the hard palate in front, formed mainly by the two palate bones, and the soft palate behind, consisting of muscular tissues between two layers of mucous membrane. It is prolonged into a pointed structure, the uvula, which hangs downwards and can be seen at the back. The soft palate shuts off the pharynx from the cavity of the mouth. Inspection of this will give information as to the health of sinuses and neighbouring tissues. During the

Palate. Diagram indicating relative positions of the teeth and the palate bones

act of swallowing food or of coughing, the soft palate is drawn up so as to cover the entrance of the nasal cavity. *See* Anatomy; Cleft Palate; Mouth.

Palatinate (Ger. *Pfalz*). Area in S.W. Germany. This historic name comes from its ruler, the most important of palatine counts deputising for Frankish monarchs before Charlemagne. In 1156 the

Palanquin of the type which is in common use in China

emperor Frederick I invested his brother Conrad with the territory and the title of count palatine of the Rhine. As a principality the country covered about 3,300 sq. m.; as part of Bavaria before the Second Great War it covered 2,120 sq. m. It was ruled from Heidelberg, where its sovereigns, from 1,228 members of the Wittelsbach dynasty, developed political and cultural activity. They produced two emperors, also the hapless "winter king," Frederick, son-in-law of James I of Great Britain. They introduced Protestantism in 1556.

France laid claim to the Palatinate inheritance and devastated the country in 1689. In 1777 the Bavarian Wittelsbachs united the Palatinate with their mainlands, part of which, around Regensburg, had been called the Upper Palatinate. Temporarily joined to France, the Palatinate, after ceding parts to Baden, Hesse, and Prussia, was set up as a Bavarian province in 1815. It was occupied by French forces after both Great Wars. In 1946 it became part of the *Land* of Rhineland-Palatinate (*q.v.*). Wine and tobacco are grown. The capital is Speyer (Spire). See Bavaria.

Palatine (Lat. *palatium*, a palace). Literally, someone belonging to the palace, and therefore a servant of the ruler. In the Roman Empire the title was given to certain officials sent out by the emperors to discharge special duties, and this use passed into France and Germany, where counts palatine appeared about the 8th century. These were more directly the representatives of the sovereign than were the ordinary counts. Their territories were called palatinates. The most important was the one that grew into the Palatinate of the Rhine.

The word, used in practically the same sense, passed into England soon after the Norman Conquest. The earls of certain counties, generally those on the borders, such as Durham and Cheshire, were given special privileges, and these were known as counties palatine. Other counties palatine were Lancashire, given the privilege in the 14th century, Shropshire, Pembrokeshire, and Kent. Durham, Cheshire, and Lancashire were, however, the only ones that retained their special privileges for any length of time, and traces thereof still remain.

Palatine Hill (anc. *Mons Palatinus*). One of the seven hills of Rome. The name is derived from Pales, the goddess of shepherds,

who was worshipped here. Originally it comprised two summits, 168 ft. and 165 ft., separated by a saddle, but during the development of the city the shape has been modified. It was the site of Roma Quadrata, the "square" town, so called from the shape of the Palatine, which contained the fig-tree and thatched hut of Romulus. Parts of the walls are still to be seen. When other hills were included, Roma Quadrata developed into the Septimontium, or circuit of the seven hills. In republican times the hill was a residential quarter; Augustus and Tiberius had palaces there, and Nero's Golden House extended from the Palatine to the Esquiline. Slight excavations were made in the 16th century; many works of art were laid bare and carried off to other Italian cities from the central area in 1721-30. Systematic excavation has been continued by the Italian government since 1870. See Rome.

Palau Islands. Name for the group of Pacific islands more often called Pelew Islands (*q.v.*).

Palauing. Burmese name for aboriginal tribes of Mon-Khmer speech in upper Burma. Calling themselves Ta'ang, numbering about 150,000, and allied to the Wa, they are hill-dwellers, mostly in Tawngpeng, Mongmit, and other Shan states, as well as the E. of the Ruby Mines dist. They were driven out of the Irawadi and Mekong headwaters in recent times by Shan and Kachin pressure. Outside their chief settlements they are usually called Pales.

Palawan or PARAGUA. Island of the Philippines. Situated to the W. of the more important islands of this group, it is about 270 m. long and from 4 m. to 15 m. wide, and has an area of 4,550 sq. m. Its dependent islands, which stretch away to Borneo, cover an additional 1,210 sq. m. Palawan is mountainous and well wooded and has a number of short, rapid rivers and excellent natural harbours. Resin and timber are exported.

In Japanese occupation since their conquest of the Philippines in May, 1942, Palawan was developed as an air base which controlled the Sulu sea and also the sea lanes between Japan and her conquests in S.E. Asia and the E. Indies. U.S. troops landed on the island March 1, 1945, and, meeting little opposition, seized Puerta Princesa, the chief town, and two airfields near by. Five survivors of a camp near Puerta Princesa, where 150 U.S. army

and navy prisoners had been held since the fall of Bataan, told how just before the U.S. landings the prisoners had been herded into a barracks which the Japanese had drenched with paraffin and set on fire, machine-gunning and bayoneting those who tried to break out. The R.A.A.F. had a base on Palawan in the last months of the Second Great War.

Palazzolo Acreide. Town of Italy, in Syracuse prov., S.E. Sicily. It is 27 m. W. of Syracuse city on the main road to Palermo. An ancient town founded by Greeks from Syracuse as Acorae in 664 B.C., it was later known as Placeolum, Balensul, and El-Akrat. Tombs of all periods, a small theatre of late Greek origin, and a temple of the dead occupy the old acropolis. Pop. est. 15,000.

Pale. In heraldry, a broad band, placed vertically, and occupying a third of the shield. It is

Pale, in heraldry

one of the ordinaries (*q.v.*). If a shield is divided down the middle by a vertical line it is said to be per pale. A shield divided by a number of vertical lines

is paly, the number of divisions being specified, but if there are two such lines the shield is described as tierced or tiercy. A row of charges placed one above the other are described as in pale. See Heraldry col. plate.

Pale (Lat. *palus*, stake). Term applied to that part of Ireland, in Dublin, Kildare, Meath, and Louth, where English law prevailed as opposed to the Celtic portion of the island. The Pale dated from the time of Henry II, though it did not bear the name until the 14th century. In the time of Henry VIII the boundary was formed by Dalkey, Tallaght, Kilcullen, Naas, Killocock, Sydan, Ardec, Derver, and Dundalk, but with the complete conquest of Ireland under Elizabeth the Pale disappeared. The term is now applied to any portion of a country whose inhabitants live under a different system of government from that of the country generally. "Outside (or beyond) the pale" is a figurative phrase. See Ireland.

Palembang. Town, river, and district of Sumatra, Indonesia. The town is 54 m. from the sea in the S.E. of the island; below the town the river, also called the Musi, flows through an extensive

area of marshland. The chief commercial centre of the island, it trades chiefly in coffee and pepper, particularly with Malays, Arabs, and Chinese, who reach the city by water. Many of the houses are

Palencia, Spain. Interior of the cathedral of S. Antolin, showing entrance, at foot of altar, to cave in which the saint lived

erected upon floating platforms. A fine mosque (1740) and an ancient palace are of interest. Much of the district is forest; here are oil wells and refineries. It became Dutch in 1825. The district has an area of 33,342 sq. m. and a pop. of 1,098,725. Town pop. 109,069. After the Japanese conquest of Netherlands Borneo during the Second Great War, some 700 parachute troops landed at Palembang, Feb. 14, 1942, followed the next day by sea-borne forces. There was fierce fighting round the town, which was captured by Japanese troops on Feb. 16, after the oil wells and refineries had been wrecked. Palembang was bombed on several occasions by Allied aircraft during the Japanese occupation, which continued until Sept., 1945, following the surrender of Japan.

Palencia. Prov. of Spain. It is in the N.W., S. of the Cantabrian Mts., from which many streams drain to the Pisuerga, which forms the N.E. boundary and crosses the S.E. of the province. The S.W. contains the marshy Laguna de la Nava in the Tierra de Campos. It formed part of Old Castile, and is scantily peopled. The N. is forested, and cereals, flax, wine, and oil are produced in the S. valleys. It manufactures rugs, paper, porcelain, and leather. Three rly. routes converge on the Pisuerga valley

close to the S. boundary. Area, 3,093 sq. m. Pop. est. 222,665.

Palencia. Walled city of Spain, the ancient Pallantia. It is the capital of Palencia prov. and stands on the Carrión river, 10 m. above its confluence with the Pisuerga, and on the E. edge of the treeless, wind-swept Tierra de Campos. The late Gothic and Renaissance cathedral was begun in 1321, and has a valuable collection of Flemish tapestries. The university, founded in 1208, was transferred to Salamanca in 1239. Shawls, blankets, chocolate, and bricks are manufactured. To the N.E. of the town is the Dominican convent of San Pablo, founded in the 15th century. The capital of the ancient Vaccaei, Palencia in the 12th century became the seat of the Castilian kings and of the Cortes. Pop. 19,540.

Palenque. Ancient city of Mexico. One of the centres of Maya civilization, its extensive ruins are near the village of Santo Domingo del Palenque in the state of Chiapas. Remains of a number of buildings have been found, and it is thought that many more exist in the surrounding forest-clad country, for evidently the city was of great size. Of the buildings the largest is called the palace; and the others were presumably temples. Of the palace the remains of the tower form a notable feature. More remarkable, perhaps, are the bas-reliefs, while other decorations are in the form of tinted reliefs in stucco. Another object of interest is an arched waterway, nearly 600 ft. long.

Palenque, Mexico. East front of one of the wings of the ancient Maya palace

Work on the ruins began in 1750. See *Maya*; Mexico; consult *Ancient Cities of Mexico*, W. H. Holmes, 1895.

Paléologue, MAURICE GEORGES (1859-1944). French diplomatist and historian, born in Paris, Jan. 13, 1859. Minister in Sofia 1909-13,

he was then ambassador in St. Petersburg until the revolution of 1917, and later permanent under-secretary of the French Foreign office. As biographer of de Vigny, Talleyrand, and Metternich, and with his own memoirs, he won fame and was elected to the Academy in 1928. He died Nov. 21, 1944.

Palermo. Prov. of Italy, in N. Sicily. It is hilly, the Madonia Mts. culminating in Monte San Salvatore, 6,267 ft. Rlys. run from the city of Palermo in both directions along the coast, and S.W. and S.E. across the prov. Sulphur, marble, wines, figs, lemons, oranges, and olives are the chief products. There was fighting in the prov. as a result of Garibaldi's expedition in 1860.

Palermo. Seaport and sixth city of Italy, capital of Sicily. On the N. coast of the island on the W. of the Bay of Palermo, surrounded by the fertile plain, the Conca d'Oro, it is backed by an amphitheatre of mountains, the chief heights of which are Monte Pellegrino and Monte Calfano. The town is built in a quadrangle, with the E. side on the sea. The ruined fort of Castellamare adjoins the water. The cathedral, built by Archbishop Walter in the 12th century, contains imperial and other monuments.

Many of the famous buildings were Norman of the 12th century. The character of the city was not seriously changed by Allied bombing of the Second Great War, though doors, windows, and roofs were damaged, two churches were destroyed, and the national library was badly damaged. The royal palace, begun by the Saracens, with additions by the Norman rulers, had already been

so altered that there are few traces of original work. It contains the Cappella Palatina, built by Roger II in 1143, reputed to be the most beautiful palace chapel in the world, with mosaics and carved roof. The churches of San Salvatore, San Giovanni degli Eremiti,

Palermo arms

Palermo. The Piazza del Duomo and the 18th century cathedral

La Martorana, and San Domenico, the 16th century archbishop's palace, the university (1805), observatory, and the national museum (seriously damaged) are notable. Fishing, boatbuilding, and ironworking are among the industries. Pop. 452,417.

The city, founded by the Phoenicians, was called by the Greeks Panormos, and became a Carthaginian stronghold, which was seized by the Romans in 254 B.C. It remained Roman until its capture by the Ostrogoths, from whom it was taken by Belisarius in 535. It fell into Saracen hands in 830, but in 1072 was taken by the Normans. Palermo was the scene of the

Sicilian Vespers (*q.v.*), 1282, which ended the Norman rule. A possession of Spain and the allied Bourbon house of Naples, the city vainly tried to cast off its thralldom, and as late as 1848 and 1860 was bombarded by its own sovereign, Ferdinand II, thereafter known as Bomba. It was captured by Garibaldi, May 27, 1860. It was occupied by units of the U.S. 7th army, July 22, 1943, against negligible opposition from Germans and Italians. See Byzantine Art.

Palermo Stone. Inscribed black granite slab in the Palermo museum, Sicily. Erected in Lower Egypt during the Vth or VIth dynasty, it is engraved with linear hieroglyphs, of which the beginning and end of each line have disappeared. A brief list of independent predynastic kings in Lower Egypt before Mena is followed by a record of the main event in every year during the reigns of early kings of united Egypt down to the Vth dynasty. The annals mention the foundation of towns, endowment of temples, erection of statues, wars and expeditions, biennial census returns, religious festivals, and the height of the Nile.

PALESTINE: THE TRAGIC HOLY LAND

Basil Mathews, M.A., (Oxon.), E. Stern-Rubarth, Ph.D., and others

This account of Palestine includes a review of its history from the invasion of the Egyptian kings to the British conquest of 1918 and the surrender of the British mandate in 1948. For later information see Novissima Verba at the end of the Encyclopædia.

See also Crusades; Jerusalem; Jews, etc.

From 1920 to 1948 the historic name of Palestine was borne by a country at the S.E. extremity of the Mediterranean Sea on the edge of Asia. It stretched between latitudes 29° 30' and 33° 15' N., with an average E. to W. width between coast and desert of 100 m. To the N. the geographical line dividing it from Syria was somewhat loosely drawn in 1920, but included within Palestine the Jewish colony of Metulla. To the E. the country was bounded by Transjordan, the river Jordan forming for all practical purposes a dividing line, which also ran through the middle of the Dead Sea. Across the S. boundary was the Egyptian province of Sinai. The area of Palestine was 10,150 sq. m.

The whole length is divided into four natural geographical strips running S. to N. in roughly parallel lines. Taking a transverse section of them, W. to E., they are: (1) the seashore; (2) the coastal plain, broken here and there by the jutting masses of (3) the hills of Judæa,

Samaria, Galilee, and Lebanon; (4) the Ghor, the rift of the Jordan valley, 1,300 ft. below the level of the Mediterranean where the river runs into the Dead Sea.

The climate is as varied as the build of the land. Roughly, it has four divisions: the coast, the hills, the Jordan valley, the desert on the E. The W. wind from the sea predominates; its characteristic is humidity. The E. wind from the desert, dry and exhilarating in the winter, is, in the summer, extremely hot and loads the air with dust. It is fortunately infrequent, except during mid-winter. There are welcome sea breezes on the coast. The climate is in general terms subtropical, with two seasons, a rainy winter, mid-October to early May, and a dry, hot summer. Palestine is a half-way house between the heavy Lebanon rainfall of Northern Syria and the almost rainless Egypt. Winter temps. vary within wide limits; in the coastal region 90° F. has been recorded, and in the Jordanian highlands temps.

below freezing point. Summer temps. are everywhere high.

The population, in 1947, was about 1,900,000 (exact figures unavailable, owing to illegal immigration, and to the movement of Arabs from and to the surrounding countries), as against 757,182 at Palestine's first census in 1922. The Jewish population grew in the same period from 83,749 to more than 608,000, the Muslim Arabs from roughly 600,000 to 1,143,000, and the Christians from 73,024 to about 145,000.

This remarkable development is due to three facts: (1) the Zionist movement, especially since the Basle congress of 1897 and under Dr. Theodore Herzl's leadership; (2) the Balfour Declaration (*q.v.*) of 1917 which promised the establishment in Palestine of a national home for the Jewish people; (3) the persecution of European Jews under the Nazi regime. Consequently, the number of Jews in Palestine increased by about 240 p.c.—compared with the last Turkish figures (1918) by 1,100 p.c.—while that of the Arabs grew by only about 20 p.c. This increase was achieved in the face of several legal and technical steps taken by the British mandatory authorities to curtail immigration and by a whole system of measures to prevent the illegal influx of Jewish settlers from the different countries that were, between 1938 and 1945, overrun by the Nazis.

The former division of Palestine's population into town dwellers, settled village peasants (fellahin), and nomadic Beduin tribes (hadari), does not hold good any more. The European Jews brought with them higher technical and scientific knowledge, as well as considerable capital, mainly contributed by co-religionists in Europe and America, and they soon developed not only scientific farming and gardening on the Californian pattern, but also a remarkable and widespread industry, constructing new towns, of which Tel Aviv, an entirely Jewish city N. of Jaffa, founded as a small settlement in 1907 and now with a pop. of over 180,000, is the outstanding example.

ARCHAEOLOGY. The material remains of the human occupation of Palestine recorded and unearthed since 1870 by the Palestine exploration fund and other organizations have greatly elucidated and extended biblical history. Many thousands of worked flints attest the presence of upland hunting communities at the Palaeolithic, and perhaps even the Eolithic, level

of culture; and in 1925 part of a Neanderthal skull was found in a Galilean cave.

Early Neolithic implements, still more abundant, come chiefly from the lower lands, better suited for primitive tillage and herding, on both Jordan banks, the Shephelah tells, and the coastlands. They include spear-heads, arrow-heads, saws, chisels, sickle-points, polished axes, millstones, and boneware.

During the 3rd millennium B.C. immigrant waves of nomad Semites began to overrun the aboriginal settlements, aided by an advanced culture showing familiarity, direct or indirect, with Egyptian metal-working and the potter's wheel. It was apparently during this early Semitic or Amorite period, marked by the overlap of stone and metal, that there came into the southlands, from Moab across to the maritime plain, taller, stronger peoples, the Biblical Rephaim and Anakim, to whom are ascribable the Megalithic dolmens, menhirs, and stone-circles which abound.

Early Semitic Remains

The pre-Israelite, Bronze Age, civilization of Canaan, revealed by excavations at Gezer, Megiddo, and Taanach, shows from the outset the characteristic forms of early Semitic worship, marked by high-places, mazzebas, and asheras or sacred posts. It exhibits also the Semitic incapacity for creative art, the indigenous crafts being based upon imported models and ideas, with indifferent workmanship. It is a period of strong walled towns, one of them being the Jebusite stronghold excavated on Mt. Ophel at Jerusalem.

The Israelitish tribes appear to have infiltrated gradually into Palestine from the 14th century B.C.; records of inroads by nomads are preserved in the tablets found at El Amarna in Egypt, and a number of towns, including Jericho, bear evidence of destruction at this period. In the 12th century B.C. coastland sites show the intrusion of an alien people from the Aegean. These are the Philistines, probably originally from Caria, fugitives from the break-up of the Cretan-Mycenaean world, and their coming ushers in the Iron Age. Traces of them are found at Gezer, Gerar, and elsewhere, after which there is a period of Hebrew domination, which lasts until the Assyrian invasion. One of the chief finds of the Hebrew period is the palace of Ahab at Samaria; while from across the Jordan, in Moab, comes the celebrated Moabite stone, found 1868 now in the Louvre,

with an inscription of c. 850 B.C. recording the defeat of the king of Israel by Mesha king of Moab.

To the general Hellenistic stream which followed upon the break-up of Alexander's empire are attributable the edifices erected before and during the time of Christ, as illustrated by the excavations at Tiberias and Capernaum.

one empire; about 2500 B.C. the Egyptian kings crossed the Sinai peninsula and the desert, broke through Gaza and Beersheba, and held Palestine. A thousand years later an account by Thothmes III of his invasion forms the first piece of detailed historic record; Canaanites occupied the land. Thothmes marched across the desert via Gaza

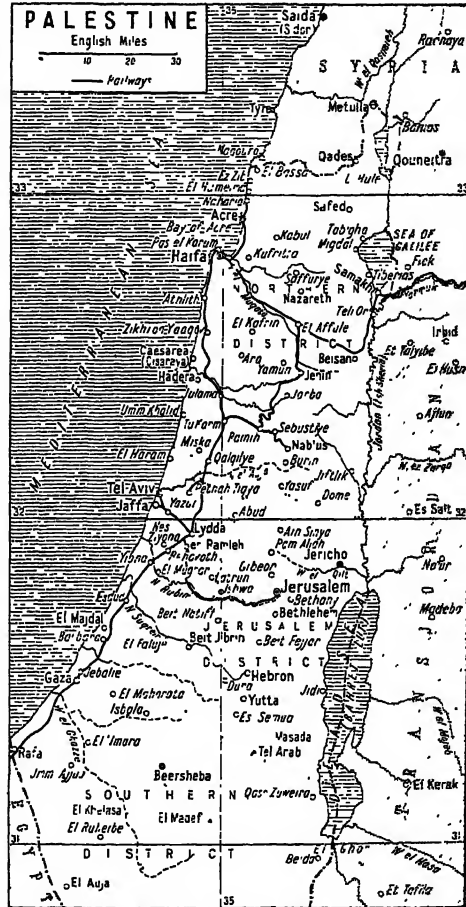

up the coastal plain to Carmel, and thence across the hills to Megiddo, where he defeated the Canaanites. Driven back a century later from Syria by the Hittites, Egypt still held Palestine loosely. About 1200 B.C., by a treaty between the Hittites and Egyptians, Palestine fell to Egypt and Syria to the Hittites.

A series of tidal waves of immigration about this time brought (a) Arameans from Arabia, whose language was used for more than 1,000 years in many parts; (b) Khabiri from Arabia; (c) Philistines from over the sea, and last, but most important, (d) Hebrews from the Southern desert.

For 150-200 years the Hebrews acknowledged no central authority; they warred against the Canaanites, and against the border Beduin

peoples. During this period, that of Judges, there was "no king in Israel."

About 1100 B.C. the Philistines mastered Palestine across to the Jordan. The Hebrews, fused with the Canaanites by this common affliction, revolted against the Philistines. They felt the need of central authority and unity. The period of "kings" began. Under Saul the ridge of hills was freed as far as Gilboa. David drove the Philistines right down to the coastal plain, united

Palestine. Map showing the chief cities and ports of this country as it was 1920-48

The building activity of Herod the Great is represented by the substructures of his temple, his aqueducts, and reservoirs at Jerusalem, his palace, porticoed streets, and hippodrome at Samaria, his basilica at Ascalon. Substantial examples of later influences have been found, notably Byzantine churches, Arab strongholds, and Crusader castles, associated with pottery, glass, terracotta, metalwork, and other forms of craftwork.

HISTORY. About 3300 B.C. the Nile cities and villages became

Palestine, centralised government in Jerusalem, and smote the desert tribes across Jordan eastwards, even as far N. as Damascus. The Philistines and the Phoenicians on the coast remained independent.

This was the greatest rule ever exercised in all history by and from Palestine itself. There was rapid decline of power under Solomon. After his death the kingdom was divided into Judah (roughly, Palestine) and Ephraim (roughly, Syria). From the 9th to the 6th cent. B.C., Assyria and Babylonia in their expansions and in their conflicts with one another and with Egypt continually won and lost and re-won the control of Palestine. Judah rebelled sporadically against the successive imperial tyrannies. Often the rebellion (e.g. against Assyria) was fomented by a rival power (e.g. Egypt). Yet Judah never secured real freedom; and the kingdom was destroyed in 586 B.C.

Outstanding and dramatic events in this kaleidoscope of conflict between empires over the Palestinian hills were: (a) the amazing escape of Judah in 701 B.C., when the Egyptians were defeated near Ekron, and Sennacherib's stupendous forces, which threatened to engulf the tiny kingdom, were defied in immortal scorn by Isaiah (Isaiah 10), and were swept out of existence (probably by pestilence) on the Philistine plain; (b) the Egyptian victory on the plain of Megiddo (607 B.C.), with the death of King Josiah of Judah, followed swiftly by the counter-defeat of the Egyptians by Nebuchadnezzar; and (c) the deportations of the Hebrews from Palestine to Babylon (usually called the exile).

End of the Exile

From the 6th century to the 4th, Persia, which under Cyrus captured Babylon in 539 B.C., took command of the provinces of Babylon, including Palestine, and set the exiles in Babylon free to go back and rebuild Jerusalem. Alexander the Great in turn overcame the Persian empire (333 B.C. onwards), and after his death and the division of his empire Palestine fell to Egypt and the dynasty of the Ptolemies, who fought the Seleucids controlling N. Syria across the prostrate body of Palestine. As these powers were enfeebled by the blows of Rome, the Jews, thrilled with patriotic and religious zeal, rose in revolt. The Maccabean family led them, 168 B.C., and the Jews won complete freedom in 143 B.C.

During these centuries of conflict and exile, ideas and ideals were wrought out, personalities sprang up, and literature was written which made Palestine of greater historical importance than even the vast empires of Babylon, Assyria, and Egypt. The little city of Jerusalem could have been hidden within the walls of one palace of Nebuchadnezzar, and it was repeatedly reduced to ruin. The hills of Judea were not much larger than Sussex, and they were hardly ever free from tyranny. But, robbed of all material power and of external freedom, the people received the conception of one almighty, invisible, wise Creator—God, who was also Shepherd; and the ideal of theocracy, omnipotent over all human rule, a rule of God to whom even the all-highest of Assyrian "frightfulness," Sennacherib, was—as Isaiah said—an axe or a wooden staff, the merest tool of the invisible King, who was to bring in His kingdom "under a Prince of Peace." Those new conceptions made Palestine the source directly of two of the great monotheistic religions of the world, Judaism and Christianity, and indirectly of the third, Islam.

The Roman Province

A new era began when Alexander the Great had swung Palestine out of the Asiatic into the Greek orbit of thought; an absolutely new world of original ideas. The centre of gravity of world history swung from E. to W., from Asia to Europe. Rome, fully armed, leapt into the Near East. The Maccabees had shared Palestine with an Arab tribe, the Nabateans. In 64 B.C. Pompey invaded the land, and in the following year reduced Jerusalem after a three months' siege. The *Pax Romana* now covered Palestine, but Herod the Great, as a prince under Rome, held Jerusalem through a five months' siege in 37 B.C.

Then in Palestine Jesus Christ was born, lived, and was crucified; and His followers proclaimed His Gospel. It was the Roman peace and the Roman roads that made the paths open for the rapid spread of the Christian faith from Palestine through the Empire.

The Jews still made political trouble in Palestine. In A.D. 70 Jerusalem was practically destroyed after a long siege. After the revolt of A.D. 132-5 Jerusalem was made a Roman colony. Through six centuries the Roman Empire held Palestine with a gradually relaxing grasp.

Then suddenly, out of Arabia, the scimitar of Islam swept, and in A.D. 635 the fall of Damascus yielded Palestine to Mahomedan rule. A fight of Heraclius against the Arabs on Aug. 20, 636, ended in his defeat. It was one of the decisive battles of the world's history, as it meant the clinching of the power of Islam. From the 7th till the 11th century Palestine was ruled by the Caliphs; and in the 11th century the Turks, coming from the N., became dominant.

The next period, that of the Crusades, 12th-13th centuries, is an involved and complicated story which ended in leaving the Turkish power still dominant over Palestine. Latin colonies in Palestine persisted after the Crusades proper were over.

A new terror swept down from the N. in the 13th century, in the shape of the Tartars, and the Mameluke or Tartar sultans ruled till the Ottoman Turks, in the 16th century, gained the upper hand and ruled Palestine continuously thereafter until defeated and dispossessed in 1918. The rule was similar to that all over the Turkish Empire. The population decreased. No progressive movements took place. In 1799 Napoleon invaded the country, mainly to defend Egypt. He failed to secure any real hold, though he crippled Turkish resources. Again, in 1831, Egypt, under Ibrahim Pasha, invaded Palestine and occupied it till 1840.

The First Great War

When Turkey became a belligerent in the First Great War, the safeguarding of the Suez Canal became a major preoccupation of British strategy. Attacks on the canal in Feb. and March, 1915, were defeated by the British, and plans were drawn up by Sir A. Murray, c-in-c. of the Egyptian Expeditionary Force, to drive the Turks out of the peninsula of Sinai. The R.E.s began to build a rly. from the canal eastward towards Palestine. In April, 1916, the Turks, based on El Arish, suddenly attacked at Katia, but without effect, being themselves completely beaten in further fighting at Romani in Aug. In Dec., Murray occupied El Arish, and moved on to Rafah on the Palestine frontier, defeating the Turks here Jan. 9, 1917. Advancing into Palestine the British advanced towards Gaza, which they twice attempted to capture, without success. Murray was then replaced by Allenby who did not renew the offensive until after several months of inten-

sive preparation, during which time the Turks had greatly strengthened a front stretching from Gaza to Beersheba.

On Oct. 27, 1917, Allenby opened a land and sea bombardment of Gaza, but his main attack was on Beersheba, captured Oct. 31. He then proceeded to roll up the Turkish front from that side. Gaza fell on Nov. 7, and Allenby pushed N. without delay. Winning a considerable victory at El Maghar, Nov. 13, he held by the following day the junction of the Central Palestine and Jerusalem rlys. To make his left secure before advancing towards Jerusalem, he captured Jaffa, Nov. 17, then advanced from Er Ramle through the Judean hills towards Jerusalem, his engineers making the roads and the rly. required for this move.

The British right flank occupied Hebron on Dec. 6, and by nightfall two days later Allenby's men were only $1\frac{1}{2}$ m. from Jerusalem. On the morning of Dec. 9, it was found that the Turks had evacuated the city, and at about noon it was formally surrendered by the mayor. Allenby made his official entry on foot, Dec. 11.

End of Allenby's Conquest.

But the Turks were only 4 m. distant, N. and E., and it was necessary for the whole British line, now about 50 m. long to the sea, to be consolidated. The Turks attacked with the object of retaking Jerusalem, but were beaten back on Dec. 28. Allenby then resumed a general assault which resulted next day in a total Turkish defeat. Advancing again, the British took Jericho, Feb. 21, 1918. During subsequent months, however, the desperate British situation on the Western Front led to serious depletion of Allenby's forces, and he was given replacements from Indian troops. This delayed his final offensive until Sept., 1918. Between Sept. 19 and 24 the Turkish armies were routed and destroyed. Arabs to the N. had occupied Deraa and intercepted the Turkish retreat, and by Sept. 29, British and Arabs were advancing towards Damascus, and the conquest of Palestine, E. of the Jordan, was complete. Turkish prisoners taken in the final offensive numbered 60,000.

Palestine remained under British military administration until July, 1920, when a civil administration was set up under a British high commissioner, appointed by the crown.

From then until May, 1948, Great Britain continued to administer

the country as mandated territory under the League of Nations, according to a constitution of Sept. 1, 1922, amended May 4, 1923, and put into force Sept. 29, 1923. This established the British high commissioner, who was simultaneously supreme commander and head of the executive council of three, assisted by an advisory council, which, because of persistent Arab refusal to participate in its election, replaced the legislative council of 10 appointed and 12 elected members provided for in the constitution. The first high commissioner, 1920-25, was Sir Herbert (later Viscount) Samuel; the last, Nov., 1945-May, 1948, was Sir A. G. Cunningham.

Palestine under Mandate.

This administration resembled that of a British crown colony and introduced many legal and social institutions on the British pattern, although Turkish civil law, largely based on the French, remained in force. Moreover, the Jewish and other religious communities possessed far reaching autonomy in education, employment, and labour policy, social services, and in respect of marriage and inheritance laws. For the Jewish community these powers were vested in the Jewish Agency; there was a Jewish Federation of Labour, Histradruth; a Labour Party, Mapai (abbr.); and a smaller, left-radical group, "Young Watchmen." Unofficially, a Jewish defence force, Haganah, was built up and equipped and trained with mostly smuggled arms; in 1947 its strength was estimated at 80,000-100,000.

The promises made variously to Arabs and Jews during the First Great War and at other times, being interpreted differently by both communities, led to severe clashes from the beginning. The Arabs, for example, interpret a 1915-16 correspondence between Sir H. MacMahon, then high commissioner of Egypt, and Emir Hussein of Mecca, later king of Hedjaz, acting as spokesman of all Arab communities, as having granted them independent rights in all Arab countries, including Palestine. The Jews claim sovereign rights on the strength of the Balfour Declaration which was embodied in the mandate entrusted to the U.K. Both claim Palestine as their Promised Land; and as neither could get full satisfaction, they resorted to force.

Strikes, then Arab revolts, against the continued Jewish immigration took place in 1929, and

during 1936-38. They were suppressed by British forces, with considerable damage and bloodshed. Great efforts were made, however, to bring about a conciliation. White papers defining British policy were published 1922, 1936, 1939, and July, 1946. Finally, a royal commission (the Peel commission) of 1937 recommended a partition of the country between Jews and Arabs. Resisted by both sides, this proposal was investigated afresh by the Woodhead mission of 1938, and was given up as impracticable. A London round-table conference, 1939, produced a scheme for the independence of Palestine within 10 years, all Jewish immigration after 1944 to be dependent upon Arab consent.

The Second Great War interrupted these attempts at overcoming the real Arab grievance: that a continued Jewish immigration, though beneficial materially and otherwise for Arabs, would abolish the Arab character of what for them is also a Holy Land.

The Second Great War.

At the outset of the Second Great War, Jews and Arabs in Palestine temporarily composed their differences, but because of its status as mandated territory, Palestine could not be formally at war. Some hundreds of Palestinians, mostly Jews, were recruited for service in the Auxiliary Military Pioneer Corps, and companies served with the B.E.F. in France in 1940. On June 10, 1940, however, the British govt. issued a decree empowering the high commissioner to place Palestine on a war footing and to mobilise the country's resources. Coastal defences were permanently manned, fifth column activities suppressed, and a black-out imposed in Jerusalem. Haifa became one of the two contraband control bases for the Mediterranean area and a refuelling base for Allied warships. On July 15 the Italians bombed Haifa; a few days later they attacked Tel Aviv.

In June, 1941, Palestine became the base for the British and Free French forces in their drive upon Syria. As a consequence, the country experienced a number of raids by German and Vichy bombers. While the Mediterranean remained virtually closed to British shipping, Palestine became a highly important base for British troops operating in N. Africa. Thousands of troops received pre-combat training there, and for the supply of these forces the country underwent consider-

able development; many engineering and chemical articles not previously manufactured in Palestine were produced on a large scale.

In Aug., 1942, the British gov. compromised with a Jewish demand for a Palestine army by authorising the raising of the Palestine Regiment (*q.v.*). Later, Jewish and Arab commando units did valuable service against Axis-held islands in the Mediterranean. Some 50,000 Palestinians, Arab and Jew, served with the British forces in N. Africa, Abyssinia, and Greece. Some 1,500 Palestinians, mostly Jews, were taken prisoner during the British evacuations of Greece and Crete. After the expulsion of the Axis forces from N. Africa, Palestine continued to be of military importance as a base and supply centre, and a training ground for troops destined for Italy. Rest and convalescent camps were also established there.

After the war, armed clashes, bomb outrages, and assassinations, often the work of Jewish terrorist organizations such as "Irgun Zvi Leumi" and the "Stern Gang," reduced the chances of peaceful settlement almost to nothing; and the Arab League, embracing Egypt, Saudi-Arabia, Iraq, etc., and backed by Indian Muslims, was set up in March, 1945. An Anglo-American committee investigated the situation; its report, April 20, 1946, and the results of a special meeting of the United Nations, April-May, 1947, upon a British application, led to a U.N. inquiry into Palestine. The U.N. report, Sept. 1, 1947, again recommended partition, with Jerusalem as an autonomous city. Both parties once more protested against this proposal and reacted with more acts of violence which cost numerous British lives.

Thereupon the U.K. announced to the U.N. on Sept. 26, 1947, her decision to give up her mandate by May 15, 1948, and to withdraw all her forces by Aug. 1, leaving it to the U.N. to implement the partition plan (accepted Nov. 29, 1947). Even as the British began to leave, violent and bitter clashes broke out between Jewish and Arab forces, communication with the rest of the world was severely restricted, and world-wide concern was expressed for the material safety of the holy places of Jerusalem and elsewhere. There were efforts made, in which the U.S.A. took a leading part, to establish a truce between the opponents. But on the very day the mandate expired the Jewish

Agency claimed the existence of a Jewish state under the name of Israel. Within a few hours Arab forces from Lebanon, Transjordan, and Egypt had invaded the country from N., E., and S. respectively, and full-scale warfare appeared inevitable. (See *Novissima Verba* at the end of this Encyclopedia.)

Jewish immigration into Palestine had raised enormously the country's production, agricultural as well as industrial, its land values, and its educational, hy-

PALESTINE. Map illustrating the United Nations proposals of Nov., 1947, for the partition of the country into Jewish and Arab states

gienic, and general living standards, for the Arab working population as well as for the Jewish and Christian ones. Wages were from twice to three times those in neighbouring Arab countries, while the cost of living exceeded theirs by from 8-15 p.c. only. Between 1921 and 1947 the number of industrial enterprises rose from 1,749 (with 4,434 employees) to about 7,000 (with 60,000), with new capital investment of about £30 million. Palestine's exports in 1946 were valued at £24,485,000, its imports at £70,432,000, the difference mainly representing new capital investment from abroad.

A special fund, established 1901, purchased land as the national property of the Jews, leasing it to

settlers, while another, established 1920, financed the development of villages and collective farm communities and granted subsidies and redeemable long-term loans. Important industrial concerns include the Palestine Potash Syndicate, of British foundation, exploiting the mineral wealth of the Dead Sea, and the Palestine Electric Corp. (Rutenberg concession) of 1921, producing 92 p.c. of the country's electric current, mainly with Jordan and Yarmuk water power. There is a large oil refinery at Haifa where the Iraq Petroleum co.'s pipe-line ends, and there are textile, mills, engineering and instrument-making plants, and those producing cement and bricks. A great deal of industry is related to agriculture: canning, vegetable oil extraction, baking, manufacture of agricultural machinery, etc.

Agriculture itself, relying on scientific irrigation, fertilisation, and soil redemption, produces wheat, barley, durrah, sesam, melons, bananas and, above all, citrus fruits. Between 1938 and 1948, 15-20 million boxes of 100-160 oranges, and 95-125 grapefruit were exported annually. Total combined port traffic for 1939 of Haifa, Jaffa, and Tel Aviv amounted to 4,411,631 tons.

These three cities, with Jerusalem, are the largest centres of population. There are 445 miles of rly., and 1,717 m. of motor roads. The main airport is at Lydda, 10 m. S.E. of Jaffa.

Bibliography. Handbook of Palestine and Transjordan, Sir H. Luke and E. Keith-Roach, 1930; History of Palestine and Syria, A. T. Olmstead, 1931; History of Palestine, A. S. Rappoport, 1931; The Holy Land under Mandate, F. Andrews, 2 vols., 1931; Historical Geography of the Holy Land, Sir G. A. Smith (25th edn.), 1931; The Arab Awakening, G. Antonius, 1938; Judeaea Lives Again, N. Bentwich, 1944.

Palestine. A city of Texas, U.S.A., the co. seat of Anderson co. It is 160 m. by rly. N. of Houston. There are rly. shops, and its industries include the manufacture of cotton, lumber products, cotton-seed oil, furniture, and bottles. Situated between the Trinity and Neckes rivers, it ships cotton, maize, fruit, and vegetables from the surrounding country. The Palestine salt dome is a geological wonder, 30,000 ft. in diameter. Settled 1837, it became a city in 1875. Pop. 12,144.

Palestine Exploration Fund. British archaeological organization. Founded in London, 1865, it

carries on excavations in Palestine. Originally the society's activity was chiefly directed towards unearthing biblical sites, and publishing its results. A number of special enterprises have been organized. In 1865-66 Captain Wilson led the first expedition to determine the places and sites to be investigated, and a similar one was commanded by Lieut. (later Sir) Charles Warren, 1867-70. An important survey of western Palestine was undertaken in 1872-77. In 1881 Captain Conder surveyed a part of E. Palestine; in 1890-93 work was carried out at the buried cities of Tel-el-Hesi, in which Flinders Petrie and F. J. Bliss took part. Later special excavations were conducted in the south wall of Jerusalem, the ruins of Gath, Gezer, Beth-Shemesh, Ascalon, and Samaria, and many other sites. Work was carried on after 1920 in conjunction with the British school of archaeology at Jerusalem.

The society has organized the making of large scale maps, and issues the Palestine Exploration Quarterly; its library is at its h.q., 2, Hinde Street, Manchester Square, London. *See* Archaeology.

Palestine Police. Former British police force. Established in 1923 when the League of Nations gave the U.K. the mandate over Palestine, the force was recruited from Britons, Arabs, and Jews; the British element, recruited in the U.K., numbered some 4,000 out of a total of 16,000. Although armed and equipped to army scale, the force was a strictly civilian organization. During the Second Great War it was incorporated into the Palestine garrison. The Arab disorders of 1936-39 and the Jewish terrorist campaign after the Second Great War caused severe casualties to the force, particularly amongst its British element. Discipline in the force was high amongst all three nationalities, and Jew and Arab personnel invariably remained loyal in periods of acute inter-racial strife. The Palestine Police was disbanded on May 15, 1948, when Britain relinquished the Palestine mandate.

Palestine Regiment. Former regt. of the British army. Authorized in Aug., 1942, it was raised and expanded from Jewish and Arab companies of the Royal West Kent regt., which in 1941 had opened its ranks to Palestinians. The Palestine regt. eventually had a strength of 10,000, divided into one Arab and three Jewish battalions.

Originally raised for service in and near Palestine, it later fought in N. Africa and Italy. In Italy it formed part of the Jewish bde. of the 8th Indian div., and earned particular distinction at the crossing of the Senio river, April 10, 1945. The regt. was disbanded at the end of the Second Great War.

Palestrina. City of Italy, in the prov. of Rome. It is 23 m. E.S.E. of the capital, and occupies the site of the Roman city of Praeneste. The modern town, with steep streets, is picturesquely situated on a hillside, and is almost entirely built over the ruins of a vast temple of Fortuna, which graced the Roman city.

Praeneste or Palestrina came in the Middle Ages into the possession of the Colonna family, but in 1298 during a war with the pope it was destroyed, as it was again, after it had been rebuilt, by the pope's troops in 1448. The Colonnas again restored it, and from them it passed to the Barberini family. There are remains of the castle of the Colonnas, and of the citadel, while the palace of the Barberini still stands. In the latter are some objects of art found in the neighbourhood. The cathedral is modern, and was badly damaged in the Second Great War, as was the temple of Fortuna. Other Roman remains include walls and a villa. *See* Praeneste.

Palestrina, GIOVANNI PIERLUIGI DA (1524-94). Italian composer. Born at Palestrina, from which he took his name, he studied in Rome about 1540, and, returning to his native town, was canon and organist there from 1544 until 1551 when he

G. P. da Palestrina,
Italian composer

was made master of music at the Vatican. On the accession of Paul IV, in 1555, he lost his post, but soon filled a similar one at S. John Lateran. He moved in 1558 to S. Maria Maggiore, and in 1571 returned to the Vatican, to remain there until his death, Feb. 2, 1594.

Palestrina was the greatest master of polyphonic music who ever lived. His famous 15 books of masses represent the perfect type for vocal music in the modal style, and are landmarks in the history of religious music, especially perhaps the one he composed for Pope Marcellus II. The simplicity and dignity of his music has influ-

enced composers of the 20th century more than those of any period since his own. Palestrina composed over 250 motets, some madrigals, and made 29 settings of the Song of Solomon. A study by H. Coates appeared in 1938.

Palestro. Village of N. Italy. It is in Pavia prov., near Vercelli, 34 m. W.S.W. of Milan. The village was the scene of heavy fighting between the Austrians and allied French and Sardinians, May 30-31, 1859. The brunt of the battle fell on the Sardinian troops, a division of whom were led into action by Victor Emmanuel, whose bravery was so conspicuous that a French regiment elected him their corporal. The Austrians were routed with a loss of 1,500, and began the retreat which led to Magenta and Solferino.

Paley, WILLIAM (1743-1805). British theologian. Born at Peterborough, the son of a schoolmaster, he was educated at Giggleswick and Christ's College, Cambridge, becoming senior wrangler, tutor, and lecturer in the university. In 1776 he took a living in Westmorland; in

Mr. Paley

1782 he was made archdeacon of Carlisle, and later rector of Bishop Wearmouth. He died at Lincoln, where he was sub-dean, May 25, 1805, but was buried in Carlisle cathedral. Paley's writings include *Principles of Moral and Political Philosophy*, 1785, a standard work; the popular *Evidences of Christianity*, 1794; *Natural Theology*, 1802. *Consult* Works, new ed. 1838; *Life*, G. W. Meadley, 1809.

Palghat. Town of Madras state, India, in the Malabar dist. It is situated at the W. end of the Palghat Gap on the main Madras-Calicut rly. Pop. 55,160.

Palghat Gap. Outstanding physical feature of the Deccan, India. The Deccan plateau is edged by the escarpments of the E. and W. Ghats which join in the Nilgiri Hills. The S. face of the Nilgiris comprises a scarp as steep as the seaward face of the W. Ghats. The S. Deccan consists of a continuation of the W. Ghats. Between these heights and the Nilgiris is a wide gap, the Palghat, which is the one large break in the W. escarpment, and is the only easy route of communication

between the Malabar and Coromandel coasts. It is 20 m. wide and just over 1,000 ft. high, and carries the main rly. line from Madras to Calicut.

Palgrave, Sir Francis (1788–1861). British historian. Son of Meyer Cohen, a Jew, he was a

Sir Francis Palgrave
British historian
After G. Richmond, R.A.

Londoner. He married Elizabeth Turner, adopted her mother's name of Palgrave, and embraced Christianity in 1823. Called to the bar at Middle Temple in 1827, he was knighted in 1832, was deputy keeper of the public records, 1836–61, and did much to promote the study of medieval history. He died at Hampstead, July 6, 1861. He wrote *The Rise and Progress of the English Commonwealth*, 1832; *Truths and Fictions of the Middle Ages*, 1837; *History of Normandy and England*, 4 vols., 1851–64.

Of Palgrave's four talented sons, the eldest, F. T., is noticed below. William Gifford (1826–88) was a missionary who in 1862–63 crossed Central Arabia disguised as a Syrian and a diplomatist who ended as British minister to Uruguay, where he died. Sir Robert Marny Inglis (1827–1919) edited *The Economist*, 1877–83, and *Dictionary of Political Economy*, 1894–1914. Sir Reginald (1829–1904) was clerk to the house of commons 1886–1900.

Palgrave, Francis Turner (1824–97). British poet and critic. Born in London, Sept. 23, 1824, eldest son of the above Sir Francis Palgrave, he was educated at the Charterhouse and Balliol College, Oxford. He joined the education department in 1849, and after his retirement was in 1886 appointed professor of poetry at Oxford. He died Oct. 25, 1897. His fame rests chiefly on the work he did as editor of poetical anthologies above all *The Golden Treasury of English Lyrics*, 1861–97 (many edns.). *Landscape in Poetry*, 1897, is a critical work.

Pali (canon). One of the oldest popular dialects of India. It is the language of the sacred books

of the Buddhists, who themselves call it Magadhi, the language of Magadha, where Buddha preached in it. The Pali characters are akin to those of Sanskrit, from which it is derived. Its extensive literature includes Tipitaka (the three baskets), the Buddhist scriptures; the commentaries on them; the Questions of Menander, a religious discussion with a Bactrian king; and two valuable chronicles of Ceylon.

Palimpsest (Gr. *palimpsestos*, rubbed again). Ancient manuscript whose writing has been imperfectly effaced and its material re-used. Vellum was washed and rubbed, papyrus was sponged. The Codex Ephraemi in Paris, a 5th century Greek Biblical text, was overwritten in the 12th century with the works of Ephraem Syrus. Examples of double palimpsests are known. The term is loosely used for monumental brasses and stone slabs, re-used on the back without erasure of the front. It is applied also to re-worked flint implements, regarded as archaeological documents. See Manuscript; Palaeography.

Palindrome (Gr. *palindromos*, running backwards). Word or sentence which reads the same forwards or backwards. An example is the saying put in the mouth of Napoleon, "Able was I ere I saw Elba."

Palingenesis (Gr. *palin*, again; *genesis*, birth). Metaphorically, the regeneration of anything old, such as institutions or mankind as a whole. Philosophically, the theory that all living beings, animals as well as men, will be born again to a more perfect state. Biologically, the reproduction of ancestral characteristics without any change, as opposed to cenogenesis.

Palinode (Gr. *palin*, contrariwise; *ōdē*, song). Ode in which the poet retracts the substance of an earlier poem, a recantation. Stesichorus (fl. c. 610 B.C.) wrote a palinode recanting an attack on Helen, and Horace, *Od.* i, 16, retracts the hasty iambic diatribes he launched against Canidia in his 5th and 17th Epodes charging her with sorcery. See Ode; Poetry.

Palinurus. In classical legend, the steersman of the ship of Aeneas. The promontory of Palinurus, now Cape Spartivento, on the coast of Lucania, in Italy, is said in the Aeneid to have been named from this hero, who there fell into the sea. The name Palinurus was used as a pseudonym by Cyril Connolly (*q.v.*) in his book *The Unquiet Grave*, 1945.

Palissy, Bernard (c. 1510–89). French potter. Born in S.W. France, he embarked on his

Bernard Palissy.
French potter.

father's trade of glass-painting. At Saintonge he began experiments which, after 16 years of effort, resulted, in 1557, in his perfecting the process of coloured enamel ware which bears his name. He was imprisoned as a Huguenot in 1562, but was released through the influence of the Duc de Montmorency, and in 1564–65 set up his workshop in the Tuileries. Towards the end of his life he was again arrested as a heretic, and imprisoned in the Bastille, where he died. See Pottery. Consult Palissy the Potter, H. Morley, 1852.

Palitana. State of the union of Saurashtra, India; also the chief town of the state. The state lies in the S.E. of the peninsula of Kathiawar, in the Gohilwad division. Grain, sugar-cane, and cotton are grown. The town, 120 miles S.W. of Ahmadabad, is an inland terminus of a branch rly. line, with connexions to Mehsana and Bhavnagar. The holy mountain of Satrunjaya dominates the town. The area of the state is 300 sq. m. Pop., state, 76,432; town, 16,700.

Palk Strait. Shallow channel separating N. Ceylon from the Deccan, India. It lies N. of Adam's Bridge, which separates it from the Gulf of Manaar. It is 45 m. wide at the Bay of Bengal entrance and opens out to the S.W., leading to Palk Bay.

Pall. Heavy cloth, black, purple, or white in colour, used to cover a coffin or hearse. Pall bearers are men who walk by the sides of the coffin, holding the corners of the pall. At the funerals of royal personages and great men, men of eminence usually act as pall bearers. At naval, military, and R.A.F. funerals a Union flag serves as a pall.

Pall. In heraldry, a charge in the form of the capital letter Y. It is supposed to represent the *palium*, and sometimes depicted as such, the lower end terminating in a fringe. More commonly all three ends touch the edge of the shield, unless it is described as couped, with the ends cut off. It should occupy about a third of the field, and is by some authorities classed as a sub-ordinary (*q.v.*). If the ends are cut off to form points the charge is called a shakefork

F. T. Palgrave.
British poet
Elliott & Fry

Palladian. A style of classical architecture associated with Andrea Palladio. Simple, correct, and rather cold in form, it was invented to meet the special demands of Venetian patrons, who desired villas and palaces which, while serving all utilitarian purposes, should at the same time present a well-balanced and dignified exterior in the neo-classic manner.

In real Palladian buildings, such as the Palazzo Thiene at Vicenza, a favourite device is the use of two orders of columns or pilasters, the minor order being used to support the arches which occurred between the major. Palladio preferred the Ionic order, and his Corinthian capitals were not well done. He avoided the broken pediment and the pedestal; composed his cornices with an eye to the order employed; and was scrupulously exact in the mathematical arrangement of his doors and windows. *See Architecture*; Jones, Inigo.

Palladio, ANDREA (1518-80). Italian architect. Born at Vicenza, Nov. 30, 1518, he studied at Rome. He is the chief exponent of the new Roman as opposed to the Renaissance architecture. His work was divided mainly between Vicenza and Venice; at the latter city he built the Foscari palace, the Redentore church, and the Carità, and an endless series of villas. His influence on foreign styles was enormous. He died at Vicenza, Aug. 19, 1580.

Andrea Palladio,
Italian architect

Palladium. In Greek legend, a statue of Pallas Athena, which fell from heaven, and was kept in the city of Troy, which could not be taken so long as this statue was there. Shortly before the fall of Troy it was abstracted by Odysseus and Diomedes, who entered the city in disguise. According to another legend, the Palladium was taken to Italy by Aeneas after the fall of Troy, and several cities professed to own it. It was probably a meteoric stone.

Palladium. A metallic element of the platinum family. W. H. Wollaston discovered it in 1804 and named it after the planet Pallas. Its chemical symbol is Pd, and it is one of the transitional elements of the second long period of the periodic table, with ruthenium and rhodium. Its atomic number is 46; atomic weight, 106.70; specific gravity, 12.0;

electrical conductivity, 15; melting point, 1,554 °C; crystal form, face-centred cubic, with lattice constant $a = 3.882$ and an interatomic distance of 2.745 Å.U.

Palladium occurs in nature associated with platinum and the other platinum metals mainly in the metallic form and as arsenide and selenide. The richest source is in the Urals, but deposits have been discovered and often worked to exhaustion elsewhere. In South Africa the metals are found native and in oxide or sulphide ores. Since 1920 the low-grade copper nickel ores at Sudbury, Ontario, have become the chief source of the platinum metals. They are concentrated with the two base metals throughout the smelting operations and then separated electrolytically and by fractional crystallisation of salts. The hot metal readily absorbs gases and precautions have to be taken to reduce this absorption. It will absorb large volumes of hydrogen, one vol. of palladium being capable of absorbing 800 vols. of hydrogen at room temperature.

Palladium is about half as heavy as platinum, but otherwise closely resembles it, though considerably cheaper. It is harder and stronger than platinum, having an ultimate tensile strength of 12 tons per sq. in. in the annealed state, compared with platinum's 10; and a Vickers hardness of 40, increasing to 105, when it is cold worked. It is not corroded by air at ordinary temperatures, but it will oxidise at 400 °C., the oxide dissociating again at about 900 °C. The metal is easily rolled into sheet, drawn into wire, or fabricated in other ways. Palladium leaf, similar to gold leaf, can be made in sheets less than 1/250,000 inch thick and is used for decoration. The chief use of palladium is in the electrical industry, where it is used for contacts, especially for telephone relays and street traffic control. Its use, both alone and as alloys with rhodium and ruthenium, for the manufacture of jewelry has much increased. Palladium salts have been used in photographic toning baths and it is employed as a hydrogenation catalyst in certain chemical processes. *See Platinum.*

Palladium. Place of entertainment, in Argyll Street, London, W.1. It was opened as a music hall, Dec. 26, 1910, and became a favourite centre of variety shows before and during the First Great War. Reopened as a theatre Dec. 26, 1921, it staged revues and

spectacular variety performances, and became the home of the Crazy Gang: Flanagan and Allen, Naughton and Gold, Nervo and Knox. It was the scene of several royal command variety performances attended by George V and George VI. The theatre seats 2,388.

Pallas. One of the minor planets or asteroids. It is remarkable for the great inclination of its orbit to the ecliptic (34°). The second to be discovered, it was found on March 28, 1802, by Olbers (1758-1840). *See Asteroids.*

Pallas. In Greek mythology, epithet of, and later name for, the goddess Athena. It perhaps means virgin. One of the Titans was also called Pallas. *See Athena.*

Pallas. Freedman of the Roman emperor Claudius. Together with another freedman named Narcissus, and Agrippina, wife of Claudius, he administered the empire. On the accession of Nero he was dismissed from office, and, after living some years in retirement, fell a victim to Nero's desire to possess his immense fortune.

Palliser, SIR HUGH (1723-96). British admiral. The son of a soldier, he was born in Yorkshire, Feb. 26, 1723, and entered the navy in 1735. In 1746 he obtained command of a ship, and in 1759 took part in the operations against Quebec. In 1764 he was made governor and commander-in-chief at Newfoundland; in 1770 controller of the navy; and in 1773 a baronet. When serving under Keppel in 1778, he engaged the French fleet but the action was not pressed to a conclusion. Palliser, whose house was burned by a mob, resigned his office and was tried by a court-martial, which gave an ambiguous verdict. However, he was made governor of Greenwich Hospital and an admiral, and he died March 19, 1796.

Pallium or **PALL** (Lat., cloak). Ecclesiastical vestment. Bestowed by the pope upon archbishops and certain bishops of the Latin Church, and equivalent to the *omophorion* of the Greek Church. It is made of white woollen cloth, Y-shaped, worn over the shoulders, falling back and front, and is embroidered with black or purple crosses. It signifies that the wearer possesses fullness of episcopal office, and

Pallium worn by archbishops of the Latin Church
Burns, Oates & Washbourne

is buried with him. Of obscure origin, it is supposed to have affinity with the breastplate of the Jewish high priest. In early times the word was applied by the Romans to the Greek cloak (*himation*), particularly affected by Diogenes and his followers. Later it became, in an enriched form, the robe of the emperor.

Pall Mall. London thoroughfare. It runs W. from the junction of Cockspur Street and Pall Mall East, where is an equestrian statue of George III by Wyatt (1836), to St. James's Palace. Originally formed about 1690, and at first called Catherine Street, it is, like The Mall (*q.v.*) named after the French game of *paille-maille*, or *mail-mall*, played here in the 17th century. On its S. side, going W., are the United Service, Athenaeum, Travellers', Reform, Royal Automobile, Oxford and Cambridge, and Marlborough-Windham clubs; on the N. side the Junior Carlton and Army and Navy clubs. Several of these had their premises damaged by German bombs in the Second Great War. The Carlton Club suffered seriously and had to move.

The R.A.C. is on the site of the old war office, which was formed from part of Schomberg House, 1650, once the residence of Cosway and Gainsborough. At the S.W. extremity of the street is the entrance to Marlborough House. On the site of No. 79 was a house in which Nell Gwynn lived the last 16 years of her life. At No. 51, Dodsley, the publisher, had a shop. At the old Star and Garter inn, Jan. 24, 1765, the 5th Lord Byron fatally wounded Chaworth in a duel. The Royal Society of Painters in Water Colours has its gallery in Pall Mall East, which runs W. from the National Gallery. Pall Mall was the first London street to be lighted with gas, 1807.

Pall Mail. Obsolete game, called *paille-maille* in France, whence it was introduced into England in the reign of Charles I. It was a kind of combination of croquet and golf, boxwood balls being driven by mallets through iron hoops set in an alley about 800 yards in length and floored with powdered cockle-shells. The game, which enjoyed great popularity after the Restoration, is mentioned by Pepys. It was first played in the long alley near St. James's Palace now called Pall Mall, and there was another alley in St. James's Park. A mallet and some balls used in the game

were found in a house in Pall Mall demolished in 1845, and are now in the British Museum.

Pall Mail Gazette. THE. Former London evening newspaper, established by George M. Smith, Feb. 7, 1865. Frederick Greenwood was the first editor. His successors included John (Viscount) Morley, W. T. Stead, who created a sensation by his articles on the white slave traffic, entitled *The Maiden Tribute of Modern Babylon*, which led to his imprisonment in Holloway; and E. T. (afterwards Sir Edward) Cook. After absorbing *The Globe* in 1921 the P.M.G. was itself incorporated in the *Evening Standard*, 1923. The title of the paper was taken from that "written by gentlemen for gentlemen" in Thackeray's *Pendennis*.

Palm. Old, natural measure of length, taken from either the breadth or the length of a man's hand. In Britain a palm was reckoned either as three or four inches, in Roman measure it equalled about 3 ins. The word is used in Holland as the equivalent of one decimetre. *See Hand.*

Palm (Palmae). Family of trees, natives of tropical and sub-tropical

sheath, which remains after the leaf is dead, and gives the characteristic ruggedness to the stem.

The flowers are produced in a great branching cluster, usually from the axils of the leaves. In some species male and female flowers are produced by the same tree, in others the sexes are in separate trees. The fruits are either berries, plum-like (drupes), or, as in the coconut, invested with a hard woody shell covered with a very thick fibrous husk. Coconuts and dates are of great importance as food, and large quantities of sugary fluid or starch are furnished by the stems of some species. The leaves are utilised for thatching, basket-making, mats, and hats, and the fibres of the leaf-sheaths are of economic importance.

A number of species are in cultivation in greenhouses as ornamental foliage plants, mostly in a juvenile condition. *See Assai; Australian Feather-Palm; Bactris; Coconut Palm; Date; Deleb Palm; Doom Palm; Fan-Palm; Oil Palm; Raphia; Rattan; Toddy Palm; Wax Palm, etc.*

Palma DE MALLORCA. Capital of the Balearic Isles, a prov. of Spain. It is a seaport on the S.W.

Palma, Majorca. A general view of the town crowned by its Gothic cathedral

regions. There are about 1,500 known species distributed in 200 genera, many of them familiar from their economic importance—such as coconut (*Cocos nucifera*), oil-palm (*Elaeis guineensis*), date (*Phoenix dactylifera*), betel (*Areca catechu*), wine-palm (*Raphia vinifera*), etc., all of which are described under their names. There is only one European species (*Chamaerops humilis*), which is found in the Mediterranean region. In a few cases, such as nipa and vegetable ivory (*Phytelphas*), the stem is dwarfed and the leaves radical, but as a rule, it is tall (up to 150 ft.), unbranched, and terminates above in a crown of very large fan-shaped or feather-shaped leaves. These are attached to the stem by a firm

coast of Majorca, 135 m. from Barcelona. Built in an amphitheatre overlooking the bay of the same name, with orange groves outside the walls, the houses are in the Moorish style. The Gothic cathedral dates from 1232–1601; the exchange and the governor's palace are interesting buildings. Manufactures include silks, woollens, liqueurs, chocolate. It is the port for the island and trades specially in fruit and vegetables. During the Spanish Civil War, 1936–39, there was a naval base here, used by Gen. Franco. Pop. 131,951.

Palma OR SAN MIGUEL DE PALMA. Most westerly of the Canary Islands. Lying 67 m. W.N.W. from Tenerife, it is 26 m. long by 16 m. wide, and has an

area of 280 sq. m. The mountainous interior culminates in the Pico de la Cruz, 7,730 ft.; severe volcanic eruptions took place here in 1949, several villages being destroyed. Wines, fruits, honey, and silk are produced in the fertile wooded valleys. The capital is Santa Cruz de la Palma, on the E. coast. Pop. est. 53,000.

Palma di Montechiaro. Town of Italy, in Agrigento prov., Sicily. It is a small modern town noted for the quality of its almonds, and is reached by steamboat from Licata or Porto Empedocle.

Palma Vecchio (c. 1480–1528). Name by which Giacomo Negretti or Palma, Italian painter, is generally known.

Palma Vecchio,
Italian painter
Self-portrait in Pinakothek, Munich

Born near Bergamo, he probably studied under Cima da Venice, where he continued to work, and where he died, July 28, 1528. Strongly influenced by Titian and Giorgione, his classic composition and characteristic colouring make his work easily recognizable, especially his Holy Conversation pictures. Examples of his work are on view in many continental galleries. He is called Vecchio (old) to distinguish him from his grand-nephew Jacopo Palma (1544–1628). See Barbara, S.

Palm Beach. Winter resort of Florida, U.S.A., in Palm Beach co. It stands on a narrow island, 30 m. long, separating Lake Worth from the Atlantic, 300 m. by rly. S.S.E. of Jacksonville, and 65 m. N. of Miami. With West Palm Beach, the co. seat, which extends 12 m. along the opposite shore of the lake, it is one of the world's most luxurious winter resorts; some 200,000 visitors come every season. The two towns on the easternmost portion of the coast are served by Seaboard air line and Florida East Coast rly. The Gulf Stream contributes to the equable climate. Development began in 1892. Both towns were damaged in the hurricane of 1928. Pop. 3,747.

Palmer. Name given to any Christian who had made a pilgrimage to the Holy Land. He brought back a consecrated palm staff or branch as evidence of his journey. The surname Palmer is probably a survival. See Pilgrim.

Palmer, Sir Charles Mark (1822–1907). British shipbuilder. Born at South Shields, Nov. 3,

1822, he joined a shipping firm in Newcastle. Later, in 1850, he built the first iron screw collier to develop the coal trade with London, and then added others. In the meantime he had become interested in coal and iron, and erected huge works at Jarrow. He was M.P. for North Durham, 1874–85, and for Durham (Jarrow) until his death, June 3, 1907. He was created a baronet in 1886.

Palmer, Samuel (1805–81). British painter. Son of a bookseller, he was born in London, Jan. 27, 1805, and studied under John Linnell whose son-in-law he afterwards became. Influenced by Blake's visionary world, he painted many water-colour landscapes with a strange mystical beauty. These belonged to the most vital and important period of his youth; his work became heavier and more stilted after his 30th year. Palmer remained unappreciated during his lifetime. He translated Virgil's Eclogues, illustrated by his own etchings, and made drawings for the works of Milton. He died at Reigate, May 24, 1881. He is represented at the Tate Gallery. Consult *The Visionary Years*, G. Grigson, 1947.

Samuel Palmer,
British painter
After J. Linnell

Palmer, William (1825–56). British poisoner. He was hanged at Stafford gaol, June 14, 1856, for poisoning a racing associate, John Parsons Cook, with antimony and strychnine. Palmer was a country surgeon at Rugeley, when he became involved with money-lenders as a result of betting. By 1855 he was driven to raise money by forged acceptances, and it was the fear of disclosure and prosecution which drove him to his final crime. His victim Cook won the Shrewsbury Handicap with his horse Polestar, and a large sum of money in bets, which Palmer determined to obtain. Cook put up at the Talbot Arms, opposite Palmer's house at Rugeley. Cook was taken ill, and from the morning of Nov. 17, 1855, to the evening of the victim's death on the 20th, Palmer literally administered everything that passed the sick man's lips. Palmer is supposed to have poisoned at least six other persons, including his brother and mother-in-law, whose lives he had insured. A novel, *Slow Poison*, J. Rowland, 1939, was based on

Palmer's trial. Consult *Trial of W. Palmer*, ed. G. Knott, 1912.

Palmerston. Former name of the port of Australia, in Northern Territory, now called Darwin (*q.v.*).

Palmerston, Henry John Temple, 3rd Viscount (1784–1865). British statesman. Born Oct. 20, 1784, at his father's seat, Broadlands, Hants, he belonged to an Irish branch of the family of Temple. Sir John Temple, speaker of the Irish house of commons, had

Lord Palmerston,
British statesman

a son Henry, who, in 1723, was made an Irish viscount. His grandson was the statesman's father. Educated at Harrow, Henry succeeded in 1802 to the title, went to St. John's College, Cambridge, and in 1807 entered the house of commons as M.P. for Newtown, Isle of Wight. At once he was appointed a lord of the admiralty, and in 1809 he became secretary at war, an office he retained until 1828, being in the cabinet from 1822.

A Tory, he served under Perceval, Liverpool, and their successors, but after Canning's death, like other of that statesman's followers, he gravitated towards the Whigs and made a study of foreign affairs. In 1830 he was made foreign secretary under Grey, and he was at the foreign office with the Whigs until 1841, except for a period in 1834–35. He came back to the same office under Russell in 1846, but in 1851, having offended the queen and his colleagues by approving of Louis Napoleon's *coup d'état* without consulting them, he was dismissed. He was home secretary 1853–55, and then disgust at the management of the Crimean War brought him the post of prime minister. He left office in 1858, but from 1859 was prime minister until his death, Oct. 18, 1865. During 1811–31 he had represented the university of Cambridge, and during 1831–65 the borough of Tiverton. Except for a few months he had sat in parliament for 58 years.

Palmerston was notable for his vigorous and even aggressive assertion of Britain's rights. For thirty years the spokesman of his country to foreign powers, he was largely responsible for the separation of Holland and Belgium in 1830; was active in checking the influence of Russia at Constantinople; sympathised with the

movement for Italian unity; and was continually suspicious of France. Never afraid of responsibility, he often ignored his colleagues and as often offended foreign statesmen. His attitude was a blend of bluff and belligerency, but his obvious devotion to British interests and his plainness of speech made "Pam" popular with the people.

Very autocratic, especially in later years, his conservative attitude of mind was responsible for the postponement by the Liberal party of democratic measures which were put forward after his death. He left no children, and his estates, including Broadlands, his seat at Romsey, passed to Lord Mount Temple, and then to the Hon. E. Ashley, both being related to Lady Palmerston, who was the widow of the 5th Earl Cowper. Palmerston was a nobleman of the old school, a sportsman, fond of society, the card table, and the racecourse, but possessing also the graces that marked the last of his kind. A statue of Palmerston stands in Palmerston Park, Southampton.

Bibliography. The standard Life is by Lord Dalling and E. Ashley, 1879. Others are by L. Sanders, 1888; B. K. Martin, 1924; P. Guedalla, 1926; E. F. M. Smith, 1935; H. C. F. Bell, 1936. *Consult also* P.'s Correspondence with Gladstone, ed. P. Guedalla, 1928.

Palmerston North. City of North Island, New Zealand, 88 m. N.N.E. of Wellington. It is a rly. junction; the industries of the neighbourhood are chiefly saw-milling and dairy farming, and it has a government experimental farm. Pop. 29,200.

Palmetto (*Sabal palmetto*). Tree of the family Palmae. It is a native of southern N. America, and has a stem from 20 to 40 ft. in height, with a spreading crown of long-stalked, heart-shaped leaves, 6 to 8 ft. long, with numerous divisions from the margins. The leaves are split up and plaited into "chp" hats.

Palmgren, SELM (b. 1878). Finnish composer. Born at Björneborg (Pori), Feb. 16, 1878, he studied at Helsingfors (Helsinki) conservatoire, and with Busoni in Italy. A brilliant pianist, he produced many short lyrical pieces for the piano. He also wrote piano concertos — Metamorphoses and

The River—and infused into his compositions a national flavour reminiscent of Grieg. Other works included two operas and incidental music for the theatre. He married the singer Maikki Järnefelt, with whom he toured extensively, and in 1923 settled at Rochester, N.Y., becoming teacher of composition at the Eastman school of music.

Palmi. Town of Italy, in Reggio di Calabria province. It is situated on the slope of Monte Elia amid orange groves and olive plantations, has a port on the Gulf of Gioia, and is 26 m. by rly. N.N.E. of Reggio. It is in the earthquake zone and suffered severely in 1783 and in 1908. Pop. 13,346.

Palmiet Rush (*Prionium palm-ita*). Perennial plant of the family Juncaceae. It is a native of S.

Africa, growing in swamps and rivers, frequently choking the latter. Unlike other rushes, it forms a trunk-like stem 5–10 ft. long, which is partly submerged. From the top of this springs a cluster of sword-shaped leaves, which are an inch broad at the base. The greenish-yellow, rush-like flowers rise from the centre of the leaf-tuft in a cluster several feet long. The leaves

are used for thatching, and contain strong fibres, those from the lower part being used for making brushes, and as a substitute for horsehair stuffing.

Palmira. Town of Colombia. It is in the Central Valley W. of the Central Cordillera, on the main road through Valle del Cauca dept. About 160 m. S.W. of Bogotá and 10 m. from the rly. terminus of Cali, it is the centre of a fertile dist. notable for tobacco. Pop. 45,055.

Palmistry. Art or practice of hand reading, also called cheiromancy. This is of great antiquity and in the Middle Ages was considered one of the black arts. Palmistry is divided into two heads: cheirognomy, which deals with character reading from shape and texture of hand, fingers, and nails; and cheirogony, which deals with marks and lines on the palm, by which are read past, present, and future events. The fingers are named Jupiter, Saturn, Apollo, and Mercury, and the fleshy pads at the base of the fingers are called mounts.

The principal lines on the palm are named life line, head line,

Diagram of left hand, illustrating principal lines and significant parts. Fingers—A, Jupiter; B, Saturn; C, Apollo; and D, Mercury—have each 3 phalanges, numbered 1, 2, and 3. On the hand: 1, 2, 3, and 4 are mounts of Jupiter, Saturn, Apollo, and Mercury respectively; 5, mount of Luna; 6, mount of Venus; 7, mount of Mars. Principal lines are: E E, Life; F F, Head; G G, Heart; H H, Fate; X X, Apollo.

heart line, fate line, and line of Apollo. From the life line is judged length of life, etc. From the head line are judged intellectual qualities and characteristics concerning business or profession. The heart line deals with the affections, the fate line with events of the future. By the line of Apollo is traced the gain or loss of riches, etc.

Mounts interpret character and denote courage, imagination, pride, benevolence, love of art, etc. A hand with few lines clearly marked and of good colour is considered a fortunate hand; a hand with numerous lines and marks is considered unfortunate.

A person who professes to tell fortunes or uses any subtle craft, means, or device by palmistry to deceive anybody may be convicted of being a rogue and vagabond.

Palmitic Acid. One of the fatty acids, to which the chemical formula $C_{15}H_{31}CO_2H$ is assigned. It was called palmitic acid by its discoverer Heintz in 1852, because it is obtained in large quantities from palm oil, in which it occurs as palmitin. Palmitic acid occurs in other vegetable and animal fats, but palm oil is the best source. It is prepared by boiling palm oil with caustic potash, decomposing the soap thus formed by sulphuric acid, and purifying the palmitic acid by recrystallisation from alcohol.

Palm-nut Cake. Artificial feeding stuff. A product of tropical W. Africa, it is made from the kernels of the palm nut (*Elaeis guineensis*) after the oil has been

Palmiet Rush. Leaf cluster and flower

extracted. It is also on sale in the form of meal.

Palm Oil OR **PALM BUTTER**. Oil extracted from the fleshy part of the fruit of several species of palm. The fruits are allowed to ferment and then pressed, a lower quality being obtained by boiling the residue with water and skimming off the oil. When fresh palm oil has a pleasant violet-like odour. It is composed of tripalmitin and olein and melts at 27° C., is soluble in ether and turpentine, and is used to make candles and soap.

Palm Sunday. Sixth Sunday in Lent, a week before Easter. On this day the Christian churches celebrate Christ's entry into Jerusalem, when the multitude strewed palm leaves and branches, emblems of victory and rejoicing, on the way (John 12). Also known as Flower Sunday (Lat. *Pascha Floridum*), the day is mentioned as early as the 4th century. In the R.C. Church it is celebrated by the blessing and distribution of palm or olive branches, and a procession. There is a procession in the Greek Church on this day. The Church of England abandoned the ceremony in 1549, but the custom of decking churches with willow sprigs is still carried out.

Palmyra. Ancient city of Syria. It stood about 150 m. N.E. of Damascus. According to 2 Chron. 8, v. 4, Tadmor, as it was at first called, was founded by Solomon. Under the Roman empire it became a great commercial centre by its position on the trade routes between E. and W. Its ruler Odenathus, c. A.D. 260, made it virtually independent of Rome. His widow Zenobia had more ambitious designs and sought to create an independent empire embracing all Syria, Asia, and Egypt. She was defeated by the emperor Aurelian, and Palmyra subsequently fell into decay. It is now deserted, but some splendid ruins, of the late Roman period, still testify to its former greatness. The city, surrounded by walls of the age of Justinian, is intersected by a street with a quadruple colonnade and an imposing triumphal arch. There are sepulchral towers, and among the temples the greatest is that of the sun, in a vast pillared enclosure

Palmyra Palm (*Borassus flabellifer*). Tree of the family Palmae, native of India. It has large fan-shaped, plaited leaves split at the edges. With the spiny leaf-stalk included, each leaf is 8-10 ft. long. Each tree bears flowers of one sex only—the males in branching catkins, the females in unbranched spikes. The three-seeded brown fruits are each as large as a child's head, produced in clusters of 15 or 20. From the unexpanded flower-spikes palm wine is obtained in quantity, which is evaporated into jaggery, or palm sugar, fermented into toddy and vinegar, and distilled to produce arrack. The trunks of old trees yield hard and durable timber; and the leaves serve a variety of useful purposes, including matting, basket making, hats, umbrellas, fans, and thatch. Seedling plants are used as food, and the pulp of the fruit furnishes a kind of jelly.

Palmyra Palm, leaves and fruit

Palni. Range of hills in Madras state, India. It lies mainly in Madura dist., N.E. of the N. end of the Cardamom Mts. and culminates in Vembadi Shola, 8,218 ft. high.

Palo Alto. City of California, U.S.A., in Santa Clara co. It is on the San Francisco peninsula, and 29 m. by rly. S.S.E. of that city. Laid out in 1891 primarily as the seat of Leland Stanford Junior university (*q.v.*), it is also the seat of a military academy, and a veterans' hospital. Agriculture and fruit-farming are local industries. It was incorporated 1894 and chartered as a city 1909. Pop. 16,774.

Palomar. Mountain in California, U.S.A. Lying 66 m. N. of San Diego, it is a peak of the Santa Anna mountains in the San Bernardino district, and has an alt. of 5,565 ft. Because of its rarefied atmosphere, it was selected as site of an observatory. See Mount Palomar Observatory.

Palos de la Frontera. Town of Spain. It is in Huelva prov., near the S.W. frontier, close to the

estuary of the Rio Tinto, 5 m. from the Atlantic Ocean. From here Columbus sailed, Aug. 3, 1492, on his historic voyage, and here Cortés landed in 1528, after his conquest of Mexico. Pop. 1,900.

Palpitation. Violent throbbing of the heart. It may be due to disorder of the heart, indigestion, excessive smoking, violent exercise, alcoholism, taking too much tea or coffee, or strong emotion. Treatment depends upon the underlying cause. See Heart.

Palstave (Icel. *palstafr*, spud-staff). Winged celt, with the haft-end thinned for fitting into a split wood or horn handle. It originated in the Bronze Age, preceding the socketed celt (*q.v.*).

Paludrine. Synthetic drug used in the prevention and treatment of malaria (1-*p*-chlorophenyl-5-isopropylbiguanide). First synthesised, 1943, in the I.C.I. laboratories, Manchester, as a substitute for quinine, it was announced 1946, and the formula made public.

Palwal. Town of Punjab state, India. It is 30 m. S.E. of Gurgaon, and is reputed to have been restored by Vikramaditya in 57 B.C. It contains an early Mahomedan mosque, is a grain market, and has a station on the rly. from Delhi to Agra. Pop. 13,606.

Pamaquin. Synthetic antimalarial substance used alone or with quinine or mepacrine.

Pamela. Novel by Samuel Richardson, first published, 1741-42, with the title of Pamela, or Virtue Rewarded. The author ascribed the genesis of the book to fellow booksellers having asked him to write a little volume of a common style that should give to country readers useful models of familiar letters. The two or three letters, which were to be devoted to instructing handsome girls, going out to service, how to avoid the snares that might be laid against their virtue, grew into a lengthy epistolary story, which not only had extraordinary popularity, but set the fashion of the sentimental novel. See Novel.

Pamiers. City of France. It stands on the Ariège, in the department of that name, 40 m. S. of Toulouse. The chief buildings are the cathedral, which has been modernised, and the Romanesque church of Notre Dame. The site of the castle is occupied by a public promenade. Industries include ironworking, tanning, brick making, and sawing. The city is an agricultural centre, and around are vineyards and nursery gardens. Pamiers grew up around a castle

Palmyra. Ruins of the ancient Temple of the Sun

built in the 12th century by a count of Foix. There was an abbey here, and much friction was caused by the conflicting authorities of the count of Foix, the bishop, and the abbot. Fauré and Delcassé were natives. Pop. 12,026.

Pamir OR ROOF OF THE WORLD. Greatest mountain knot in the world. It occurs where the plains of N. India (Kashmir) approach most closely those of Asiatic Russia (Tadzhik S.S.R.), and Afghanistan touches China (Sinkiang prov.). From it radiate the Kwenlun, Karakoram, Himalaya, Suleiman, Hindu Kush, Paropamisus and Tien Shan ranges. Comprising a series of ridges of elevation varying from 16,000 ft. to 18,000 ft., with elevated valleys or pamirs between them, this great highland is almost without vegetation. Politically the greater part belongs to Tadzhik S.S.R. The sparse pop. consists of Kirghiz.

Pamlico Sound. Body of water on the coast of N. Carolina, U.S.A. The largest of many lagoons on the E. coast of the U.S.A., it is separated from the Atlantic by a long, narrow strip of land, with three navigable inlets, and measures about 60 m. by 25 m. Oyster fishing is extensively carried on.

Pampa Central OR LA PAMPA. Territory of Argentina. Entirely inland, W. of the prov. of Buenos Aires, N. of the territory of Rio Negro, it is true pampa country crossed by the Colorado and Salado rivers. Rlys. from Bahia Blanca cross the S. and N.E. of the state. Agriculture occupies most of the people, wheat, alfalfa, maize, and linseed being exported in large quantities; while there are large numbers of cattle and sheep. Santa Rosa is the centre of administration. Area 55,669 sq. m. Pop. 166,900.

Pampas. Temperate grasslands of S. America, situated W. of the Paraná river and E. of the Andes. They support vast numbers of cattle and sheep, and produce enormous quantities of wheat for export. See Argentina; Steppe.

Pampas Grass (*Gynerium argenteum*). Noble grass of the family Gramineae. It is a native of S. America, where it grows on the pampas. It forms a tuft 5-6 ft. in diameter, its long, slender, arching leaves being about 6 ft. long.

Pampas Grass. Tuft of the South American grass

The flowers form large, dense, silky, and silvery-white plumes rising to a height of 10 or 12 ft., bearing 40 or 50 plumes.

Pampas Indians. Collective term for the S. American Indians upon the Argentine plains. In the N. they were largely of Guaycuru and Guarani stocks. On the true pampas they mingled with the Araucanian Puelche. Usually unclad, they were predatory and warlike, becoming eventually better riders than the Gauchos. They migrated beyond the Rio Negro in 1881. See American Indians.

Pampero. Severe line squall, usually accompanied by rain, thunder, and lightning, experienced in Argentina and Uruguay in the neighbourhood of the Plate estuary. It is associated with depressions moving W. to E.; as the depression passes the wind suddenly shifts to S. or S.W. with a great drop in temperature.

Pamphlet. Treatise of short or moderate length, usually unbound and of small format, and generally dealing with matters of current public interest. In a technical sense, a pamphlet is a printed work with eight or more pages of matter, the whole not exceeding five sheets.

The derivation of the word is obscure, some authorities claiming that it comes from Pamphilus or Pamphila, a Latin poem which circulated widely in mediæval times. From the time of the Reformation the pamphlet has been of considerable historic importance and often exercised much political, ecclesiastical, and social influence. Wycliffe, Erasmus, Luther, and Calvin used it, and the Civil War in England produced an astonishing crop of controversial works in pamphlet form, many, such as

those of John Milton, of great interest. One of the most celebrated collections is that of Civil War pamphlets in the British Museum, numbering over 22,000.

Defoe, Swift, William Law, "Junius," and Newman represent various aspects of pamphlet-writing. Periods of war and revolution bring the pamphlet into active life, e.g. 1789-1815, 1848, 1914-18, 1939-45. During the last period the pamphlet form was particularly useful because of the great scarcity of

paper, and govt. departments played a leading part in repopularising it. See Tract.

Pamphylia (Gr., land of all tribes). Ancient region on the S. coast of Asia Minor, between Lycia on the W. and Cilicia on the E. Its inhabitants were of mixed race, partly Semitic and Greek. Pamphylia belonged successively to the Persian and Macedonian empires and to the kingdom of Syria and of Pergamum, from which, in 133 B.C., it passed to Rome.

Pamplona. City of Spain, capital of the prov. of Navarre. It is 16 m. from the French frontier, among the foothills of the W. Pyrenees, on the Arga, a tributary of the Aragon, 195 m. N.E. of Madrid. It is a rly. centre for the prov. The Gothic cathedral was built in 1397 over the ruins of the earlier edifice of 1100. The Cortes of Navarre met in the Sala Preciosa in the cathedral. The bull-ring seats 13,600. Pamplona was the capital of the ancient kingdom of Navarre. It was rebuilt by Pompey in 68 B.C., taken from the Romans by the Visigoths in 476, sacked by Charlemagne, unsuccessfully attacked by Moors and Castilians, blockaded by Wellington, and besieged by Carlists. Pop. 75,002.

Pamplona. City of Colombia, in the dept. of Santander. It is 40 m. S. of Cucuta near the Venezuelan frontier. Founded by the Spaniards in 1549, it was for a time a valuable source of gold. Now it exports coal, dyewoods, coffee, cacao, gum, resin, and wheat, besides some gold. There are breweries, distilleries, and textile mills. Pamplona is the see of a bishop. Pop. 21,381.

Pan. In Greek mythology, the god of shepherds. Generally regarded as the son of Hermes, and especially associated with Arcadia, his worship afterwards spread throughout all parts of Greece. He was of monstrous appearance, with the horns and legs of a goat. He was the inventor of the flute, or shepherd's pipe, which he made from reeds, after the nymph Syrinx, whom he had pursued, had at her own request been turned into a reed by the gods. The sudden apparition of Pan to travellers caused terror, whence the word panic. The legendary representation of the devil is a memory of Pan and similar beings.

Panaetius. Stoic philosopher of the 2nd century B.C. A native of Rhodes, educated at Pergamum and Athens, he came to Rome, and was there admitted to the friendship of Laelius and Scipio the

Younger, later becoming the foremost teacher of Greek philosophy in Rome and in Athens.

Panama. Republic of Central America, formerly a dept. of the republic of Colombia, with which

Panama Republic
arms

it was united for 82 years. In 1903 discussions were opened by the U.S.A. with a view to taking over the existing canal works of Ferdinand de Lesseps and constructing a canal across the isthmus. A treaty, giving Colombia \$10,000,000 (then £2,000,000) and \$250,000 (£50,000) a year in exchange for a six-m. wide strip of land was approved by the U.S. senate but rejected by Colombia. The people of Panama, afraid that the U.S.A. might choose the alternative canal route through Nicaragua, rebelled Nov. 3, 1903. The U.S. navy deterred Colombian troops from landing, and ten days later the U.S.A. recognized the independence of the new republic of Panama. By a treaty with the U.S.A., entered into in 1914 and ratified in 1921, Colombia recognized the independence of Panama, receiving from the U.S.A. \$25,000,000 (£5,000,000) in compensation for loss of territory.

The republic occupies the isthmus connecting N. and S. America and lies between the Caribbean sea to the N. and the Pacific ocean to the S. It covers an area of 28,576 sq. m.; It is divided into seven provs., Bocas del Toro, Chiriqui, Coclé, Colon, Los Santos, Panama, and Veraguas. The chief town, after Panama city (*v.i.*), is Colon (pop. 44,393) on the Atlantic.

The first American trans-continental rly. was built across the fifty-mile narrows of Panama. A concrete highway now also traverses the isthmus, which can be crossed in 1½ hrs. by car. Panama also has important airfields.

Two mt. ranges enclose valleys and tablelands with excellent pasturage. On the mt. slopes there are extensive forests. In the lowlands the climate is tropical and the Panamanian jungle is one of the extraordinary sights of America with its giant humming birds,

multi-coloured parakeets, snow-white egrets, alligators, green lizards, snakes, scorpions, tapirs, pumas, and hosts of monkeys.

The chief exports are bananas, cocoa, coconuts, and pearls.

The pop. of 622,576 is highly diverse in origin and drawn from all parts of the world. Indians of full blood comprise about 10 p.c., Negroes about 13 p.c. Spanish is the official language, though English is much spoken.

A new constitution, promulgated March 1, 1946, extended the term of the president from four to six years and made him ineligible to succeed himself. The national assembly, which meets biennially on Jan. 2, has 32 members elected for six years. Women have equal political rights with men.

The R.C. religion prevails, but there is religious freedom. Primary education is free and compulsory from seven to 15. The national university, opened Oct. 7, 1935, is at Panama city. There is no army or navy.

Panama declared war on Japan Dec. 8, 1941, on Germany and Italy Dec. 12. She took no active part in the war, but in 1942 leased to the U.S.A. 134 bases for the protection of the Panama canal (*q.v.*); 120 were returned at the end of the Second Great War. Negotiations for the retention of the other 14, including a bomber base at Rio Hato, for a further period of 5-10 years, broke down Dec., 1947, with the unanimous refusal of the assembly to ratify an agreement to that effect.

Panama, Central America. Ruins of the old cathedral, looted and burned by Morgan, the pirate; top, right, facade of the present cathedral

Panama. Capital of the republic of Panama. It lies close to the Pacific entrance to the Panama canal and is 47 m. from Colon on the other side of the isthmus, with which it is connected by rly. and a concrete motor road. Settled in the 17th century, Panama city

was sacked and destroyed by Morgan, the buccaneer. The present city blends the charm of old Spain with American progressiveness. The bazaar, with its curio sellers from India, China, and other countries, has an Asiatic atmosphere. The twin-towered cathedral, finished in 1776, has its domes sheathed in mother-o'-pearl. Other buildings of note are the national university, the national theatre (one of the finest of its kind), the city hall, the government palace, the post office, and many fine churches, of which that of S. Jose is celebrated for its golden altar, said to have been preserved from the buccaneers by being painted over to represent grained wood. The climate is good from Jan. to April; during the rest of the year the rainfall is heavy. The mean temp. is 80° F.

There are breweries, shoe and furniture factories, and native potteries. There is a ferry across the Pacific entrance connecting La Boca, Balboa, and Panama city on the E. bank of the canal with Thatcher highway on the W. Panama has an active night life. Pop. 111,893.

Panama, GULF OF. Large inlet of the Pacific ocean in Panama. It lies between the peninsula of Azuero and the S.E. littoral of the republic, and is 140 m. wide at its mouth. At its head, some 120 m. N. of the mouth, is the entrance to the Panama canal.

Panama, Isthmus of. Narrow neck of land connecting N. and S. America. It lies E. and W., with the gulf of Panama on the Pacific side and the gulf of Darien on the Atlantic side. Columbus landed on the isthmus in 1502, and here Balboa was the first European to see the Pacific ocean. It averages 70 m. across, but is 32 m. at its narrowest. See Darien.

Panama Canal. An artificial waterway for navigation through the isthmus of Panama and connecting the Caribbean sea with the Pacific ocean. In 1523 Charles V of Spain, convinced that nature had provided no waterway through the isthmian narrow lands, directed Hernando de la Soma to explore the isthmus. Plans were drawn in 1529, and from that time projects were made for the construction of an artificial channel across the isthmus. The opening of the Suez Canal, 1869, was followed by a French attempt to construct a canal at Panama under the direction of de Lesseps; it failed partly through financial mismanagement and partly through the unhealthy conditions at the isthmus—the cause and treatment of malaria were not then understood; work on a sea-level canal, started in 1888, stopped the next year.

The war with Spain, 1898, impressed the U.S.A. with the desirability of quicker water-communication between the U.S. Atlantic and Pacific coasts; and by a treaty ratified Feb. 26, 1904, it acquired from the new republic of Panama (*q.v.*) a 10-m. strip of territory, five m. on each side of the route of the proposed canal, and the right to construct and main-

tain in perpetuity an inter-oceanic canal, for a payment of \$10,000,000 (then £2,000,000) and \$250,000 (£50,000) a year from 1912. The area of the ceded territory, called the Canal Zone, is 552.8 sq. m., of which 191 sq. m. is water. Pop. 48,352 (19,620 Americans).

In 1904 the U.S.A. also took over the rights and property of the New Panama company, which had been "care-taking" at the isthmus since the bankruptcy of the Lesseps company.

The two most important features of the narrowlands of Panama are the Chagres river and the Culebra mts. The river, often swelling to a torrent, crossed the route of the proposed canal; the mts. run down the isthmus near the Pacific coast, interposing a barrier which would have to be cut. The French had chosen to build at tide-level; the Americans decided to build a high-level waterway.

Near the outlet of the Chagres into the Caribbean the Gatun dam, 8,400 ft. long, was built across the channel of the river, and the waters accumulated behind it to form Gatun lake, 164 sq. m. in extent, at

Panama Canal. Map of the great waterway, constructed 1904-13, through which ocean-going vessels can move between the Caribbean and the Pacific

an alt. of 85 ft. The channel of the canal runs for about 30 m. through the lake, to the level of which ships are lifted by locks at either end. The channel of the canal begins about 4½ m. out to sea in Limón bay in the Caribbean at a depth of 41 ft. Through the sea and the shore it runs for 8 m. until it reaches the first locks, the gigantic three-stepped, two-flighted stairways at Gatun. Beyond Gatun lake the channel is compressed into the 8 m. Gaillard cutting through the Culebra mts. as far as the Pedro Miguel lock at the S. end of the 85-ft. above-sea-level section; this lock drops the vessel 30 ft. to the little Miraflores lake, from which the Miraflores locks drop it to the sea-level salt-water stretch of 8 m. to the Pacific. Minimum width of the canal is 300 ft. at the bottom, minimum depth is 41 ft.

Construction was completed in 1913 at a cost of \$366,850,000 (£73,330,000), and the canal was informally opened Aug. 15, 1914, by the passage of the 9,000-ton Ancon. It was formally opened July 12, 1920, by proclamation of the president of the U.S.A. A dam completed near Alhajuela in 1935 created Madden lake, 22 sq. m. in extent, and 260 ft. above sea-level, to maintain the level of Gatun lake in dry seasons. Construction of a new set of locks approx. parallel to the existing locks began in 1940. Passage through the canal normally takes 7-8 hrs.; it has, however, been completed in 4 hrs.

Panama Canal. Air view of the two-stepped Miraflores lock by which vessels are lowered from the Miraflores lake to Pacific level

10 mins. It has been estimated that 10,000 vessels could pass through it in a year. In 1946 the number which went through was 3,747, carrying a total cargo of 15 million tons; they paid nearly \$15 million in tolls. *Consult Panama: the Canal, the Country and the People*, A. Edwards, 1914; *The Panama Canal in Peace and War*, N. J. Padelford, 1942.

Panama Hat. Light hat which can be folded without injury. It is made from the young leaf of a palm, the *Carludovica palmata*, which grows in Central America, also in Ecuador and Columbia, where the hat was for long exclusively manufactured.

Pan-American Airways. Air transport company of the U.S.A. Formed in Oct., 1927, to maintain a service between the U.S.A. and Bermuda, it soon inaugurated routes throughout Latin America. In Nov., 1935, it started a trans-Pacific service to China; in 1938 regular flights to New Zealand; in June, 1939, a mail and passenger service across the Atlantic. The co. was the first to instal high speed land aircraft on the Atlantic route. In 1947, when Pan-American Airways covered 53,000 route miles serving 47 countries, a round the world service was begun. Annual distance flown was some 1,100 million miles.

*** Pan-American Conference.** Properly, the international conference of American states called periodically by the Pan-American Union; the term is loosely used for any conference of representatives of the American republics.

Simon Bolivar (*q.v.*) called a Pan-American conference in Panama in 1826, but only Great Colombia, Guatemala, Mexico, and Peru attended, although the U.S.A. had named a delegate. A treaty of union, league, and confederation was signed but never ratified. The conference officially recognized as the first Pan-American conference was held at the instance of the U.S.A. in Washington in 1890, Santo Domingo being the only absentee. The second Pan-American conference in Mexico City, Oct., 1901, was attended by all the republics. Subsequent conferences took place at Rio de Janeiro, Brazil, 1906; Buenos Aires, Argentina, 1910; Santiago, Chile, 1923; Havana, Cuba, 1928; Montevideo, Uruguay, 1933; Lima, Peru, 1938; Bogota, Colombia, 1948. The work of all these conventions was directed towards increased economic cooperation between the American republics and

solidarity in the event of aggression against an individual state. Machinery was set up for resolving disputes between American republics, and the 1933 meeting played an important part in ending the war between Paraguay and Bolivia.

Other meetings loosely called Pan-American conferences were *e.g.* the Pan-American federation of labour conference at Laredo, Texas, 1919; the Washington conference on arbitration, 1928; and the conference at Buenos Aires in 1936, at which President Roosevelt put forward his plea for a "good neighbour" policy.

During the Second Great War several conferences were held. That held at Rio de Janeiro in 1942 led to the setting up of the Inter-American Defence Board to recommend measures for the defence of the continent. At the Mexico City conference of 1945 it was decided that an international conference of American states should be held at intervals of four years. *See Chapultepec; Havana, Act of.*

Pan-American Highway, or INTER-AMERICAN HIGHWAY. Motor road under construction in the American continent, to run eventually from Alaska to Chile. The Alcan Highway (*q.v.*) links Alaska with the U.S. road system; and from Nuevo Laredo, Texas, the highway leads by way of Mexico City, Guatemala, Tegucigalpa (Honduras), and Costa Rica to Panama city; thence it follows the W. coast of S. America as far as Valparaiso, Chile, where it turns E., crossing the Andes to terminate at Buenos Aires, Argentina. An alternative inland route branches off at Vitor, near Arequipa, Peru, and runs E. to La Paz, Bolivia, and then S.E. to Buenos Aires.

From the Texas border to Panama city the road measures 3,300 m., of which 2,487 m. were in 1946 suitable for motor-traffic in all weathers; impassable gaps in Mexico, Honduras, Costa Rica, and Panama totalled 567 m. The route from Panama to Buenos Aires via Valparaiso measures 5,757 m., of which over 4,000 m. were suitable for all weathers in 1946; via La Paz, the distance is 5,433 m., of which some 3,800 m. are all-weather road. About one-third of the sections described as all-weather road is paved.

Pan-American Union. Organization for the promotion of friendly relations and cooperation between the countries of the Americas S. of the Canadian border. Bolivar first made an attempt in

1826 to form such a union. J. G. Blaine when secretary of state of the U.S.A. made a second attempt, cut short by the death of President Garfield in 1881. He was successful in 1890 under President Harrison after the first conference of the American states. Originally called the international bureau of American republics, its name was changed in 1910 to the Pan-American Union. Its h.q., a magnificent white marble palace in Washington, was the gift of Andrew Carnegie. Its governing board consists of the diplomatic representatives at Washington of all the Latin-American republics, with the U.S. secretary of state. The union is financed by contributions from the member nations in proportion to their pop. One of its normal functions is to draw up the programme for the Pan-American conferences. The adhesion of Canada to the union has been mooted, but without result. *See Pan-American Conference.*

Pan-Arabia. Term for the Arab world. The Pan-Arabia envisaged by, *e.g.*, T. E. Lawrence, included Syria and the Lebanon, Iraq, Palestine and Transjordan, and the whole of Arabia including the Yemen, Hadhramaut, Oman, etc., under the rule of the Hashimite kings of the Hejaz. Developments after the First Great War put an end to such a concept; but at a Pan-Arab conference held at Alexandria, Sept.-Oct., 1944, the Arab League was set up with the support of Iraq, Saudi Arabia, Syria, the Lebanon, Transjordan, and Egypt. *See Arabia; Arab League; Lawrence, T. E.; Palestine; Syria.*

Panathenaea. Festival of ancient Athens. It was held annually in Aug. in honour of Athena. Every fourth year the festival was celebrated on a splendid scale; it was then called the greater Panathenaea, the intervening festivals being known as the lesser Panathenaea. The festival, of legendary origin, had grown by the time of Pericles to great dimensions, and musical and athletic contests were regularly included.

Panay. Sixth in size of the Philippine Islands. The extreme W. island of the Visayan group, it lies between Negros and Mindoro islands, and covers 4,446 sq. m., or with adjacent islands an additional 300 sq. m. Panay has a mountainous surface, ranges extending from the centre to its three corners, with peaks exceeding 5,000 ft., Madias, the culminating summit, being 7,265 ft. The

N. and E. coasts are well indented, and contain several good harbours, Iloilo being one of the finest in the Philippines. The principal rivers are the Jalauro and Jaro. Agriculture is the chief industry, and rice, sugar, and copra are extensively cultivated. Pineapples, bananas, and mangoes are grown. In 1569 the Spaniard Legaspi conquered Panay from his first base at Cebu. From the headquarters he established at Iloilo he proceeded to the conquest of Mindoro and Luzon.

During the Second Great War Panay was in Japanese occupation from May, 1942. Heavily bombed by U.S. carrier-based aircraft in Sept., 1944, it was invaded March 19, 1945, by U.S. infantry who landed 14 m. W. of the capital, Iloilo, achieving a complete surprise of the enemy. Iloilo was captured and all serious opposition overcome March 21. Pop. 800,000. See Iloilo.

Panay Incident. On Dec. 12, 1937, the U.S. gunboat Panay was proceeding up river from Nanking, China, which was being shelled by Japanese guns. When some 25 m. from the city she was sunk by bombs from a Japanese aircraft. Four separate attacks were made, and at the same time three tankers belonging to the Standard Oil co. were set on fire. The U.S. government having sent notes of protest, the Japanese ambassador in Washington broadcast on Dec. 24 an apology for the attack, and on Dec. 29 his country's reply to the protests was received and acknowledged as satisfactory.

Pancake. Thin, flat cake fried in butter or fat. It is made of a thin batter, turned in the pan by tossing. The origin of eating pancakes on Shrove Tuesday, the day before Lent, is a survival of the old custom of feasting on that day, pancakes being fried in the grease that was forbidden in Lent. For 300 years past a ceremony known strictly as the Greaze and popularly as tossing the pancake has been enacted at Westminster School on Shrove Tuesday, the boys scrambling for it and the successful one receiving a guinea from the dean.

Panchatantra (Skt., five books). Oldest known collection of fables. It is the origin of the Fables of Bidpai (*q.v.*) and one of the sources of the Hitopadesa (*q.v.*) or Book of Good Counsels. A work in five tantras or sections, it derives from a treatise in which the ancient Brahmans of India inserted the choicest treasures of

worldly wisdom and the perfect rules for government, and then presented them to their rajahs. Written in Sanskrit, it has been rendered into the chief languages of Asia and Europe.

Panchayat. Name given to the committee that manages the affairs of an Indian village. In some places it consists of the heads of the various households; in others of a fixed number of persons chosen by their fellows. See Village Community.

Panch Mahals (five districts). Dist. of India, in the N. division of Bombay. It is a small district, area 1,606 sq. m., bounded W. by the Mahi river. The annual rainfall is 38 ins. Rice and pulses are grown, and native food grains occupy half the tilled area. It has been British since 1853. Administratively it is now combined with Broach. Pop. 924,527.

Panchromatic Photography. Panchromatic emulsions are sensitive to all colours; but not in

It has two ruined castles, and gives its name to the Garganta or gorge of Pancorbo, a rocky ravine in the Pyrenees, leading to Castile. Pop. 1,300.

Pancras. Patron saint of children. He is said traditionally to have been born at Synnada, in Phrygia, of noble parentage, and to have been taken in childhood to Rome, where he was baptized by the pope. During Diocletian's persecution he was asked by the emperor to give up Christianity, and on refusing was beheaded at the age of 14. His festival is May 12, which makes him one of the Ice Saints (*q.v.*). Numerous churches and a London borough are named after him. See St. Pancras.

Pancratium (Gr. *pan*, all; *kratos*, strength). Event in the Olympic and other games of ancient Greece. The term means a comprehensive contest, wrestling and boxing combined. It was a trial of strength in which the two unarmed competitors were at

Panchromatic Photography. Diagram showing the relative sensitivity of photographic emulsions to the colours of the spectrum as compared with the sensitivity of the human eye

the same proportions as the human eye, which perceives a greater visual luminosity in the yellow-green region than any photographic emulsion unless the latter is balanced by the use of correction filters. Panchromatic plates are usually most sensitive to blue, but many fast varieties achieve their great speed by oversensitiveness to the red end of the spectrum, and so are better suited to half-watt tungsten light than to daylight. This makes them valuable in artificial light and out of doors at morning and evening. The greatest value of the panchromatic emulsion, however, lies in the fact that by the use of correction or contrast colour filters any colour in the subject may be accentuated or subdued at will. See Colour Filter.

Pancorbo. Village of Spain, in Burgos prov. It is 124 m. S.W. of Irún and stands on the Ebro.

liberty to use any means, even strangulation. See Ludi.

Pancratium. Genus of bulbous herbs of the family Amaryllidaceae. Natives of the Mediterranean region, the Canaries, and W. Indies, they have strap-shaped leaves and large funnel-shaped, fragrant white flowers, forming a large umbel, on a tall stem. *P. illyricum* and *P. maritimum* are natives of S. Europe.

Pancreas. Organ situated behind the stomach. About 6 to 8 ins. long, it contains a duct which opens into the second part of the duodenum in contact with the common bile duct. The pancreas

Pancreas. The organ shown in section

secretes a juice which plays an important part in the digestion of food. It contains four enzymes or ferments, namely trypsin, which splits up the proteins of the food; amylase, which converts starch into maltose, a form of sugar; lipase, which splits up fats; and an enzyme which causes milk to curdle. The pancreas of sheep is called sweetbread (*q.v.*).

Panda OR **WAAH** (*Aelurus fulgens*). Small mammal of the order Carnivora. It is a native of the Himalayas only. Allied to the racoons it, resembles the kinkadee.

Panda. Small Himalayan cat-bear allied to the racoons.
W. S. Berridge, F.Z.S.

jou (*q.v.*) in having the claws partially retractile. Its total length is about 2½ ft., but somewhat more than half this measurement is due to the long bushy tail, which has suggested the alternative name of cat-bear. Its fine, dense coat of fur is chestnut-brown above and black beneath. Mainly nocturnal and arboreal in habits, it is found on the outskirts of the pine-woods. See Giant Panda.

Pandanaceae. Family of trees and shrubs. They are natives of the tropics, mainly of the Old

Pandanaceae. Leaves of the Screw Pine, *Pandanus utilis*

World, and have long, narrow, rigid leaves, the bases of the older ones sheathing the younger. The small flowers are in crowded clusters, the two sexes on separate plants. There are only two genera, *Freyinetia*, climbing shrubs, and *Pandanus*, the screw pines.

Pandarus. In Greek legend, a Lycian archer, who fought for Troy and was slain by Diomedes.

From the part he plays as a go-between in the story of Troilus and Cressida as told by Boccaccio, Chaucer, and Shakespeare is derived the word pander.

Pandean Pipes OR **PAN'S PIPES.** Simple musical instrument of extreme antiquity. It consists of a row of tubes, stopped at their lower ends and bound together, and blown across their tops by the performer. The number of tubes has varied, and the larger instruments are capable of considerable effects, though in England chiefly associated with Punch and Judy shows.

Pandect (Gr. *pandektēs*, all-receiver; *pan*, all; *dekhesthai*, to receive). Term apparently first applied to an encyclopedic work. In the plural, it is specially used of the digest or analysis of the works and legal opinions of the classical Roman jurists, the chief of whom were Papinian and Ulpian, which had been approved by earlier emperors. This digest was in 50 books, and was compiled at the instance of the emperor Justinian. With the Institutes and the Codex the Pandects formed the Corpus Juris Civilis, a complete system of Roman civil law. See Roman Law.

Pandemic. Term for an epidemic on a vast scale, attacking a large area such as a continent.

Pando. Department of Bolivia. It is situated in the N.W. corner of the country on the Brazilian frontier and has an area of 32,405 sq. m., pop. 18,300 and is one of the three low-lying depts. The capital is Cobija (pop. 5,000).

Pandora (Gr., all-gifted). In Greek mythology, the first woman on earth, made from clay by the god Hephaestus at the command of Zeus, who desired to avenge himself on Prometheus (*q.v.*). The gods were so pleased with the result of the skill of Hephaestus that they vied with each other in endowing her with various physical and mental gifts. Pandora became the wife of Epimetheus, brother of Prometheus. In his house was a box which he had been forbidden to open, but Pandora, overcome by curiosity, opened the box, and let out all the evils that afflict mankind. She shut the box in time to prevent the escape of Hope.

Pandour. Term formerly used to designate members of a body of Austrian infantry, first recruited near the village of Pandur, in S. Hungary. They were noted for their savage methods of warfare. The word is extended to indicate robbers and marauders.

Pandulf (d. 1226). Papal legate. Of Roman birth, he early entered

the service of Innocent III and first appeared in England, on a mission from the pope, in 1211. On his next visit, in 1213, John made complete submission to the pope; and at Runnymede Pandulf took the king's side, repudiating Magna Carta, and ordered the suspension of Archbishop Langton for refusing to carry out the papal sentences. In the same year he was elected bishop of Norwich. Made papal legate in 1218, Pandulf soon became the virtual ruler of England. In 1221 he returned to Rome, and died Sept. 16, 1226.

Panel (Old Fr., a little sheet). In English law, the list of jurors returned by the sheriff to serve at a trial. Hence a jury is said to be empanelled. In Scots law, the accused in a criminal trial is called the panel. The word is generally used for any list of names from which a choice can be made.

Panelling. Covering of a surface in a building, such as a wall, door, or ceiling, formerly with panels, *i.e.* raised or sunk compartments, usually framed at the edges. The material used is wood, stone, or plaster. In the past the division of a plaster ceiling by breaking it up into panels has been a favourite form of decoration. Wood panelling, as a mural decoration, was introduced into England in the 15th century.

In Elizabethan and Jacobean work the small wood panel appears, sometimes with a coloured inlay, and with gradually increasing elaboration of the mouldings. Ceiling plaster panels become correspondingly rich. The size of wood panels was greatly increased after the middle of the 17th century, developing into the long oblong of the Palladian style, with very much bolder mouldings. The Italians of the Renaissance panelled both the inside and outside of their buildings with stone or marble, and the use of these materials was adopted sometimes by Wren (*q.v.*) in England. The classic taste of Robert Adam reduced the panel in the 18th century to more reasonable proportions, especially in the treatment of doors; the moulding was simplified, and it became the fashion to paint panels white or cream.

The introduction of plywood towards the end of the 19th century revolutionised interior decoration. While the word panelling remained in use, a principal object of the architect was to eliminate the panel. Veneered plywood was often used to cover completely walls of large area in one plane,

except for a protecting skirting, and possibly an unobtrusive cornice. The aesthetic appeal was thus found in large unbroken surfaces, the beauty of the veneer's figure and colour, and perfect craftsmanship. See Ceiling; Gibbons, Grinling; Mahomedan Art; Mural Decoration. Walter Coventon

Pangani. Dist., river, and town of E. Africa, in Tanganyika Territory. The dist. lies S. of the Tanga and Wilhelmstal districts and N. of the Bagamoyo district, and borders on the E. upon the Indian Ocean. The town is situated at the mouth of the river and has a considerable maritime trade. The river is navigable over considerable distances for small craft. Pangani is also the name of two Falls, one on the Pangani, and the other on the Rufiji river, below its junction with the Ruaha.

Pange Lingua (Lat. *pangere*, to record; *lingua*, tongue). First words, used as the name, of a Latin hymn in honour of the Holy Eucharist. Composed by S. Thomas Aquinas, it begins, *Pange, lingua, gloriosi corporis mysterium* (Now, my tongue, the mystery telling Of the glorious body, sing), and was appointed for the feast of Corpus Christi in the Sarum, Hereford, York, Aberdeen, and Paris breviaries. It was translated into English by E. Caswall and J. M. Neale. See Aquinas, Thomas; Corpus Christi; Tantum Ergo.

Pangenesis (Gr. *pan*, all; *genesis*, generation). Theory of heredity formulated by Darwin in 1868 as a provisional hypothesis. It endeavoured to satisfy the claims of the doctrine of Lamarck to the effect that acquired characters were transmitted to offspring. It was an effort to understand how characters could be continued from one generation to another. Darwin supposed that the cells composing the tissues of the body gave off minute portions of themselves—"gemmules," he termed them—and that these found their way to the germinal area and constituted the germ-plasm from which the next generation was to spring. The discovery of the part played by chromosomes in heredity rendered this hypothesis unnecessary. See Evolution; Heredity.

Pan-Germanism. International term adopted to describe originally the *Alldeutscher Verband* and the imperialist movement represented by it; subsequently the whole imperialist and militarist German policy, including that of the Nazi movement. The *Alldeutscher Verband*, founded in 1891

and claiming the inheritance of Bismarck's ideas (which, however, were essentially Little German in outlook), was officially meant to foster cultural contact with Germans under other European rule. It preached in fact German expansion by threat or actual making of war, and predominance in the E. and S.E. Particularly active just before and during the First Great War, it claimed Bernhardt (*q.v.*) as a protagonist, and in the Fatherland party, formed 1917 by Tirpitz (*q.v.*), found its political expression. Though originally backed mainly by extreme conservatives, and parts of the upper classes, the Pan-German movement was revived and developed by Hitler. See Germans Abroad.

Pangloss, Doctor. Character in Voltaire's *Candide* (1759). This brilliantly conceived figure of satire, with his many inconsistencies, quotes Leibniz's famous maxim that "all is for the best in the best of all possible worlds," but applies it with little or no justification.

Pangolin (Manis). Genus of edentate mammals, occurring in S. Asia and Africa. The pangolin is

Pangolin, the African species

2-3 ft. long, and its body is somewhat like that of a lizard in shape. Except about the mouth and on the under parts, it is entirely covered with large horny scales; and the feet are provided with strong and powerful claws. No teeth are present, but there are horny ridges on the lower jaws; the tongue is long and wormlike, as in the anteaters. The pangolin rolls itself into a ball when disturbed.

Asiatic pangolins, which comprise three species, live in crevices of the rocks, and in long burrows terminating in a chamber sometimes as much as 6 ft. across. The animals are strictly nocturnal, and feed on termites. There are four species in Africa. They resemble the Asiatic species in habits, but have a curious method of resting on a tree-trunk by clinging with the hind feet and tail, while the

body is thrown back till it is nearly horizontal.

Panick Grass (*Panicum*). A large genus of grasses of the family Gramineae. They are mostly

Panick Grass. Leaves and flower spray of *Panicum miliaceum*

natives of the tropics, but a few are widely distributed in temperate regions. The flowers are clustered in spikes or branching sprays. Many species are useful fodder grasses, and a few of them yield grains large enough for use as human food. *P. miliaceum*, which yields Indian millet or warree, is cultivated in S. Europe. *P. maximum* of the W. Indies attains a height of 6-10 ft., and another large species is the Angola grass (*P. spectabile*) of Brazil. Several are grown as ornamental grasses.

Panicle (Lat.). In botany, term denoting the arrangement of the flowers in a raceme or spray with branches, as in the oat. See Inflorescence.

Panipat. Town of Punjab state, India, in Karnal dist. It is situated about 50 m. by rly. N. of Delhi and W. of the Jumna. Decisive battles were fought here in 1526, when Babar (*q.v.*) triumphed; in 1556, when a victory placed Akbar on the throne of Delhi; and in 1761, when Ahmad Shah of Afghanistan defeated the Mahrattas. Pop. 37,837.

Pan-Islamism. Concept of a union of Muslim powers opposed to the Christian powers of Europe. The expression dates from the 1880s, when this was regarded as something new and threatening; but in fact Muslim political theory has always embodied hostility to unbelievers. Pan-Islamism was bound up with the efforts of the Turkish sultan Abdul Hamid II to win recognition as caliph and spiritual head of all Muslims. The movement declined with the prestige of Turkey. By 1919 it was kept alive only by the Khilafat movement in India, and virtually perished with the caliphate in 1923.

Panixer. An Alpine pass in Switzerland. It connects cantons Glarus and Grisons over the Tödi range, and leads E. of the Hausstock from the valley of the Sernf to Panix on a small affluent of the Vorder Rhine. Its alt. is 7,897 ft. and the top is marked by two tablets which record the retreat, Oct. 5-10, 1799, of the Russians under Suvorov.

Panjandrum. Nonsense word made up by S. Foote, and occurring in a fantastic composition intended as a memory test. A sentence frequently quoted is as follows: And there were present the Picinnies, and the Jobillies, and the Garyulies, and the Grand Panjandrum himself, with the little round button at top. Hence the word came to be used by 19th century writers as a synonym for any pretender to undue importance or fussy local magnate.

Panjim. Alternative name for the Indo-Portuguese city of New Goa (*q.v.*).

Pankhurst. Name of a family of English pioneers in the women's suffrage movement. Emmeline (1858-1928), daughter of a calico-printer, Robert Goulden, of Manchester, was born July 14, 1858, and in 1879 married R. M. Pankhurst (*d.1898*), a barrister who drafted the Married Women's Property Act of 1882, with whom she helped to found the Women's Franchise League in 1889. She joined the Independent Labour party in 1892, founded the Women's Social and Political Union in 1903, and was the leader of the militant "suffragettes" until the outbreak of the First Great War in 1914, when she transformed her organization into one of national service. Imprisoned some eight times for sensational activities—inciting to riot, window breaking, assault, and complicity in a bomb outrage on Lloyd George's

Emmeline Pankhurst,
British women's leader
Elliott & Fry

house—she remained undeterred and continued to demonstrate and lecture in England and the U.S.A. In 1918 she joined the Conservative party. She

died June 14, 1928. She wrote *My Own Story*, 1914. Her statue in Victoria Tower Gardens, Westminster, was unveiled 1930.

Sylvia Pankhurst,
British propagandist

Her daughter Christabel (*b.1880*) played a leading part in the suffrage movement from 1905, editing *The Suffragette* and several times undergoing imprisonment. After the granting of the vote to woman in 1918 she devoted herself to a religious movement and preached the immediate second coming of Christ. She was created D.B.E. in 1936.

Mrs. Pankhurst's second daughter Sylvia (*Estelle*) (*b.1882*) was also associated with the suffrage movement, edited *The Workers' Dreadnought* in 1914, and joined a pacifist group. She was sentenced to six months' imprisonment in 1921 for publishing articles calculated to cause sedition. Chairman of the international Ethiopian council for study and report, she did much propaganda on behalf of Abyssinian independence. Her Life of her mother appeared in 1935; she also wrote *The Suffragette Movement*, 1931.

Panna. Town and former state of India, in Bundelkhand. The state is now part of Vindhya union. It is adjacent to Northern dists. of the Madhya union and to the former Kothi state. The town is 105 m. N. of Jubbulpore, and contains several modern Hindu temples. Formerly diamonds were mined in the locality. The state covered 2,580 sq. m. Pop., state, 231,170; town, 14,000.

Panning. Process of concentrating heavy minerals used by prospectors, by miners working placer deposits on a small scale, and for the rough assaying of samples of certain ores. The method is based on the fact that some minerals have higher specific gravities than others and that some heavy ore minerals frequently occur associated with lighter, worthless minerals.

The pan is a circular dish with sloping sides. The average size is 15 ins. in diameter and 2½ ins. deep. The pan, often made of thin steel and sometimes wood, should be light and stiff, with a smooth inner surface.

The pan of gravel is placed in water and the contents thoroughly wetted and stirred by hand to

break up any lumps of clay; the larger stones are picked out. In the water it is given a shaking, circular motion, the lighter minerals working their way to the surface and the heavier settling to the bottom. The lighter minerals are washed off, the heaviest finally remain, and these may be examined for the presence of gold, cassiterite, wolfram, etc. The method is primitive and slow, but extensively used where labour is cheap and the use of machinery uneconomic. Variations are used in S. America, Malaya, India, and Nigeria.

Pannonia. A province of the Roman empire. It lay between the Alps and the Danube, from a point above the modern Vienna to Belgrade, and embraced a large part of the present Austria, Hungary, and Yugoslavia. Its people, who seem to have been of Illyrian race, were defeated, c. 30 B.C., by Vibius, one of the generals of Octavianus. They revolted A.D. 7 and were reconquered by Tiberius.

Panorama (*Gr. pan, all; horama, sight*). Term for a picture giving views of objects in all directions. A panoramic display, which was in a sense the predecessor of the cinematograph, was a picture representing a number of scenes which passed in succession before the audience. See *Cinematography*.

Panos. Family of S. American Indian tribes of allied speech. Mostly in the Pampa del Sacramento, Peru, they are a branch of the Caras, once dominant in Ecuador. Their numbers have dwindled to insignificance.

Pans. In geology, hard layers formed by the consolidation of loose material at depth below the surface of the soil. They interfere with drainage and decrease fertility. A pan simply consisting of hardened clay is known as a plough sole, and may be caused by continuous ploughing of heavy land. In lighter soils the pan is formed by infiltration of various substances in solution, these being deposited and acting like cement. A distinction is thus made between moor-bed pan (organic cement), iron pan (ferrie oxide), and limy pan (carbonate of lime). Pans require breaking up by subsoiling or deep ploughing.

Pan-Slavism. Movement for the unification of all Slavonic nations under Russian leadership. The word appeared first in 1826 in a book by a Slovak, J. Herkel, but its cultural aspect had been outlined in 1794 by a Pole named Staszyc, and elaborated by the

Christabel Pankhurst,
British suffragist

Czech poet Jan Kollar in some widely read sonnets. The movement was fostered by the anti-Western slavophiles in Russia, and exploited by tsarist politicians, mainly for the furthering of aims in the Balkans. Pan-Slavist congresses were held in Prague, 1848, and in Moscow, 1867. The severance of the Poles from the movement, after their revolt of 1863, changed its trend in the late 19th century into neo-slavism, a more liberal concept. In this form it held congresses at Prague, 1908, and Sofia, 1910. Deprived of its fundamental tenets by international Bolshevism, Pan-Slavism again became a live force under the impact of Nazi pan-Germanism, and played a part in Russian policy after the Second Great War.

Pansy (*Viola tricolor*). Perennial herb of the family *Violaceae*. It is a native of Europe, N. Africa, and N. and W. Asia. The leaves in general form are oblong, or lance-shaped, but variously

lobed and out. The flowers are purple, whitish, or yellow, or a varied mixture of the three colours. The number of named varieties is enormous, and every year sees additions. They do well in almost any garden soil, but the best results are obtained by planting deeply in a well-drained sandy loam, enriched with stable or cow manure. Special varieties can be propagated only by means of cuttings and divisions of the old plants, made at the end of Aug. or Sept., and given slight protection in winter. The word pansy is derived from the French *pensée*, thought. Alternative names are heartsease and love-in-idleness.

Pantagruel. Giant and king of the Dipsodes in Rabelais's *Life of Gargantua and the Heroic Deeds of Pantagruel*. He is the son of Gargantua, and his name is explained as signifying all-thirsty.

Pantaloön

(Ital. *Pantaleone*, a saint popular in Venice). Ridiculous old Venetian bourgeois in the Italian comedy, or *Commedia dell'Arte* (*q.v.*). Sometimes he was an old bachelor, but generally he was married to an unfaithful young wife or was the father of troublesome young daughters. Columbine was often his daughter, and Harlequin sometimes his lackey. Lean and slippered, as Shakespeare called him, Pantaloön wore the skin-tight trousers all of one piece named after him, and a long gaberdine, originally red, but changed to black when Venice lost Negroponte and the whole city put on mourning. In traditional English pantomime he is a butt for the practical jokes of harlequin and clown. See Columbine; Harlequin; Pantomime.

Pantellaria. Volcanic island of the Mediterranean. Situated 80 m. S. of Sicily and 40 m. N. of Tunisia, it has an area of 32 sq. m., and forms part of the prov. of Trapani. A dependency of Sicily (*q.v.*), it has a similar history. There is an extinct crater, *Montagna Grande*, 2,740 ft. high; numerous fumaroles and hot springs exist; in 1891 a submarine eruption occurred 3 m. to the N.W. Raisins and figs are produced, and fishing is engaged in. Round towers, known as *Sesi*, betoken a prehistoric population.

Pantellaria was colonised by the Phoenicians and captured by Rome in 217 B.C. The Christian inhabitants were exterminated by the Arabs about 700.

Bombed from the air by the Allies, with scarcely a day's respite, from May 9, 1943, and frequently also bombarded from the sea, Pantellaria surrendered unconditionally June 11 without the necessity of an Allied landing.

Pantaloön, in English pantomime

Under the peace treaty between the Allies and Italy, 1947, Pantellaria was to be demilitarised.

Panthay. Burmese name for Chinese Mahomedans, especially in Yunnan. Calling themselves Hui-hui, they are presumably descendants of medieval Tartar soldiery. Official oppression led in 1855 to a rebellion under Tu Wenhshui, who was proclaimed sultan, 1867, but overthrown, 1873. Panthay muleteers serve the caravan trade between Burma and China.

Pantheism (Gr. *pan*, all; *theos*, god). The doctrine which affirms the unity of the Deity with the world. Pantheism has received different names according to its attitude towards the relation of individual things to the absolute. Acosmism denies the existence of a universe as distinct from God; emanationism explains all things as flowing out from the Deity, of whom they form part; Krause's pantheism teaches that all things are in God.

A fundamental part of much ancient Indian philosophy, pantheism appears in the Greek Eleatic and Neoplatonic systems, and in many Christian mystics from the so-called Dionysius the Areopagite onwards. It was taught by Bruno and other Italians of the Renaissance, and by many German Idealists. It is most completely developed in the philosophy of Spinoza. See God; Spinoza.

Pantheon (Gr. *pantheon*, belonging to all the gods). Temple in Rome, now a church. One of the most celebrated of ancient Roman buildings that still survive, it was built by Hadrian between A.D. 120-130. An early temple near the site was built by Agrippa in 27 B.C., as a memorial to the house of Caesar, and was burnt A.D. 80. The main structural parts of the Pantheon consist of a rotunda and a dome, the interior of the latter

Pantheon. Portico of the ancient Roman temple built by Hadrian and now used as a church

Pansy. The two-coloured variety. Left, the common yellow pansy

forming a perfect hemisphere, the total height and diameter of the building amounting to 142 ft. 6 ins. The portico of Corinthian columns supports a massive pediment (*q.v.*) surmounted by another partially screening the dome, which is constructed of solid concrete and lighted at the summit by an opening 27 ft. in diameter. Originally the dome was covered with tiles of gilded bronze, but these were removed by Constantine II, a leaden covering being substituted by Pope Gregory III. The interior is lined with marble. In 609 the Pantheon was consecrated by Boniface IV, and dedicated to S. Mary of the Martyrs. It contains the tombs and monuments of eminent Italians.

The Panthéon, Paris, a building in the Roman style, with a large portico and a dome, designed by Soufflot, was begun in 1764, and has been three times a church, dedicated to S. Geneviève, and three times, as now, a temple of honour to great Frenchmen, of whom Voltaire, Rousseau, and Hugo are buried in the crypt.

Panther (*Felis pardus*). Large and ferocious spotted cat. It is a native of Africa, S. Asia, Java, and Japan, about 7 ft. in length. Its upper parts are yellow closely spotted with black, paling to white on the under surface. The spots vary in form from broken rings and ovals to short longitudinal bars and blotches. Generally known in India as the panther, in other parts of its distribution it is called leopard (*q.v.*).

Pantin. Town of France, in the dept. of Seine. An industrial suburb of Paris, it lies just outside the fortifications, 1 m. N.E. of the city. The Ourcq canal runs past it, and the industries include rly. wagon factories, the making of chocolate, soap, preserves, and perfumery, distilleries, dyeworks, and some stone quarries. Although an old town, mentioned as Pentium in the 11th century, Pantin has no points of outstanding interest. Pop. 36,212.

Pantograph. Instrument for copying designs on a larger or a reduced scale. Its principle is shown by the accompanying illustration. A D, D C and B F, B E are two pairs of rods of equal length, hinged together at D and B respectively, and attached by removable screws at *x* and *y*. The apparatus is secured to the board by a single spike at A, about which it can be moved freely in any direction. All four rods have a series of holes in them, and by set-

ting the screws in similarly-numbered] holes the sides D *x*, B *y* of the parallelogram B *x* D *y* may be made equal to, longer than,

Pantograph for copying designs on different scales. See text

or shorter than the sides B *x*, D *y*. The longer D *x* is relatively to D *y*, the greater will be the movements of C relatively to those of B. If the reproduction is to be larger than the original, a pencil is inserted at C and a tracing stylus at B; if smaller, the positions are reversed.

Pantomime. Art of acting without words, by gestures and facial expression only. Though practised in ancient Greece, it became more popular in Rome, where it had the great advantage of supplying an entertainment intelligible to the cosmopolitan crowd that lived there. Facial expression, however, was excluded in those days because of the masks worn by the performers—contrivances of bark, leather, or metal, lined with cloth, which covered the entire head. In the 17th and 18th centuries the word pantomime was applied in France to a kind of mythological ballet which was in great favour in Paris and at Versailles. Nowadays the word is chiefly used for spectacular Christmas theatrical productions which first became popular in Great Britain during the 19th century and have developed unique traditions of their own. Originally they were a combination of familiar fairy story with ballet and harlequinade, introducing the stock characters of Harlequin, Columbine, Pantaloon, and Clown, and traditional "business" with sausages and red-hot poker. The fairy story element was gradually strengthened at the expense of the other two, the ballet becoming a special feature at the end of the first half, and the harlequinade concluding the whole performance. The harlequinade has now almost disappeared. For a time it was the vogue to combine two or more fairy stories with burlesque effect, as seen still in the tradition which

combines Robin Hood with the Babes in the Wood. The stories were never much more than a flimsy basis for a riot of song, dance, and comic business, which became increasingly sophisticated and vulgarised. Certain features have become characteristic, *e.g.* the masquerading of a woman as "principal boy" and of a man as an elderly widow, or "dame"; the inclusion of fairy

and demon as supernatural protagonists; the grand parade finale with all the performers entering in ascending order of importance to receive their applause. Stock characters like Idle Jack (Dick Whittington), Dandini and Buttons (Cinderella), and Pekoe and Widow Twankey (Aladdin), owe their whole existence to pantomime. The names of the last two were taken from popular brands of China tea in mid-19th century, Twankey being Twan-kee. Drury Lane theatre was long famous for the elaborate nature of its Christmas pantomimes, as were certain theatres in the north of England and in Scotland, *e.g.* the Grand, Leeds, and the Prince's, Glasgow, where the productions often run well into the spring.

Panzer (Ger., coat of mail, iron-clad). Name given to the German armoured division in the Second Great War. The term Panzer division was first used by the Austrian Gen. Eimannsberg in his book Tank War, 1934, which became a German general staff textbook. Although its composition varied according to operational conditions, the division normally consisted of: two tank regiments of three battalions each, totalling 468 light, medium, and heavy tanks; three battalions of motorised infantry; a battalion of 50 armoured cars; a battery of 24 self-propelled guns; another of 24 A.A. guns; an anti-tank battery of 36 guns; two battalions of engineers; one of signals; 12 reconnaissance aircraft and 32 dive-bombers. The purpose of the Panzer division was to act as the spearhead of attack, its mobility enabling it to exploit any weakness in the enemy defence.

Paoli, PASQUALE (1725-1807). Corsican patriot. Born April 25, 1725, son of the Corsican leader, Giacinto Paoli, he was educated

at Naples, where his father commanded a regiment of Corsican exiles. In 1755 Pasquale was offered the supreme power in Corsica, where he consolidated the Corsicans by making vendettas unlawful, and provided a generous constitution. When, in 1768,

Pasquale Paoli,
Corsican patriot

Corsica was ceded by Genoa to France, Paoli offered a fierce resistance, but he was compelled to leave the island with 350 followers on a British frigate, June 12, 1769. He settled in London, received a pension, and joined the circle of Dr. Johnson. By a vote of the National Assembly of France, Nov. 30, 1789, he was allowed to return to Corsica, which he again governed. He defied the French, and British troops were sent to his aid, in return for which he handed over the sovereignty of Corsica to George III. The British evacuated it in 1796. Paoli returned to London, 1795, and died there Feb. 5, 1807. See Corsica.

Paolo and Francesca (d. 1285). Lovers celebrated by Dante, who meets them in the second circle of Hell (*Inferno*, v). Giovanni Malatesta of Rimini, who was lame and ugly, received from the lord of Ravenna, as a reward for his military services, the hand of his beautiful daughter, Francesca (q.v.). She loved his brother Paolo, and was surprised with him by her husband, who slew them both. The story is the subject of a tragedy by Stephen Phillips, produced March 6, 1902, at the St. James's Theatre, London, where it ran for 136 performances. Henry Ainley played Paolo; George Alexander, Malatesta; Elizabeth Robins, Lucrezia; and Evelyn Millard, Francesca. See Francesca.

Papa. Latin form of the Greek *pappas* or *papas*, father. In origin and in ordinary usage the word is a child's name for father. It was an early title of bishops, e.g. S. Jerome refers to S. Cyprian as *Beatissimus papa*. Since the time of Gregory VII (1073-85) it has been claimed as the prescriptive title of the bishop of Rome. In the Greek Church the word denotes a priest. See Pope.

THE PAPACY: HISTORICAL OUTLINE

Canon W. F. Barry, D.D., Author of *The Papal Monarchy*

This article is supplemented by one on the Roman Catholic Church. See also the biographies of the Popes and the entries on the Councils; also Curia; Investiture; Pope; Rome; Vatican, etc.

No dynasty of rulers or lawgivers left standing in Europe today is as old as the papacy; none, perhaps, in the world except that of Japan.

Papacy, shield on which each pope emblazons his arms

In legal documents issuing from his court the pope is termed bishop of Rome, successor of S. Peter, Pontifex Maximus and Vicar of Christ. He holds many more titles, but they all flow from one; for he is the Roman Father, emphatically such, and this Virgilian appellation (*Aeneid* ix, 449) prefigures an empire without end, visible in its throne of majesty, but something higher still, because the gift of Heaven. If S. Peter was prince of the Apostles, yet imperial Caesar was head of the college of Pontiffs, a priest who could offer sacrifice and edit or interpret the Sibylline books. This very ancient mingling of attributes in a priest-king was familiar to Jews and Christians, who venerated Melchizedek, king

of Salem, priest of the Most High God.

The Apostle Peter came to Rome, according to tradition, in A.D. 42, and in whatever year he suffered martyrdom, it is certain that his Confession became a place of pilgrimage from all parts of the empire, as Caius the priest bears witness at the beginning of the 3rd century. Reference to the good Apostles in S. Clement's epistle, about A.D. 94, and an implication of their heroic end, confirm the association of Peter and Paul with Roman Christianity; but succession to the bishopric is never derived from the teacher of the Gentiles. In the earliest catalogues of the popes a slight derangement leaves the chief links secure. There is no question among scholars of best reputation that Peter died in Rome, where he had exercised supreme authority, and had designated Linus or Clement to succeed him as bishop.

Need for a Universal Religion

When Nero put to death an immense multitude of Christians in A.D. 64, the new and spiritual Rome, which was to rise upon the ruin of republic and empire, celebrated her birthday. When, again,

Titus destroyed Jerusalem, its prerogatives could not fail to be transferred elsewhere; and what city enjoyed an equal greatness with the world's capital, sanctified by the memories of Peter and Paul? Moreover, the unity of the empire demanded a universal religion which might absorb or supersede the many local gods, rites, and temples in East and West. From Egypt came the Isis worship, from Persia that of Mithras; both were tried by large numbers, only to be found wanting; and the field lay open to Christianity, which inherited the promises made to Judaism, while divesting them of its burdensome restrictions.

Identification with Rome

From S. Clement to S. Sylvester 90-313, the movement went forward, quickened by the "ten persecutions"; for, as Tertullian knew, "the blood of martyrs is the seed of the Church." At last Caesar made terms with Peter; the great Constantine saw victory in the Cross and wove it into his standard. Jupiter Capitolinus abdicated; the Vatican became, in S. Jerome's language, the "Roman height"; a fresh capital was set up on the shores of the Bosphorus; and the heirs of Augustan Rome quitted the Tiber, to which they never returned, A.D. 324. From now on, the papacy and the most sacred of world cities were identified in fact as in idea. Old Rome had civilized the West; it fell to the lot of a better dynasty to convert the barbarians, to make the future Christian, and to plant foundations on which European culture, instinct with principles taught in the Gospel, should prove itself to be the dominant power above mankind.

When the Iconoclast emperors lost their hold on Central Italy, the popes were acclaimed deliverers of Rome, and the temporal power, as it is called, began. "Their noblest title," wrote Gibbon, "is the free choice of a people whom they had redeemed from slavery." They could not yet rescue Spain from the Saracens; but on Christmas Day, 800, Leo III crowned Charlemagne in S. Peter's and created the Holy Roman Empire, of which a far-off shadow flitted away in the disappearance of its Austrian successor. The popes made the French monarchy; they converted Ireland, Britain, Central Europe, Poland, Bohemia, and Russia by their missionaries Patrick, Augustine, Boniface, Cyril, and Methodius; they resisted the Franconian and Hohenstaufen emperors, who would have made the Church a department of state; and

they became suzerains of every Western kingdom except France.

The holy war against Mahomedans revealed the same spirit armed for battle. If it began with the conquest of Jerusalem in 1099, it did not cease until 1720, under Clement XI; and it remains the great Christian epic. The genuine Middle Ages came to an end when the 14th century opened with a fatal dispute between Philip the Fair of France and Boniface VIII. No century has been more disastrous to the papacy, captive at Avignon for seventy years, rent by the Great Schism during another forty. The council of Constance (1414-17), which restored visible unity, voted by nations instead of by bishops; and our modern world stood at the door.

Renaissance and Reformation

In 1453 the Turks captured Constantinople. All that we understand by culture fled to the West, and Rome took to herself the glorious task of Athens. A brilliant era came in, with learning, luxury, scandals, catastrophe in its train—Luther's revolt and the sack of Rome. The whole North fell away. England struck out a line of her own; Scotland obeyed Knox, who obeyed Calvin. Then Ignatius of Loyola founded the Jesuits, and Rome got back one-half of what she had lost; but the Thirty Years War, ending in 1648, drew a line which has never been altered since. The last of the great popes were Julius II, Pius V, and Sixtus V.

The principle of nationality, which was to make Italy free and united, ruled throughout the 19th century. The pope's temporal power fell before it. On Sept. 20, 1870, the Porta Pia was blown open by Italian guns; a plebiscite followed, and Rome began to fill the part of a secular capital. The Vatican was left to S. Peter. Yet in Leo XIII a great pope became once more visible, who could compel Bismarck to kneel in spirit at Canossa. The Vatican council had brought together bishops from every region of the globe; and papal infallibility was proclaimed 63 days before Rome capitulated.

For hundreds of years the papacy had been overlord of Europe, controlling the two swords, spiritual and temporal. It is now the head of a world-wide voluntary association, which wields no sword but its faith, and which owes nothing to secular governments. The pope is guardian of a temple not made with hands; in this light, at least, three hundred millions of Catholics regard him. His effective influence,

at present, is more extensive than in any former age, being less hampered by secular considerations, and much more direct in action.

W. F. Barry, D.D.

From 1870 the popes maintained a dignified protest against the spoliation of their territory by remaining within the Vatican and its gardens for 59 years, and by refusing to accept the so-called law of guarantees. Gradually relations between the papacy and the Italian government improved and, to the astonishment of the world, which had regarded the "Roman question" as insoluble, on Feb. 11, 1929, the treaty of the Lateran was signed by the secretary of state, representing Pius XI, and Mussolini, representing the king. The pope gave up all but a minimum of territory, but was acknowledged as an independent sovereign. The limits of the pope's temporal jurisdiction are the Vatican city, including the palace and gardens, S. Peter's basilica and its square, the chief basilicas and certain other buildings in Rome, and Castel Gandolfo where popes sometimes go to escape intense heat in summer. The Vatican city covers 109 acres, has 1,025 inhabitants, and must be the smallest independent state in the world. In spite of some early disagreements the settlement has worked well.

Papain. Vegetable ferment present in the milky juice of the unripe fruit of *Carica papaya* (papaw, *q.v.*). Papain occurs in commerce as a fine greyish powder with a characteristic odour and sweetish taste. It is a proteolytic enzyme intermediate in action between pepsin and trypsin, and has been given as a digestive.

Papal States or STATES OF THE CHURCH. Name given to the Italian territories which were under the temporal sovereignty of the popes. Differing at different periods, they

generally formed a solid strip of territory running across Italy and bounded N.W. and N. by Tuscany, Modena, and the Po, and S.E. by the kingdom of Naples, the nucleus being the Roman patrimony of S. Peter and the exarchate of Ravenna, extorted from the Lombard kingdom by Pepin and given by him to Pope Stephen II in 755.

Through the Middle Ages the regions in which the pope was able to exercise temporal sovereignty varied greatly, reaching their maximum under Innocent III (1198-1216). The annexations of Ravenna, Ancona, Bologna, Ferrara, Perugia, etc., date from the 16th century. Submerged under Napoleon's ascendancy, the Papal States reappeared in 1814, and received a constitution in 1849. The formation of the kingdom of Italy in 1860 reduced them to the comarca of Rome, the legation of Velletri, and the delegations of Viterbo, Frosinone, and Civita Vecchia. These being absorbed in 1870, the popes thereafter remained as self-constituted prisoners in the Vatican, until the Lateran treaty between the Holy See and Italy, Feb. 11, 1929, recognized the pope as sovereign of a clearly defined territory, the Vatican city. See Papacy.

Papal University. Ecclesiastical educational institution in Rome. It consists of three colleges: the pontifical, founded by S. Ignatius Loyola in 1550; the biblical, founded in 1909; and the oriental, founded in 1917. The three colleges, called collectively the Pontifical Gregorian university, are under the direction of the society of Jesus; they prepare candidates for the priesthood. The buildings are outside the Vatican city, but since the concordat with Italy of 1929 have enjoyed extraterritorial rights in relation to the Holy See.

Papaveraceae. Name given to the poppy family. It forms a family of herbs and a few small shrubs with milky or coloured juice, chiefly natives of the N. temperate regions. They have alternate leaves on their stalks. There are only two sepals, which are thrown off when the four crumpled, silky petals expand. The seed capsule either is like the familiar poppy head of the druggists' shops, opening when ripe by pores just beneath the broad-lobed stigma to release the innumerable small seeds, or is a long, slender, cylinder opening by a long valve on each side. *Papaver somniferum* yields opium from its milky juice;

its seeds, which are not narcotic, are the maw-seed of the bird-fancier. *See* Opium; Poppy.

Papaw (*Carica papaya*). Small evergreen tree of the family Caricaceae. A native of S. America, it has large, alternate, seven-lobed leaves, the segments themselves being deeply lobed. The greenish flowers are either male or female, and the two kinds are often on separate trees. The dingy, orange-coloured fruit is an elongated oval nearly a foot long, with fleshy gourd-like rind enclosing five rows of

Papaw tree laden with fruit

small black seeds. It is eaten after being boiled or pickled. It yields the proteid-ferment papain.

Papeete. Capital and seaport of the Society Islands. Situated on the N.W. coast of Tahiti, it contains the residence of the French governor. Pop. 11,614.

Papen, FRANZ VON (b. 1879). German politician. Of a family belonging to the R.C. aristocracy, he was born at Werl, Westphalia, Oct. 29, 1879. At the outbreak of the First Great War he was military attaché in Mexico; being transferred to Washington

Franz von Papen, German politician

he became an active German agent, organizing plots to impede the output of munitions for the Allies; but after losing incriminating documents he was sent home. A member of the centre in the Prussian diet, 1921-28, he became German chancellor in June, 1932, but after the Nazis had obtained an electoral majority he resigned on Nov. 17.

Papen helped the Nazis to power in the belief that he could direct them as vice-chancellor, and narrowly escaped Hitler's purge in 1934. Ambassador to Vienna, in 1938 he helped to bring about Schuschnigg's downfall, and during the Second Great War as ambassador to Ankara he furthered German designs in the Balkans. After his country's defeat he was brought to trial before the Allied court at Nuremberg as a war criminal and acquitted. Immedi-

ately arrested by the Germans, he was in 1947 sentenced to eight years in a labour camp. Released on appeal, 1949, he was still debarred from political or public activity.

Paper. Material on which records are kept by means of symbols made with ink. Man first recorded his thoughts and actions by carving hieroglyphics in rock and stone, then he used metal slabs, waxed boards, clay tablets, cured reptile and animal skins, papyrus and parchment, the last two direct forerunners of paper. (*See* Papyri.) Parchment, made from sheep and goat skin, came into vogue when the export of Egyptian papyrus was prohibited. It was very popular in the Middle Ages and has continued in use for important legal documents.

HISTORY. Paper (a word derived from papyrus) is a deposit of vegetable fibre prepared from an aqueous suspension. It was first produced, from bark, tow, and old linen, by Ts'ai-Lun, a Chinese minister, in A.D. 105. The process was kept secret for hundreds of years until some Chinese paper-makers were captured in 751 by Moors and Arabs and forced to divulge their knowledge. Linen formed the basic raw material in Bagdad paper mills, and as early as 1035 Arab merchants were wrapping their wares in paper. In the 12th century the art of papermaking reached Spain, coming a little later to Italy, France, and the Netherlands.

After a mill was started in Hainault (Flanders) in 1189, the industry rapidly spread throughout the Continent. The first English mill was opened in 1496 by John Tate at Hertford. Cotton and linen rags were moistened, and after fermentation and washing were "beaten" to pulp in stamping machines, rather like mechanical pestles and mortars. After Tate's time, papermaking fell into comparative desuetude in England until de Portal took up his monopoly of making paper at Laverstoke for Bank of England notes in 1725; the famous Whatman mills were founded in 1740. In the meantime, the industry had been making great strides in the Netherlands, where the Hollander beating engine, invented in 1680, was followed by Louis Robert's invention of the paper machine at Essonne in 1798. A few years later the Fourdrinier brothers, of London, financed Bryan Donkin's first paper machine at Two Waters Mill, Hertford, in 1803. John

Dickinson invented the cylinder vat machine in 1809, drying cylinders were added to the Fourdrinier machine in 1821, suction pumps and the dandy roll followed, and by 1831 the prototype of the machine of the 20th century appeared.

The discovery of the bleaching action of chlorine by Berthollet and the cheapening of soda manufacture by Leblanc at the turn of the 18th century made it possible to prepare cellulose pulp cheaply from a wide range of fibrous materials. Koops used straw pulp in 1800, Routledge used esparto in 1852 and bamboo in 1875, and about 1855 in the U.S.A. brown wrapping paper was made from the linen shrouds taken from shiploads of Egyptian mummies. From his observation of the fibrous construction of wasps' nests, Réaumur concluded that paper could be manufactured from wood, and in 1840 Keller first introduced ground wood pulp. This, with Tilghman's invention of the sulphite wood-pulp process in 1866, made possible the production of the huge quantities of newsprint consumed by the press of the world.

MANUFACTURE. Cotton and linen rags, which yield virtually pure cellulose, are still extensively used for paper making; they yield high grade handmade and machine-made papers of great durability. Esparto grass, straw, bamboo, hemp, jute, and waste paper are all valuable sources of fibre, and much of the paper in everyday use is made of wood fibre from the coniferous forests of Scandinavia and N. America. Deciduous or hard woods such as poplar and birch have been used, and the search for new sources of fibre goes on continuously.

In making handmade paper cotton and linen rags and new white cuttings from the textile mills are sorted carefully, cut and dusted, and then digested with alkali under pressure. Partial disintegration in a breaking machine is followed by washing and bleaching to reach the "half-stuff" stage. The half-stuff is reduced by the beater to ultimate fibres, the individual fibres being separated, fibrillated, and shortened. The manner and duration of beating govern the properties of the finished stock. The beater is a heavy roll fitted with steel or bronze knives or bars. The roll is housed in an oblong trough with rounded ends and rotates with a peripheral speed of about 2,000 ft. per min. over a bedplate, which is fitted with bars. The

1. Stacks of wood pulp in bales waiting to be turned into paper. 2. Beaters, in which the wood pulp is treated before passing to the paper-making machines. 3. A super-calender which imparts a smooth surface.

4. Reelers on which the paper is slit to the size required. 5. "Wet-end" of a paper machine on which the paper is formed. 6. "Dry-end" of a paper machine where paper is reeled for the super-calenders

PAPER: STAGES IN THE PROCESS OF NEWSPRINT MANUFACTURE

By courtesy of the Imperial Paper Mills, Ltd., Gravesend

pulp circulates round the trough, past a central partition (the mid-feather), and then under the roll, the clearance between the beater bars and the bedplate being very small but adjustable to give the required degree of beating to the fibres. This treatment, which may take from one to 16 hrs., develops the strength of the pulp and alters its drainage characteristics; it needs to be carefully controlled to suit the specific type of paper being made.

After screening, the diluted paper pulp is run into a vat into which the vatman dips a shallow wire gauze sieve, called a hand mould. He withdraws a definite amount of stuff and shakes the mould in such a way as to cause the individual fibres to interlock as the water drains away. The mould is handed to the coucher who inverts it and deposits the sheet skilfully on to a wet woollen felt. The eventual pile of paper and felt is then pressed in a hydraulic press for 12-24 hrs. at $1\frac{1}{2}$ tons per sq. in. to remove excess moisture. The sheets are then hung over cow-hair ropes (to prevent staining) to become air-dry, dipped into gelatine size solution, and again air dried. The final operation is plate-glazing, the sheets being placed singly between polished copper or zinc plates and passed to and fro between heavy calender rolls.

Handmade papers are nowadays usually reserved for special library editions of books, for high grade stationery, and as artists' material.

For mass production paper machines cheaper materials than rags, e.g. wood, straw, esparto, are used. They are much less pure forms of cellulose than rag and all need special chemical treatment to eliminate lignin (*q.v.*), etc. Most chemical wood pulp is prepared by the sulphite process, in which small chips of wood are cooked under pressure with calcium bisulphite solution containing some free sulphur dioxide in solution. The product is very useful for most types of paper, including printing and writing grades. The "Kraft" process, based on digestion with caustic soda and sodium sulphide, yields a strong brownish pulp suitable for wrapping and paper sacks; after bleaching, it can also be used for most purposes for which bleached sulphite pulp is used, but with the advantage of greater fibre length. The soda process involves cooking with caustic soda and yields soft, easily bleached pulps.

Wood can, however, be used without chemical treatment. Barked logs are pressed against revolving grindstones under a flow of water which serves to cool the stone and carry the groundwood away to the screening machines. It then emerges as a fine, uniform pulp of good colour and brightness, suitable for newsprint manufacture. About 15 p.c. of the comparatively long-fibred sulphite pulp is added to improve the strength of the resulting sheet. Enormous newsprint machines, up to 300 ins. in width, and working at speeds up to 1,500 ft. per min., produce a paper able to stand the strain of printing by high-speed rotary newspaper presses. Wood pulp is generally made where wood and water power are readily available, as in Scandinavia and N. America, and is frequently converted immediately into paper, being pumped directly to the paper machines in the form of an aqueous suspension or "slush." Alternatively both chemical and groundwood pulp are made into sheets and baled for shipment to paper mills. Groundwood is usually shipped 40-50 p.c. wet, whilst chemical pulp is normally exported air-dry.

Process of Manufacture

On arrival at the newsprint mill, the pulp needs only the barest minimum of beating, mixed with water at a concentration of six p.c. After the addition of china clay slurry and a trace of dye, the stock passes through the refiners which break down oversize bundles of fibre and generally help to prepare a uniform suspension having the required drainage properties. The refined stock is diluted to 0.5-1.0 p.c. concentration and pumped to the strainers. From there it flows into a breast box where the necessary head and special streamlined construction make the stock pass smoothly under a slice on to the wire of the Fourdrinier paper machine. The wire is an endless wire gauze with about 55 meshes to the inch, drawn level between the breast roll at one end and the couch roll at the other. At intermediate positions it is supported by table rolls and suction boxes. As the thin mixture of pulp and water travels along with the wire, the fibres part with their water by drainage and by extraction at the suction boxes. After the wire, carrying the stock with it, has passed over the suction couch roll, the moisture content of the very wet immature sheet has dropped to 80 p.c. From

the couch, the paper is drawn forward, unsupported for the first time, to the woollen "wet felts" which convey the web through presses. The press rolls, of which there may be two or three pairs, smooth the web and reduce the moisture content to about 65 p.c. The web then passes to steam-heated drying cylinders, against which it is pressed by cotton "dry felts"; it arrives at the other end containing about eight p.c. moisture. Still in continuous production, the paper passes direct from the dryers to the machine calender, where a certain amount of gloss is given to it. After this the paper is put on reels, and the reels are afterwards transferred to a super-calender. This is a stack of alternate paper and steel rolls, which by friction and pressure produce a high gloss on the web. Finally, the wide reels are slit on the reeler by rotary knives to provide sizes suitable for newspaper printing; the correctly cut reels are then packed carefully for transport to the press rooms.

The pulp for paper other than newsprint requires beating to some degree, and when necessary rosin soap and alum are added to the stock as sizing agents, together with loading materials, dyes, and pigments. The machines are slower than newsprint machines and range from about 80 to 150 ins. in width. The wire part is shaken by mechanical means to assist the felting of the fibres. The watermark is applied by means of a dandy roll, a rotating wire gauze cylinder with a wire design raised on it, placed just before the point at which the full vacuum of the suction boxes comes into play. The web becomes thinner where the design presses on it and the paper is consequently more transparent in that place.

Millions of shell containers were manufactured during the Second Great War from low grade waste paper mixed with a certain proportion of "Kraft" pulp, and vital supplies reached Allied troops in torrid, frigid, arid, and humid theatres of war in good condition, thanks to the efficient waterproof and weatherproof paperboard packages. Aeroplane and machine parts were fabricated from paper-base plastics, and containers for oil, petrol, and blood plasma were made from paper. One of the most notable was the jettison fuel tank, a 100-gall. torpedo-shaped vessel made from "Kraft" paper, which extended the range of fighter aeroplanes.

Commercial paper products include packages for milk, cereals, and dehydrated foods, and sacks for cement and chemicals; laminated "Kraft" and other products used in building; twisted, braided and woven papers for textiles and the cable industry. Paper is also used for surgical dressings, curtains, and draperies, and to some extent for clothing.

Consumption of paper and paper-board in the U.S.A. has risen from 58 lb. per capita in 1899 to 121 lb. in 1918 and nearly 350 lb. in 1947. Restriction in the U.K. during and after the Second Great War kept consumption there at an artificially low level. World paper production for 1947-48 was estimated at over 25 million tons, about seven million of it newsprint.

Paper, SIZES OF. Term for the dimensions of printing, writing, drawing, and brown papers. Of British printing paper there are 14 sizes, ranging from foolscap, 17 ins. by 13½ ins., to double post, 32 ins. by 40 ins.; of writing and drawing papers, 17 sizes, varying from post, 15 ins. by 12½ ins., to emperor, 72 ins. by 48 ins.; and of brown papers, eight sizes, from Kent cap, 21 ins. by 18 ins., to casing, 46 ins. by 36 ins.

Paper Control. This feature of administration in the Second Great War is mentioned under Newsprint.

Paperhanging. For details of this work, see under Painting and Decorating.

Paper Money. Slips of paper which are legal tender. Cheques, bills of exchange, etc., though forms of money, are not legal tender. In most modern states paper money forms the major constituent of the currency, metallic money—coins—being used only for units of small denomination. In the U.S.A., Canada, and many European countries notes are used for sums even lower than the largest British coin (the five-shilling piece).

In Scotland and N. Ireland the notes of trading banks con-

stitute an important part of the paper money, while in the U.S.A. notes are issued by commercial banks and the Federal Reserve banking system as well as by the Treasury. In Canada, Australia, and New Zealand commercial bank notes were formerly common. Usually, however, notes are issued by the state, or, more usually, by the central bank on behalf of the state. English bank notes are issued by the Bank of England, a state-owned institution since 1946. The former treasury notes were taken over by the Bank of

NOMINAL VALUE OF SELECTED NOTE ISSUES

	1939	1946
Bank of England	£563 m.	£1,400,248 m.
Bank of Australia	£A48 m.	£A198 m.
Bank of New Zealand	£NZ16 m.	£NZ46 m.
Bank of France	Fcs. 130,000 m.	Fcs. 680,517 m.
U.S. Federal Reserve Banks	\$4,609 m.	\$24,552 m.
Swiss National Bank	Fcs. 1,724 m.	Fcs. 3,722 m.
Reserve Bank of India	Rs. 1,700 m.	Rs. 12,000 m.
Netherlands Bank	Fls. 1,133 m.	Fls. 2,810 m.
Bank of Belgium	Fcs. 23,910 m.	Fcs. 71,440 m.

England, although then a private institution, in 1928.

The use of paper for money was common in China more than 1,000 years ago. In the U.K. it arose early in the 17th century and then consisted of the notes—or receipts—given by the goldsmiths for coin deposited with them for greater safety, these receipts eventually passing from hand to hand as money. The first Bank of England notes, for £20, came into circulation in 1695; by 1844 notes issued by 279 other banks were in circulation. The Bank Charter Act of that year so restricted the right of note issue that by 1921 that of the last remaining issuing bank, apart from the Bank of England, lapsed on the bank's amalgamation with Lloyds Bank Ltd. From 1829 until the issue of treasury notes (called "Bradburys" from the fact that they bore the signature of Sir John Bradbury, then secretary to the Treasury) in 1914, notes of less than £5 were prohibited. They were then issued for 10s., £1, £5, £10, £20, £50, £100, £200, £500, and £1000; notes of denominations larger than £5 were withdrawn and ceased to be legal tender on April 30, 1945, as a precaution against tax evasion.

Notes have almost entirely superseded gold coins internally. Externally, however, they have the disadvantage that, unlike gold, they have no guaranteed value abroad. Over-issue of notes was

once thought to constitute a major cause of inflation, and as a safeguard only notes which were fully convertible into gold on demand were considered safe; but experience has proved that inflation arises from a variety of causes of which the over-issue of paper currency is only one. The linking of the note issue to gold has been shewn to be harmful owing to the extent to which it makes the internal economy of a country subject to external conditions (gold having to be imported by most countries). The last attempt made

by the U.K. to do so, in 1925, was abandoned in 1931.

The extent to which notes are used as money appears from the table showing the nominal value of the note issue in certain countries in 1939 and 1946.

See Bank Note; Currency; Legal Tender; Money.

Paper Mulberry (*Broussonetia papyrifera*). A small tree of the family Moraceae. A native of China, it has hairy egg-shaped leaves. The greenish flowers have the sexes distinct on separate trees, the males in catkin-like clusters, the females in a round

Paper Mulberry. Leaves and flower clusters

head. The latter are succeeded by scarlet fruits much like a mulberry in shape, but without flavour. The inner bark is beaten into pulp to make paper in China and Japan, and in the South Sea Islands into a kind of cloth.

Paper Reed (*Cyperus papyrus*). Perennial sedge of the family Cyperaceae. A native of Egypt, it has triangular flowering stems, 3-12 ft. high, from whose summit is produced the spike of flowers ringed by whorls of bracts. See Egypt; Paper; Papyrus.

Paper Reed. Stem with flowering spike

Paphlagonia. Ancient country of Asia Minor. On the Black Sea, it lay between Pontus on the E. and Bithynia on the W. It was a mountainous area, and its capital was Gangra. After having been part of the kingdom of Croesus, it passed under the rule of the Persian kings, but it evidently enjoyed a considerable measure of independence, while Greeks made settlements on the coast. The eastern portion next became part of the domains of the king of Pontus, and remained so until the power of Mithradates was destroyed by the Romans, who included it in Bithynia.

Paphos. Two ancient towns on the W. coast of the island of Cyprus. Old Paphos (mod. Kuklia), about a mile from the sea, and originally a Phoenician colony, was famous for its worship of Aphrodite, who was said to have landed here after her birth from the sea foam. Remains of the wall of the temple erected in her honour still exist. New Paphos (mod. Baffo), about 7 m. W. and more inland, became one of the seats of administration of the island in Roman times. See Cyprus.

Papias (c. 60-135). Apostolic father. He was of Phrygian birth, and is said to have become bishop of Hierapolis. The statements that he was associated with S. John and S. Polycarp, and that he was martyred, have been disproved. He is important as the author of an Exposition of the Oracles of the Lord, of which only fragments are extant.

Papier Mâché (Fr., pulped paper). Paper pulp compressed and moulded, and used in the manufacture of various articles. Usually some earthy material is added, with glue or resinous matter to help to bind it. This composition is then rolled into thick sheets, which are moulded and pressed to the requisite shape and dried, after which the article can be decorated with enamel, paint, or inlaying. Trays, boxes, masks, and even light furniture are made of papier mâché.

Papilloma. Tumour more or less elongated in shape. Warts (*q.v.*) and polympi are common forms.

Papin, DENIS (1647-1712). French physicist. Born Aug. 22, 1647, at Blois, he became assistant to Huygens in Paris in his experiments with the air pump. Papin visited England, became a member of the Royal Society, and in 1690 constructed the first steam engine with a piston, applying his invention to a paddle-wheel boat. He invented the safety valve, and

showed that the boiling points of liquids depended upon the pressures to which they were subjected. He died in London. Consult Growth of the Steam Engine, R. H. Thurston, 5th ed. 1895.

Papineau, LOUIS JOSEPH (1786-1871). Canadian politician. Born at Montreal, Oct. 7, 1786, and educated at Quebec, he was made Speaker in 1815, and in 1820

a member of the executive council, on which he sat for three years. A leader of the French Canadians, he was prominent in desiring drastic changes in the methods of government, and in opposing the suggested union of the two Canadas. Embittered by failure to carry his reforms, he led a rebellion in 1837. This failed and Papineau fled to the

Louis Papineau, Canadian politician
U.S.A., being declared a rebel. In 1847 a general amnesty was proclaimed and he returned to Canada. Elected to the legislature until 1864 he continued to work for Canadian independence. He died Sept. 24, 1871.

Pappenheim, GOTTFRIED HEINRICH, COUNT VON (1594-1632). Bavarian soldier. He was born at Pappenheim, May 29, 1594. He fought under Sigismund against the Poles, and joined the Catholic League, 1620. He was one of the chief imperial leaders of the Thirty Years' War (*q.v.*). After Tilly's death he served with Wallenstein, and at the battle of Lützen in the midst of a furious attack he fell wounded, dying the next day at Leipzig, Nov. 17, 1632.

Paps of Jura. Mountain peaks of the island of Jura, Argyleshire, Scotland. They form the S. extremity of a bleak and rugged range, and consist of three conical summits rising above a deer forest. Beinn-an-Oir (mountain of gold) reaches 2,571 ft.; Beinn Siantaidh (hallowed mountain), 2,477 ft.; and Beinn-a-Chaolais (mountain of the firth), 2,407 ft.

Papua. Name formerly given to the Pacific island of New Guinea, but now applied only to British New Guinea, the S.E. section. Its geography and history are dealt with under New Guinea.

Papua. Native couple, the woman in mourning weeds

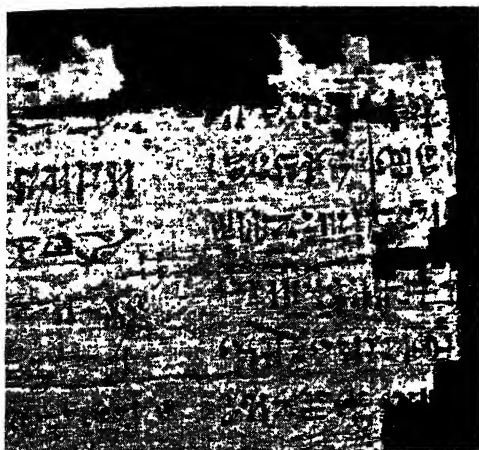

Papua, GULF OF. Large bay on the S. coast of the island of New Guinea, N.E. of Cape York Peninsula, Queensland. It receives the waters of the Fly and other rivers of Papua.

Papuan (Malay, mop-headed). Term denoting aboriginal peoples of negroid stock, mostly in Dutch New Guinea. They are a tall, brownish-black, long-headed race, with receding forehead, prominent brow-ridges, nose sometimes aquiline, and frizzy hair—often dressed mopwise. Their culture is characterised by bone-tipped arrows and stone clubs.

Papworth Village Settlement. Community near Cambridge, England, for the employment of consumptives. Founded in 1917 by Dr. (later Sir) Pendrill Varrier-Jones, it grew from one cottage garden to a village of 1,500, grouped about a hospital and a sanatorium, where patients are helped to recovery and ex-patients settle with their families. Most inhabitants of the settlement would normally be unemployable, and the cost of their wages is largely met by the sale of their productions and supplemented by public contributions. The direction of Papworth is closely associated with that of Enham (*q.v.*).

Papyrus. Ancient documents written upon papyrus, this being the Greek form of the Egyptian name. The papyrus rush, *Cyperus papyrus*, formerly harvested in the Egyptian delta for numerous purposes, has receded to the upper Nile. Moistened strips of stem laid side by side formed the longitudinal warp; shorter strips overlaid crosswise, after the whole was pressed, dried, and polished, formed the writing surface. Ink, of sepia, animal charcoal, and other substances, was applied with a reed. These materials endured in literary use from the pyramid age, if not before, to the 4th century of our era, surviving casually to 1250.

Invented for Egyptian writing, they were adopted for Aramaic (as at Elephantine), Greek, Latin, and Arabic, constituting an important export trade at Alexandria in Greco-Roman times. The oldest example, now at Cairo, contains records of the Vth dynasty king Assa, during whose reign his tutor, Ptahhotep, compiled the famous maxims preserved in a XIIth

Papyrus. Reproduction of part of a papyrus inscribed in the Hieratic character, containing an Egyptian romance and bearing the names of Antef, 2500 B.C., and Thothmes III, 1600 B.C.

British Museum

dynasty copy, the Prisse at Paris, sometimes called the oldest book in the world. The longest roll is the Harris No. 1, 135 ft. long, a panegyric of Rameses III (c. 1170 B.C.), in the British Museum. The finest rolls are the illustrated copies of the Book of the Dead. The Alexandrian library, destroyed by fire, 47 B.C., contained 700,000 works. The masses of papyri found in Egypt have yielded valuable literary remains. See Ani; Book of the Dead; Codex.

Par (Lat., equal). Financial term for the price of a stock or share when such sells for exactly its face value. Thus if Consols stood at £100 it would be said that the price was at par. Above or below par means that the selling price is higher or lower than the face value.

Pará. River of Brazil. Strictly the S. tributary of the Amazon delta, it receives the Tocantins and has the island of Marajo between it and the N. Channel. It is 200 m. long with a width from 12 to 40 m., and has a bore during the spring tides 15 ft. in height.

Pará. State of Brazil. It is situated in the N.E., adjacent to the three Guianas, to the E. of Amazonas, with a long coast-line on the Atlantic Ocean. The lower Amazon almost bisects the state, which contains the lower courses of the Tapajoz, Xingu, and Tocantins tributaries, and includes the island of Marajo in the Amazon delta. The only rly. is from Belem to Bragança. Most of the state is covered with dense forest. Rubber, cacao, timber, and Brazil nuts are obtained, and it gives its name

to a form of rubber. Pará is the capital. Its area is 443,789 sq. m. Pop. 1,039,661. See Rubber.

Pará or BELEM DO PARÁ. Details of this Brazilian port will be found under Belem.

Parable (Gr. *parabolē*, juxtaposition, comparison). Illustration of a statement in a discourse. The term is now mainly confined to those teachings of Christ which convey a spiritual lesson in the form of an anecdote or short story. Popularly described as an

earthly story with a heavenly meaning, a parable differs from a fable or an allegory in being either a true record of fact, or at least true to experience, while a fable always, and an allegory usually, is purely fictitious and often impossible. In the Bible the word parable is used somewhat vaguely, but its meanings may be classed under three headings—enigmatical assertions, ornate discourses, and illustrative stories. The last method of teaching was common among the Jews, and several of Christ's parables occur also in the writings of the great Rabbis. See Bible; Christianity.

Parabola. In geometry, one of the sections of a cone. It is the section produced by a cut parallel to the slanting edge of the cone. In analytical geometry it is defined as the locus of a point the distance of which from a fixed point, called the focus, is always equal to its distance from a fixed straight line, the directrix. The curve is an important one in dynamics as the path of a body projected at an angle to the horizon, and in optics, since a light placed at the focus of a parabolic mirror has its rays reflected in parallel lines, a fact made use of in the construction of lighthouse lanterns. See Conic Sections.

Parabolic Reflector. Instrument to reflect light from a concentrated source and so form a beam of small divergence. The reflector consists of a concave mirror

Parabolic Reflector

(sometimes of metal), placed behind the light source. The point source of light is placed at the focus of the mirror, when, the angle of reflection equalling the angle of incidence at all points, the light is reflected as a parallel beam. Parabolic reflectors are sometimes incorporated in motor car headlamps, but their principal use is for searchlights, lighthouses, and similar projectors.

Paraboloid. In solid geometry, a solid whose surface is generated by a parabola which moves with

Paraboloid. Diagram illustrating a paraboloid surface. OPQ is a parabola along which the vertex O of parabola AOB moves

its vertex always on another parabola. The axes of the two parabolas are parallel and their planes at right angles. A paraboloid of revolution is generated by the revolution of a parabola about its own axis.

Paracelsus or THEOPHRASTUS BOMBAST VON HOHENHEIM (c.1492–1541). Swiss philosopher, born at Einsiedeln, the son of a physician. His education was irregular, but he acquired a knowledge of medicine, chemistry, etc.

He travelled much, studied nature, and despised bookmen. Although he had no degree, he practised, and was even appointed professor of physic and surgery at Basel, lecturing in German. Of undoubted ability, though of erratic life, Paracelsus, by his successful if empirical application of mineral medicines, gave a great impetus to pharmaceutical chemistry. Accused of being a necromancer, he fled from Basel, and, after an adventurous life, died at Salzburg, Sept. 24, 1541.

Paracelsus is the hero of a work by R. Browning, published 1836, in which he is represented as a philosophical genius with lofty

Paracelsus, Swiss physician

aims, whose pride and ambition destroy his sympathy and his moral character. *Consull* Lives, F. Hartmann, 1887; A. M. Stoddart, 1911.

Parachute (Fr., from Ital. *parare*, ward off; Fr. *chute*, fall). Device to retard the descent of a falling body. Leonardo da Vinci (1452-1519) left notes and sketches explaining the theory of the parachute, but did not construct one. The first man to design and use a parachute was André Garnerin, who jumped from a balloon over Paris on Oct. 22, 1797. The Garnerin parachute consisted of a piece of cloth stretched over a rigid framework

observers in kite balloons. They were attached by a cord to the balloon basket and opened by the weight of the wearer as he jumped. The manually-operated parachute, fixed to the wearer, was introduced towards the close of the First Great War for use by aircraft crews, though it was not officially adopted by the R.A.F. until some years later.

The standard parachute used by the R.A.F. during the Second Great War consisted of a canopy of pure silk or high quality nylon 24 ft. in diam. with a surface area of 62 sq. yds. The canopy was made of a number of small panels,

When he jumped, the parachutist counted three, to give him sufficient time to clear the aircraft, and then pulled the release ring, so withdrawing the release pins from the slots on the pack. The flaps of the pack then opened, and the small pilot-parachute held by compressed springs, was freed to drag after it the main canopy which opened fully in $1\frac{1}{2}$ secs. The vertical movement under the effect of gravity induced an upward air pressure which inflated the canopy and so retarded descent. The average rate of descent was about 20 ft. per sec., and by pulling on the cords the parachutist could exercise some control over the direction of his descent. Parachutes used by parachute troops were of the static line type, the rip cord being attached to the aircraft and automatically released as the wearer jumped. Parachutes used for dropping supplies were made of cotton and were smaller than those used to support men.

With the development of the high-speed jet-propelled fighter, it was found that a pilot obliged to use his parachute had difficulty in clearing the aircraft before his parachute opened, with the consequent risk of the canopy becoming entangled in the machine. This was overcome by the invention of the ejector parachute. In this, the pilot's seat was incorporated with the parachute and connected to an explosive charge. By pressing a button, the pilot shot himself clear of the aircraft to a safe distance, when he pulled the rip cord in the normal way.

In the Second Great War 10,000 parachutes a month were made for the British forces.

Parachute and Cable Unit.

British anti-aircraft weapon of the Second Great War. It consisted of a number of cables, each 400 ft. long and having a rocket and folded parachute attached to its free end, coiled in a box. The rockets were electrically connected with a master switch in an observation post close to the target. The closing of the switch ignited the rockets, which carried the cables to their maximum height, when the parachutes automatically opened, so preventing the cables from falling back to earth. Cables could be fired simultaneously in any number up to 50. The weapon was particularly effective against dive-bombers, the cables either becoming entangled in the aircraft or forcing it to take evasive action. It

Parachute. Left, airman with packed parachute fastened to his back before entering an aeroplane. Right, a descent

of wooden laths. Later, silk parachutes were stretched over balloons and kept open ready for emergency descents.

In 1838 John Hampden designed an umbrella type of parachute consisting of a piece of canvas 15 ft. in diameter stretched over whalebone ribs. He jumped from a height of 9,000 ft., taking 13 mins. to descend. Towards the close of the 19th century parachute descents were a popular exhibition at the Alexandra and Crystal Palaces, London. Free, or unpacked, parachutes were used, the jumper and his equipment being taken up in a balloon. The chief defect of early parachutes was the excessive oscillation to which they were subject during descent; in 1885 this was overcome by a U.S. parachutist, Thomas Baldwin, who fitted a hole or vent in the top of the fabric.

During the First Great War, parachutes were provided for

so that in the event of a rip the tear would not extend beyond one section of the material. Evenly spaced around its circumference were 36 shrouds, or lines of silk cord. These met at a point some distance below the fabric, and were attached to the wearer's harness by a ring. On top of the canopy was a small pilot-parachute 3 ft. in diam. Parachutes and shrouds were folded into a pack 18 ins. square, the whole weighing 18 lb. The pack was attached by long straps to a web harness passing over the shoulders and between the thighs of the wearer, who could carry the pack on his back or lap or use it as a seat. The folded canopy was held in the pack by two pins running through slots in the outer cover, and attached to each pin was a flexible steel cable, called the rip cord, which was connected to a release ring on the left-hand side of the wearer's belt.

could not, however, be sighted on a target, so that it could be used only when an aircraft came within its range and direction. Operation of the parachute and cable unit was the responsibility of the R.A.F., which used large numbers to protect dispersal points on airfields. It was also used to a limited extent in the defensive arming of merchant ships.

Parachute Bomb. Aerial bomb to which a parachute is attached. It was developed in the Second Great War by the R.A.F. so that low-flying bombing could be carried out with accuracy. Parachute bombs ranged in size from a small fragmentation bomb to those weighing 1,000 lb. The parachute was held in a container attached to the end of the bomb, and the canopy opened automatically as the bomb was released from the aircraft. The bomb was fired by time or contact fuse. Large parachute fragmentation bombs were particularly effective in attacks on aircraft dispersed on aerodromes, the casing breaking into 1,500 pieces on impact and striking the target with a velocity of 4,000 ft. per sec. There was little defence against the parachute bomb, as destroying the parachute by gunfire merely brought the bomb down faster, when it exploded on contact.

Parachute Regiment. Regiment of the British army. It was formed in 1942 to provide personnel for the Parachute bdes. and Independent (Pathfinder) companies within the airborne divs. With the Glider Pilot regt. (*q.v.*) it constitutes the Army Air Corps (*q.v.*). All personnel of the Parachute regt. are volunteers, and recruits are given special physical hardening training to fit them for the four weeks' parachute course at the parachute instruction school. Primary training at the school consists of exercise on various types of ground apparatus designed to teach the correct principles of breaking falls, etc. Recruits then make two jumps at 800 ft. from a captive balloon by day, after which they make five jumps by day from an aircraft and one by night from a captive balloon. On successful completion of the course, recruits are awarded their parachute wings, worn on the right sleeve, and are entitled to parachute pay.

The parachute is merely the means of getting members of the Parachute regt. into battle; when they have landed they fight as infantry.

When making their drop, parachute troops are as lightly equipped as possible. Their non-offensive equipment comprises two days' food and water, a crash helmet, and thick-soled boots. Weapons carried are revolvers, sub-machine-guns, light automatic rifles, and hand grenades. Heavier equipment, such as machine guns, demolition material, radio transmitters and receivers, motor cycles, and tools, are dropped in containers by separate parachutes.

In the Second Great War, the Parachute regt. served in N. Africa, Italy, and W. Europe. There are a number of Territorial army battalions affiliated to the Parachute Regt. See Parachute Troops.

Parachute Troops. Soldiers carried in aircraft and dropped by parachute on to their objective.

The U.S.S.R. was the first country to train military parachutists in any numbers. By 1935 the Red army had at least one fully-equipped and trained parachute battalion. At the army manoeuvres held in Russia in 1937, and observed by British and German military missions, a mechanised brigade, complete with light artillery and tanks, was carried a distance of 200 m. in converted bombers and dropped at night by parachute without accident. By 1939, the Red army was estimated to have at its disposal some half million men trained in the use of parachutes. Nazi Germany, appreciating the potentialities of parachute attack, in the years immediately preceding the Second Great War trained thousands of troops in the use of parachutes. France in the autumn of 1938 also carried out a convincing demonstration by dropping a fully-equipped machine-gun co. of 60 men from six troop-carriers. Within five minutes of landing the co. was free of its parachutes and had set up its machine guns. British military opinion dismissed parachute attack as of little practical value, holding that any troops successfully dropped would be wiped out before they could go into action.

Parachute troops went into action for the first time on Nov. 30, 1939, when Russia invaded Finland and dropped a number of parachutists near Petsamo. Germany used parachute troops successfully in her attacks on Norway, the Netherlands, Belgium, and France in 1940; she assembled a large parachute force for the invasion of Great Britain, but in

April, 1941, diverted it to the attack on Greece and Crete. German parachute troops were employed on a comparatively small scale in the campaigns against the U.S.S.R.; principally because of the great distances and the mobility of the Soviet armies. One of their most notable uses in Russia was as a defensive measure in Nov., 1942, when the Soviet army was advancing on Kharkov. Von Bock then dropped a large force on the Russian communications, disorganizing the Soviet advance and enabling the Germans to regroup their troops.

British parachute troops first went into action in Feb., 1941, when a small force was dropped in S. Italy in an unsuccessful attempt to destroy a viaduct. Better success attended the newly-formed Parachute regt. (*q.v.*) in the raid on Bruneval (*q.v.*), Feb., 1942, and those of the unit taking part in the combined operations attack on St. Nazaire (*q.v.*) the following Nov. British parachute troops occupied enemy airfields in the N. African landings, Nov., 1942, took part in the invasion of Sicily in July, 1943, and in the struggle for the Anzio beach-head, Jan., 1944. British and U.S. parachutists formed the spearhead of the Allied invasion of Normandy, June 6, 1944; more parachute troops were used in that operation than the Germans had had available for the invasions of Norway, the Netherlands, and Crete. A large force of British parachute troops was landed at Arnhem (*q.v.*) on Sept. 17, 1944, U.S. troops landing at Eindhoven and Nijmegen on the same day.

Besides the part they played in N. Africa and Europe, U.S. parachute troops also fought in the Pacific war, *e.g.* in operations in the Markham valley in New Guinea Sept., 1943. The Japanese used parachute troops in their attacks on Malaya, the Netherlands East Indies, Borneo, and the Philippines, 1941-42.

The training of parachute troops is described under Parachute Regiment. See also Airborne Forces.

Paraclete (Gr. *paracletus*).

Word used in S. John's Gospel as a name of the Holy Ghost or Holy Spirit (chaps. 14. *vv.* 16 and 26; 15. *v.* 26; 16. *v.* 7). It is also used, in the 1st Epistle of S. John (2. *v.* 1), of Christ. From Chrysostom's time, the word has been translated Comforter, a custom based on Isaiah 40. *v.* 1, and on the fact that *paracletis* sometimes means consolation, but modern commentators

prefer the translation of "one called in" or "called to the side of another," for the Gospel reference, and that of Advocate in the Epistle. Paraclete is a title of the Holy Ghost in the Roman Breviary. See Abelard; Holy Spirit.

Paradise. Word used as a synonym for the garden of Eden; for a region of surpassing loveliness; as a place to which the souls of the righteous are transplanted after death; and sometimes for heaven. The Heb. *pardes*, and Gr. *paradeisos*, were borrowed from old Persian *pairi-daeza*, a park, especially a deer park or garden of the Persian kings. Applied in the LXX, Syriac and Vulgate versions, though not in the Hebrew original, except in Ezek. 28, v. 31, to the garden of Eden, the word came to be used by the apocalyptic writers to the heavenly counterpart of the earthly garden.

The phrase Paradise of Fools is applied to a place midway between Paradise and Purgatory, in which those who have sinned without intention await the Judgement Day. The medieval conception of Paradise is elaborated in the third part of Dante's Divine Comedy.

The Muslim paradise is usually spoken of as a place of unsatiating sensual pleasure; modern commentators on the Koran insist that Paradise is not only a place in which to enjoy the blessings and rewards of good deeds on earth, but a starting-point of unending spiritual advancement. See Angelico, illus. p. 437; Eden; Heaven; Hell; Purgatory.

Paradise Fish. Name given to an artificially modified fish belonging to the genus *Macropodus*. It is nearly allied to the climbing perch, and has been developed in China by a long process of selective breeding. It is striped with red, gold, and green, and has long wavy fins and tail; it is hardy, and breeds readily in small aquariums.

Paradise Lost. Epic poem by Milton, published in 1667. It begins with the fall of Satan and his rebellious host of angels from heaven and then proceeds to man's fall, consequent upon the warning of the powers of darkness against the beings whom God had put in Paradise in the newly created world, and so to the expulsion of Adam and Eve from the Garden of Eden. The work is acknowledged as the great representative of the epic in English literature, written in finely cadenced and dignified blank verse, to which the poet imparted something of a new music,

and as the greatest of all poems in its use of supernatural machinery. See Milton, John.

Paradise Regained. Epic poem by Milton, published in 1671. Stimulated by Thomas Ellwood, a Quaker friend, who remarked: Thou hast said much here of Paradise Lost, but what hast thou to say of Paradise Found? Milton set about this sequel in four books. The subject is the temptation of Christ, by whose victory over Satan the effect of the temptation of Adam was reversed. The poem differs from Paradise Lost in the much greater simplicity of the story, which is mainly an expansion of the Gospel narrative, and in the singular austerity of the style. It has never been popular, although some critics have expressed the highest admiration for it. See Milton, John.

Paradiso, GRAN. Mountain of Italy, in Aosta prov., Piedmont. The culminating peak of the Graian Alps, and the highest mountain in Italy, alt. 13,324 ft., it overlooks the Piedmont plain and is S. of the Dora Baltea. The ascent is usually made from Valsavaranche, skirting the Gran Paradiso glacier; the descent frequently across the Glacier de la Tribulation to Cogne. It was first climbed by Cowell and Dundas in 1860. See Alps; Mountaineering.

Parados (Fr. from Ital. *parare*, to shelter, and Fr. *dos*, back). Military term for the cover at the back of a trench. In fortifications and trenches it is necessary to provide cover from reverse fire, i.e. fire directed at the occupants from

Paradise Fish. The artificially modified fish bred in China

the rear of the position, or badly aimed shots from another position, and from flying fragments of shell exploding behind the position. The cover provided, whether it be earth, sandbags, or masonry, is termed the parados of the position.

Paradox (Gr. *para*, contrary to; *doxa*, opinion). Statement contrary to accepted opinion, apparently self-contradictory, or reversing that which is commonly understood. A legitimate figure, serving to illus-

trate an argument either by exaggeration, or by revealing a side of it in a new light, it is one that becomes dangerously facile, and degenerates into little more than playing with ideas as a punster plays with words. Modern writers who have made something like a cult of the paradox are Wilde and Chesterton, the latter having defended the use of Latin in church services, because "a language must die to be immortal."

Paraffin. In organic chemistry, term applied to a homologous series with the general formula C_nH_{2n+2} . The normal members have the carbon atoms linked in a straight chain, and isomerism (*q.v.*) can arise by branching. The simplest member is methane (marsh gas), CH_4 . The next three members, ethane, propane, and the butanes, and an isomer of pentane, tetramethylmethane, are also gases at normal temperature and pressure. From pentane to pentadecane, $C_{15}H_{32}$, they are liquid, and from hexadecane, $C_{16}H_{34}$, onwards they are crystalline solids. The paraffins are stable saturated compounds, but it is possible to substitute various elements such as the halogens for one or more of the hydrogen atoms. Gaseous, liquid, and solid paraffins occur naturally in petroleum, shale oils and some tars derived from coal and lignite.

In the petroleum industry the term paraffin usually refers to the wax (paraffin wax) removed from certain crude oils. The principal source is the lubricating oil distillate from paraffinous crudes. When cooled the wax crystallises, causing a great increase in viscosity. Removal of the wax is therefore necessary to improve the quality of the lubricant. The oil is chilled and filter-pressed, crude wax being left. It still contains oil which is removed by sweating, and in the same process the wax itself is divided into a number of grades. For final purification molten wax is filtered through fuller's earth. Paraffin wax has many applications: candles and nightlights; waterproofing paper, cartons, cloth, concrete, wood; coating certain foodstuffs; electrical insulators and dielectrics; polishes.

The soft paraffin of the British pharmacopoeia is a petroleum jelly (petrolatum) which has been refined. Petroleum jelly is a residual product from the refining of certain crude oils and is composed of microcrystalline waxes intimately associated with oil. In the U.K. paraffin or paraffin oil are names popularly given to kerosene (*q.v.*).

Paragua. Island of the Philippines, also called Palawan (*q.v.*).

Paraguay. River of S. America, principal affluent of the Paraná. It rises in the Sierra Diamante in the Matto Grosso plateau of Brazil, and flows S. across the state of Paraguay to join the Paraná above Corrientes in Argentina. Above Asunción it receives the São Lourenço, Taquary, and other tributaries from the E. At Asunción the Pilcomayo, and lower

down the Bermejo, drain from the Andes across El Gran Chaco. The Pilcomayo and lower Paraguay form the W. boundary of the state of Paraguay. Steamboats from Buenos Aires reach Asunción. For smaller boats the Pilcomayo is navigable for 150 m. and the main stream for nearly the whole course. Its length is 1,500 m. The confluence with the Paraná was discovered by Sebastian Cabot in 1526. *See* Asunción.

He holds office for five years, and appoints his cabinet of nine, which need do no more than inform the diet (consisting of one elected member for every 25,000 inhabitants) and council of state (nominated) of its policy. The country is divided into two parts—Oriental and Occidental—the Paraguay river dividing the two.

There is a small standing army of about 6,000. In the event of war, service is compulsory in the army, the national guard, or the territorial guard. The R.C. church is established, and all religions are tolerated. Primary education is free and nominally compulsory. There is provision for higher education. The guarani (equivalent to 32-3625 U.S. cents) replaced the former unit of currency, the peso, in Oct., 1943.

River Communication

The main channel of communication is the Río de la Plata. Large river steamers and small sea-going ships penetrate as far as Asunción. Thence N. the Paraguay is navigable by smaller steamers throughout the limits of the republic. The broken and rapid stream of the Upper Paraná above its junction with the Paraguay, offers less easy and less continuous navigation. The use of small motor-boats is gradually making available for transit the rivers which flow between the ridges of hills into the Paraguay.

Asunción has direct rly. communication with Buenos Aires. A steam train-ferry crosses the Alto Paraná from Encarnación in Paraguay to Posadas in Argentina, and links the Central Paraguay rly. with the Argentine North-Eastern. Paraguay has altogether 713 m. of rly., and 150 m. of all-weather roads; total road mileage is 3,759 m. There are three airports, served by Brazilian and Paraguayan aeroplanes.

Almost the whole foreign trade passes through Buenos Aires. Quebracho extract from the tree of the same name, used in tanning, is a valuable product, and still more so is the *yerba maté*, gathered wild and also grown in plantations, which provides the popular beverage of Argentina, Uruguay, and Chile. The pastoral industry has made great advance through improvement of breeds, and through the establishment of freezing and canning plants. The chief exports are hides, *yerba maté*, tangerine, orange, tobacco, timber, meat, cattle, and quebracho extract. Foreign war, civil strife, political disturbances have retarded progress;

PARAGUAY: THE LAND & THE PEOPLE

* Capt. Grenville Holmes

Further information will be found in the articles on the towns and rivers of Paraguay. See also South America; Jesuits

Paraguay, or La República del Paraguay, is a S. American republic forming part of the Río de la Plata system. It has no sea coast, but possesses access to the Atlantic by the open waters of the Río de la Plata. Paraguay proper, the main

Paraguay arms

and more settled part of the country, forms an irregular rectangle, about 65,000 sq. m. in extent, bordered by the river Paraná and its great affluent the Paraguay, which gives its name to the republic. These streams separate Paraguayan territory from Argentina on the W., S., and S.W., and from Brazil on the E.

To the N. the river Apá forms the Brazilian boundary. Besides this clearly defined main territory, the republic owns the vast region of the N. Chaco, probably about 50,000 sq. m., separated from the Argentine Chaco to the S.W. by the river Pilcomayo, and from Bolivia to the N.W. by an arbitrary frontier line. The Paraguayan Chaco is a region quite distinct from Paraguay proper. Most of it lies within the tropics, and is a country of forest and swamp with intervening grassy savannas, of winding rivers, affluents of the Paraguay, which frequently shift their course and overflow their banks. Settlement by white men is only beginning in the Chaco, and tribes of Indians still in a state of savagery inhabit the river banks.

Paraguay is traversed in its N. part by the Tropic of Capricorn. Thus the climate is between tropical and subtropical. The summers are hot and bring a plague of insects, especially near the rivers; the winters are warm, but temperate and agreeable. The rainy season is in summer. A great part of the country is clothed with

magnificent forest yielding many kinds of valuable and beautiful timber, varied by abundance of flowering shrubs. Ranges of hills, seldom exceeding 1,500 ft. alt., rise above grassy plateaux admirably adapted for pasture. The rich soil responds readily to cultivation and can produce all tropical and subtropical fruits. The river Paraguay provides a splendid natural waterway from N. to S.

The pop. was estimated at 1,141,332 in 1945. Asunción, the capital and chief port, situated on the left bank of the Paraguay opposite the mouth of the Pilcomayo, has 130,067 inhabitants; Villarrica 31,081; Concepción, a port on the Paraguay, 16,487. The people are of Spanish, Indian, and mixed Spanish and Indian descent.

Paraguay flag, red, white, and blue

The country is bilingual: an aristocracy of European or mixed origin fills the chief official posts and the ranks of the professions, and speaks Spanish. The peasantry and working classes speak Guarani, the language of the extinct Guarani Indians who inhabited the country when the Spaniards arrived. More perhaps than in any other S. American republic the Indians have been adopted into the social scheme and have tranquilly accepted this arrangement, of which the foundations were laid by the conquistadores of the 16th century. The stormy history of the republic and its peculiar social system have precluded any marked literary development. There is a prolific newspaper press.

CONSTITUTION. Under a new constitution ratified by plebiscite Aug. 4, 1940, the president was accorded considerable powers.

so also have scanty population, primitive methods of life, scarcity of labour and of machinery.

HISTORY. The history of Paraguay since the Spaniards arrived in the early 16th century comprises two distinct stories, that of the early Spanish settlement at Asunción, and that of the singularly interesting Jesuit missions on the Alto Paraná. It is a fallacy to find the origin of the republic in the missionary work of the Jesuits. Those missions certainly facilitated the growth of Asunción and of the other Río de la Plata settlements, including Buenos Aires, by the orderly pacification of a neighbouring territory and by providing some defence against enemies, whether European or indigenous. But the curious politico-religious community founded by the Jesuits was virtually a separate and rival state, remote and excluded from the Spanish settlements. It lay chiefly within the present confines of the Argentine republic; and after the expulsion of the Jesuits in 1767 and before the birth of the Paraguayan republic, which sprang in fact from Spanish conquest and settlement in the region of the river Paraguay, it virtually ceased to exist.

Founding of Asunción

The early exploration in these regions by Sebastian Cabot and others can only be mentioned here. Continuous history begins with the foundation of the city of Asunción in 1536. When, five years later, the infant Spanish settlement at Buenos Aires was abandoned, Asunción, in the country of the peaceable and amenable Guaranis, became the capital of the whole Río de la Plata region, and the headquarters of all Spanish enterprise upon the Atlantic side of the continent. Buenos Aires, refounded in 1580, was a colony from Asunción, and did not receive separate administrative recognition until 1620. But to a much later period the term Paraguay was commonly used to designate the whole Río de la Plata region as far as Patagonia. However, from 1620 to 1776 Paraguay proper was a distinct province, with a royal governor residing at Asunción and subordinate to the viceroy of Peru.

The true founders of Paraguay were the conquistadores and governors of the 16th and early 17th centuries, of whom the most notable were appointed by the Spanish settlers themselves, by virtue of a decree which empowered them to elect a governor in case of accidental vacancy. The early settlers

put a liberal interpretation upon this privilege, deposing and replacing unpopular governors upon occasion. Later the municipality of Asunción claimed the exercise of this privilege; and this almost self-contained Spanish settlement, remote from royal and viceregal authority, pursued a singularly agitated and independent political course.

In the middle of the 17th century the bishop of Asunción made himself governor with the support of the town council and citizens, defying superior authority until reduced by force of arms. Again, from 1720 Asunción acted almost like an independent city-state, accepting governors approved by the people and resisting all outside authority. Finally, in 1736, the revolt of the *comuneros*, the Paraguayan insurgents in Asunción, was put down by a regular military expedition from Buenos Aires,

Paraguay. Map of this South American republic

and the country reduced to submission. From 1776 to 1820 the province of Paraguay formed part of the newly-constituted viceroyalty of Buenos Aires.

In 1811 Buenos Aires, having achieved independence, sent a force up the river under Belgrano to offer to the Paraguayans independence and union with the Argentine provinces. Paraguay declined union but resolved upon independence, deposing the royal governor of Asunción, and setting up a local administration which soon merged into personal despotism under an able lawyer, Francia. From 1816 to his death in 1840 Francia exercised an absolute tyranny, a long reign of terror. He sealed up the country, forbade all commerce, all communication with the outside world, and, with rare exceptions, allowed no one to cross the frontier in either direction. Francia was succeeded by Carlos López, who opened the river to commerce, but continued Francia's system of internal tyranny. In

1862 he was succeeded by his son, Francisco López, an audacious megalomaniac who aimed at setting up a quasi-Napoleonic empire in S. America. He committed acts of war against Brazil, violated Argentine territory, and brought upon his country a combined invasion by the armies and ships of Brazil, Argentina, and Uruguay. During five years of war Paraguay was overwhelmed, devastated, and depopulated. When the struggle ended with the death of López in 1870, nearly all the men and most of the women had perished. Victory rested with the three allied republics, but the true heroes of the war were the poor Indian peasants of Paraguay, who, in frail canoes, attacked armed ships of war and struggled to the death against overwhelming odds.

The country has since suffered from a succession of internal conflicts and presidential "revolutions," though the degree of recovery from the catastrophe of 1865-70 has been remarkable. Paraguay remained neutral during the First Great War. The country broke off relations with Germany, Italy, and Japan Jan. 26, 1942, and declared war on Germany and Japan Feb. 9, 1945, but took no active part in the conflict.

Bibliography. A Vanished Arcadia, R. B. C. Graham, 1901; History of S. America, 1854-1904, C. E. Akers, 1904; Paraguay, W. H. Koebel, 1917; Paraguay, P. de Ronde, 1935; Une Civilisation du Miel: Les Indiens Guayakis due Paraguay, J. Vellard, 1939.

Parahyba. State and river of N.E. Brazil. The state, which has an area of 28,846 sq. m., fronts the N.E. coast and lies between Río Grande do Norte and Pernambuco. From March to June is the rainy season. The coast has several bays and the large estuary of the Parahyba river, all spoilt as harbours by coral reefs. Cotton, cotton-seed, and manioc (tapioca) are the principal products. The river rises in the mts. on the border of Pernambuco and flows E. for 270 m. Pop. 1,592,369 (est.). The capital of Parahyba state, also sometimes called Parahyba, is described under João Pessoa.

Parahyba do Sul. River of Brazil. It rises in the Serra do Mar in São Paulo, and flows N.E. across the state of Rio de Janeiro in a narrow valley to enter the Atlantic below Campos, after a course of 658 m., of which 150 m. are navigable.

Paraldehyde (C₆H₁₂O₃). Colourless liquid with burning taste and foul smell. It is used in

medicine to produce sleep, and is often employed as a safe hypnotic and as a narcotic to allay anxiety before an operation.

Parallax. In astronomy, the angular difference between the direction of a heavenly body as seen from the place of observation and as seen from some standard reference position.

The *annual* or *heliocentric parallax* of a star is the difference between the star's direction as seen from the earth and from the sun. In its restricted sense it is the angle subtended at the star by the radius of the earth's orbit. This angle can be measured by taking photographs of the star against a background of more distant stars at intervals of six months when the earth is at opposite sides of its orbit. It is a measure of the distance of the star. Even the nearest star (Alpha Centauri) has a parallax of only 0.75 second of arc (see Parsec).

The *diurnal* or *geocentric parallax* of the sun, moon, or planets is the difference between the direction of the object as seen from the centre of the earth and from its surface. If the object is directly overhead its geocentric parallax is zero; if it is rising or setting its parallax (now called the *horizontal parallax*) is equal to the angular radius of the earth as seen from the object, and is a measure of its distance. The sun's mean equatorial horizontal parallax, or *solar parallax* (8.79 seconds of arc) measures the sun's distance in terms of the earth's equatorial radius. The distance derived from this parallax is called the astronomical unit (*q.v.*).

The concept of parallax is thus connected with that of distance: large distances (parsecs) in terms of a base-line equal to the radius of the earth's orbit, smaller distances (astronomical units) in terms of a base-line equal to the radius of the earth. The word parallax has thus come to be used interchangeably with distance in astronomical parlance, and is now applied to distances where no measurement of an angle is attempted. Thus the *dynamical parallax* of a double star is its distance derived from observations of its orbit; the *mean parallax* of a group of stars is their average distance found from a knowledge of the sun's motion amongst them in space; and the *spectroscopic parallax* of a star is its distance calculated from its intrinsic brightness as revealed by its spectrum.

In photography, as the viewfinder of a camera cannot normally be in the same axis as the taking lens, there is a lateral error in positioning, known as parallax, which increases the nearer the object is to the camera. In the more expensive apparatus compensation is introduced by coupling devices which tilt the finder or focusing screen as the focus is altered so as to bring visible and recorded images into coincidence. If there is no such compensation the error must be allowed for.

Similar errors in the reading of instruments may arise when the indicator of the instrument and the scale against which the indicator is to be compared are separated. Any movement of the observer's head will cause him to see the indicator intersect the scale at different positions. Care must be taken to keep both eye and indicator in a plane at right angles to the scale. Some instruments, *e.g.* mercury barometers, incorporate devices which ensure that such errors of parallax are eliminated.

Parallel. In geometry, term used for straight lines in a plane which do not meet however indefinitely they are produced, *i.e.* they always remain at the same distance from each other.

By an extension of the Euclidean definition, it is used for things that are similar, *e.g.* parallel passages in literature. In electricity, accumulators are said to be connected in parallel when all the positive poles are connected to one wire and all the negative poles to another.

Parallelepiped. Solid figure contained by six parallelograms of which every two opposite faces are parallel. A brick is a rectangular parallelepiped.

Parallelogram of Forces. In mechanics, a rule for finding the resultant of two forces. The rule is as follows. If two forces acting at a point O are represented in magnitude and direction by two straight lines O A and O B, they are together equivalent to a single force, represented by the diagonal O C of the parallelogram constructed on the two straight lines passing through the point. The rule also applies to displacements and velocities or any vector quantity. The rule is implied in Sir Isaac Newton's second law of motion. See Vector.

Paralysis. Loss of power to contract muscles voluntarily. Two widely different forms occur, namely hysterical paralysis, which is a manifestation of a neurosis

and is not associated with recognizable changes in the nerves, and organic paralysis, due to disease or destruction of a nerve tissue.

Hysterical paralysis frequently follows a severe shock, either mental or physical, and is associated with many disorders of the mind, and nervous balance. Functional paralysis may follow an organic injury, with or without involvement of a nerve, which has necessitated the patient's keeping a limb in a fixed position (as in a splint) for a considerable time. Any form of organic paralysis may be simulated by the functional type. A group of muscles alone may be affected, or there may be paralysis of an arm or a leg, or of more than one limb. With the loss of power in the muscles there may be loss of sensation in the skin. An hysterically paralysed limb may be quite limp and flaccid, or there may be a firm contracture of groups of muscles, the latter condition being more frequent after a wound.

Hysterical paralysis is due to a fixed idea in the mind of the individual, following the shock he has received, that the limb is actually powerless, an idea which it is often difficult to dispel. Treatment accordingly is directed towards breaking down this resistance and inducing him to use the affected muscles. Sometimes recovery occurs suddenly, as a result of a shock or fright. Usually, however, recovery under treatment is brought about by suggestion treatment and re-education in the use of the muscles.

Organic paralysis is a symptom of many diseases of the nervous system which are accompanied by degenerative changes in the nerves, or it may be the result of injury to a nerve. When the nerve which is the immediate supply of a group of muscles is severed, *e.g.* by a bullet, the paralysed muscles are limp, show marked wasting, and eventually lose the power of reacting to electrical stimuli. Paralysis may also be due to injuries of nerves or nerve centres which do not immediately supply muscles, but control the nerve cells which do supply the muscles, as in the paralysis of limbs following an injury to the brain, or in a case of a haemorrhage into the brain from rupture of an artery, as in apoplexy.

The diseases most frequently responsible for organic paralysis are apoplexy, disseminated sclerosis, and anterior poliomyelitis (infantile paralysis).

Paralysis Agitans or **SHAKING PALSY**. Chronic disease of the nervous system. It usually occurs in people past middle life, men being more frequently affected than women, and is incurable. The cause is unknown. The disease comes on gradually, and is characterised by tremor, which may occur in the hands or feet or both. Movements of the thumb and fingers resemble those that would be made in rolling a pill. Sometimes the head is also affected by the tremor. Weakness of the muscles occurs, and the movements of the limbs become slow and stiff. The attitude of the patient is characteristic, the head being bent forward and the back bowed. In walking he leans forward. The face is characteristically without expression, blank, masklike.

Paramaribo. Capital and chief seaport of Surinam (Dutch Guiana). The city is situated at the confluence of the Surinam and Commewine rivers, some 10 m. from the sea, and is served by steamship lines and airways. The commodious harbour, taking vessels of 19-ft. draught, has two forts—Zeelandia and New Amsterdam. Coffee, cocoa, sugar, and rum are exported. Pop. 60,723.

Paramoecium or **SLIPPER ANIMALCULE** (Gr. *paramēkēs*, oblong). Lowly infusorian animal belonging to the Protozoa. Just visible as a speck to the naked eye, it is common in infusions of decaying vegetable matter, and can usually be secured by steeping rotting leaves in water for a few days. It is oval and flattened in form, one end being thicker than the other, and it swims freely by means of the vibratile cilia with which it is covered. There is no stomach, the food particles being assimilated by the body protoplasm generally. Reproduction takes place by fission, each animal splitting into two, and by a complex sexual process.

Paraná. Second largest river in S. America. With the Uruguay, it occupies the Plate Basin between the Brazilian Highlands and the Andes of Bolivia; it drains the great lowland which extends N. from Buenos Aires to the Matto Grosso. The Paraná begins at the confluence of the Paranahyba and Rio Grande, flows S.W. as far as Posadas, W. until it receives the Paraguay, and then S.S.W. past Corrientes to Rosario, whence it goes S.E. to the Rio de la Plata. In its upper course in Brazil it receives many rapid rivers. Above the great Guaira Falls the main stream is navigable for 400 m.

Below the falls the Paraná forms the boundary of Paraguay; below Posadas are the Falls of Apipé, below which navigation is uninterrupted for vessels of 300 tons. Below Corrientes it flows through Argentina past La Paz, Santa Fé, Paraná, and the great river port of Rosario; in this section it receives its second great tributary from the Andes, the Salado. Its total length is estimated at 2,800 m. It was first ascended as far as the Paraguay by Sebastian Cabot in 1526.

Paraná. State of S. Brazil. It extends between the Paraná river on the frontier of Paraguay and the Atlantic Ocean. The Serra do Mar rises sharply from the shore as part of the Brazilian Highlands, from which the long slope to the W. is drained by the Paranapanema, Ivahy, Piquiry, and Iguassú, all affluents of the Paraná river. The W., the narrow coastal lowland, and the mts. are all forested, and the forested lowlands are hot, damp, and unhealthy. Much timber is cut from the forests. Maté, cotton, cereals, and fruits are cultivated on the fertile uplands, and rice on the coastal lowlands. Deposits of coal exist. Curitiba is the capital. The state covers 93,269 sq. m. Pop. est. 1,328,804.

Paraná. City of Argentina, capital of the state of Entre Rios. Situated on the river Paraná

Paraná, Argentina. Plaza and cathedral of S. Miguel

opposite Santa Fé, with rly. connexions with Concepción on the Uruguay, and with Buenos Aires, 350 m. to the S.E., it is an important river port and exports the agricultural produce of the state. The cathedral is reputed to be the most beautiful in Argentina. Local industries are flour milling and meat packing. From 1852 to 1861 Paraná was the capital of Argentina. Pop. 78,284.

Paranagua. Seaport of Brazil. Situated on the bay of the same name in the state of Paraná, it

has rly. connexion with Curitiba, 80 m. to the W., São Paulo, and Rio de Janeiro, and daily air services. Maté, sugar, rice, and cereals are exported. Pop. est. 6,000.

Paranahyba. River of Brazil. One of the headstreams of the Paraná, its waters ultimately reach the Plate estuary. W. of the Brazilian Highlands, a wide depression extending to the Goyaz Plateau is occupied by the Paranahyba and Paraná, which flow S.W. for 500 m. and receive numerous tributaries from the heights on both sides. The name Paraná is applied to the main river below the confluence of the Paranahyba with the Rio Negro. The Paranahyba separates the Brazilian states of Goyaz and Minas Geraes.

Paranoia. A mental disorder in which a delusion is unusually permanent. Its development is slow, and there may be remissions of the disease. It is more common in males than in females. In a typical case it shows four stages: (1) Withdrawal of interest from outer life and other people on to the self, together with a tendency to refer things heard or read to the self, and to regard them as slights or insults; there may also be hypochondriacal tendencies. (2) Delusions of persecution, sometimes accompanied by hallucinations. They are often of a religious

or erotic type. (3) Ideas of grandeur form, and sometimes anti-social and even dangerous tendencies. Hatred takes the place of affection in human relations. (4) In some cases the withdrawal of interest becomes more marked and there is a degradation of personality. Mild attacks of a paranoid nature

occur in the sick, especially after operations or childbirth.

Freud considers that the root cause of paranoia is a homosexual fixation. This is successfully repressed until some strain or frustration arouses a wave of homosexual feeling which overcomes the repressing forces. Then the forbidden longing returns to consciousness in a disguised form.

Amber Bianco White

Parapet (Ital. *parare*, to guard; *petto*, breast). Term in architecture denoting a low wall rising from

the lower level of a roof. In the medieval castle it was usually battlemented, and the more elabo-

Parapet. Example of Early English parapet in Salisbury Cathedral

rate examples also pierced with tracery. The parapet was revived in Georgian architecture, in combination with the hipped roof, but in the form of a balustrade.

As a military term a parapet is the head cover provided on the forward face of a trench or fortification to protect the occupants from the effects of fire or fragments of projectiles bursting in front of the position. *See* Battlement; Castle; Entrenchment.

Paraphernalia (late Lat. from Gr. *para*, beside; *phernē*, dower). Term of English law. It is descriptive of articles of personal adornment and apparel given by a husband to his wife, not as her absolute property, but for her use. Before the Married Woman's Property Act of 1870, subsequently amended, he could sell them or otherwise dispose of them, but on his death they became the wife's as against the husband's executors. The word has also acquired a more general meaning, more or less synonymous with miscellanea.

Paraphrase. Rendering in other words of anything said or written, generally for the purpose of elucidation. The recasting of the works of great writers into other words in the same language was a practice recommended by the ancient teachers of rhetoric to their pupils with a view to their obtaining command of vocabulary and syntax. Formerly paraphrase was restricted to such recasting of prose, metaphor being the term applied to poetry. The most famous example of paraphrase now generally known is the metrical version of the Psalms in use in the Presbyterian Church of Scotland. *See* Psalter.

Paraplegia. Medical term for paralysis which affects both sides of the body. *See* Locomotor Ataxia; Myelitis; Paralysis.

Pará Rubber Tree (*Hevea brasiliensis*). Tree of the family Euphorbiaceae. A native of Brazil, it has alternate leaves, divided into

five leaflets, finger fashion. The bell-shaped flowers are greenish white and the sexes separate. The tree abounds in a thin, milky juice which exudes when incisions are made in the trunk. It is collected in earthen vessels and hardened by exposing it to smoke, when it becomes crude rubber or caoutchouc. *See* Rubber.

Parasite (Gr. *para*, beside; *sitos*, food; *parasitos*, one who eats at another's table). Name given to an organism which lives at the expense of and in close contact with another organism, called the host. Parasites are common throughout the plant and animal kingdoms. Both parasite and host may be animals, e.g. the liver-fluke in the sheep's liver which causes liver rot. The parasite may be a plant, the host an animal, e.g. the fungus which in man causes athlete's foot. Both parasite and host may be plants, e.g. heath dodder which feeds entirely on various heath plants. The parasite may be an animal, the host a plant, e.g. green flies which pierce flowering plant stems and suck up sap. In a few animals the male acts as a parasite on the female, as in certain deep sea angler fish, the dwarf male of which becomes, when young, permanently fused to the female, thus obtaining its food via the blood of the female.

The extent of dependence on the host varies greatly. Some parasites live independently away from their hosts at certain stages, e.g. the hookworm passes through the early stages of its development in the open, the adult stage only infecting the intestine of man. A form like the flea is even more independent, passing from one host to another freely and often living without a host for days at a time. When related to their hosts endoparasites are internal, e.g. the malarial parasite, which lives in the red blood cells of its host. Ectoparasites, e.g. the flea, live on the external surface of their hosts. All parasites are small relatively to their hosts, and they often show certain modifications in structure; they tend, for example, to lose their organs of locomotion and of sense. The effects of parasites upon their hosts vary. Some live in a state of successful balance with their hosts, causing no marked ill effects; but others never achieve a successful relationship, and these pathogenic forms cause illness or death. Typhoid fever is caused by parasitic bacteria, sleeping sickness by a blood protozoan, and elephantiasis by a roundworm.

Parasites play an important part in controlling the balance of numbers in animal communities, since, by preying on others, they constitute one of the factors which prevent unchecked increase. *Consult* Bacteriology, C. H. Brown, 1925; Protozoology, C. M. Wenyon, 1926; Helminthology, Medical and Veterinary, H. A. Baylis, 1929; A History of Fishes, J. R. Norman, 1931.

Parasol (Ital. *parare*, to ward off; *sole*, sun). Light form of umbrella used for protection against

Parasol of paper, as used in Japan

the sun. Parasols are usually made of silk or other light material, although in China and Japan, where they are extensively used by both sexes, many are of coloured paper. Among some peoples the right to carry

a parasol is confined to the chiefs. *See* Umbrella.

Paratyphoid Fever. Disease resembling a mild form of typhoid fever. The incubation period is ten days, and a temperature lasts perhaps 18 days. Isolation is necessary and the treatment is the same as for typhoid fever (*q.v.*).

Paravane. Device to protect a ship against moored sea mines. Invented in the First Great War by

Paravane. Diagram of the main components of a paravane. A. Torpedo-shaped body. B. Hydrovanes. C. Weight. D. Float. E. Elevators. F. Rudder. G. Cutting blade. H. Hook for saw line

Commander C. D. Burney, and further developed in 1939-45, it consists of a torpedo-shaped body fitted with hydrovanes. Attached to one hydrovane is a float and to the other a weight. At the rear of the body is a rudder which, actuated by a hydrostatic valve, regulates the depth of flotation. The hydrovanes are so shaped that, when the towline becomes taut, the paravane submerges to the determined depth and sweeps out from the bow of the towing ship.

Stretched across the front of the paravane is a serrated blade which cuts through the mine's mooring. Paravanes are used normally in pairs, one on either side of the ship. See Mine.

Paray-le-Monial. Town of France. In the dept. of Saône-et-Loire, it stands on the Bourbince and the Canal du Centre, 48 m. W.N.W. of Mâcon, and is a junction of the Paris-Lyons rly. There are oil refineries, tanneries, and manufactures of tiles and ceramics. The most important building is the convent of the Visitation, where the nun M. M. Alacoque (d. 1690) was supposed to have had visions of the Saviour.

Parazoa. Zoological term used to denote the sponges (*q.v.*) in contradistinction to the protozoa and the metazoa. These three groups of animals are usually given the status of sub-kingdoms of the animal world.

Parcae. In classical mythology, the Latin name for the Fates, goddesses who presided over the destiny of man. The Greeks called them Moirai. See Fates.

Parcel Post. Postal service for the conveyance of bulkier and heavier packages than are carried by the ordinary letter post. In the U.K. a parcel post was recommended by Rowland Hill in 1842, but the scheme was not put into operation until 1883. Headquarters for the new dept. were provided in 1887, and a system of coaches started in 1892. As a result of the Crown Proceedings Act, 1947, proceedings may be brought against the crown for loss or damage to any registered inland postal packet due to wrongful act, neglect, or default of the Post Office. The amount recoverable cannot exceed the market value of the packet or the sum covered by registration fee.

Parchment. Writing material made of the skins of animals, especially those of sheep and goats. It is supposed to have been first used as a substitute for papyrus in the 2nd century B.C., and derives its name from Pergamum, a city of Mysia, where it was first employed. In preparing parchment the hair or wool is first removed, and the skin is then steeped in lime, stretched on a framework, and scraped with a special knife. After being sprinkled with powdered chalk or lime, it is again rubbed to make the surface smooth. Coarse parchment is made of the skins of he-goats, calves, or asses. Parchment as writing material was superseded by paper.

Pardo-Bazan, EMILIA, COUNTESS (1852-1921). Spanish writer. Born at Corunna, Sept. 16, 1852, she was brought up amongst a brilliant society in Madrid. After marrying Don José Quiroga, she travelled in Europe, and divided her home-life between Madrid and Galicia, becoming an industrious writer, a leading spirit in the Spanish feminist movement, and an eloquent public speaker. Among her works are realistic novels, literary studies, and descriptions of her travels. She died May 12, 1921.

Pardon. Legal term for the forgiveness of a crime. It is in all countries the peculiar prerogative of the head of the state; although in constitutional countries he always acts upon the advice of his ministers. In Great Britain the king has the sole right of pardon and the home secretary advises him. He also has the legal right of pardon over the whole empire; but in practice he does not interfere in the dominions or colonies, where the exercise of the prerogative is left in the hands of the governor or governor-general. Remission of a sentence found to be mistaken is granted by a pardon. See Amnesty.

Pardon. Name given to popular religious gatherings and village feasts in Brittany. In rural districts, where the pardon is primarily devotional and associated with the quest of absolution, or cure of some bodily ill is the object of pilgrimage, the ceremonial begins overnight with vespers. Mass is said at 3 a.m., there is a procession in the afternoon, and sometimes one in the evening.

Pardubice. Town of Czechoslovakia, in Bohemia. It is 65 m. by rly. E. of Prague on the route to Brno, and stands on the Labe. Spirits, sugar, farm machines, flour, and timber products are manufactured. The ruined castle of Kunetzitz (1,000 ft.) crowns an isolated hill N. of the town. Pop. 44,557.

Paré, AMBROISE (1510-90). A French surgeon. Born near Laval, Mayenne, he was apprenticed to a barber-surgeon. In the army he gained such distinction that, although a Protestant, he became surgeon to Henry II and three other kings, Charles IX saving him at the massacre of St. Bartho-

Ambroise Paré,
French surgeon

lomew. He wrote on gun-shot wounds and anatomy, in *Anatomie Universelle*, 1550, and was the first to use ligatures for arteries after amputation, his rational treatment earning him the title of father of modern French surgery. Paré died Dec. 22, 1590.

Paregoric. Camphorated tincture of opium. It is used as a sedative in conditions associated with irritating cough.

Pareira Brava (*Chondrodendron tomentosum*). Climbing shrub of the family Menispermaceae. It

Pareira Brava. Foliage and sprays of, left, flowers, and, right, seeds

is a native of Brazil and the W. Indies. It has roundish leaves with the leaf-stalk attached to the middle, and silky on the underside. The flowers are greenish, in sprays, and the sexes separate. From the dried root a substance called pelosine is obtained, better known by the name of pareira brava.

Parent (Lat. *parere*, to bring forth). Primarily a father or mother. The word is also used for anything that begets something else, *e.g.* a parent plant. The complement of parent is child, and in all civilized countries a body of law deals with the duties of parents towards their children. See Children, Law about; Family.

Pares, SIR BERNARD (1867-1949). British scholar, born March 1, 1867. From Harrow he went to Trinity College, Cambridge. He specialised in Russian language, literature, and history, becoming professor in these subjects at Liverpool, 1908-17, and at London, 1919-36. He was director of the school of Slavonic and E. European studies, 1922-39, and lectured in American universities during the Second Great War. Pares, who was knighted in 1919, after service at the British embassy to Russia, published a *History of Russia*, 1926; *My Russian Memoirs*, 1931; *The Fall of the Russian Monarchy*, 1939. He died in New York, April 17, 1949.

Pargasite. Name sometimes given to green and greenish-blue varieties of hornblende (*q.v.*) found at Pargas, in Sweden.

Parham. Village of Sussex, England, 10 m. S.E. of Petworth. The church of S. Peter is noteworthy. Parham Park, with its deer and a famous heronry, is the property of Viscount Cowdray. The house was built in the time of Elizabeth, her arms and date, 1583, being on the wall.

Parhelia (Gr. *para*, beside; *helios*, sun). Name for the mock suns of a solar halo. See Mock Sun.

Paria, GULF OF. Almost enclosed arm of the sea in N.E. Venezuela. The island of Trinidad is separated at its N.W. corner from the peninsula of Paria on the mainland by the passage called the Dragon's Mouth, and at its S.W. by that of the Serpent's Mouth from the Orinoco delta. These passages, discovered and named by Columbus in 1498, connect the Gulf of Paria with the Atlantic Ocean. The gulf receives the Guanipa and the Manamo, and is 100 m. from Trinidad to its most westerly point in the prov. of Sucre.

In 1946 a British company began drilling for oil in the gulf; the first tests were carried out off the coast of Trinidad adjacent to the existing land wells, and were extended over an area of 150 sq. m. of the ocean bed.

Pariah. Term popularly applied to natives of India who have no caste, and hence figuratively to any social outcast. The Paraiyans, drum-beaters, from whom they take their name, number over 2,000,000, mostly in Madras, are a low labouring caste with many sub-castes, and although they were traditionally classed as "untouchables" they actually rank higher than several true castes.

Parian Ware. Feldspar pottery fired at a moderate temperature. It is a pure white, marble-like substance, much used for figure work and vases.

Parima, SIERRA. South-western section of the Venezuelan Highlands. From Roraima, where British Guiana, Brazil, and Venezuela meet, an elevated region separates the tributaries of the Amazon from those of the Orinoco. This area is known first as the Sierra Pacaraima and in the S.W. as Sierra Parima. From the latter descend the Orinoco and its tributary the Ventuari.

Pari-Mutuel. French name for the method of backing horses by means of a machine known in the U.K. as a totalisator (*q.v.*).

Parini, GIUSEPPE (1729-99). Italian poet and satirist. Born at Bosisio, near Milan, May 22, 1729,

he became a priest in 1754, but is chiefly memorable for his satiric poem, *Il Giorno* (The Day), in four parts—Morning, Afternoon, Evening, and Night. The first part, *Mattina*, 1763, created something of a sensation on its publication. Written in blank verse, the poem gives wonderful pictures of contemporary manners. Parini published about a score of odes, and in 1795 issued his *Epistle to Sylvia*. He died Aug. 15, 1799.

Pari passu (Lat., with equal pace). At the same time and rate.

Paris. Small genus of perennial herbs of the family Liliaceae. They are natives of Europe and temperate parts of Asia. They have creeping rootstocks, a simple stem, a single whorl of from four to nine leaves, and a solitary yellow-green flower, succeeded by a black berry. See Herb Paris.

Paris. In Greek legend, son of Priam and Hecuba. Soothsayers having foretold that Paris would bring calamity on Troy, the infant was exposed on Mount Ida, and

cared for by shepherds, but afterwards, becoming aware of his origin, was received again into the royal household. While still a shepherd on Ida he delivered his famous judgement. The goddess of strife, enraged at not having been invited to the marriage of Peleus and Thetis, had thrown a golden apple among the guests, inscribed "for the fairest."

Hera, Athena, and Aphroditē each claiming the apple, Zeus ordered them to submit to the judgement of Paris. Hera promised Paris sovereignty, Athena, military glory, and Aphroditē, the most beautiful woman in the world. Paris gave the apple to Aphroditē, who caused Helen, wife of Menelaus of Sparta, to fall in love with Paris. He carried her off to Troy, and thus provoked the Trojan War. During the war Paris distinguished himself little. He was worsted in combat with Menelaus, and was only saved by being carried off the field by Aphroditē. He is credited, however, with having caused the death of Achilles by shooting him with an arrow in the heel. On the taking of Troy, Paris was wounded by one of the poisoned arrows of Philoctētēs, and repaired to his long deserted wife, Oenōnē, a nymph of Mount Ida, who refused to heal him, and he returned to Troy to die. See Helen of Troy.

Italian poet

PARIS: THE CITY AND ITS HISTORY

Nora Beloff, Paris Correspondent of The Observer

Further information concerning the French capital is given in articles on the city's famous buildings, e.g. *Invalides*; *Louvre*; *Notre Dame*. See pictures facing page 6353; see also France

Paris, the capital of France, is on the River Seine and is situated in the modern dept. of the Seine which is in the heart of the medieval prov. of the Île de France. It is 240 m. by air from London (Northolt to Le Bourget), and 285 by rly. and steamer via Dover and Calais.

Paris proper extends over an area of 40 sq. m. of which one-third is covered by buildings. Pop. 1946, of the city, 2,725,374; of the dept. of the Seine, which covers the city's outer suburbs, 4,775,711 (including 194,192 foreigners). Thus almost one in eight of the French people lives in or around Paris, which is more densely populated than any other major European capital.

Thirty-two bridges span the river as it runs through Paris. Ridges of

hills rise on either side. On the right bank, the ridge starts at Bercy in the E. and runs to Passy in the W. Its highest point is the hill of Montmartre, 410 ft. high, from which the domes of the Neo-Byzantine basilica of the Sacré Coeur, built after the Franco-Prussian war, dominate the city. On the left bank the hills, which are lower, stretch from the Butte aux Cailles to Meudon and St. Cloud. The dominating monument is the 18th century church, secularised during the Revolution as "Le Panthéon," built on the hill of S. Geneviève which rises to 213 ft.

The city's original kernel, the Île de la Cité, still contains two of Paris's finest surviving monuments of Gothic architecture: the cathedral of Notre Dame (12th and 13th century) and La Sainte Chapelle (13th century). On the W. of the island stands the Palais de Justice (the law courts), most of it

Paris arms

Paris. Map of the city and its environs, showing the network of railways which connect the business centre with the suburbs

19th century imitation of the original buildings, of which the earliest were Roman. Survivals of the pre-revolutionary palace are the clock tower and the prison of the conciergerie. Paris's police h.q. in a vast squat edifice, the Préfecture de Police, replaced under Napoleon III the old narrow streets of the isle. The administrative centre, the Hôtel de Ville, is opposite the isle on the N. bank.

The city is divided roughly into equal quarters by the great highways intersecting at the Place du Chatelet, N. of the Île de la Cité. From E. to W. the following streets form a single artery: la rue du Faubourg Saint Antoine, rue Saint Antoine, rue de Rivoli, avenue des Champs Elysées, avenue de la Grande Armée. From N. to S. the artery runs through the boulevards: of Strasbourg, Sébastopol, the Palais de Justice (running across the isle), and Saint Michel, and then up the rue Denfert Rochereau and the avenue Général Leclerc (formerly avenue d'Orléans).

The central part of the city is bounded on the N. and on the S. by a series of main roads which form an oval. The N. curve starts at the Place de la Bastille, where a

column commemorates the fall of the royal fortress in 1789. It follows the large avenues known as the Grands Boulevards, centres of business, shopping, and amusements, leading to the early 19th century church of La Madeleine. Thence it turns down the Rue Royale, leading to La Place de la Concorde, and across the Concorde bridge to the national assembly, a much modified 18th century palace.

On the S. side, an inner arc starts from the Bastille and ends at the Concorde bridge, formed by two main roads: the boulevards Henri IV and St. Germain. As it crosses the river in the E. it touches the upstream point of the Île St. Louis which is joined by a bridge to its larger sister to the W., the Île de la Cité. An outer arc of boulevards to the S. runs over the crest of Montparnasse; a third ring encircles the city.

Approx. two-thirds of the city's surface is on the N. bank, bounded on E. and W. by two vast parks: Bois de Boulogne and Vincennes.

The E. of Paris, rising to the slopes of Montmartre and Ménilmontant, is older and poorer than the W. Its heart is the region known as the *marais* (marshland), which contains some of Paris's

finest renaissance and 17th century buildings, and houses chiefly small traders and artisans. Westwards of the *marais* lies the business and commercial centre with the central markets (Les Halles), the stock exchange, the bank of France, and the great luxury avenues centring on the national state opera house.

Between this region and the river lies the Place du Louvre, now Paris's chief museum and, to the west, the gardens of the Tuileries.

W. of the Place de la Concorde lie the expensive residential quarters, the luxury hotels, the up-to-date theatres and museums, of which the central highway is the avenue des Champs Elysées stretching up to the Napoleonic Arc de Triomphe in the Place de l'Étoile, from which eleven other avenues radiate. One of these leads to the Place du Trocadéro, with a magnificent view towards the Eiffel Tower, and here another series of wide avenues converge.

The outer regions of N. Paris are mainly industrial, notably the N.E. In the working-class suburbs of Aubervilliers and St. Denis can be found the capital's worst slums and most revolutionary population, and also the abbey of St. Denis containing the royal tombs.

On the S. side of the river, the E. is also mainly popular and industrial. The two principal parks are the Jardin des Plantes, which contains one of Paris's zoological gardens, and the Jardin du Luxembourg, attached to the 17th century palace which houses the upper chamber of parliament, the *conseil de la république*. To its N. lies Montparnasse, the counterpart of Montmartre as a cosmopolitan intellectual and artistic centre.

Between the Luxembourg and the river lies the university and students' quarter centring round the Sorbonne, i.e. the central university building, La Faculté de Droit, École de Médecine, École des Beaux Arts. The student population, one of the largest in the world, can no longer find room within the restricted *quartier latin*. The more fortunate now reside at the Cité Universitaire beyond the Parc Montsouris, in a southern suburb, made available by the dismantling of the Paris fortifications after 1919.

Westwards of the university lies the fashionable 18th century residential quarter of the Faubourg St. Germain, where private palaces have been transformed into em-

bassies and public buildings. Many govt. offices are situated in the rue de Varennes, rue de Grenelle, and rue de l'Université. They stretch W. as far as the Invalides, near which, on the Quai d'Orsay, stands the present French Foreign office.

The Invalides, with a golden dome which is one of Paris's finest landmarks, is surrounded by vast open squares. Near it stands the École Militaire, between which and the river stands the steel Eiffel Tower, the world's first skyscraper, bestriding the Champs de Mars and looking across at the Place du Trocadéro. To the S. and W., working-class and industrial suburbs spread shapelessly outward.

The principal libraries of Paris are the Bibliothèque Nationale, Bibliothèque Municipale, Bibliothèque Mazarine. The principal museums are the Louvre (European art down to current times, Egyptian and Near Eastern arts); Musée Guimet (Far Eastern art); Cluny (medieval art); Carnavalet (history of Paris); Invalides (history of the army); Musée de l'Homme (ethnology); Musée de l'Art Français (casts of French sculpture); l'Orangerie, Le Jeu de Paume, temporary exhibitions.

HISTORY. When conquered by Julius Caesar in 53 B.C., Paris was the capital of a small Gaulish tribe living by shipping. Roman Paris spread from the Île de la Cité to the left bank but, by the end of the third century, barbarian onslaughts forced the population back into the easily defensible island. In 508, Clovis made Paris one of his residences and, three years later, S. Geneviève—the city's patron saint, to whom legend attributes the city's resistance to Attila—died there.

When the counts of Paris became kings of France in the ninth century, Paris's pre-eminence and her prosperity as a trading centre and port were assured. Her municipal arms, showing a sailing ship buffeted by the waves with the motto *Fluctuat nec mergitur* date from the 11th century.

Under Louis VI, Philip Augustus, and Louis IX, Gothic architecture and art flowered. In the 13th century Paris, the oldest university of Europe with 20,000 students, had become uncontestedly the intellectual capital of the W. In the 14th century, despite English aggression, invasion, internal strife, and an abortive muni-

Paris. The west front of the venerable cathedral of Notre Dame

principal revolt against royal authority by Étienne Marcel, Paris continued to expand and grow richer. In the 15th century the wars and the plague only partially interrupted the city's development; the 16th and early 17th centuries saw the building of the Tuileries, now destroyed, the oldest surviving parts of the Louvre, S. Étienne du Mont, S. Eustache, the Place Dauphiné, and the Place des Vosges.

In the 17th century Paris became indisputably the greatest capital of Europe. The Louvre was completed on a grandiose scale. The Invalides was built, as well as many churches, monasteries, hospitals, and buildings for social services, such as the Salpêtrière. During the same period of enlightened Bourbon despotism, Paris was better cleaned, and new security measures, including street lighting on moonless nights, were instituted. The expansion con-

tinued under Louis XV and included the construction of the Place de la Concorde and the Place Vendôme. The Concorde bridge was started in this reign, though completed only after the Revolution and embodying stones from the dismantled Bastille fortress so that Parisians could daily step on the symbol of royal tyranny. The Revolution cost Paris a number of medieval churches and chapels destroyed under the anticlerical reaction; but the expansion of the city was barely interrupted and attained new vigour under Napoleon. The Madeleine and the present national assembly, which balance each other on the N. and S. banks of the Seine, were either completed or transformed. The driving of wide streets through the city was initiated with the foundation of the rue de Rivoli and the Arc de Triomphe. Napoleon improved the administration, safe-

guarded public peace, and centralised marketing in the newly constructed *halles*.

In the 19th century Paris burst its bounds and tripled its pop., becoming a first-class industrial centre. The radical transformation of the city under Napoleon III was stamped by the controversial personality of Baron Haussmann, prefect of the Seine, whose passion for symmetrical lines, light, air, and easily defensible broad straight roads prevailed over respect for antiquity and art. His wide avenues bordered with trees which stretch in straight lines have opened up the centre of the old city, and old buildings and winding ways were ruthlessly obliterated. The regions of the Étoile and the Opéra catered for the new tastes in luxury.

The worst destruction inflicted at a single blow in all Paris's history came at the fall of the second empire in the clash between the Paris Commune and the govt. of Thiers established at Versailles. In their retreat, the Communards burnt down the Palais de Justice, the palace of the Tuileries, the Cour des Comptes and the palace of the Legion of Honour. The Sainte Chapelle was saved because the fuse went out before the flame reached the powder barrel.

In the early decades of the Third Republic, world exhibitions bequeathed a series of disputed architectural assets which now mark the centre of the city: the Eiffel Tower, the Grand and Petit Palais (the former used for industrial, the latter for art, exhibitions), the bridge of Alexandre III, and, in 1937, the Palais de Chaillot—the new Trocadéro and the museum of modern art.

Paris suffered physically little during either of the Great Wars. Nevertheless the effects of the wars, the impoverishment of the nation as a whole, loss of population, and economic stagnation set their mark on Paris which, like the rest of the country, to some extent lived on past capital after the Second Great War was over. Inflation and social legislation blocking rents took profits out of building and, apart from a number of large shops, a few blocks of flats in the W. end of the city, and a number of churches built by subscription during the R.C. revival of the thirties, the expansion of Paris—for the first time in centuries—ceased; buildings fell into disrepair, the city outside the expensive luxury centre became shabby and overcrowded.

Paris is no longer the unchallenged capital of world art and thought, though art and thought are still vigorous, but she retains pre-eminence in the world of fashion and is still the tourists' favourite playground.

ADMINISTRATION. Royal, imperial, and republican governments have always been jealous of the city's power, and have contrived to leave the capital less self-government than any other French city. The special regime under which Paris is administered precludes the 20 arrondissements into which it is divided from electing their own mayors or conducting their own executive business. A municipal council of 80 votes the municipal budget, and elects its president who carries out the ceremonial functions of a mayor. But effective executive authority rests with the prefect of police and the prefect of the Seine who share the services between them.

The municipality owns the underground railway system which provides convenient and swift transport, although it is permanently overcrowded and badly ventilated, while its financial management and the fares are government-controlled. Lighting and gas are organized by the nationalised services responsible to the state, not the municipality.

The state also owns the national state opera house and the state theatres, the Comédie Française and the Théâtre Richelieu, most productions in which are French classics. Paris finds compensation for her limited power of self-government in the highly centralised national life of France, of which she remains the centre.

Nora Beloff

SECOND GREAT WAR. On June 3, 1940, Paris was raided from the air by the Germans, most of the bombs falling on the western outskirts; and as the fighting drew nearer hordes of refugees poured into the city. The govt. left Paris for Tours on June 11, and three days later the capital was declared an open city, the French army retiring to the S. The Germans

entered Paris on the same day. Many of the Paris factories had been destroyed or damaged to prevent them from being used by the Germans, but German specialists soon restarted them on the production of war materials; and the city became the centre of German govt. of occupied France. Unemployment rose steadily; and the food and fuel situation became critical. By Aug., 1941, poor families were on the verge of famine, and a black market sent prices soaring.

In March, 1942, the R.A.F. began a series of raids on Paris factories producing war materials for the Germans, the Renault, Farman, Salmson, Matford, and Goodrich works all being severely damaged. During 1943 an increasing number of hostages were shot in an effort to curb attacks on German military personnel and acts of sabotage; but the underground movement gained strength as the tide of war turned.

The Liberation of 1944

As the Allies were approaching Paris from the W. in mid-Aug., 1944, orders by the Paris liberation committee and the national resistance council led to a general strike and a rising which assumed serious proportions on Aug. 19. Fighting was particularly heavy near the Hôtel de Ville, in the Île de la Cité, and between the Porte d'Orléans and the Cité Universitaire. The F.F.I. gained control of a number of the chief buildings, and during the 20th the Germans negotiated an armistice and made a feint of leaving the city. Returning in force, they were met by tanks of the French 2nd armoured div. which entered the Porte d'Orléans in the evening of Aug. 24 and made contact with the F.F.I. in the Île de la Cité. The Germans resisted desperately in some sectors, setting fire to the Grand Palais, the ministry of Marine, and the Hôtel Crillon. The main body of the 2nd armoured div., led by Gen. Leclerc, entered the city early on the 25th and was joined during the morning by other Allied detachments. The commander of the German garrison signed an armistice in the evening, and at 7 p.m. Gen. de Gaulle arrived at the Hôtel de Ville. By nightfall the city was completely liberated from the Germans. Next day de Gaulle with members of the exiled govt. and of the resistance council marched in public to a service of thanksgiving for the liberation of Paris at Notre Dame, where he was shot at by Vichy snipers both

inside and outside the cathedral. A new govt. was immediately formed by de Gaulle in Paris; and on Nov. 7 the consultative assembly, which had first met in Algiers in Nov., 1943, met in Paris at the Luxembourg palace. Paris was once more the centre of govt. of the French empire.

Paris. City of Texas, U.S.A. The co. seat of Lamar co., it lies 97 m. N.E. of Dallas and 15 m. S. of the Red R. Served by rlys., it is also the headquarters of a long-distance commercial lorry service. Industries include cotton ginning, flour milling, and manufactures of cotton-seed oil, furniture, and bricks. Settled in 1874, Paris became a city in 1905. Pop. 18,678.

Paris, BRUNO PAULIN GASTON (1839-1903). French philologist. Born at Avenay, Aug. 9, 1839, son of the philologist Paulin Paris (1800-81), he became in 1895 director of the Collège de France, where he had succeeded his father as professor. His works and numerous contributions to periodicals deal chiefly with medieval French literature, of which he wrote a history. His biography of Villon is regarded by some as his best work. He died in Paris, March 6, 1903.

Paris, LOUIS PHILIPPE ALBERT, COUNT OF (1838-94). French prince. The grandson of Louis Philippe, he was born Aug. 24, 1838, and became the king's heir in 1842, retaining this position until the latter was deposed in 1848. He lived with his mother in Germany and England, and saw something of the American Civil War. He returned to France in 1871, remaining there until 1886, when he and his family were again exiled. He died Sept. 8, 1894, leaving two sons, known as the dukes of Orléans and Montpensier. He wrote a *History of the American Civil War*, 8 vols., 1874-75. *See Bourbon*; *Orléans*.

Paris, DECLARATION OF. Term applied to four articles for the regulation of maritime warfare drawn up and agreed to by the plenipotentiaries of the powers who concluded in Paris in 1856 the treaty of peace after the Crimean War. The four articles are; (1) privateering is and remains abolished; (2) the neutral flag covers enemy goods, with the exception of contraband of war; (3) neutral goods, with the exception of contraband of war, are not liable to capture under the enemy flag; (4) blockades to be binding must be effective, i.e. the blockading force must be able to prevent virtually all ingress and egress from the enemy coast.

The government of the U.S.A. was asked to subscribe, but refused. Spain and Venezuela also refused to subscribe. During the war between the U.S.A. and Spain, however, both nations agreed to conduct their maritime warfare in accordance with the principles of the Declaration. *See* Blockade.

Paris, TREATIES OF. Various international treaties signed in Paris. Used without qualification, the term generally refers to:

(1) First treaty of Paris, concluded May 30, 1814, by the Allies and France after the abdication of Napoleon I. France reverted generally to the frontier of 1790, but acquired territory round Mons and Philippeville and a portion of Savoy. Most of her colonies were restored, but Great Britain gained Mauritius, Seychelles, and islands in the West Indies, and the part of San Domingo formerly Spanish was returned to Spain. The treaty awarded Malta to Great Britain. A secret treaty signed at the same time bound France to the provisions of the congress of Vienna (*q.v.*).

(2) Second treaty of Paris, concluded between the Allies and France, Nov. 20, 1815, after the final overthrow of Napoleon. France lost most of her acquisitions under the former agreement and had to pay an indemnity of £28,000,000.

Also signed at Paris were:

(3) Treaty of Feb. 10, 1763, between Great Britain, France, and Spain, at the close of the Seven Years' War. France surrendered to Great Britain all her American possessions except Louisiana, though retaining fishing rights off Newfoundland. She regained Guadeloupe, Martinique, and Santa Lucia, her rival keeping Tobago, Dominica, St. Vincent, and Grenada. Territorial adjustments were made in Africa and India. Spain recovered the Philippines and Havana, but ceded Florida to Great Britain. (*See* Hubertusburg, Treaty of.)

(4) Treaty of March 30, 1856, between France, Great Britain, Russia, Turkey, and Sardinia, after the Crimean War. The Moldavian frontier was rectified, Russia lost control of the mouths of the Danube, and merchant ships were allowed complete freedom of entrance to the Black-Sea. A limit was placed on Russian and Turkish naval forces.

(5) The peace treaties signed between the Allied and associated powers on the one hand and Italy, Rumania, Hungary, Bulgaria, and Finland on the other, Feb. 10,

1947. All ex-enemy states except Finland presented notes of protest concurrently with signing. The terms are described in the articles on the countries concerned.

Paris Basin. Term applied by geologists and geographers to designate the general dip of the rocks downwards towards Paris from the edges of a roughly circular area which extends from the Ardennes to the Auvergne, and the Vosges to the Brittany Highlands. It embraces most of the Seine valley and part of that of the Loire. The downwarping occurred during the Tertiary period, and the basin is similar in origin to that of the London Basin.

Parish (Gr. *paroikia*, neighbourhood, from *para*, near; *oikos*, house). District committed to the care of one parson or minister having permanent cure of souls, known as the incumbent. The origin of the division of the country into parishes has been much disputed, some writers giving it an ecclesiastical ancestry, while others assert that the ecclesiastical parish system was based upon an earlier division for civil purposes. Parishes appear to have become general about the 9th or 10th century, possibly as the result of mission work radiating from the principal or bishop's church.

For civil purposes the parish is the smallest area, so far as local government is concerned. Its organization varies according as it is a rural or an urban parish. Most rural parishes have a parish council, its place in others being taken by the parish meeting.

The urban parish ceased to be an organ of local government in 1933. In ecclesiastical matters the vestry was formerly the council of the parish, but all its functions except those relating to the affairs of the Church and to charities have been transferred to parochial church councils in rural areas and to borough councils and urban district councils in other areas. In Scotland the parish ceased to exist as a civil administrative area in 1929. In ecclesiastical matters it is under the control of the general assembly. *See* Local Government.

Parish Council. Body which administers civil affairs of rural parishes which had such a council on June 1, 1934, when the Local Government Act, 1933, came into force, or in which a council has been established by order of the county council. The latter must establish a council in every rural parish with a pop. of 300 and also in parishes with a pop. between

200 and 300 if the parish meeting, consisting of the local government electors, so resolves. There are between 5 and 15 members elected every three years.

Parish Register. Register kept by parochial clergy for recording baptisms, marriages, and burials. It belongs legally to the parochial clergy, and is generally kept in the parish church. Copies of all entries are forwarded to the registrar-general. Parish registers began to be kept in England about the middle of the 16th century, but certainly existed in France 200 years earlier. Similar records were kept in ancient Athens and Rome. Before the 18th century it was usual for the entries to contain notes and comments, which provide much material for students of the period; but they developed into bare records, of merely legal interest. There was no law compelling the preservation of parish registers until 1812. Parish registers are to be distinguished from the records of births, marriages, and deaths kept by the registrar-general since 1836. The Parish Register is the title of a poem by Crabbe, 1807.

Park. Literally, an enclosed space. The word connotes either enclosed land round a large house, *e.g.* Chatsworth, Knole; or an open space set aside for the use of the public. The idea in both is that the land has been reserved.

National Parks (*q.v.*) are areas of country invested in national ownership and administered by the state for the enjoyment of the public.

A military park is an enclosed space for the storage of supplies, guns, etc.; also the actual material in such a space.

A car park is a place on public or private property on which vehicles may be left unattended. Local authorities in the U.K. may authorise the use of any part of a street as a parking place so long as this does not cause a nuisance. The liability of owners of a parking place depends on the terms of any contract made, but in general the owners merely allow drivers to leave vehicles at their own risk on the property. Public parking places are provided in many towns by local authorities. Some are merely marked off at the sides or middle of the road by white lines. The position of a car park is generally marked by a blue disk with a white P in the centre. After the Second Great War, London and other cities used as car parks some sites of buildings destroyed by German bombs.

Park, Sir Keith Rodney (b.1892). N.Z. airman. Educated at Auckland, and Dunedin, N.Z., he served with the R.F.C. and R.A.F. during the First Great War, becoming a leading air "ace." From 1919 onwards he held various staff appointments. In 1940

Sir Keith Park,
British airman

he organised fighter squadrons to protect Holland and Belgium and to cover the evacuation of Allied troops. When daylight attacks on the S. and S.E. coasts of England began in the summer of 1940, Park was in command of No. 11 fighter group, which bore the brunt of the air fighting in the battle of Britain. Later he was in charge of the R.A.F. in Egypt, and in 1942 took over the Malta Command, directing the island's defensive and offensive operations. In 1944 he became c-in-c. Middle East, and in 1945-46 was Allied air c-in-c. S.E. Asia Command. An air chief marshal, he was knighted, 1942.

Park, Mungo (1771-1806). British explorer. Born at Foulshields, Selkirkshire, Sept. 20, 1771,

he became a surgeon and in that capacity went on a voyage to India in the service of the East India Company in 1792. In 1795 he was employed by the African as-

Mungo Park,
British explorer

sociation to explore the Niger, and proceeded to Gambia, where, crossing the Senegal, he followed the Niger to within a short distance of Timbuktu.

His adventures, described in his *Travels in the Interior of Africa*, 1799, awakened great interest, and he was commissioned by the government to make another expedition in 1805. The attempt was disastrous. He had started with Anderson, his brother-in-law, and 45 British soldiers. Of this party only three soldiers were left when, after a canoe voyage of over 1,000 m., he reached the lower Niger. The end came near Yuri, where the canoe was upset and Park and his companions were drowned. One native rower escaped, from whom the facts were learned in 1812. *Consult* his *Journal*

of a Mission to the Interior, 1815; *Niger: The Life of M.P.*, L. G. Gibbon, 1934.

Park Avenue. Street of New York City. One of the main and fashionable thoroughfares of Manhattan, it continues Fourth Avenue above 32nd St. to the Grand Central terminus and thence from 45th St. to the Harlem river. It is lined with expensive blocks of flats in the middle section.

Parker, Sir Gilbert (1862-1932). British writer. Born at Addington, Ont., Canada, Nov. 23, 1862, he became a journalist. He drew on memories of the land of his birth for many novels, the best-known of which included *Pierre* and his *People*, 1892; *When Valmond*

Sir Gilbert Parker,
British writer

Came to Pontiac, 1895; *The Seats of the Mighty* (dramatised by its author), 1896; *Northern Lights*, 1909; *The Judgment House*, 1913; *There is a Man*, 1927. His autobiography, *Tarboe*, appeared in 1927. He was Conservative M.P. for Gravesend, 1900-18. Knighted in 1902, he was created a baronet in 1915. He died July 8, 1932.

Parker, Sir Hyde (1739-1807). British sailor. He was commissioned in the navy in 1758. He was knighted, 1779, for services in the American War of Independence. Made a rear-admiral in 1793, in 1801 he commanded the Baltic fleet against the Northern Confederation, with Nelson as second in command. The victory of the latter at Copenhagen, where Nelson put his blind eye to the telescope that he might not see Parker's signals to retire, led to Parker's recall. He died March 16, 1807.

Parker, Joseph (1830-1902). British divine. The son of a stonemason, he was born at Hexham,

Joseph Parker,
British divine

April 9, 1830. In 1852 he entered the Congregational ministry. After being in London at Moorfields for a short time, he went in 1853 to Banbury, and in 1858 to Manchester. In 1869 the independent church in the Poultry, London, invited him to become its minister, and while there he secured the erection of the City Temple, Hol-

born Viaduct, opened in 1874. Here Parker was one of the most popular preachers of the day. He died Nov. 28, 1902. He published a large number of books, including *The People's Bible*, 25 vols., 1885-95; and *The Paraclete*, 1874. *Consult* *My Life and Teaching*, J. Parker, 1889; *A Preacher's Life*, J. Parker, 1899.

Parker, Louis Napoleon (1852-1944). British dramatist and pageant-master. The son of an American father and English mother, he was born in Calvados, France, Oct. 21, 1852. After studying at the Royal Academy of Music, he became director of music at Sherborne school, 1873-92. The pageant which he organized at Sherborne in 1905 was followed by other equally successful spectacles, e.g. *Warwick*, 1906; *Bury St. Edmunds*, 1907; *Dover*, 1908; *Colchester and York*, 1909. As a dramatist he achieved fame with *Drake*, produced at His Majesty's 1912. A skilful adapter and translator, he prepared for the English stage *Beauty and the Barge* (from *The Lady of the Barge*, by W. W. Jacobs), *David Copperfield*, *Rosmersholm*, and *L'Aiglon*. He died Sept. 21, 1944.

Parker, Matthew (1504-75). English prelate. Born at Norwich, Aug. 6, 1504, the son of a cloth presser, he was educated at Corpus Christi College, Cambridge, where he associated with Latimer and other reformers. Ordained in 1527, he became chaplain to Anne Boleyn in 1535, and in 1537 to Henry VIII. In 1544 he was appointed master of his college, and was twice elected vice-chancellor of Cambridge university. He married the daughter of Robert Harlestone, an ardent reformer, in 1546, supported Northumberland against Mary, was in danger of his life throughout her reign, and had to remain in concealment. Elizabeth on her accession in 1558 made him archbishop of Canterbury. Parker took a leading part in translating and publishing the Bishop's Bible, 1563-68, made a collection of literary treasures, and presented priceless MSS. to Corpus Christi library. He opposed Puritanism with moderate success. He died May 17, 1575.

Matthew Parker,
English prelate

Parker, Sir Peter (1721-1811). British sailor. Born in Ireland, son of Rear-Admiral Christopher

Parker (d. 1765), he went to sea young, and after serving in the W. Indies saw action at Toulon, 1744. In 1759, commanding the Bristol, he assisted in the reduction of Guadeloupe, and in 1761 of Belle-Île. He was given command of a squadron and sent to N. America, 1775. Disastrous failure to force the entrance to Charleston Harbour cast him under a cloud, but in 1777 he was made commander-in-chief of Jamaica. In 1782 he returned to England, and was made a baronet. He died Dec. 21, 1811.

Parker Dam. Dam across the Colorado river, U.S.A. Situated below Boulder, it diverts the river water into the Colorado aqueduct for Los Angeles. Completed in 1938, the Parker Dam is of concrete and has a maximum height of 320 ft., maximum width 800 ft. It is unique in having 235 ft. of its height below the river bed.

Parkersburg. City of West Virginia, U.S.A., the co. seat of Wood co. It stands at the confluence of the Little Kanawha and Ohio rivers, 65 m. N. of Charleston, and is served by the Baltimore and Ohio and other rlys., steamers, and airport. In the Ohio, 2 m. below the city, is Blennerhassett Island, associated with Aaron Burr's abortive conspiracy to establish an "empire" in the south-west. There are gas and oil wells, farms, and mineral springs in the district, coal and clay being produced. Industrial establishments include foundries, oil refineries, lumber and flour mills, rly. shops, and manufactures of iron and steel, clothing, and porcelain. Settled 1773, incorporated 1820, Parkersburg became a city 1863. Pop. 30,103.

Parkes. Town of New South Wales, Australia, in Ashburnham co. It is 300 m. by rly. W.N.W. of Sydney, and is a centre of fruit and wheat growing and gold mining. Pop. 6,800.

Parkes, Sir Harry Smith (1828-85). A British diplomatist, born Feb. 24, 1828. He was the son of a Walsall ironmaster, and went to King Edward's grammar school, Birmingham. As a boy of 13 he went out to China and a year later became an official interpreter. He was one of the principal agents in negotiating a treaty with Siam in 1855. After the capture of Canton by the British in 1857 Parkes was one of three commissioners placed in charge, and though the Chinese set a price on his head he not only kept order in the city, but also explored a large hostile district. After the Peiho

disaster, 1859, he secured Kowloon and Chusan as army bases, and took part in the Peking campaign. His party was treacherously arrested under a flag of truce and tortured, but Parkes was eventually released and was present at the capture of Peking. Knighted in 1862 and appointed minister to Japan in 1865, he succeeded in enforcing the ratification of the 1858 treaty, and remained there 18 years except for periods of leave. Transferred to China, he died there March 22, 1885.

Parkes, Sir Henry (1815-96). Australian statesman. Born at Stoneleigh, Warwickshire, May 27, 1815, he emigrated to Australia at 24 and settled in Sydney. Entering political journalism, he started *The Empire* newspaper, 1849, and agitated strongly against the importation of convicts and in favour of colonial self-government. Member of the legislative council in 1858, he was colonial secretary 1866-68, and in 1872 became prime minister on the free imports platform. Defeated in 1875, he returned to office for a few months in 1877, in which year he was knighted. He was prime minister again 1878-83 and 1887-91. A consistent advocate of free trade, he was also the principal author of Australian federation. He died April 27, 1896. *Consult* Life and Work, T. Bavin, 1941.

Parkhurst. An English convict establishment. Situated about 1 m. N. of Newport, Isle of Wight, it consists of two separate prisons. It accommodates ordinary convicts serving sentences of over 3 years and men under sentence of preventive detention. Convicts requiring hospital treatment are usually sent there.

Park Lane. London, thoroughfare. It runs N.W. from Piccadilly to Marble Arch and marks the W. boundary of Mayfair. At its junction with Hamilton Place a "poets'" fountain by Thornycroft was erected in 1875 and demolished in 1949. From here Hyde Park is on its W. side. A lane leading from semi-rural Piccadilly to Tyburn at the beginning of the 18th century, Park Lane became a fashionable place of residence; during the 19th and early 20th

centuries palatial mansions were erected, notably Londonderry House, 1850; Dorchester House, 1851-53; Dudley House, Brook House, Aldford House, and Stanhope House. At No. 29 Disraeli lived 1839-72. Before the First Great War its character was plutocratic rather than aristocratic. Grosvenor House and Dorchester House were later demolished and replaced by hotels, flats, and shops.

Park Lane, London. Looking N.W. along this noted Mayfair thoroughfare, with Hyde Park on the left

During the Second Great War German bombs wrecked a number of the bow-fronted houses that faced Hyde Park.

Parkman, Francis (1823-93). American historian. Born at Boston, Sept. 16, 1823, he passed most of his youth in roaming about the woods, and had visited Italy before he took his degree at Harvard in 1844. The idea of writing the story of America's past gripped him early, and to study primitive life he spent some time in the wild west, learning much about the Indians. Despite an affection of the eyes which obliged him to live in a darkened room, he produced classic books: *The Conspiracy of Pontiac*, 1851; *England and France in the New World*, published in sections, each with a separate title, 1865-92. Parkman died Nov. 8, 1893. *Consult* Journals, ed. M. Loade, 2 vols., 1949; *Lives*, C. H. Farnham, 1901; H. D. Sedgwick, 1904.

Park Royal. Dist. of Middlesex, England. It has Willesden to E.N.E. and Ealing to S.W., and is well served by rly. and bus, Western Avenue running through it. The district was laid out as a permanent showground of the Royal Agricultural Society of England, but after 1905 the estate was split up into building sites. Here are Guinness's London brewery and other industrial works.

Parkstone. District of Dorset, England, forming a N.E. suburb of Poole. Lying between that town

and Bournemouth, it has a rly. station. Owing to the fine woods around it and other attractions, it is much visited during summer. Pop. 11,618.

Parlement. Former French court of justice. The name is identical with that of parliament, although now used in a different sense. It was first given, as in England, to a meeting for discussion, but soon the parlement of France developed into a court of justice, not a legislative assembly.

The early French kings heard disputes in person; in this work they were assisted by their vassals, and about the time of St. Louis this *curia regis* became definitely a court of law, not unlike the English court of exchequer. It sat permanently in Paris, and was therefore called the parlement of Paris; its active members became a class of regular professional judges, both clergy and laymen; the king ceased to preside over its sessions, giving way to a president. It was the court to which came cases about the royal estates, and appeals from the decisions of the king's baillis and seneschals. This process was completed before 1500, but soon the business of the parlement had increased so much that it was divided into several sections. It was also a court of which theoretically all the peers of France were members.

On this model, parlements were established in the provinces; at the Revolution they existed at

Rouen, Rennes, Grenoble, Dijon, Bordeaux, Nancy, Besançon, Toulouse, and elsewhere. These were courts of appeal for the various provinces, having each a retinue of lawyers, including a president, councillors, and permanent officials of lower rank. The offices passed from father to son, or were sold openly to the highest bidder. A

parlement could make regulations for the government of the province, and before coming into force all laws were registered by it. The parlements were most powerful during the 18th century, when they were the only remaining check on the royal authority. They were abolished at the time of the Revolution, and never revived.

PARLIAMENT: HISTORY & PROCEDURE

A. F. Pollard, M.A., former Prof. of History, London Univ.

In addition to this historical sketch, which concludes with a section on parliamentary procedure, there are articles on Commons, House of Lords, House of Commons, Division; King's Speech, etc.; also Government; Politics; Representation; Vote

Parliament originally meant a parley, and nothing more. The word is found in French early in the 12th century, and its use became common in England during the 13th, to denote any kind of conference. Its official use was restricted to specially full meetings of the king's council summoned four times a year, i.e. in every legal term, to consider public affairs and particularly legal cases which were especially difficult or required a novel remedy. To official gatherings of this kind the word was long restricted in both France and Scotland, and even in England a "parliament of the council" was described as a full parliament in the 14th century, even though no specially summoned peers were present, and no generally summoned representatives of the

commons. The really original work of Edward I, which was ultimately to distinguish the constitutional system of England from those of France and Scotland, was that, instead of keeping these parliaments of the council separate from the representative estates, he joined the latter to the former, and thus formed the Parliament which is at once a "high court"—indeed, the highest law court in the land—and also a popularly elected legislative and taxing body.

In both its aspects Parliament developed out of feudal ideas and conditions. Representation, unknown to the classical world, had been familiar in Anglo-Saxon times since the days when the reeve and four "best" men of the town began to attend the shire-moot. But the "best" men were the

Parliament. The Houses of Parliament, seat of British legislature, on the banks of the Thames, at Westminster, London. On the extreme left are the towers of Westminster Abbey, next are the Victoria Tower and Central Tower, and on the right the Clock Tower containing Big Ben

possessors of the best tenements, and the obligation of attendance was often attached as a duty to the particular holding. After the Norman Conquest the rule was that if the lord or his steward chose to attend, his attendance excused the rest of the community; but if neither proposed to attend, then the township must send its reeve and four best men. The obligation lay on each community as a whole, and the boon of representation consisted not in the fact that the few had to attend, but in the fact that all the rest were thus enabled to stay at home. The same principle was extended from the shire-courts to the king's high court at Westminster. The greatest tenants-in-chief, whether bishops or barons, were required to come by individual writs of summons; they enjoyed no representation. But the lesser tenants-in-chief and the cities and boroughs were excused on condition of producing two representatives of each shire, city, and borough, to do their duty for them; and the lower clergy were offered the same advantage.

The business of these representatives was judicial and financial; politics could only come later when the people had acquired some political knowledge and capacity. Work of this kind had long been done on the representative principle in the shire-courts, and the summons to Westminster was due to the increasing superiority of the justice administered in the king's court to that which was administered in the local popular or feudal courts. Henry II had created a highly expert *curia regis*, with which no other court could compete, either in respect of competence or of power; and in spite of the reactionary attempts of the barons to limit by means of Magna Carta the jurisdiction of the king's court, it developed rapidly during the reign of Henry III.

Hearing of Pleas

New writs were devised to remedy abuses; no court could use them but the king's, and this meant that an increasing number of suitors were continually being attracted to Westminster Hall, where three committees of the king's court, common pleas, exchequer, and king's bench, were gradually formed to deal with their petitions. A parliament was properly a joint session of these committees, with the non-judicial members of the council, and its preliminary was a proclamation that all who had petitions to present should present them by a certain date; receivers and triers of petitions were then appointed, and the pleas were

heard. A further advantage of a parliament was that no fees were charged for a petition.

Parliaments of this sort were held before the business of representation was organized by means of the writs to the sheriffs and the regular return of elected representatives from the shires and boroughs; and agents of the shires and boroughs had often presented their legal business at Westminster. Simon de Montfort's parliament of 1265 was an extension and application of this kind of assembly to the political purpose of placing the royal authority in commission. Its defect was that it consisted solely of his partisans, and there is little evidence that this gathering had either the means or the will to perform the legal functions which long continued to be the principal business of parliament. The regularisation of this legal business was largely due to financial reasons. So long as land was the only source of direct taxation, only the chief landholders had been consulted.

Taxation and Representation

But as the financial necessities of government increased, the basis of taxation was extended to personal property and to a larger section of the community; and taxation became the mother of representation. At first the king sent his agents round to the shires and boroughs to negotiate locally for grants; but it was soon found more expeditious and profitable to summon agents of the localities to make their grants in the king's presence at Westminster. Thus representatives were summoned to attend the parliaments of the council (a) to make grants of taxation and (b) to present petitions for legal redress. They were not asked to legislate. What legislation there was took the form of ordinances in council, devised by the judges and enacted by the crown, and Edward I himself enacted most of his legislation before he summoned his model parliament of 1295.

These parliaments were held in a single chamber, at the upper end of which sat the king on his throne. At his feet sat the chancellor on one of the four woolsocks, arranged in a square on which sat the council, the judges of the king's bench on the chancellor's right, and the judges of common pleas on his left: opposite the chancellor sat the masters in chancery. The council was the original core of parliament, and all the other elements were accretions. Outside this inner square of councillors the bishops and abbots sat on benches running down from the right of the

throne, and the earls and barons on its left. At the lower end of the chamber beyond the bar stood the Commons with the Speaker at their head, on the rare and solemn occasions on which they appeared in parliament.

The business was opened by the chancellor or some other councillor, who explained the cause of summons and the royal needs; and the various estates (the notion that there were only three is a misleading fiction) separated to deliberate on the answers they should make. The lower clergy withdrew to their own convocation, and in the 14th century ceased altogether to come to parliament. The knights of the shires and burgesses at first withdrew to separate rooms, but before the middle of the 14th century coalesced to deliberate, first in the refectory, and then in the chapter house of the Abbey across the way. The specially summoned prelates, earls, and barons asserted, probably in Edward II's reign, a claim to remain in the parliament chamber with the king's council, thus making it a *magnum concilium*, and the parliament chamber was thus also known as *camera magni concilii*.

As soon as the various estates had agreed upon their answers they returned into the parliament chamber to report them, the Commons by the mouth of their Speaker, and the clergy by their prolocutor; and the business of the representatives was at an end. They might stay on to hear the result of their petitions, but did not do so in any numbers until their individual petitions had been converted into effective or common petitions and made the basis of legislation. In any case the council continued sitting in parliament to deal with parliamentary petitions long after all the other elements had gone home. Most of the petitions presented were, however, at once referred to the appropriate courts; and it was only with the residue, which on account of their special difficulty or the novelty of the remedy required could not be so referred, that the council dealt in parliament.

Formation of Two Houses

Parliament was thus in the 14th century a single chamber for its solemn business, and broke up into a variety of meetings for what might be called committee-business. The two "Houses," so familiar to-day, were formed not so much by the division of parliament as by the amalgamation of various "estates." The prelates, earls, and barons clung to, and gradually

swamped, the council, the lower clergy went off to convocation; and the knights of the shire and burgesses united to form the house of commons. In time the separate work of these two groups, lords and commons, grew more important than their joint work in common session.

More unfortunate from the point of view of understanding the origin and history of parliament has been the removal of the law courts from Westminster Hall to the Strand, and the consequent severance in the public mind of what was originally a single institution.

Change in Functions

The kernel of this change was the conversion of individual petitions, which are matters for judicial redress, into the common petition, which requires legislation and political action, and this development, which, more than anything else, created the house of commons, also determined the functions of parliament. Parliamentary petitions were more and more referred to the council and by the council to chancery, the star chamber, and others of its departments; and with the loss of this business parliaments grew more infrequent towards the close of the Middle Ages. Attendance was shirked both by lords and commons, and it was not until the growth of political intelligence followed on the Renaissance, localism expanded into nationalism, and the Tudors were compelled by their break with the Church to rely on parliament, that the ebbing tide of parliamentary activity was turned into its broader modern channels.

It was nursed by Henry VIII, grew fractious under Elizabeth, and rebelled against the Stuarts. That war against the Stuarts was the best testimony to the fostering care of the Tudors, for no parliament in the Middle Ages could ever have waged a war against the crown. But under Henry VIII a parliament, instead of being a matter of two or three weeks, sat for seven years, and during such periods acquired a solidarity, a self-knowledge, a tradition, a body of rules and customs, and a mastery of politics such as it had never possessed before. The Rolls of Parliament kept by the crown are superseded by the Journals kept by the Houses themselves; Henry VIII's habit of doing everything by parliament created the impression that nothing could be done without parliament; and it developed a will of its own,

denying the crown all sorts of control it had exerted before and eventually establishing its claim to be the superior power. The Revolution of 1688 asserted the responsibility of the executive to parliament, but not until 1832 was the responsibility of parliament to the people fully recognized, and that recognition led to the supremacy of the house of commons, which was established by the Parliament Act of 1911.

Parliament is now legally the sovereign body in the constitution, though politically it obeys the will of the constituencies, and is sometimes threatened with the unconstitutional alternative of "direct action." It makes and unmakes laws, retains or turns out ministries, and directly or indirectly controls the whole of British policy. Unlike most modern legislatures, and particularly that of the United States, it is bound by no written constitution and hampered by no "separation of powers."

Scope of Powers

It can alter the most fundamental law with the same expedition and machinery as it passes or repeals a tramway Act; and no fixed terms of office, either for legislature or executive, prohibit the solution of disputes between them by a dissolution of the legislature or an ejection of the executive. On the other hand the elasticity of the system subjects parliament to manipulation; it can be dissolved at a psychological moment, and can then prolong its own existence long after the popular mood has passed. The English parliament has been imitated in every quarter of the globe.

PARLIAMENTARY PROCEDURE. The term "parliamentary procedure" in the British parliament is often restricted to the internal procedure which each house is free to regulate for itself; but it also covers properly the relations between the two houses and between them and the crown. It has developed over 600 years and is still constantly changing. It consists of a mass of time-honoured rules and conventions, supplemented by modern standing orders.

When a new parliament meets the commons are directed to elect a speaker, who is their impartial president and the guardian of procedure. He calls members

who wish to speak, puts the necessary questions, and announces the decisions of the house; but he takes no part in debates and has only a casting vote. He enforces the rules of order and has powers to select amendments and to accept or refuse the closure.

The government benches are on the speaker's right, those of the opposition on his left. All members are deemed equal in the house. They must address the chair and may not use "unparliamentary" language.

Every matter to be decided is put in the form of a question, capable of being voted upon, aye or no, and the decision of the majority is accepted as that of the house. The quorum is 40.

Standing orders provide the hours of sittings, but these hours may vary, either because the house has agreed to suspend these rules or because it is considering certain business which is specially exempted from the rules.

Questions to ministers occupy the first hour of every day (except Fridays) after prayers. The remaining time is divided between "notices of motions," or fresh propositions, and "orders of the day," which are items ordered by the house, to be considered, including the stages of bills, financial business, and adjourned debates.

A bill may originate in either house and is given a formal first reading. Its principle is decided upon second reading and its details thrashed out during the committee and the consideration (or report) stages. After a final debate on third reading, the process is repeated in the other house. Failing agreement between the two houses, the bill is lost; but if agreement is reached, the bill receives the royal assent in the house of lords and becomes an Act of Parliament.

All taxing and spending proposals, being of special importance, require extra stages. Thus, the budget resolutions originate in committee of ways and means, the estimates for the fighting and civil services occupy about 26 "allotted days" in committee of supply, and projects for fresh spending start in other committees of the whole house. They must all be agreed to by the house itself and then incorporated in legislation, the finance bill, the appropriation bill, and other bills. Proposals for fresh spending can be initiated only by the crown, by means of the king's recommendation signified by a minister.

Much business is devolved upon standing committees of about 50 members which are microcosms of the house and which consider the committee stages of bills; and upon smaller select committees, e.g. the committee of privileges, the committee of selection, and the public accounts committee.

Procedure in the house of lords differs mainly in detail. The quorum is 3. The lord chancellor, who acts as speaker, has no powers of authority, but he is a member of the government and takes part in debate. No financial measure may originate in the lords. There are no committees of supply or ways and means, and no standing committees.

Parliament, Houses or. Seat of the U.K. legislature at Westminster. The building in which the commons and the lords meet forms, together with Westminster Hall, a single pile. Erected in Yorkshire sandstone (which proved to weather badly in London's atmosphere) from Sir Charles Barry's designs to replace an edifice destroyed by fire in 1834, it was begun 1836 and completed 1857, although in use before that. In Late Gothic style, the present building covers 8 acres, and contains 11 courts, 100 staircases, and 1,100 apartments, principally the chambers of the house of commons and house of lords, those for use of the sovereign on ceremonial occasions, the royal court, and royal gallery. Westminster Hall, part of the ancient palace, escaped the fire of 1834, and forms a vestibule to the houses of parliament.

Other features include the clock tower (containing Big Ben, *q.v.*) at the N. end, 318 ft. high; the central tower, 300 ft.; and Victoria Tower, 340 ft. While parliament is sitting a Union flag flies from Victoria Tower by day, a light is shown in the clock tower by night. The imposing river front, with its terrace facing the Thames, is 940 ft. long, and adorned with statues of English monarchs. Twelve times the houses of Parliament were hit by bombs during the Second Great War, the chamber of the house of commons being destroyed on May 10, 1941. Frescoes painted

for the halls and galleries include Madise's huge Death of Nelson and Meeting of Wellington and Blucher; Copley's Death of Chatham; Cope's series depicting events of the Stuart period; another series by various artists depicting the Tudor period; and a series relating to the building of Britain by Glyn Philpot, Charles

Sims, A. K. Lawrence, Sir W. Rothenstein, and others. See Commons, House of; Lords, House of; Westminster Hall.

Parliament Act. Statute enacted Aug. 18, 1911, limiting the power of the house of lords. A controversy had arisen between lords and commons as a result of the rejection by the lords of the Liberal gov't's budget of 1909. After two general elections in 1910, Parliament bill was passed in the commons and ultimately in the lords after an announcement by H. H. Asquith, the prime minister, that the king would, if necessary, use his prerogative of creating enough new peers to secure the passage of the bill.

The Act limited the power of the lords to delay a money bill to one month, and provided that if any other bill were passed by the commons in three successive sessions it would become law at the end of that time even if not passed by the lords. But two years had to elapse between its second reading in the commons on its first introduction and its final acceptance by that house. A further Parliament Act, passed by the commons in three successive sessions in 1947-49, reduced this period to one year.

The Act of 1911 had referred in its preamble to the necessity for reforming the house of lords, and various proposals for reform were put forward, notably by a committee under Lord Bryce in 1917-18. In 1947-48 an inter-party conference was held to consider reform, but this broke down in May, 1948, following impossibility of agreement on the length of the suspensory period. See Lords, House of.

Parliamentary Agent. Person, usually a solicitor by profession, and acquainted with the details

Parliament Square, Westminster. View from the W. side looking towards the Houses of Parliament. The statue in the bottom left corner is that of Lincoln. See page 6349

of parliamentary procedure, employed to assist the promoters of private bills by canvassing members of parliament, securing information, and facilitating the drafting and passing of bills.

Parliamentary Train. Type of railway service formerly operated in the U.K. When the first railways were granted concessions to build their tracks, they were obliged by Act of Parliament to reserve a proportion of accommodation on the trains for 3rd-class passengers at the rate of 1d. a mile. The companies met this obligation by running a number of trains of this kind every day. Parliamentary trains were generally slow and uncomfortable, and were gradually withdrawn as higher fares were allowed, and 3rd-class accommodation was provided on ordinary trains. The last ran in 1912.

Parliament Hill and Fields. London open space. Situated near the Hampstead border of St. Pancras, the hill is 319 ft. in height, and has a chain of ponds, over one of which the roadway is carried by a viaduct. Since 1889 the hill and fields, covering 267 acres, have formed an integral part of Hampstead Heath, being acquired for the public at a cost of £301,000.

The name Parliament Hill is supposed to connect the spot with an ancient folk-moot, or with the planting of cannon here by the Parliamentary forces for the defence of London during the Civil War. Its alternative name of Traitors' Hill is associated with the legend that here the confederates of Guy Fawkes assembled to witness the blowing up of the houses of parliament. The tumulus popularly known as Boadicea's Tomb was explored in 1894, when it yielded the rival theories that

it was an ancient burial mound of the early bronze period, or that it was originally raised as a Roman boundary mark.

Parliament Square. Square and open space in the city of Westminster. Facing New Palace Yard, it is overlooked by Westminster Abbey, the houses of parliament, and Middlesex Guildhall. Until the early 19th cent. the site was covered by narrow streets and mean houses; when the houses of parliament were completed, the present lawns were laid. In the square are statues of the prime ministers Canning, Peel, Palmerston, Derby, and Beaconsfield, and of President Lincoln. The roads bounding the square form a traffic "roundabout." Parliament Street leads out on the N. side. Work was undertaken in 1950 to widen the square and make new lawns, to link it with the Abbey sanctuary. See illus. p. 6348.

Parma. Prov. of N. Italy, in Emilia. It is bounded N. by Cremona, S. by Massa e Carrara and Genoa, E. by Ferrara, and W. by Piacenza. Mountainous in the S., it slopes in a N.E. direction from the Ligurian Apennines to the river Po, which forms its N. boundary. The Parma, Baganza, and Taro, all tributaries of the Po, are the chief rivers watering the province. Cereals, wine, oil, cheese, and fruit are produced. Cattle rearing and silk manufacture are important industries. There are many mineral springs, the most famous being that at Salsomaggiore. The capital is Parma (*v.i.*). Area, 1,258 sq. m.

Parma. City of Italy, capital of the prov. of Parma. It stands on both banks of the river Parma, 75 m. by rly. S.E. of Milan. An ancient and handsome city, surrounded in part by ramparts, its streets are straight and wide, while

the old Aemilian Way traverses the city from E. to W. Its Lombard-Romanesque cathedral, built about 1059-1106, with later additions, has a lofty campanile and an octagonal dome, containing a fresco of the Assumption, one of Correggio's greatest works. The Romanesque baptistery, with a Gothic upper storey, 1196-1302, built of marble, is one of the finest in Italy.

There are about 60 other churches, some of which were damaged by bombing during the Second Great War. The most notable, which received only superficial damage, are three Renaissance churches, Our Lady, 1521-39, S. John the Evangelist, 1510-1614, with frescoes in the dome by Correggio, and the Annunciation, 1566-1632. The ducal palace, or Palazzo della Pilotta, had art galleries with paintings by Correggio and other masters, a library containing over 300,000 volumes and 4,500 MSS.; and a museum of antiquities: but was extensively damaged during the Second Great War. The university dates from 1482. The convent of San Paolo contains the celebrated Putti of Correggio. The chief industries of the city are connected with printing, silk, cereals, dairy produce, wine, and cattle.

Probably of Etruscan origin, Parma was colonised by Rome, 183 B.C., and the Roman bridge over the Parma is still extant. Its bishopric is first mentioned A.D. 378. In 1346 Parma was sold by the Correggio family to that of Visconti, and was associated under the Sforzas with the duchy of Milan until 1511. On June 29, 1734, the Austrians were defeated here by the French and Sardinians. Pop. 72,000.

During the Second Great War Parma was lightly damaged except near the rly. station. The city was captured from the Germans by the 5th Army on April 25, 1945, with no opposition worthy of mention being encountered.

Parma, DUCHY or. Former independent state of Italy. Adherent to the Guelph faction during the Middle Ages, the city and its territories passed through many hands before they

were absorbed in the papal possessions in 1512. In 1541 Pope Paul III made his son, Pier Luigi Farnese, duke of Parma and Piacenza, and his descendants held the title until 1731, when, with the death of Antonio, 8th and last Farnese duke, the duchy became an apanage of the Spanish crown. It was transferred to Austria in 1734, but reverted to Spain in 1748. In 1796 the French Revolutionary armies occupied it for six years, when Napoleon included it in the kingdom of Etruria, 1802.

The congress of Vienna, 1815, welded Parma, Piacenza, and Guastalla into a grand duchy of Parma, in which Napoleon's widow, Marie Louise, was given a life interest. On her death, 1847, this duchy passed to Charles Louis, son of the last Spanish duke. Charles Louis, a mere tool of Austria and governed by Tom Ward, the English stable-lad whom he had made prime minister, fled at the revolution of 1848, and the following year abdicated in favour of his son, Charles III, who was assassinated in 1853. He was succeeded by his son Robert, who was deposed in 1860, when the grand duchy became part of the kingdom of Italy. See Farnese; Italy.

Parma, ALESSANDRO FARNESE, 3RD DUKE OF (1545-92). Italian soldier and statesman. Born in Rome, Aug. 27, 1545, Alessandro was the son of Ottavio Farnese (1520-86) and Margaret, natural daughter of the emperor Charles V, and spent his early years at Brussels and Madrid. Under Don John of Austria he showed conspicuous courage at Lepanto, 1571, and was dispatched to aid his struggle to maintain Spanish supremacy in the Netherlands, 1577. He succeeded Don John as governor-general in 1578, and by astute diplomacy and skilful generalship succeeded in recovering the Walloon dependencies, his chief exploit being the 14 months' siege of Antwerp, 1584-5. He succeeded in saving Paris from capture by Henry IV, 1590, and Rouen from the Huguenots, 1591, but died at Arras on Dec. 3, 1592. See Farnese.

Parmenides (c. 540-460 B.C.). Greek philosopher. A native of Elea, he was the chief representative of the Eleatic school of philosophy, founded by Xenophanes. Whereas Heraclitus had taught that everything was in a state of flux or movement, and that permanence was an illusion of the senses, Parmenides taught the opposite doctrine. All movement

Parma, Italy. Cathedral and 13th century campanile, from the south-east

and change, he said, were illusions, and all things have existed, and will exist, the same for ever.

Parmenio (d. 330 B.C.). Macedonian soldier. He was second in command to Alexander the Great on his Persian campaigns, leading the left wing in the three battles of the Granicus, Issus, and Gaugamela. Subsequently he became involved in a plot organized by his son against Alexander, and was put to death.

Parmesan Cheese. Product of two districts of Italy, Parma and Emilia. It is so hard that it is used only for cookery, in grated form. It is made from heated cow's milk, into which rennet is dropped in bags and then removed. The curd is broken up, heated again, pressed between boards, and left in a mould for two or three years. The crust is then nearly black, the cheese very pale, and covered with tiny holes.

Parmigiano (1504-40). Italian painter. His name was Girolamo Francesco Maria Mazzola, and he was born Jan. 11, 1504, at Parma, whence he was commonly called *Il Parmigiano*. The son and nephew of painters, he was largely self-taught, but his early work was influenced by Correggio, and his later by Raphael. His chief paintings include frescoes at Parma and in Rome, and a famous altar-piece at Bologna. Parmigiano was one of the first Italians to practise etching. He died at Casal Maggiore, Aug. 24, 1540.

Farmoor, CHARLES ALFRED CRIPPS, 1ST BARON (1852-1941). British politician. Born Oct. 3,

1st Baron Farmoor,
British lawyer
Russell

1852, he was educated at Winchester and New College, Oxford, where he took four firsts. He was called to the bar in 1877, took silk in 1890, and became attorney-general to the prince of Wales in 1895, being reappointed in 1901 and 1912. He was Unionist M.P. from 1895 to 1914, with intervals, for various divisions, then becoming a baron. An authority on ecclesiastical law, he was chancellor and vicar-general of York, 1900, and vicar-general of Canterbury, 1902-24. During the First Great War he championed the conscientious objectors, and later became an enthusiastic supporter of the League of Nations. Embracing the cause of Labour, he was lord president of

the council in Ramsay MacDonald's 1924 cabinet, holding the same office from 1929 to 1931, when he resigned on the formation of the National government. In 1939 he finally broke with the Labour party. He was made a privy councillor in 1914. His *Principles of the Law of Compensation*, 1881, is a standard work. He also published *A Retrospect*, 1936. He died June 30, 1941. His second son was Sir Stafford Cripps (*q.v.*).

Parnahyba. Town and river of Brazil. The former, in the state of Piahy (Piaui), stands on the river Parnahyba, 11 m. from its mouth. An important river port, it exports cattle, hides, tobacco, cotton, etc. Pop. 15,000.

The river rises in the Serra das Mangabeiras, and flows N.N.E., forming the boundary of the states of Piahy and Maranhão. After a course of about 800 m., 400 m. of which are navigable by small steamers, it discharges into the Atlantic by a delta.

Parnassiens. Group of French poets of the later 19th century. The name is derived from *Le Parnasse Contemporain*, a collection of poems by many authors published in 1866. Among the contributors were the older poets Leconte de Lisle, Théophile Gautier, Théodore de Banville, and Charles Baudelaire. Other collections under the same title appeared in 1869 and 1876. An offshoot of Romanticism, the school, which was mainly lyrical, eschewed all appeals but the aesthetic. Falling into preciosity and artificiality, they were succeeded by the Symbolists (*q.v.*).

Parnassus. Mountain of Greece. It is the highest peak, 8,069 ft. alt., of a range in Phocis, ancient Greece, lying N. of Delphi. Parnassus was sacred to Apollo and the Muses, and also of Dionysus. Immediately above Delphi is the celebrated Castalian spring.

Parnell, CHARLES STEWART (1846-91). Irish nationalist. He was born at Avondale, co. Wicklow, June 27, 1846, of an English family long settled as landowners in Ireland, and was educated at Magdalen College, Cambridge. In 1875 he entered parliament as a Home Ruler.

Though a landlord, a Protestant, and a man reserved and aloof in manner, he exercised a commanding influence which transformed his party, small as it was, into an instrument which came near to paralysing the house of commons; a disciplined body which devoted itself to such an organized obstruction of public

business as hitherto had never been known in England.

Parnell's aim was explicitly the establishment of an independent parliament in Dublin. For the

Charles S. Parnell,
Irish Nationalist

agrarian question, the grievance consciously felt by the Irish peasant, he avowedly cared little, but he saw in it the means of combining the great majority of the Irish people into one compact force. To that end in 1878 he organized the Land League, poured vitriolic scorn on every English attempt to provide remedial agrarian legislation, and urged the Irish peasantry to adopt every conceivable method short of positive crime to render the law nugatory. The Phoenix Park murders in 1882 forced him to an open denunciation of such crimes, and a contemptuous repudiation of charges that he had condoned them.

Popular opinion, however, still held Parnell guilty, morally at least, of Irish crimes and outrages, until a special judicial commission was appointed to investigate the whole question of "Parnellism and crime." The sensational event of this inquiry was the demonstration that an alleged letter of Parnell's, utterly damning if genuine, was a forgery by Richard Pigott, which The Times newspaper had accepted with reckless credulity. Liberals and Irish Home Rulers were drawing into a close alliance, when Parnell was disastrously implicated in a divorce scandal. His intimate and trusted agent, Captain O'Shea, cited him as co-respondent in an action for divorce which he instituted against his wife, and, the action being undefended, secured a decree in Nov., 1890.

Parnell's retirement from the leadership was demanded by Gladstone; the Irish party was divided, the great majority insisting upon Parnell's withdrawal. Parnell fought fiercely for his position, repudiating the Liberal alliance. But before it could be said that the fight was decided, he died suddenly on Oct. 6, 1891, within four months of his marriage to Mrs. O'Shea. Had he lived, his help would probably have enabled Gladstone to carry the Home Rule proposal in 1892. He was at once a driving and a restraining force, and without him Irish nationalism

was tactically leaderless. See Home Rule; Ireland.

Bibliography. Lives. R. B. O'Brien, 1898; Mrs. C. S. Parnell, 1914; St. J. Ervine, 1925; The Parnellite Movement, T. P. O'Connor, 1889; P., The Last Five Years, A. F. Robbins; P. Vindicated, H. Harrison, 1931. A play, Parnell, by Elsie Schaffer, was shown in London, 1936.

Parnell, THOMAS (1679-1718). British poet. Of English descent, he was born in Dublin and educated at Trinity College.

Thomas Parnell, English poet

Made a minor canon of S. Patrick's cathedral, 1704, he was archdeacon of Clogher, 1706-16, and then became vicar of Finglas. Visiting England in 1706, he was

on terms of friendship with Harley, Swift, and Pope. He contributed to The Spectator and The Guardian; was one of the Scriblerus Club; and aided Pope in his translation of the Iliad, for which he wrote the introductory essay on Homer. On the death of his wife (Anne Minchin) in 1711, Parnell gave way to intemperance, and, dying at Chester, was buried in Trinity church there, Oct. 24, 1718. Praised by Goldsmith, who wrote his Life, and by Campbell, his work is marked by love of the classics, humorous fancy, grace, good taste, and moral feeling, and serves as a link between that of Pope and Goldsmith. Especially notable are his Hymn to Contentment, A Night-piece on Death, Epistle to Pope, A Fairy Tale, and The Hermit. Pope edited Parnell's Poems, 1721, and G. A. Aitken his Collected Works, 1894.

Parody. Imitation, mainly as manifested in literature, of the general style or spirit of a writer or of the form of a specific piece of work, with intent to make fun. It differs from burlesque, which is a laughable perversion of a serious theme, in that it is a mocking of the manner rather than the matter. In Sir Owen Seaman's words, "At its lowest a mere verbal echo, at its highest it becomes a department of criticism."

Though the art is an old one, exemplified first in The Battle of the Frogs and Mice, and merging in the hands of Aristophanes through burlesque into pure comedy, modern parody may be said to begin with The Pipe of

Tobacco of Isaac Hawkins Browne, 1736, little known now except by students. Popular parody started in England with The Anti-Jacobin of Canning and Frere, 1797, and The Rejected Addresses by James and Horace Smith, 1812. Some of the chief British parodists are Thackeray, Sir Theodore Martin, W. E. Aytoun, C. S. Calverley, Quiller-Couch, Seaman, Sir John Squire, and Sir Max Beerbohm.

Parole. In international law, the pledge of honour of a prisoner of war to observe conditions imposed by his captor, if allowed his liberty. Under The Hague convention the government of a country cannot compel one of its subjects to break such parole, though if the government disapproves of the conditions of parole it is the duty of the combatant concerned to surrender again to the enemy. In a military sense, a parole is a watchword given by the commander of an army or garrison for officers to use. In penal law, it is a pledge of good conduct given by a person convicted of crime as a condition of his or her release from prison. The parole system in penology is steadily on the increase in many countries, notably the U.S.A.

Paros. Island in the Aegean Sea, belonging to Greece. One of the Cyclades group, it is 5 m. W. of Naxos, and has a length of 13 m. and a breadth of 10 m. Pyramidal in shape, it rises in Hagios Elias, the ancient Marpessa, to about 2,500 ft. Near the chief town, Parikia, are the quarries of Parian marble, wrought from ancient times. Paros was colonised by Ionian Greeks who afterwards founded Parium and Thasos. It was captured by the Persians in 490 B.C. and later became merged in the Athenian confederacy. The Arundel marbles were brought to England from Paros in 1667. Its area is 96 sq. m.

Parotid Gland. One of the salivary glands situated just in front of the ear, its duct running on the inner aspect of the cheek to empty itself along the upper jaw. It is generally the first gland to become enlarged in mumps.

Parousia. Greek term for coming, appearance, or revelation. It is used in the Greek version of the N.T. for the Second Advent or Second Coming of Christ (2 Thess. 2). See Messianic Hope.

Parquet (Fr.). Name given to an inlaid or mosaic wooden flooring. Small blocks of wood are arranged in a geometric pattern. Oak is the wood most generally

used, other woods of various colours being added for the more elaborate forms of parquetry.

Parr, CATHERINE (1512-48). Queen of Henry VIII, entered in this work as Catherine Parr.

Parr, GEORGE (1826-91). English cricketer. Born at Radcliffe-on-Trent, near Nottingham, he was the son of a small landowner and farmer. In 1840 he joined the All England team led by Clarke, which he himself captained, 1857-1870. Playing

George Parr, English cricketer

for Notts, he was regarded as the finest batsman of his day. He died June 23, 1891.

Parr, THOMAS (c. 1483-1635). English centenarian, known as Old Parr. He is supposed to have lived in ten reigns, from that of Edward IV to that of Charles I. Tradition said that he was born at Winnington, Salop, and he lived there mostly. In 1635 the earl of Arundel took him to London that he might be shown at court as a marvel, but in London he died on Nov. 15, at the alleged age of 152, being buried in Westminster Abbey. Taylor, the water poet, wrote a pamphlet, The Olde, Olde, Very Olde Man, 1635. The cottage in which Parr lived between Shrewsbury and Welshpool was sold to a namesake in 1917.

Thomas Parr, English centenarian

Parrakeet. Name popularly given to many small long-tailed parrots. The ring-necked parakeet, well known in aviaries, has green plumage with a red collar. It is about 16 ins. long, and is found in India and Cochinchina. Flying in flocks and feeding upon fruit and grain, it is a serious pest to gardeners and agriculturists. The grass parakeets of Australia have beautiful plumage of green and blue, and are popular pets. They spend most of their time on the ground, as do also the swamp parakeet and the ground parakeet, while both have barred tail feathers. See Parrot, colour plate.

Parral or **HIDALGO DEL PARRAL.** City of Mexico, in the state of Chihuahua. An important mining centre and rly. junction, it stands on the river Parral, 120 m. S. of

Chihuahua. Silver is extensively worked in the neighbourhood, and wine making is an industry. Parral has some splendid ancient churches. Pop. 16,000. Parral is also the name of a small town and dist. in the Linares prov. of Chile.

Parramatta. Town and river of New South Wales, Australia, in Cumberland co. The town is a major manufacturing centre and stands on the river, 13 m. W.N.W. of Sydney, with which it is connected by road, electric rly., and river steamer. Pop. 21,000. The river is in reality an extension of Port Jackson, 10 m. in length.

Parratt, Sir Walter (1841-1924). British organist. Born at Huddersfield, Feb. 10, 1841, he

was educated privately, and became organist at S. Paul's church there, 1854-61. He succeeded Stainer at Magdalen College, Oxford, in 1872, and ten years later was appointed organ-

Sir Walter Parratt,
British organist
Elliott & Fry

gist to S. George's Chapel, Windsor, a post he held until his death on March 27, 1924. Professor at the R.C.M. from 1883, he conducted the choral class. He was knighted in 1892, and appointed master of the queen's music. During 1908-18 he was professor of music at Oxford. Parratt, who helped to establish Reger's reputation as a composer in England, revolutionised organ playing. A devotee of Bach, he was regarded as a purist but a splendid performer. *Consult* Life, D. F. Tovey and G. Parratt, 1942.

Parret. River of England. It rises in Dorset, near Cheddington, and flows N.W. through Somerset, past Langport and Bridgwater, to the Bristol Channel, which it enters by an estuary. Near Langport, to which it is navigable, it receives the Yeo and the Isle, and lower down the Tone joins it. Its length is 35 m.

Parricide. Murderer of a father. The term is not recognized in English law, no distinction being made between the killing of a father and any other form of murder. In Roman law the term included the murder of other near relatives, e.g. a grandfather, brother, etc., and was punishable by drowning in a sack. *See* Murder.

Parrot. Name applied in a broad sense to all birds of the order Psittaci, of which there are about 500 species known, from the

warmer regions of both Old and New Worlds. They are distinguished structurally by the form of the bill. Both mandibles are hooked, the lower biting within the larger, strongly curved upper one, which is hinged to the skull. The feet are of the scansorial type, two of the toes being turned backwards.

Parrots have brightly, often gaudily coloured plumage, are monogamous, mostly sociable, and nest in tree holes. They are mainly fruit-eaters, though the kea has in recent years developed a carnivorous propensity. The order includes the cockatoos (Ptyctolophidae), macaws (Conuridae), parakeets (Platyercidae), lorries (Trichoglossidae), the true parrots (Psittacidae), and others. In general use the name parrot is restricted to birds of the family Psittacidae, which are mainly African, and of these the most familiar in the U.K. is the grey parrot (*Psittacus erythacus*), of which large numbers are imported.

The food should be mainly seeds, such as maize, hemp, canary seed, with nuts of all kinds except monkey-nuts; apple, pear, plum, banana; raw carrot, dry biscuit, and a stick of soft wood to cut to pieces. There should always be a good supply of coarse, gritty sand; and two or three times a day the bird should be allowed a drink of water, but a constant supply will be abused. Animal food, even a bone, should never be given. *See* Bird, colour plate; Kaka; Kea; Lory; Macaw; Parakeet; Parrot, colour plate.

Parrot Fish (*Scarus*). Name applied to fish of the family Scaridae, closely allied to the wrasse family, found in tropic seas, one species occurring in the Mediterranean. The teeth are modified to form sharp biting beaks; and this, together with brilliant colouring, has given rise to the popular name. These fish feed upon corals, molluscs, and seaweeds, which they chew in a curious fashion, giving rise to the ancient notion that they were ruminating animals. The Mediterranean species was greatly esteemed for the table by the Greeks and Romans.

Parry. General name of a group of islands in the Arctic Ocean. They are situated N. of Lancaster Sound, Melville Sound, and Barrow Strait, and W. of Baffin Bay. They include Devon, Cornwallis, Bathurst, Melville, and Prince Patrick islands. Named after Sir W. E. Parry, who visited them in his 1819 expedition, they were further explored by the expeditions in search of Sir John Franklin.

Parry Sir (Charles) Hubert (Hastings) (1848-1918). British composer. Born at Bournemouth,

Sir Hubert Parry,
British composer

Feb. 27, 1848, he was educated at Eton and Exeter College, Oxford, and studied music at Stuttgart and in London. In 1883 he was appointed professor of composition and of

musical history at the Royal College of Music, and he became its director in 1895. From 1899 to 1908 he was professor of music at Oxford. He was knighted in 1898 and made a baronet in 1902. He died Oct. 7, 1918. Parry's compositions include symphonies, overtures, and chamber music; several fine oratorios, of which *Judith* and *Job* are best known; and beautiful settings of Milton's *Blest Pair of Sirens*, and Blake's *Jerusalem*. He wrote the *Art of Music*, 1893; *Music of the 17th Century*, 1902; and *J. S. Bach*, 1910. *A Life*, by C. L. Graves, appeared in 1926.

Parry, Sir William Edward (1790-1855). British explorer.

Born at Bath, Dec. 19, 1790, he

entered the navy in 1806, was employed in protecting whalers in Spitsbergen, 1811-13, and five years later accompanied Ross's Arctic expedition. In 1819 he was given command of the *Hecla*, and set sail to find the North-West Passage. Passing through Baffin Bay he made 114° W. During 1821-25 Parry made two other Arctic voyages of discovery, and in 1827 he sailed to Spitsbergen, and there made an attempt to reach the N. Pole by boat and sledge. Surmounting great difficulties, and hampered by the southward drift of the ice, Parry reached 82° 45' N., a record which was unsurpassed for nearly fifty years. Returning in 1829, he was knighted, and later became deputy governor of Greenwich Hospital. He died at Ems, July 8, 1855. His best known works are *Voyages to the North-West Passage*, 1821; *Narrative of an Attempt to Reach the N. Pole in Boats*, 1828. His *Memoirs* were ed. E. Parry, 1857.

Sir W. E. Parry,
British explorer

1 Blue-headed parrot, *Pionus menstruus*, Brazil. 2. Rosella parakeet or parroquet, *Platyercus eximius*, S.E. Australia. 3. Red-shouldered parakeet, *Aprosmictus erythropterus*, Australia. 4. Swainson's lorikeet, *Trichoglossus haematodus*, E. Australia. 5. African grey parrot, *Psittacus erithacus*, W. Africa. 6. Pennant's parakeet, *Platyercus elegans*, S. Australia. 7. Vulturine parrot, *Gypopsitta vulturina*, Brazil.

8 Beautiful parakeet, *Psephotus pulcherrimus*, Australia. 9. Many-coloured parakeet, *Psephotus varius*, S. Australia. 10. Black-tailed parakeet, *Polytelis anthopeplus*, S. Australia. 11. Red-sided lorikeet, *Lorius rufatus*, British New Guinea. 13. Black-capped lory, *Domicella garrula*, N.W. New Guinea.

PARROT: MULTI-COLOURED REPRESENTATIVES FROM THREE CONTINENTS

1. Church of Le Sacré Coeur, Montmartre. 2. Avenue des Champs Élysées, looking towards the Arc de Triomphe de L'Étoile (3). 4. Church of La Madeleine. 5. The Palais du Chaillot now occupying the site of

the former Trocadéro. 6. The Panthéon, built on the site of the tomb of the patron saint of Paris, S. Geneviève. 7. Place de la Concorde, and the Concorde bridge. 8. A familiar boulevard café scene

PARIS: FAMOUS BUILDINGS AND SCENES IN THE FRENCH CAPITAL. See text pp. 6337-41

Parry Sound. Town of Ontario, Canada. On Georgian Bay, at the mouth of the Seguin, it is 150 m. N. of Toronto, on the C.P.R. and C.N.R. Chief industries are planing mills, and making spools and buttons. The surrounding district is noted for pines, hemlock, and hardwoods, and deposits of copper and feldspar. Pop. 5,765.

Parsec. Unit used in astronomy for measuring stellar distances. It is the distance at which the *parallax* (*q.v.*) of a star would be one second of arc. No known star is as close as this, so all stellar distances are represented in parsecs by numbers greater than 1. The nearest, Alpha Centauri, is at a distance of 1.3 parsecs. One parsec equals 3.26 light years or 19.2 million million miles.

Parsees or PARSI (inhabitants of Pars, or Persia). Religious community of India and parts of Persia. In India, where they form a leading section of the native trading classes, they number rather more than 100,000, mostly in Bombay and other places on the W. coast. Their religion, known as Parseism, is the modern form of Zoroastrianism. On the Arab conquest of Persia, in 651, the inhabitants were forcibly converted to Mahomedanism, with the exception of those who fled the country, and a few others whose descendants, numbering about 9,000, maintain their religion in Persia to the present day. Parsees, known, from their regard for fire as an emblem of purity, as fire-worshippers, are also sometimes called Ghebers or Guebers, an Arabic term for unbelievers.

The Parsees of India are the most enterprising and educated native community, and many have devoted their wealth and ability to philanthropic and public ends. Olive-complexioned and black-eyed, they are notable for integrity, benevolence, business acumen, loyalty, and clean living. They expose their dead on iron gratings in towers of silence, where the bones, denuded of flesh by vultures, drop into a pit, and are afterwards removed to a resting-place underground. See India: Zend-Avesta: Zoroastrianism.

Parsifal. Opera by Wagner. Produced at Baireuth in 1882, it is based on Wolfram von Eschenbach's Parzival, a version of the legend of Sir Perceval, in which the story of the Grail is combined with that of the simple, ignorant hero, who attains wisdom through charity and purity of heart. The

opera created a storm of controversy, principally on account of the supposed resemblance of the argument to the life of Christ. It is now accepted as musically one of the greatest operas. See Grail, The Holy: Opera; Perceval.

Parsimony (Lat. *parsimonia*, sparingness). In metaphysics, the law of parsimony deprecates the unnecessary assumption of the existence of anything in order to explain what is admitted to be fact, when such explanation is equally possible without such assumption. In physical and general science the same law asserts that the number of causative factors adduced in the explanation of a phenomenon shall be the smallest possible. This is the doctrine of Ockham (*q.v.*), known as Ockham's razor, that entities should not be multiplied unnecessarily.

Parsing. Exercise in grammar. A group of words, preferably a complete sentence, is taken, and each word is examined as to the part of speech to which it belongs and the relationship it bears to other words in the group. Description should be detailed, *e.g.* a noun is common, proper, or abstract; a verb transitive or intransitive, finite or infinite; an adverb one of time, place, or manner, etc. See Parts of Speech.

Parsley (*Carum petroselinum*). Biennial herb of the family Umbelliferae. It was introduced into Great Britain from Sardinia in 1548, and is used as a seasoning and flavouring in various forms. It succeeds best in a light loam, generally failing to withstand the winter in a heavy or clayey soil. To ensure a succession of crops three sowings of seeds should be made—one in March, another in June, and the third in Aug. in rows

12 ins. apart. When the young plants are 2 ins. in height they may be separated to a distance of about 6 ms. every way, and left until the leaves are ready to cut.

At the end of the second year the crop will be coarse. The old plants should then be eradicated, and a fresh sowing made in a different situation.

Parsley Fern (*Cryptogramma crispa*). Fern of the family Polypodiaceae. Native of Europe, Asia, and Alaska, it forms tufts among the stones in mountainous districts, the fronds springing from a scaly rootstock. The fronds are rather thin in texture, oval-wedge-shaped, bluish green, and much divided like a parsley leaf.

Parsnip (*Pastinaca sativa*). Native British biennial plant of the family Umbelliferae. In its wild state it has no nutritive value, but under cultivation it has developed into a popular edible root vegetable.

Parsley Fern. 'Lux' at the delicate fronds

Parsnip. Edible roots of the vegetable
By courtesy of Sutton & Sons

able, attaining often a length of 2-3 ft. Parsnips flourish in deep, rich loam which has not been freshly manured; the presence of raw stimulant tends to deform and split the roots. The seed should be sown in the open ground in March, in rows a foot apart and an inch deep. The young plants should be thinned to 9 ins. apart every way, and left until Sept. or Oct. The roots are ready to pull when the foliage dies down, but may be left until touched by early frost.

Parson (Med. Lat. *persona*, a representative). Legal title of one who holds a parochial cure of souls. Holy orders, presentation, institution, and induction are necessary to make a man a parson, and as such the owner of the parsonage house, glebe, tithes, and other dues. The term parson properly belongs only to a rector. A vicar had the same parochial responsibility, but did not hold the church property, being merely the deputy of an absent rector. The term is used in a

Parsley. Plant of Dwarf Perfection parsley
By courtesy of Sutton & Sons

popular sense of any minister of religion. See Clergy; Induction.

Parsons, Sir Charles Aiger-
NON (1854-1931). British inven-

tor and engineer. Sixth and youngest son of the 3rd earl of Rosse, a distinguished astronomer, he was born in London June 13, 1854, and was educated at Trinity College, Dublin, and St. John's, Cambridge. After serving an

Sir C. A. Parsons,
British engineer
Russell

engineering apprenticeship with Armstrong, he acquired in 1884 a partnership in the Newcastle firm of Clarke, Chapman and Co., and built his first turbo-generator. In 1889 he founded at Heaton his own works for making turbines and electrical equipment. Besides revolutionising the application of mechanical power, he designed a mercury pump for mass production of incandescent electric lamps.

In 1893, when most engineers dismissed the possibility of mechanical flight, Parsons built a steam-driven helicopter that lifted itself several yards into the air. Two years later he constructed a model monoplane which on its first test rose 20 ft. and flew 80 yds. His auxelophone, for amplifying musical and vocal sounds without the distortion inseparable from reproduction by a mechanical diaphragm, was adopted by Henry Wood and used at Queen's Hall in 1896. Other experiments resulted in diamonds being made by the crystallisation of carbon, and a non-skid device for motor tires.

Parsons was elected F.R.S. in 1898, and in 1902 received the society's Rumford medal. He was president of the Institute of Marine Engineers 1905-06, and of the British Association 1919-20. Created K.C.B. in 1911, he was the first engineer to be awarded the O.M., in 1927. He died on board ship, Feb. 11, 1931. See *Turbine. Consult Life, R. Appleyard, 1933: The Steam Turbine, R. H. Parsons, 1946.*

Parsons or **PERSONS, ROBERT** (1546-1610). English Jesuit. Born at Nether Stowey, Somerset, June 24, 1546, and educated at Oxford, he resigned his fellowship of Balliol in 1574 to escape expulsion, on account of his tendencies to Roman Catholicism. He went to Rome and became a member of the Society of Jesus, July 4, 1575. Henceforth all his energies were

bent on overthrowing the reformed Church in England, which he secretly visited in 1580. In 1587 he was made rector of the English College at Rome, and in 1591 wrote his *Responsio ad Elizabethae edictum*. He died April 18, 1610.

Parsonstown. This name of a town in Offaly, Eire, has been superseded by Birr (*q.v.*).

Part. In music, that portion of a concerted composition which is allotted to any component voice or instrument. Thus there are four parts in the ordinary hymn-tune: for soprano, alto, tenor, and bass. By analogy, contrapuntal music, such as fugues, etc., which are derived from vocal forms, is also said to be in parts, even though it is performed upon a single instrument, as the pianoforte. A part song is an unaccompanied song harmonised in three or more parts.

In medieval times composers of vocal music did not write their work in score (*q.v.*) but in separate "part books," usually one for each part. Alternatively, the separate parts were displayed side by side on the double page of a book, so that singers of the different parts could use the same book, and sometimes so that singers of different parts could read the music from opposite sides of a table.

Partabgarh. Former state of India, now part of Rajasthan. To the N.W. the hills are peopled chiefly by Bhils; elsewhere is open country with no large rivers. There is a trade in grain and locally made cloth. The town of the same name is 120 m. N.W. of Indore and is noted for its enamelled work. Area of former state, 873 sq. m. Pop., state, 91,967; town, 11,000.

Partabgarh. District of the Uttar union, India, in the Fyzabad division. It lies N. of Allahabad dist., with the Ganges in the S.W. Annual rainfall is 38 ins. The chief crops are rice, wheat, barley, and millet. The capital is Bela, sometimes known as Partabgarh. Area of dist. 1,457 sq. m. Pop., dist., 1,041,024; town, 7,500.

Partenkirchen. Bavarian winter resort, described under Garmisch-Partenkirchen.

Parthenogenesis (Gr. *parthenos*, virgin; *genesis*, generation). Biological term expressing the development of an organism from an egg cell which has not been fertilised. Some animal species, e.g. many gall flies and saw flies, consist of females only; in others males appear infrequently. Among aphids (plant lice) parthenogenesis

is common and, often accompanied by vivipary, leads to rapid multiplication of females during spring and summer. Males are usually produced later on to fertilise the last eggs of the season, which pass the winter as such and develop into viviparous parthenogenetic females the following spring. Other instances are known among rotifers and crustaceans and among plants.

Reduced or haploid parthenogenesis occurs when development is from an unfertilised egg the nucleus of which contains the gametic number of chromosomes. In bees and some other insects such eggs produce males. The occasional appearance of haploid plants of a kind normally diploid suggests that they have arisen from haploid egg cells. Unreduced or diploid parthenogenesis is more common in plants; it takes place when as a result of aberrations in sporocyte divisions an egg cell is formed with the sporophytic number of chromosomes.

Parthenon, THE (Gr., virgin's chamber). Temple of Athena, on the Acropolis, Athens. It was built between 447 and 438 B.C., and was opened on the occasion of the Panathenaic festival in the latter year; the cult of Athena having been previously practised in an older temple on the Acropolis, near the site of the Parthenon itself. The architects were Ictinus and Callicrates, and the structure, which is of the Doric order, consisted entirely of Pentelic marble. In plan the Parthenon is a parallelogram, the cella or nave, 194 ft. long, being divided into two main parts—the Hekatompedos to the E., where Pheidias's great statue was placed, and the Opisthodomos to the W., where the offerings were made. There were eight outside columns at each end, and 17 on each side. The portico at either end was double, i.e. there was an inner line of six columns behind the outer line of eight. Strictly speaking, the Opisthodomos, where the virgin priestess received the offerings, was the Parthenon proper.

Architecturally the Parthenon is the crowning instance of the subtlety involved in the apparent simplicity of Greek construction. Penrose discovered that the horizontal lines are imperceptibly curved, and that the perpendicular lines incline very slightly towards the centre of the temple. The apparently flat floor is slightly higher towards the centre than at the

Parthenon, Athens. Ruins of the ancient temple of Athena, from the north-west

edges; the columns not only taper towards the summit, but are of greater girth at the centre than they are at the base. Little variations of height and thickness occur in the corner columns, according to the intensity of the light that fell upon them, and the fluting is studied with an eye to its relationship with the light.

The chief glory of the Parthenon was the decorative sculpture by Pheidias (*q.v.*) and his school. Of the metopes (*q.v.*) attributed to them, there were originally 92, 41 of which remain in their place, the bulk of the remainder being in the British Museum. The subjects, including combats between Centaurs and Lapithae, and Greeks and Amazons, are treated in high relief. The group of statuary on the eastern pediment represents the birth of Athena; that on the western, the contest between Athena and Poseidon for the possession of Attica. Finally, the continuous frieze round the cella, representing the Panathenaic festival, ranks as the most wonderful pictorial representation in low relief in the world, as regards both scale and treatment. In contrast to the gleaming white marble columns and roof of the Parthenon, the sculptures and mouldings were enriched with colour. With the exception of the inside sculptures, the Parthenon remained nearly intact till 1687, when the explosion by a Venetian bomb of a powder magazine stored here by the Turks dislodged much of its splendid masonry. See *Acropolis*, also col. plate; Art; Athens; Centaur, Elgin Marbles.

Parthenopaeian Republic. Republican state formed at Naples, 1799-1800. The name is taken from Parthenopis, the old name of Naples. Established under French auspices, Jan. 23, 1799, after the flight of Ferdinand IV the republic was in the hands of patriotic and cultured men who endeavoured to establish a model state run on elevated but quite impracticable lines. Championnet, the French general, did little to help.

When Cardinal Ruffo, commissioned by Ferdinand to re-establish the Bourbon rule, marched up through Calabria with his army of brigands and liberated convicts, the French withdrew, and after a desperate but hopeless encounter, the republicans were defeated at Ponte della Maddalena, Ruffo and his cut-throats entering and sacking Naples, June 13, 1800. An armistice was signed between Ruffo and the republican authorities, which Nelson ignored on his arrival. He arrested and hanged Caracciolo (*q.v.*), and other leaders of the republic, which thus ended in treachery and bloodshed. See Naples.

Parthia. County of ancient Asia. It lay S.E. of the Caspian Sea, and adjoined Media on its W. and N.W. border. It formed a part of the old Persian or Achaemenid empire, and when that empire was overthrown by Alexander the Great, and split up among his successors, was included in the dominion of the Seleucid kings of Syria. About 250 B.C. it

became an independent kingdom under Arsaces I, founder of the Arsacid dynasty. During the succeeding centuries it increased enormously in size and importance, and under Mithradates I (170-138 B.C.) became the Parthian empire, stretching at its greatest extent from the Euphrates to beyond the Indus. Even the all-conquering Romans could make no real headway against this great Eastern power.

Of nomadic Scythian origin, though gradually absorbed by the Persians, the Parthians relied on their formidable mounted bowmen. They promoted Greek civilization, and made Ctésiphon their capital. They overthrew Crassus (*q.v.*) at Carrhae (Haran) in 53 B.C., conquered Syria, 40-38, and were again intermittently at war with Rome with varying success from A.D. 115 to 218. In 226 Parthia was conquered by the Persian, Ardashir I, and absorbed in the rehabilitated Persian empire.

Parthian Shot. Decisive remark by a person supposed to be defeated in an argument. The term originated in a military tactic frequently practised by the Parthians. When the tide of battle appeared to go against them, they would pretend to retreat by galloping away from the enemy; then turning in their saddles, they would discharge their arrows against their pursuers, so throwing them into confusion.

Partick. Dist. of Glasgow, Scotland, formerly a separate burgh. It is situated where the Clyde is joined by its tributary, the Kelvin, which separates it from Glasgow proper. It is in the main an industrial area, with engineering works, shipbuilding yards, etc. In 1912 it was absorbed into Glasgow. Before the industrial developments of the 19th century, Partick was a village at which the bishop of Glasgow had a palace.

Partinico. Town of Sicily, in the prov. of Palermo. It stands on the coastal rly., about midway between Castellamare and Palermo, 15 m. direct W.S.W. of the latter city. It manufactures silken and woollen goods, and trades in wine and oil. Pop. 23,900.

Partisan. Adherent of a party or cause who follows his leader with unflinching devotion. The term is also applied to guerrilla troops who harry an enemy army in occupation of their country. In the Second Great War partisans operated in most German- and Italian-occupied territories and

compelled the enemy to maintain there large numbers of troops urgently required on the military fronts. A partisan was also the name of a long-handled weapon resembling a halberd, used in the 14th and 15th cents. See *Guerrilla Warfare*.

Partition. In law, the actual division, by metes and bounds, of real property which belongs to co-owners. After the Partition Acts of 1868 and 1876 the court could instead order the land to be sold and the proceeds divided. Since the Law of Property Act, 1925, land belonging to co-owners has been held on trust for sale. Partition can take place by the trustees with consent of the co-owners or by order of the court.

Partnership. Defined by the Partnership Act, 1890, as "the relation which subsists between two or more persons carrying on a business in common with a view to profit." Thus there are excluded mere joint ownership of property and the mere association of persons with a common object but not with a view to profit, e.g. a social club, or a philanthropic society. The great characteristic of partnership is that every partner is agent for the firm as a whole.

The law of Scotland differs from the law of England. In Scotland a firm is a separate legal person, just as a limited liability company or corporation is. In England "there is no such thing, in law, as a firm." A partnership firm is merely a convenient way of describing the individuals who compose the firm; and the rights of a creditor are against these individuals, so that he can sue them individually and issue execution against their private estate. In England also all partnership debts are joint. In Scotland partnership debts are joint and several.

As between partners the rights and duties and powers are governed by *articles of partnership*; but these may be varied from time to time by practice, or verbally. A partnership comes to an end by effluxion of time, agreement to dissolve, decree of dissolution, or death of a partner. See *Business Names*.

Partridge. A game bird of which two species occur in Great Britain. The common or grey partridge (*Perdix perdix*) is found throughout Great Britain and Europe, but the French or red-legged species (*Alectoris rufa*) is a native of S. Europe, and was introduced into Great Britain about the close of the 18th century.

Partridge. Common British hen partridge, with a brood of chicks

The French bird is distinguished by its more handsome plumage and bright red legs and beak, and has now become common in England, preferring sandy soil and uncultivated land, as distinct from the grey partridge, which thrives best on rich soil and amid cultivated fields. The French bird is more fleet of foot and difficult to approach than the grey partridge.

Partridges are found in coveys of from five to twenty birds, except in the nesting season, feeding upon insects, leaves, grain and other seeds early in the morning and in the afternoon. During the heat of the day they bask in the sun and take frequent dust baths. At night the covey roosts in a circle in the middle of an open field, each bird facing outwards as a precaution against enemies. The nest is made of grass and leaves placed in a hollow in the earth under a hedge or among the standing corn, and may contain up to 20 eggs.

In Great Britain the partridge shooting season as fixed by the Game Act is from Sept. 1 to Feb. 1 inclusive. The birds are either driven towards the guns or shot over dogs. In large open fields the former is the more usual plan, beaters raising the birds and then driving them towards the guns arranged in line in the form of an arc of a circle. In small fields and broken country walking up the birds over dogs is the better plan, pointers and retrievers being the best dogs. See *Eggs col. plate*; *Game*; *Game Laws*; *Shooting*.

Partridge, Sir BERNARD (1861-1945). British cartoonist. Born in London, Oct. 11, 1861, he was educated at Stonyhurst, and became a stained glass designer and decorative painter. He became a contributor to *Punch* in 1891, was junior cartoonist under Sam-
Sir Bernard Partridge

and eventually (1910) chief cartoonist, making over 2,400 black-and-white drawings. He excelled in the heroic, monumental style and his drawings were unrivalled for facial expression; and his sense of the occasion made his cartoons world-famous, especially during the First Great War, e.g. Unconquerable, depicting the German Kaiser and Albert of the Belgians. Another well-known cartoon showed S. George defending Malta against the dragon in the Second Great War. Knighted 1925, Partridge died Aug. 9, 1945.

Partridge

Berry. Popular name for *Mitchellarepens*, a small trailing evergreen herb belonging to the family Rubiaceae. It has simple leaves, pairs of fragrant white flowers, and red berries. N. America is its home.

The name is also given to a shrub, *Gaultheria procumbens*, of the family Ericaceae.

Partridge Wood (*Andira inermis*) OR CABBAGE TREE. Evergreen tree of the family Leguminosae. It is a native of Jamaica. The alternate leaves are broken into about a dozen oval-lance-shaped leaflets in two rows. It has clustered purple flowers and roundish fleshy pods. The name is also applied to the wood of *Heisteria coccinea*, a W. Indian tree of the family Olacaceae.

Parts of Speech. In grammar, the name given to the different classes of words, the members of which play a special and well-defined part in the sentence. They are generally reckoned as eight in number: adjective, adverb, conjunction, interjection, noun, preposition, pronoun, verb. See *Grammar*; *Parsing*; *Noun*, etc.

Part-song. This style of composition is mentioned under *Part*.

Party. In politics, a body of persons holding the same political opinions and usually opposed by one or more parties holding other opinions. Government by party is the normal condition of things in all countries where popular representation is established. In a different sense the phrase applies where there is only one official party. The word is also used for those who hold similar views on religious or

Partridge Berry. Leaves and flowers with trailing roots

other matters, e.g. a party in the Church of England, and in a more general sense for a body of persons banded together in some common purpose, as a pleasure party. In law, party is a synonym for a litigant, or a person entering into an agreement. See Conservative; Democrat; Labour; Left; Liberal; Republican, etc.

Party-Wall. Wall separating one house from another. The term is, however, often applied to a wall or fence separating the land of one owner from that of another. Before the Law of Property Act, 1925, party-walls usually belonged to both owners as tenants in common; now the wall is usually regarded as divided vertically into two, each owner having half.

Pas (Fr., step). Word adopted in English for certain dances particularised by other French words indicating the number of performers engaged. Thus a *pas seul* is an exhibition of the art of dancing given by a single virtuoso; a *pas de deux*, of *trois*, or *de quatre*, a similar spectacular display by two, three, or four dancers.

Precedence is another sense in which there is good authority for the use of the word *pas* in English, to have the *pas* of anyone signifying the right of going before him on ceremonial occasions. *Faux pas*, a false step or trip, is an accepted term for a social solecism. See Ballet; Dancing; Russian Ballet.

Pasadena. City of California, U.S.A., in Los Angeles co. It is 9 m. N.E. of Los Angeles in the foothills of Sierra Madre Mts., at the head of San Gabriel Valley, and is served by rlys. A residential city and winter resort, it lies in a fruit farming area. At San Marino are the Henry E. Huntington library and art gallery, and botanical gardens. The library contains one of the world's finest collections of MSS. and rare books. The Rose Bowl, a sports stadium in a dry cañon, seats 86,000. Mt. Wilson (q.v.) lies 5 m. N.E. First settled by the Spanish in 1771, Pasadena was a centre of sheep ranches until fruit growers from Indiana arrived in 1873. It was incorporated in 1886. Pop. 81,864.

Pasargadae OR PASARGADA. City of ancient Persia. Situated in the plain now called Mughab, it was established as the capital of Persia by Cyrus the Great until it gave place to Persepolis. The tomb of Cyrus has been identified.

Pascal, BLAISE (1623-62). French philosopher, theologian, and mathematician. Member of an aristocratic Auvergnat family,

he was born at Clermont-Ferrand, June 19, 1623, and educated by his father. As a boy he revealed a

Blaise Pascal,
French philosopher

precocious genius for mathematics; he wrote on sound at 12, invented a calculating machine, and, before the family moved to Rouen in 1641, had completed a work on conic sections which laid the foundations of modern methods. At Rouen he met Corneille and Descartes and—which proved of more significance—a number of Jansenists. His sister Jacqueline was attracted to the convent at Port Royal and wished to enter it. Blaise, who often visited the place with her, encouraged her in this course. To prevent such a happening, their father sent them both to Paris in 1650, but on his death in 1651, Jacqueline at once entered Port Royal. Blaise remained in Paris until 1654, and it is impossible to discover accurately what influences persuaded him that year to embrace a monastic life.

His life at Port Royal was uneventful; he continued his work on mathematics and science. An attack being made by the Jesuits on Antoine Arnauld, the leading teacher there, Pascal was entrusted with the task of answering it. To this fact we owe the *Lettres Provinciales*, 18 letters published anonymously in 1656. Ironical masterpieces, they established Pascal's reputation as one of the greatest stylists in French literature. He was the first to state clearly the nature of the conflict between reason and religion. He divested of pedantry the problems of metaphysics. His affection for the theory of probabilities doubtless underlay his challenge: "Either God exists or He does not; if He does, and you deny Him, you are lost. If He does not, and you affirm Him, no matter." Deeper was his vision of man as a monster linked with two immensities—the wretchedness of despair, and the certainty of a brighter destiny.

At Port Royal he worked at his *Pensées*, a projected apologia of Christianity, but disease made rapid progress, and, being moved to the Paris house of Mme. Périer, his eldest sister, he died there. Aug. 19, 1662. The *Pensées sur la Religion et sur Quelques Autres Sujets* were unfinished, and

not until 1844 was a reliable edition compiled by A. P. Faugère. Pascal's influence on mathematics and science has been profound, particularly his study of barometric pressure. Work on the cycloid, in which he solved problems that had baffled Galileo, Descartes, and Fermat, entitles him to a high place among those who evolved the differential calculus. He can claim to have founded the science of hydrodynamics and, with Fermat, the theory of probability.

Bibliography. Works, A. P. Faugère, 8 vols., 1886-95; L. Brunschwig, 14 vols., 1904-14; Lives (in French), V. Cousin, 5th ed. 1857; J. Bertrand, 1891; E. Boutroux, 1900; V. Giraud, 1905; J. Chevalier, 1930; (in English) Viscount St. Cyres, 1909; H. R. Jordan, 1909; M. Duclaux, 1927; R. Soltan, 1928; M. Bishop, 1937; The Secret of Pascal, H. F. Stewart, 1941.

Paschal. Name of two popes and one anti-pope. Paschal I was pope from 817-24. Paschal II, a Benedictine monk, reigned from 1099 to 1118. Overpowered and imprisoned by the emperor Henry V, he yielded the right of investiture, which his predecessors had refused to allow. He died Jan. 21, 1118. Paschal III was anti-pope in the reign of Alexander III, during 1164-68.

Pasco OR CERRO DE PASCO. Mountain group of Peru, in the dept. of Junin. The mountain systems of Peru form a knot in the neighbourhood of the town of Cerro de Pasco (q.v.). See Andes.

Pasco. Dept. of Peru of which the full name is Cerro de Pasco. It is about 14,000 ft. above sea level, and is connected with Oroya by the Central rly. Good roads run to Lima, Cuzco, and Huanuco. Here are some of the greatest copper and silver mines in S. America. The principal town, Cerro de Pasco, has est. pop. 20,000.

Pas-de-Calais (Fr. name for the Strait of Dover). Department of France. Situated in the extreme N., bounded by Nord and Somme depts., it covers 2,606 sq. m., has a coast on the English Channel, and is mainly a fertile plain with some low ranges of hills. The chief rivers are the Lys and the Scarpe. Wheat, oats, potatoes, and other crops are grown; horses, cattle, and poultry are reared. Coal is mined, and there is a considerable fishing industry. For conveying the coal the dept. has a complete network of canals. Arras is the capital, and in the department are Calais,

Boulogne, Lens, St. Omer, Wimereux, and Agincourt. A region of drained fenland called the Wattergands is famous for its market gardens. Pop. 1,168,545.

Containing Arras, Loos, and Béthune, this dept. saw some of the most stubborn fighting in the First Great War. Here, too, in the part of France nearest the British Isles, the Germans erected launching sites for their flying bombs in 1944, so that the dept. came in for heavy Allied bombing. Even after the invasion of Normandy the German high command thought that a second, probably larger, landing would be made in Pas-de-Calais, and held reserves there. British and Canadian forces cleared Pas-de-Calais Sept. 1 and 2, 1944, except for Calais, where the German garrison held out until midnight, Sept. 30-Oct. 1.

Pasha. Turkish title given to governors of provinces, high military and naval officers, and others. The rank of pashas was formerly indicated by horse tails carried as standards, three denoting the highest grade, two the middle, and one the lowest. Bashaw is an early English form of the word.

Pasque Flower (*Anemone pulsatilla*). Perennial herb of the family Ranunculaceae. A native of Europe and N. Asia, it has a woody rootstock, and leaves very much divided into narrow segments. The dull purple, silky, solitary flowers are supported on stout erect stalks. The seeds have feathery tails $1\frac{1}{2}$ in. long. The folk-name, from Lat. *Pascha*, Easter, is due to the fact that Easter eggs were often stained by rubbing them with the flowers.

Pasquinade. Abusive personal lampoon, or satire. The name is derived from a 15th century cobbler of Rome, Pasquino, famous for his sarcasms. After his death a statue found near his stall was given the name of Pasquino, and to it wits secretly affixed their lampoons on public persons. Thus the lampoons themselves came to be termed pasquinades.

Pass. Low part of a water-parting or divide. Passes generally owe their origin to denudation produced by two streams, which rise close together but on opposite sides of the divide. Sometimes they occur where a river has breached a mountain range. They are of great economic value, since routes connecting the opposite sides of the divide will cross them, or rivers will tunnel below them, as in the examples of the St. Gotthard Pass

in the Alps, and Uspallata or Cumbre Pass in the S. Andes. See Carso.

Passacaglia. Old stately dance, probably of Spanish origin (*pasar*, to walk; *calle*, a street). The dances were one or two in number. The music was constructed over a ground bass in triple time, a feature which led composers to adopt it as a medium for displaying their fertility in devising variations. It was thus very much like the chaconne (*g.v.*), though in the passacaglia the theme might appear in any part. A celebrated example is Bach's passacaglia in C minor for the organ.

Passaglia, CARLO (1812-87). Italian theologian. He was born at Lucca, May 2, 1812, joined the Jesuits at fifteen, became in 1844 a professor at the Collegio Romano, and was in favour with Pope Pius IX. His championship of Italian unity and opposition to the temporal power of the pope led to his expulsion from the Jesuit Society, and he settled at Turin, where the king made him professor of moral philosophy. In 1861 he became a

Pasque Flower. Blooms of the species of *anemone*, formerly used for colouring Easter eggs

member of the Italian parliament, and editor of *Il Mediatore*. Excommunicated in 1862, he died March 12, 1887.

Passaic. River of New Jersey, U.S.A. It winds first in a N.E. direction, and at Paterson turns S. to enter Newark Bay between Jersey City and Newark. At Paterson it makes a sheer descent of 50 ft. It is 98 m. long and navigable for about 10 m. to Passaic city.

Passaic. City of New Jersey, U.S.A., in Passaic co. It stands on the Passaic R., at the head of navigation, 9 m. above Newark and 4 m. below Paterson, and 10 m. N.W. of New York. The state's leading textile manufacturing and processing centre, it produces woollens and worsteds, cotton and linen

goods. Other industrial products include chemicals, dyes, mill machinery, boxes, and biscuits. Settled about 1676 by the Dutch, Passaic was incorporated in 1869 and became a city in 1873. Washington crossed the Passaic here in the retreat of 1776. Pop. 61,394.

Passamaquoddy Bay. Inlet on the E. coast of N. America. An arm of the Bay of Fundy, between the state of Maine, U.S.A., and the province of New Brunswick, Canada, it is 12 m. long and 6 m. wide, and forms a fine harbour, protected by a group of islands. Among the rivers flowing to the bay is the St. Croix. The bay is named from an Algonquin tribe.

Passant. In heraldry, an animal walking past in profile, with its dexter paw elevated. If its head faces the spectator it is passant guardant, and if looking back over its shoulder passant regardant. See Guardant; Regardant.

Passaro. Cape of Sicily. It forms the S.E. corner of the island and is a low, rocky projection on the E. side of the small bay of Porto Palo. Here Admiral Byng gained a naval victory over the Spanish fleet on Aug. 31, 1718. Near here Canadian troops landed July 10, 1943, the day the Allies invaded Sicily during the Second Great War.

Passarowitz OR POZAREVAC. Town of Yugoslavia. It lies near the Morava river, 37 m. E.S.E. of Belgrade, and has considerable agricultural trade, and agricultural schools, being a centre of a rich stock raising and corn growing country. The treaty of Passarowitz, signed on July 21, 1718, by Austria, Venice, and Turkey, with England and the Netherlands as mediators, assigned Moravia to the Turks, but gave Austria the Temesvar, Wallachia as far as the Aluta, Belgrade, and other parts of Serbia. See Turkey.

Passau. Town of Bavaria, Germany. It lies on the Danube, here joined by the Inn and Ilz, 92 m. E.N.E. of Munich. It has been called one of the most beautiful towns in Germany, built on the slopes of a hill 1,000 ft. high. The cathedral of S. Stephen dates in part from the 6th or 7th century, and other old buildings include the Gothic hospital church (1345), the Baroque S. Paul's (1618), and the town hall (14th century). Originally a Celtic settlement (Bojodrum), it was later renamed Batava, and was the site of a 1st-century Roman fortress. The scene of a bishopric from 739, it was a clerical principality from the

end of the 12th to the beginning of the 19th century. Partly in the possession of the Grand Duke of Toscana from 1803 to 1805, it became Bavarian in the latter year. Industries in the 20th century have included the manufacture of porcelain and pottery, brewing, and some linen-weaving. It was captured by armour of the U.S. 3rd army, May 3, 1945, and at the end of the war came within the American zone of occupation. Pop. (1950) 35,000.

Passau, TREATY OF. Agreement to conclude hostilities between Roman Catholics and Lutherans, 1552. Signed by Maurice, elector of Saxony, the Lutheran champion, and Ferdinand, king of the Romans, on behalf of the emperor Charles V, its principal clauses provided for holding a diet to consider how best to prevent future religious warfare. It decreed that if the conference should prove abortive, peace should be continued; and gave free exercise of religion to both Protestants and Roman Catholics. See Augsburg, Peace of.

Passchendaele. Village and ridge of Belgium in the prov. of W. Flanders. The former is $7\frac{1}{2}$ m. N.E. of Ypres. The ridge, 200 ft. in alt., extends from Gheluvelt on the S. to the forest of Houthulst in the N., about 18 m., and is the last elevation before the Flanders plain is reached. From the village, on the ridge, Bruges and Ostend can be seen in clear weather.

Passchendaele became notorious in the First Great War as giving its name in common parlance to a prolonged and terrible battle between British and Germans officially known as the 3rd battle of Ypres. It was a British offensive battle, lasting from July 31 to the end of Nov., 1917. The offensive had been prepared by Haig for almost a year beforehand, and was agreed to, with some misgivings, by the British war cabinet in June, 1917. Its declared minimum object was the clearing of the Flanders coast and the German submarine bases, but the British H.Q. staff were optimistic enough to believe that it might lead to a complete break-through, with the employment of "masses"

Passau. The beautiful Bavarian town at the confluence of the river Inn, left, and the Danube

of cavalry in clearing the German forces out of Belgium.

The first objective was the capture of the entire length of Passchendaele Ridge as a jumping-off place. The first attack was delivered by the 5th army (Gough) with the 2nd army (Plumer) on the right and the 1st French army on the left. The British 4th army (Rawlinson) was moved to the coast ready for an advance on that quarter.

The battlefield selected was a reclaimed swamp. Tanks were to be used in force, in spite of protests from the Tank Corps that the terrain was entirely unsuitable. The evidence of weather reports for the district over 80 years also showed that the offensive was badly timed, but the risk was taken. The generals in command expressed serious misgivings about the success of the venture, but did their best to carry out their orders. Foch and Pétain were also opposed to the offensive, their preference being for a period of limited Allied offensives pending the arrival of the promised U.S. armies in 1918.

The attack was preceded by 24 days of violent bombardment which shattered the drainage system of the swampy region. On the opening day of the attack there was a heavy storm. Gough's infantry began the advance at 3.50 a.m., but most of the tanks were soon ditched. German defences were captured on the left, but on the right there were heavy casualties and little progress was made in the bad weather. Gough foresaw the danger of forming a salient within the range of German artillery on hills to his right, and asked for help from the 2nd army in clearing those hills; but the help was not sent for several weeks. Meanwhile the farther the 5th

army advanced on the right the heavier were the casualties.

After a week of steady rain which reduced the battlefield to an appalling condition, a further British attack was made on Aug. 16, E. and N.E. of Ypres, with limited success. The rainfall proved to be far above the average for the time of year, but even had it been below average, the destruction of the drainage system would have made the ground a quagmire. Hundreds of unwounded men and thousands of wounded lost their lives by drowning in the yellow slime of shell craters. Duckboard walks and other tracks were under constant fire. The Germans used mustard-gas shells on a heavy scale, and employed machine-gun fire from low-flying aeroplanes.

Further costly assaults were made, again with some success, on Sept. 26, Oct. 4, and Oct. 9. A further attack on Oct. 12 coincided with the return of violent rain, and brought trifling result and heavy loss. A large-scale attack planned for Oct. 20 was also frustrated by heavy rain, Gheluvelt being taken and lost because British rifles were choked with slime. Finally on Nov. 6, again in a downpour, Canadians fought their way through the swamps into Passchendaele village. After this the offensive gradually petered out.

Results of the Battle

Over 25,000 shells were used in the British bombardment. Ludendorff admitted later that until mid-September the persistence of the attack, with its reckless disregard of casualties, was not without its impression on the German army; after that date there was a change in German tactics, by which they left unoccupied a considerable zone in front of their main line and thereby reduced casualties. Total British casualties amounted to nearly 400,000 (including 17,000 officers). German casualties on the whole front opposite to the British from July 31-Dec. 31 were less than 300,000. Ten weeks' fighting had brought Haig about one sixth of his first objective, five miles only of the 18 m. ridge. The new British line formed a narrow and dangerous salient; and all the ground was lost in the German advance of the following April. Moreover, the damage to British morale was serious. The army had been ordered to achieve the impossible, and there was a diminution of confidence in leadership.

There has been considerable controversy in the attempt to fix

the responsibility, first for launching, then for continuing the battle. Sir W. Robertson, as C.I.G.S., accepted responsibility, while blaming the shortcomings of staff intelligence reports. Undoubtedly there was an inclination at G.H.Q. to override the advice of the men on the spot, and to discredit their views as exaggerating the facts. Gough advised the abandonment of the offensive in mid-August, but Haig was still optimistic at the end of Sept., hoping that with improving weather the cavalry could be utilised even sooner than originally thought. The war cabinet hesitated to override the views of their military strategists, even if they had been given all the facts, which they were not. Support had been given to the original plan only on condition that the offensive would be abandoned at once if it became clear that it would not succeed. Lloyd George advised abandonment in mid-Aug. and again in Oct., but Robertson supported Haig in an optimistic view. To have overridden G.H.Q. would have entailed the dismissal of both Haig and Robertson, a step that would have seriously disturbed public morale at home, especially as the press was reporting each costly, painful advance as a great British victory. A further consideration, by which Haig and Robertson set great store, was that Jellicoe, as first sea lord, had said that unless the Flanders submarine bases were cleared before the end of the year, the whole British war effort would be jeopardised.

This most terrible, costly, and futile battle of all time left a lesson which was not forgotten. Its warning and its bitter memory probably played an indirect part in contributing to the relatively small British casualty lists of the Second Great War. *Consult War Memories, D. Lloyd George, 1933-36 (Chap. LXIII); also Soldiers and Statesmen, Sir W. Robertson, 1926; Field Marshal Earl Haig, Brig.-Gen. J. Charteris, 1929.*

Gordon Stowell

Passenger Pigeon (*Ectopistes migratoria*). Species of pigeon found in N. America, notable for its long wings and long, narrow tail. It formerly occurred in vast flocks, and at its nesting sites every tree for many miles was laden with the nests. It was largely shot for the table, and in one year 15,000,000 birds were procured in Michigan and Pennsylvania. It almost disappeared in 1888 and is now extinct, the last known survivor dying in the

zoological gardens at Cincinnati, in 1914. *See Pigeon.*

Passe-partout (Fr., passes everywhere). Term used in English as well as in French, both literally and figuratively, in the sense of an expedient for obviating difficulties. Thus it is applied to a master-key, i.e. to a key which opens a series of locks, the subordinate keys opening only one lock each; to an adjustable picture frame or mount; to strips of adhesive paper for the easy mounting of pictures or photographs; and, in printing and engraving, to a stock border which may be used with different centres.

Passepied or **TRIHORS**, also corrupted in English as Paspy, or passy-measure. An old dance of Breton origin, a variety of the Branle, in which dancers imitated shepherds, laundresses, etc., it was brought to Paris before 1600 and remained popular for nearly 200 years. The French ballets of the 17th and 18th centuries contain many examples. The music is in triple time, similar to that of the minuet, but much quicker.

Passeriformes, **PASSERINE** OR **PERCHING BIRDS**. Order of birds, distinguished by the presence of four toes, three in front and one behind, a certain type of palate, and the habit of constructing elaborate and finished nests, etc. The section includes the finches, warblers, thrushes, crows, swallows, shrikes, etc., numbering thousands of species and more than half the existing birds. They are named after *passer*, Latin for sparrow, a member of the order.

Passfield, SIDNEY JAMES WEBB, 1ST BARON (1859-1947). English sociologist. Born in London, July 13, 1859, he entered the civil service in 1878. In 1891 he resigned to devote himself to municipal politics, and the next

year was elected to the L.C.C., of which he was a member for eighteen years. A leading authority on economics, sociology, and municipal affairs, he helped to found the London School of Economics, of which he was professor of public administration,

Lord and Lady Passfield, British sociologists. Lady Passfield continued to be known as Mrs. Sidney Webb up to her death in 1943

1912-27. An original member of the Fabian society, he served on many commissions and committees, and was responsible for the minority report of the poor law commission of 1909, which deeply influenced legislation. He founded the New Statesman in 1913. In 1922 he was elected to parliament as Labour member for Seaham, and in 1929 was created a baron. He was president of the board of trade in the Labour administration of 1924, secretary for the dominions, 1929-30, and for the colonies, 1929-31. He was awarded the O.M. in 1944, and died Oct. 13, 1947.

A prolific writer on sociology, his publications included *Socialism in England*, 1890; *The London Programme*, 1892; *Towards Social Democracy?*, 1916; *Story of the Durham Miners*, 1921; and in conjunction with his wife (v.i.) *The History of Trade Unionism*, 1894; *Industrial Democracy*, 1897; a series of studies of *English Local Government*, 1908-22; *The State and the Doctor*, 1910; *A Constitution for the Socialist Commonwealth of Great Britain*, 1920; *English Poor Law History*, 3 vols., 1927-29; *Soviet Communism: a New Civilization?* 1935; *The Truth About Soviet Russia*, 1942.

In 1892 Webb married Beatrice Potter (1858-1943), an associate in the Fabian society, joint author of the minority report of the poor law commission, and a sociologist in her own right. The Webbs were among the mainstays of the Labour movement. After Sidney Webb's elevation to the peerage, his wife expressed her desire to continue to be known as Mrs. Webb. Besides collaborating with her husband, she wrote *My Apprenticeship*.

Passenger Pigeon. Extinct species formerly common in N. America

ship, 1926; Our Partnership, 1948. She died April 30, 1943.

Passifloraceae. Family of trees, shrubs, and herbs sometimes called the Passion flower family. They are natives of tropical and sub-tropical regions, especially of S. America. They have mostly alternate leaves and showy, regular flowers. The fruit is a many-seeded berry or capsule, in some species edible.

Passion Flower foliage and bloom.

Passing Bell. Name given to the solemn tolling of a bell, usually of a parish church, at the death or "passing" of a parishioner. The tolling customarily opens with a single note for a man, two for a woman, three for a child.

Passing of the Third Floor Back, THE. Morality play, written by Jerome K. Jerome. It was produced Sept. 1, 1908, at the St. James's Theatre, London. The story tells how "the stranger," an incarnation of Christian influence, appears in a Bloomsbury boarding-house and transforms the characters of all the inhabitants. Sir Johnston Forbes-Robertson played the leading part, the stranger. Although somewhat dated in its detail as well as its style, the play has been kept alive by repertory and amateur performances.

Passion, THE. Term used in a religious sense for the sufferings and Crucifixion of Jesus Christ. It early became a custom in the Church to recite the story of the Passion as told in the Gospels, the narrative portion being sung to Gregorian tones by a tenor, while individual speeches were allotted to other selected voices and the answers of the crowd were sung by a chorus. These musical compositions were known as Passion music.

Among the earliest composers to produce definite Passions in this form were the Spaniard Tom-masso Ludovico da Victoria (1540-1613) and the Italian Francisco Soriano (b. 1549). A little later the German Heinrich Schütz (1585-1672) wrote four Passions and the Story of the Resurrection of Christ. Another German, R. Keiser (1673-1739), introduced the chorale. German genius, profoundly influenced by the Reformation, was particularly sensitive to this form of music, and in the hands of J. S. Bach Passion music attained its highest development. Elsewhere it was gradually modi-

fied and assumed the form of oratorio (*q.v.*).

Passion Flower (*Passiflora*). Large genus of climbing herbs and shrubs of the family Passifloraceae,

natives chiefly of the warmer parts of America. They have variously lobed or undivided leaves, mostly alternate, and stout tendrils by which they climb. The flowers, which are of remarkable structure, are often large and showy, coloured blue, purple, red,

white, or yellow. The cup-shaped receptacle bears 4-5 sepals, an equal number of petals, and a corona of very many spreading filaments. The sexual organs are borne above the corona on an organ known as the gynophore; there are 4-5 spreading stamens with large anthers, and above them is the ovary supporting the clubbed styles. The name (*flos passionis*) is due to the fact that the early Jesuits, with a little straining of the facts, saw in the flower numerous emblems of the Crucifixion.

Passion Fruit. Fruit of the granadilla species of the passion flower (*v.s.*). It is about 2 ins. in diameter, containing within a hard, shrivelled, stringy shell a gelatinous pale yellow pulp with greenish pips. It is cultivated in Australia, where it is used to flavour ice cream, and in the W. Indies, where it is known as the sweet calabash.

Passionists. R.C. order of priests and laymen, entitled the Congregation of Discalced Clerks of the Most Holy Cross and Passion of Our Lord Jesus Christ. It was founded about 1730 by S. Paul of the Cross (1694-1775), and was formally approved by the pope in 1741. Its special work is to conduct missions and retreats, and to undertake parochial work when desired by the bishop. The usual life vows are taken. The order came to Great Britain in 1841, and has several houses there, the headquarters being at Highgate, London. In America it has over a hundred houses.

Passion Plays. Scriptural plays developed in France and Germany in the Middle Ages. Derived from old Easter plays, they were enacted not in the churches but by brotherhoods under clerical direction in the open market, representing the Passion of Christ and employing some-

times hundreds of amateur actors. Variations of the texts are preserved: the Confrérie de la Passion (Paris), the 14th century St. Gall, the 1514 Heidelberg, the Bolzano, Eger, Hamburg, Hildesheim, and other plays. In modern days the Oberammergau (*q.v.*) play, held every ten years, is the most famous.

Passion Week. In the ecclesiastical year, the week following Passion Sunday, or the 5th Sunday in Lent. The name is sometimes applied to Holy Week (*q.v.*).

Passive Resistance. Act of resisting a law or system of government without recourse to active or militant methods. It is usually resorted to on conscientious grounds, which may be purely moral, or in which political and national considerations are involved. The refusal of Quakers and others to pay tithes and impositions of the Church of England is an example of the former, and there were many examples and forms of the latter in the Nazi-occupied countries of the Second Great War. The civil disobedience and boycott movement of Gandhi in India was passive resistance, as was refusal to undertake military service in Great Britain. The pacifist proposal that in time of war civilians should interpose themselves unarmed between the combatants, suggested passive resistance in an extreme form.

The term is historically associated with the Free Church passive resistance movement, which originated with the passing of the Education Act of 1902. These Free Churchmen consistently objected to pay a rate which provided for sectarian teaching in voluntary schools. They objected to pay that portion of their local rate devoted to education. Some paid when summoned after making a protest in public. Others refused to pay when summoned, and allowed their goods to be distrained upon for the amount in question. Others refused distraint and underwent regular terms of imprisonment. The movement died away after the Liberal govt. came to power in 1906, though the Act remained on the statute book.

Passmore Edwards Settlement. Name by which the London social welfare institute, the Mary Ward Settlement (*q.v.*), London, W.C., was known from 1897 to 1920. It was named after J. Passmore Edwards (*q.v.*).

Passover (Heb. *pesach*; Gr. *pascha*). Ancient Jewish feast. Called in the Bible the Lord's

Passover, and instituted at the time of the exodus, it was so named from the passing over by the destroying angel of the thresholds of the Israelites, red with the blood of the sacrificial lamb, when all the first-born of Egypt were smitten (Ex. 12). It was afterwards and still is observed as a symbol of the deliverance and of the beginning of harvest, the seven days of observance beginning on Abib or Nisan 14. The whole feast is also called the festival of unleavened bread. In modern times the festival closes with the words, "Next year in Jerusalem." It was observed by Christ the night before His crucifixion, when He instituted the Eucharist; and He is called "our Passover" (1 Cor. 5, vv. 7-8). See Easter; Last Supper; consult History of the Jewish Church, A. P. Stanley, 1876; Hebrew Feasts, W. H. Green, 1886.

Passport (Fr. *passport*). Warrant of safe conduct and licence to travel issued in the name of a sovereign state to its subjects wishing to visit foreign countries. British subjects require passports when travelling to or from British dominions or colonies. In international law a passport is a document issued by a belligerent permitting foreigners to travel within its territory. Every country has the sovereign right to regulate the admittance or exclusion of foreigners to or from its territories. Until the First Great War, passports were not required for travel to most European countries or the U.S.A., but since then they have become necessary for all British subjects leaving the U.K. and all foreigners entering it. They must be shown both to the British authorities at the home port and to the foreign authorities when arriving in or leaving the other country. The need for a visa (*q.v.*) on passports was mutually abolished during 1947 between the U.K. and France, Belgium, Luxemburg, the Netherlands, Denmark, Norway, Sweden.

Passports are issued to British subjects on the recommendation of a banker, mayor, magistrate, minister of religion, barrister-at-law, physician, etc., resident in the U.K. Two unmounted copies of a recent photograph certified by the individual recommending him, of which one is attached to the document, are required. Passports, for which a charge is made, are obtained from the Passport and Permit Office, Dartmouth Street, Westminster, S.W.1, or from the branches at 36, Dale Street, Liverpool, 2, and

10, Bothwell Street, Glasgow, C.2. Joint passports for husband and wife (with their children under 16) if travelling together are issued. A passport is valid for five years, and may then be extended for a further five years, after which a new one must be obtained. Employment exchanges can supply information about current passport regulations.

Passy. A western suburb of Paris, France. Near the Bois de Boulogne, it extends from the Chaillot (Trocadéro) to the fortifications, and is a residential quarter. See Paris.

Past and Present. Study of social and political conditions by Thomas Carlyle. It was first published in 1843. Developing ideas earlier expressed in Sartor Resartus and Heroes and Hero Worship, it discusses the problems of capital and labour, aristocracy and people, as they appeared in the first half of the 19th century, and contrasts them with social conditions in the Middle Ages, illustrated by the chronicle of the abbey of Bury St. Edmunds, written by Jocelin de Brakelond (c. 1200).

Pastaza or PASTASSA. River of S. America. Rising in the Andes and flowing generally S.E. through Ecuador for some 400 m., it joins the Marañon in Peru 30 m. W. of the point where the last-named river receives the Huallaga.

Paste (prob. Gr. *pastē*, barley broth). Specifically a plastic mass made from flour and water; generally any mixture of similar properties, e.g. adhesive made from flour and/or starch and too thick for liquid flow. Paper-hangers' and bookbinders' paste is usually made from flour with a small amount of alum added.

The term is also used for the glass preparation used in making imitation gems, and generally for any soft plastic mass, e.g. the clay of potters and the mixture of synthetic resins and filler made up and put into moulds for hardening into the required shape by heat and pressure.

Pasteboard. Paper pasted together to make thick sheets. After pasting it is pressed, dried, calendered, and cast into moulds. It is largely used as mounts for pictures. Bristol board is a finer pasteboard for pen-and-ink drawing. The word also denotes the wooden board upon which paste crust is rolled. See Card-board; Strawboard.

Pasteur, Louis (1822-95). French biologist. Born at Dôle, Dec. 27, 1822, and educated at the

Louis Pasteur,
French biologist

École Normale, Paris, he was by 1857 its scientific director. In 1863 he was appointed to the École des Beaux Arts as professor of geology, physics, and chemistry, and from 1867 to 1889 he was professor of chemistry at the Sorbonne. He established the Pasteur Institute in Paris, 1888, and remained its director until his death, Sept. 28, 1895.

Pasteur was one of the most brilliant investigators of the 19th century. He first attracted notice by his solution of the problem presented by isomerism (*q.v.*), which ultimately led him to the discoveries connected with fermentation, with which his name is universally associated. In connexion with the latter he showed that vinous, acetic, and lactic fermentations were caused by micro-organisms existing in the air, and he formulated methods for the prevention of "diseases" in wines, beer, vinegar, etc. At the request of the French government he undertook a study of silkworm disease, indicated the bacterial cause and cure, afterwards isolating the bacillus of anthrax, an epoch-making discovery which led to his preparation of vaccines for various diseases, e.g. fowl cholera, rabies, and diphtheria. These last results, which have been extended by followers of Pasteur, have left their imperishable mark on preventive medicine throughout the world. The more dramatic aspects of his work were brought out by a film, in which Paul Muni played Pasteur, shown 1936. See Bacteriology; Hydrophobia; Milk. *Bibliography.* Pasteur and after Pasteur, S. Paget, 1914; Lives, G. T. Hallowell and C. E. Turner, 1930; P. Compton, 1932; R. V. Rudot, 1937.

Pasteur Institute. Research laboratory established for the purpose of combating hydrophobia; named after Louis Pasteur. The first and most important, L'Institut Pasteur, was erected in Paris by public subscription, and opened Nov. 14, 1888.

Subsequently other Pasteur institutes were established throughout Europe, the U.S.A., etc., including one at Kasauli, in the Himalayas.

Pasteurisation. Preservation of wine, milk, and other liquids from deterioration by heating.

The process is named after Pasteur, who showed that sufficient heat killed all micro-organisms. Two methods are officially recognized: (a) The Holder method in which milk is held at a temperature of 145–150° F. for half an hour; (b) the short-time process, in which milk is heated to 162–165° F. for 15 secs. In both methods the milk must be immediately cooled to 55° F.

Pasticcio (Ital., a pie). In music, a medley of favourite excerpts from different operas, whether or not by the same composer is immaterial. It was very popular during the 18th century.

In art and literature pasticcio or pastiche (Fr.) denotes a work made up from fragments of other works, or borrowing motives or suggestions from them.

Pasto. City of Colombia, the capital of the dept. of Nariño. It stands at an alt. of 8,650 ft., at the foot of Pasto Volcano (alt. 14,000 ft.), 140 m. N.E. of Quito. It is on the route for the great pass between Quito and Popayán, is the seat of a bishop, and has a university. Its manufactures include decorated pottery, hats, and blankets and other woollen goods. Founded by Pizarro in 1539, it was twice destroyed in the wars of independence and was ruined by an earthquake in 1827. Pop. 49,644.

Paston Letters. A series of letters and other documents written between 1422 and 1509, mostly addressed to or written by members of the Paston family. Rising from obscurity about 1400, the Pastons, of a village of that name near North Walsham, Norfolk, acquired land and influence in the county. William Paston (1378–1444) was justice of the common pleas under Henry VI. His son John (1421–66) acquired by doubtful means Caister Castle and the other estates of Sir John Fastolf, for which the family had to fight as well as litigate. Sir John Paston (1442–79) was a courtier of Edward IV, but went over to the Lancastrians.

The letters and other papers, of which nearly 1,200 exist, form an invaluable record of the political, social, and economic life of the time, and of its manners and morals, and especially of the troublous times of the Wars of the Roses. A complete collection, with valuable introductions, was edited by James Gairdner, 1872–75.

Pastor, also called rose-coloured starling.
W. S. Berridge, F.Z.S.

Pastor (Lat. *pascere*, to feed). Literally a shepherd, but now used for a minister of religion, especially among the Lutherans. The office is known as the pastorate. See Lutheranism.

Pastor. Bird, known also as the rose-coloured starling (*Pastor roseus*). The plumage is pink on the back and under parts, violet-black on the head, neck, and tail, and greenish-black on the wings. It nests in W. Asia and S.E. Europe, and feeds largely on locusts. At times it migrates in large numbers to W. Europe, and occasional specimens are met with in England.

Pastoral. Literary term denoting poetry, romance, or drama setting forth the shepherd's life in a more or less conventionalised or idealised fashion. In the more modern manifestations it may be said to be the homage which artificiality pays to simplicity. Originating in the idylls of the Greeks of Sicily, notably Theocritus, which were imitated by Virgil in his Eclogues, pastoral poetry was revived by the Renaissance poets on the Continent, and in England became something of a new type in The Shepherd's Calendar of Spenser and his followers, though it degenerated in the artificiality of the 18th century.

Pastoral drama—which has been described as the bucolic idyll in dramatic form—flourished in Italy from the close of the 15th century, and may be said to have reached its height with Tasso's *Aminta*, 1573, and Guarini's *Pastor Fido*, 1585. Those plays had considerable influence on the pastoral drama in England, which, however, was marked by artificiality even in its most notable examples, such as Fletcher's *Faithful Shepherdess*, 1610, and Jonson's *Sad Shepherd*, 1636. Outstanding examples of pastoral romance are the *Diana* of the Spaniard Montemayor, c. 1559, and Sidney's *Arcadia*, 1590. In pastoral lyrics the century that followed Spenser was particularly rich. Pastoral setting or allusion has frequently been a convention in the writing of funeral elegies from Spenser's *Astrophel*, 1586, and Milton's *Lycidas*, at Arnold's *Thyrsis*, 1861. Consult English Pastorals, intro. E. K. Chambers, 1906; Pastoral Poetry and Pastoral Drama, W. W. Greg, 1906.

Pastorale. Musical term denoting (1) a 17th century kind of opera with a rural or idyllic subject; (2) an instrumental piece suggesting by conventional means, such as the use of compound time and of placid and flowing melody, the atmosphere of the countryside. A typical example is the pastoral symphony in Handel's *Messiah*. Beethoven's *Pastoral Symphony*, No. 6 in F, is the most extended example.

Pastoral Letter. Name given to a written communication by a bishop to the clergy and laity of his diocese on matters of Church organization and government. It is so called from the fact that a bishop is regarded as a spiritual shepherd. The Epistles of S. Paul to Timothy and Titus are called pastoral epistles.

Pastoral Staff. Name for the symbol of authority given to a bishop or abbot at his consecration, also known as a crosier (*q.v.*). Some authorities, probably mistakenly, distinguish between them.

Pasture. Land used for grazing. Some pasture lands are uncultivated, some are cultivated. Uncultivated pastures are far greater in extent. In the U.K. and W. Europe they are represented by rough and hill grazings; in S. Africa by the veldt; in N. America by the prairie; in S. America by pampa; and in Australasia by the montane tussock grasslands and others. Most uncultivated pastures have been greatly modified by human action, especially during the 19th and 20th centuries. They are well developed in arid areas, at high elevations, and in storm-swept localities.

Cultivated pasture, although not nearly so extensive in total area, is, in the aggregate, much more important agriculturally. Usually, this type of pasture is best developed in countries having relatively humid climates, where it replaces forest or woodland. Cultivated pasture is, therefore, characteristic of large areas throughout the U.K. and in other parts of Europe, in New Zealand, in the humid maritime districts of N. America, in parts of Southern Australia, and in the Cape prov. and Natal, S. Africa.

Cultivated pasture may again be sub-divided into permanent pasture and leys (see *Ley Farming*). Permanent pasture has, for the most part, been cultivated at one time or another. This is made evident in the U.K., for example, by the fact that most permanent

pasture fields are in ridge and furrow. Though much of this land was deliberately sown, much was probably not; and the present condition of the permanent pastures of the U.K. bears no relationship to any seeds that may originally have been sown on them.

Most leys have ceased to function as leys after the 10th to 15th year, depending on situation and treatment. On poor soils or under indifferent farming, the ley is ready for ploughing after the fourth or fifth year from sowing. The outrun ley is no longer highly productive and may, in this respect, be even less so than is permanent grass. The ley ceases to be a ley when the species first sown in it are replaced by the indigenous grasses and herbs.

Plants used for Pasture

The chief pasture plants used in seeds mixtures for leys are ryegrass (*Lolium* spp.), cocksfoot (*Dactylis glomerata*), timothy (*Phleum* spp.), fescue (*Festuca* spp.), the clovers (*Trifolium* spp.), and the medicks (*Medicago* spp.). In some countries and for special conditions, use is also made of such plants as foxtail (*Alopecurus* spp.), meadow grass (*Poa* spp.), dogstail (*Cynosurus* spp.), Bent (*Agrostis* spp.), Brome (*Bromus* spp.), oat grasses (*Avena* and *Arrhenatherum* spp.), bird's foot trefoil (*Lotus* spp.), sweet clover (*Melilotus* spp.). In other countries, notably in Africa, the Americas, India, and certain parts of Australasia, where the climate is hot and with long dry spells, leys are sometimes based on such plants as Rhodes grass (*Chloris* spp.), star grass (*Cynodum* spp.), paspalum (*Paspalum* spp.), panidums (*Panicum* spp.), elephant grass (*Pennisetum* spp.).

Pasture may be said ecologically to be a pioneer form of vegetation; the tendency in natural development is always towards regeneration of scrub, woodland, or even forest.

The farmer aims at preventing this progression by maintaining open pasture land on which he feeds his livestock. To do this effectively and to maintain his pasture in good condition, the farmer has to pay special heed to the proper management of the pasture lands, whether they be cultivated or uncultivated. To maintain high production from season to season, pasture land must be adequately manured (although in many parts of the world the application of manures is not at present warranted for economic reasons). In the case of cultivated pasture, special care is taken to

sow proper seeds including only those species in the seeds mixture which are capable of producing the desired class of pasture.

In 1947 the total area of pasture land of all descriptions in England and Wales was 19,422,000 acres. Of this area 5,567,000 acres were uncultivated heaths and moors, mostly at high elevation; 10,252,000 acres were permanent pasture; 3,603,000 acres were under leys of all kinds. In Scotland in 1947 there were 10,945,000 acres of rough grazings (uncultivated), 1,130,000 acres of permanent pasture, and 1,424,000 acres of ley. Between 1939 and 1943, England, Wales, and Scotland ploughed up about 6 million acres of permanent pasture; during 1944-47 there was little further ploughing up, so that in 1947 England and Wales together still had 10 acres of permanent pasture to every three acres under ley, although the latter is known to be, on the average, at least twice as productive as ordinary old pasture.

Among overseas countries New Zealand is in a foremost place in the production of meat, butter, cheese, and other grassland products. She has realized fully that grass, which provides the best and cheapest food for cattle and sheep, is a true crop and, further, that pasture must be farmed well and intelligently if it is to produce at the best economical level of output.

William Davies, D.Sc.

Patagonia. Extensive region forming the southern extremity of S. America and belonging to Argentina and Chile. It extends S. from the Rio Colorado to the Strait of Magellan, which divides it from the islands of the 'Tierra del Fuegian archipelago. Originally claimed by both Chile and Argentina, a treaty between these countries was ratified in 1881, which apportioned the territory E. of the Andes to Argentina and the W. coastal region to Chile.

Argentine Patagonia is divided into the territories of Rio Negro, Neuquen, Chubut, and Santa Cruz. It is bordered on the W. by the Andes, which constitute the water-parting of the Atlantic and Pacific systems, with an alt. of from 3,000 ft. to 6,000 ft.; the range is broken by several lakes lying partly in Argentina and partly in Chile. The terrain slopes in a succession of terraces towards the E., interspersed by numerous ravines and valleys. The chief rivers are the Colorado, Rio Negro, Chico, Chubut, Gallegos, and Santa

Cruz, mostly impeded by rapids, and there are a large number of salt lakes and lagoons. Though arid, sterile, and bush-covered for the most part, the valleys and margins of rivers in the N. portion are fertile. The climate is cool and violent winds prevail.

In Argentine Patagonia there are estimated to be almost 20,000,000 sheep, and the export of wool averages 50,000 tons per annum. There are large canning plants. Mammals include guanacos, armadillos, viscachas, pumas, foxes, and skunks; among the numerous birds are condors, vultures, hawks, partridges, rheas, and flamingoes. The native Indians, noted for their tall stature, are nomadic and thinly scattered over the territory. The most important tribes, the Tehuelches and Gennakens, are fast dying out. Area, 322,904 sq. m., or, including the E. section of Tierra del Fuego, 331,203 sq. m. The pop. is est. at 100,000.

Chilean Patagonia is a coastal strip W. of the Andes, consisting of the provs. of Chilo and Magallanes, which lie S. of the prov. of Llanquihue. The coast is fringed with innumerable islands, including the archipelagos of Chonos, Queen Adelaide, and Madre de Dios. The coasts are steep and rugged, and cleft by numerous fjord-like openings. The lower slopes of the mountains are densely forested, yielding valuable timber. There are no rivers exceeding 15 m. in length. The climate is raw and damp, and in the S. snow and sleet are of almost daily occurrence. Its area is 72,334 sq. m. Pop. about 40,000, of whom one-third are foreigners. One-fifth of the cultivated land is British-owned, and 90 p.c. of the larger sheep farms (3,500,000 head of sheep) are managed by Scots. There are large meat packing and refrigerating plants. Coal is extensively mined.

First seen by Magellan in 1520, Patagonia was afterwards visited by various Spanish and English explorers. Scientific explorations were also made by Darwin, Fitzroy, and several Argentine travellers. See Chile.

Pataliputra. Capital of the Magadha kingdom in ancient India. Extending for 9 m. along the right Ganges bank, between the modern Bankipur and Patna, it is now submerged beneath 14 ft. of alluvium. Completed by Udaya, about 450 B.C., it was visited about 300 by Megasthenes, ambassador of Seleucus to the court of

Chandragupta, of whose dynasty it was the capital. The Greeks knew it as Palibothra. Remains of its palisaded walls, whose many gates and towers he described, have been recovered. Asoka (*q.v.*) added masonry walls, and held there the 3rd Buddhist council about 246. By the 7th century it had become a heap of ruins. On its site stands Bankipur, the W. extremity of the city of Patna. *See* Magadha.

Patan. Town of Baroda, Bombay state, India. It is 62 m. N.W. of Ahmadabad, and is one of the oldest towns in Gujarat. It manufactures weapons, silks, and cottons, contains over 100 Jain temples, and is noted for its Jain palm leaf MSS. Pop. 36,549.

Patani. Monthon or prov. of Siam. It is in the S.E., on the S. China Sea, with a land boundary with Malaya. It is drained by the Patani, the largest of many N.-flowing streams. Tin, lead, gutta-percha, and timber are exported. It was formerly an independent state, dominating all the E. coast of the peninsula, but was annexed to Siam in 1832. After the Second Great War a movement was started among the 95 p.c. Malay pop. to ally Patani with the Malayan Union or with Indonesia, but the peace treaty with Siam, 1946, frustrated these hopes. Pop. 310,000.

Patas Monkey (*Erythrocebus patas*). Large and brilliantly coloured guenon, native of W. Africa.

Patas Monkey of West Africa

It is an agile, long-tailed species, of a foxy red colour on the upper parts and white below. The face is blue, with long hair on the cheeks, a narrow black band above the eyes, and moustache-like lines of the same colour on the upper lip. The length of head and body is about 16 ins., and that of the tail the same. *See* Monkey.

Pataudi, IFTIKHAR ALI KHAN, NAWAB OF (b. 1910). Indian

cricketer. This ruler of a small state in the Punjab was born March 17, 1910, and was awarded his cricket blue at Oxford in 1929. He qualified for Worcestershire in 1932 and went with the English test team to Australia. In 1934 he also opposed the Australians and headed English batting averages. When an Indian team toured England in 1946 the nawab was captain, but failed to repeat the brilliance of his earlier play.

Patay. Village of France. In the dept. of Loiret, it is 13 m. N.W. of Orléans. Here a battle was fought between the English and the French, June 19, 1429. Joan of Arc was continuing her victorious career, and to check her the duke of Bedford sent out a force from Paris to the assistance of the English near Orléans. Under Talbot, this reached Patay only to learn that the English leader, the duke of Suffolk, was a prisoner. Moving forward, the English came unexpectedly into contact with the scouts of a French force, chasing a stag. Urged on by the Maid, the French men-at-arms engaged the enemy before the English bowmen were ready. The fight ended in the defeat of the English; Talbot was made a prisoner, and only a remnant of his army got back to Paris.

Patch. Small piece of court plaster or black silk worn on the face. It was used to conceal a scar or blemish, or to enhance beauty by contrasting with the fairness of the skin. It came into fashion in the reign of Charles I, its use being banned by the Puritans. After the Restoration it was worn extravagantly and in many shapes.

Patch, ALEXANDER MCCARRELL (1889-1945). An American soldier. The son of an army officer, he was born Nov. 23, 1889, in Arizona, and graduated from West Point in 1913. He served in France in the First Great War. Promoted maj.-gen., 1942, he commanded the troops who relieved the marines on Guadalcanal in 1943. In 1944 he led the U.S. 7th army, which on Aug. 16 landed in S. France, and was promoted lieutenant-gen. His troops drove N., made contact with Gen. Patton's 3rd army, and joined the assault on Germany. In 1945 Patch was recalled to the U.S.A. and named head of the board set up to study post-war army requirements, but died from pneumonia on Nov. 21.

Patel, VALLABHBHAI JHAVERBHAI (b. 1875). Indian politician. Born Oct. 31, 1875, he was educated at Nadiad high school and

became a district pleader at Godhra; after study in England he was called to the bar at the Middle Temple, returning to practise at Ahmadabad. In 1916 he became associated with Gandhi, and led the Bardoli "no tax" campaign. He was president of the Indian nationalist congress in 1931, chairman of its parliamentary sub-committee, 1935-42, and several times gaoled for subversive activities. His violent denunciations of the British in 1945 were held responsible for outbreaks. In the interim government formed in 1946, he held the portfolio of home affairs, as he did after the independent Indian government was formed in 1947.

Pateley Bridge. Market town of the W. Riding of Yorkshire, England. It stands on the Nidd, 10 m. S.W. of Ripon, with a rly. station. The chief industries are mining lead and quarrying stone. Near are caverns with stalactites and stalagmites. Market day, Sat. Pop. 7,065.

Patella or KNEE-CAP. Sesamoid bone, i.e. a bone developed in the tendon of a muscle, situated at the front of the knee-joint. It is roughly triangular in shape. The posterior surface is covered with cartilage, and articulates with the femur or thigh-bone. The upper margin passes into the tendon of the quadriceps extensor or large muscle forming the front of the thigh. From the lower margin springs the infra-patella tendon, by which the bone is fastened to the anterior surface of the tibia.

Dislocation of the patella may be outwards, inwards, or sideways, the first being much the commonest form. Reduction is effected by manipulation. Fracture of the patella may be the result of direct violence, or may follow a vigorous muscular effort, such as may be made in an endeavour to prevent a fall, the bone breaking transversely across the middle; wiring of

Patella. Left, knee-joint from the front, showing position of patella; right, front and back view of bone

the bony parts is usually a necessary part of treatment. See Anatomy; Knee.

Patén. In the service of the Eucharist, the plate on which the consecrated bread is placed; in the Mass, the plate on which the Host is laid. The term also describes the covering of the chalice used at these services; in this case it is usually of gold or silver-gilt.

Patent (Lat. *patere*, to lie open). Official document issued by the sovereign conferring an exclusive right or privilege. Titles of nobility are conferred by letters patent. A patent is the sole right for a term of years of the proceeds of an invention, the person who holds such a right being called the patentee. Patent leather has a japanned polished surface.

by law, but any other publication known to the Patent Office examiner can be cited. The law gives to the comptroller of patents the power of refusing the grant of a patent in cases in which the invention has been wholly and specifically claimed or described in specifications to which the search has extended or other prior publications cited. Complete specifications can be amended at the instance of the applicant to distinguish an invention from those described in cited prior publications. Alternatively, the comptroller may insert in the specification, by way of warning to the public, specific reference to any earlier publication held to describe or claim an applicant's invention. An inventor may, before applying for a patent, but after notice to the comptroller, place his invention on view at an exhibition certified by the board of trade without invalidating, by reason of prior publication, a patent which he may subsequently obtain.

The normal protection period of 16 yrs. may be extended by the court if it can be shown that the patentee has received inadequate remuneration having due regard to the merits of the invention, or has suffered loss through engagement of the U.K. in war.

Grounds of Opposition

Before a patent is granted, but after the acceptance by the Patent Office of the complete specification, interested parties may, within three months, oppose, and, if successful, prevent the sealing of the patent, or obtain an amendment of the complete specification. An opposition can be based only upon one or more grounds of which the following is a summary: That the invention has been obtained from the opponent, or someone of whom he is the legal representative; that the application lacks invention; that it has been publicly used or disclosed in a document published in the U.K. before the date or the effective date of the application; that it has been claimed in the U.K. in an application of prior date or prior effective date; or that it is not sufficiently or fairly described in the complete specification. Oppositions are conducted before the comptroller, from whose decision an appeal lies to the patent appeal tribunal. Similar action to opposition may be brought in the Patent Office within 12 months of the sealing of a patent. Action to revoke may be brought at any time in the

PATENT LAW AND PRACTICE

This article, by a chartered patent agent, deals with a branch of law which is of great importance commercially. See also Company Law; Copyright; Monopoly; Trade Mark

The patent (Lat. *patere*, to lie open) law of the U.K. may be said to date from the statute of monopolies, 1623. Before the passing of that statute patents were granted by the crown with a view to improving the economic condition of the country, industry being encouraged by prohibiting or restricting competition. The grant of monopolies freed from competition led to abuses prejudicial to the state, and was followed by their restriction by statute. According to the statute of monopolies the grant of a patent was restricted to the "first and true inventor," who, according to present-day practice (Patents Act, 1949), may comprise several classes of persons, and includes not only the actual inventor, but the first importer of an invention into the U.K.; an assignee can also apply. The patent dates from the date of filing the complete specification, with priority from the filing of the provisional specification, if any, and the applicant for a patent in any of a number of overseas territories (including most industrially important countries) or his assignee can, by making application in the U.K. within twelve months of his first application, obtain a patent with priority from that application.

The subject matter of a valid patent must comprise a manner of new manufacture, or method of testing applicable in manufacture. Moreover it must not be contrary to law or morality or well established natural laws. Novelty alone does not necessarily imply invention, and of itself is insufficient to sustain a patent.

A patent is invalid if before its priority date the invention has been publicly disclosed in the U.K. either by a prior user or by public description; it is also invalid if the specification is inadequate or ambiguous. A British patent secures to the grantee the exclu-

sive right (in the U.K. only) to manufacture, use, and sell, or to grant licences for these purposes, and an infringer may be restrained and made liable for damages. An infringement action is brought in the high court, usually the chancery division, and the defendant may plead invalidity as well as non-infringement. Unjustifiable threats of patent proceedings can be restrained and damages can be recovered. A patent has effect against the crown; but govt. depts. and their agents may use patented inventions for crown purposes, subject to the payment of compensation. In the absence of a specific agreement between them, joint patentees may each work the invention independently, but cannot independently grant licences. A patent is transferable by deed, and if an agreement to assign is registered before a patent is sealed, the patent will be granted to the assignee. Patents relating to food or medicine are subject to compulsory licence.

In the U.K. an application for letters patent in respect of inventions is made upon forms obtainable at the Patent Office, London, where also the forms which require fees can be stamped. An application may be accompanied by a provisional specification, in which the invention is described, or by a complete specification, in which are particularly described the invention and the manner in which it is to be given practical effect. In the former case, the provisional specification must be followed within twelve months by a complete specification. The lodging of a provisional specification confers no exclusive rights upon an applicant, unless the application is completed later by lodging a complete specification.

A search for novelty among British patent specifications published within 50 yrs. back from the date of the application is prescribed

high court on the above grounds or on certain further grounds.

A specification may, after its acceptance, be amended, either by way of disclaimer, correction, or explanation, provided that the specification, after amendment, does not contain an invention substantially larger or different from the invention claimed before the amendment.

At any time not less than three years after the sealing of a patent, any person may apply for a compulsory licence under a patent on the ground that the protected product or process is manufactured or carried on wholly or largely outside the U.K., or that the invention is not being commercially worked or the public demand is not being met on reasonable terms, or that trade or industry is prejudiced by the unwillingness of the patentee to grant licences or by unfair use of the patent.

The fees payable for a patent are £6, £1 with the application, £4 when lodging the complete specification, and £1 at the time of sealing. No further fees are payable until the expiration of four years from the date of the patent, when the scale of charges becomes £5 for the fifth year, £6 for the sixth year, and so on until the sixteenth year, when £16 is chargeable which covers the rest of the normal life of the patent. By voluntarily having his patent endorsed as subject to compulsory licences (fee £1), a patentee saves half the renewal fees due thereafter. *Consult Compendium of Patents and Designs, Law and Practice, Haddan, 1931.*

PATENT LAW IN THE U.S.A. The first patent law in the U.S.A., enacted in 1790, has been several times revised. The Patent Office, previously a branch of the dept. of the Interior, was transferred in 1925 to the dept. of Commerce. A patent for an invention may be granted to the inventor of any new and useful art, machine, manufacture, or composition of matter, or for any new and useful improvement in these classes. The patent right in an invention lasts for 17 yrs. and in a design for an article of manufacture for 3½, 7, or 14 yrs. as the inventor may elect. An application must be made by the inventor himself. It must consist of a petition, specification, or oath, with a filing fee of \$30 (about £7 10s.). A fee of the same amount is charged for the issue of a patent. The application is officially examined to see if it is complete and in the correct

form, and search is then made to find if the invention is new. If the application is rejected, an appeal may be made to the board of appeals in the Patent Office, and further, if necessary, to the court of customs and patent appeals or, as an alternative, to the district court for the district of Columbia. An "interference proceeding" is instituted by the Patent Office if claims are made by different persons to the same invention. If a patent be infringed the patentee may sue in a federal court for the recovery of damages and for an injunction. A patent may not be used to form a combination in restraint of trade in violation of the anti-trust laws.

Patent Medicine. Term originally describing a medicinal preparation which had been the subject of "letters patent" under the Great Seal. The first tax on medicines was imposed in 1783, and was followed by other measures until 1812, when the Medicine Stamp Act was passed. This placed a duty on patent medicines, the duty being indicated by a stamp on the box or bottle, etc., in which the preparation was sold. The Pharmacy and Medicines Act (g.v.), 1941, abolished both the medicine duties and the medicine vendor's licence; and also made it compulsory to state the constituents of a medicine on the article or its container.

Patent Office. Govt. office under the board of trade, supervising the grant of patents. At its offices, 25, Southampton Buildings W.C.2, is the U.K.'s largest scientific library.

Pater, JEAN BAPTISTE JOSEPH (1695-1736). French painter. Born at Valenciennes, he studied under Watteau in Paris. A slavish follower of his master's manner, without his delicate and refining touch, Pater was received into the Academy in 1728 as a painter of *fêtes galantes*. He died July 25, 1736.

Pater, WALTER HORATIO (1839-94). British critic and essayist. He was born at Shadwell, Aug. 4,

Walter H. Pater,
British critic
Elliott & Fry

1839, the son of a physician of Dutch ancestry, and educated at King's school, Canterbury, and Queen's College, Oxford. He became a fellow of Brasenose College in 1864, and passed most of his life at Oxford, spending his vacations in

travel on the Continent. A visit to Italy in 1865 turned a mind, already under the influence of Ruskin, in the direction of Renaissance art, and inspired a number of essays. These, collected and issued in 1873, obtained wide recognition as *Studies in the History of the Renaissance*.

In 1885 appeared his romance of Marius the Epicurean, an apologia for hedonism in its highest form and the pursuit of beauty. His other publications include *Imaginary Portraits*, 1887; *Plato and Platonism*, 1893; *Greek Studies*, 1895; and appreciations of Wordsworth, Coleridge, Rossetti, and others. A collected edition was published in 1901. Pater strove after a jewelled, polished, and musical prose that should satisfy the most fastidious ear. His matter has stood less well the test of time. He died July 30, 1894. A *Life* by A. C. Benson appeared in 1906, and a study by A. Symonds in 1932.

Paterno. Town of Sicily, in the prov. of Catania. It stands at the foot of Mt. Etna, 13 m. by rly. W.N.W. of Catania. Built on the site of the ancient Hybla Major or Galeatis, celebrated for its honey, it has Greek and Roman remains. Its castle, founded in 1073 by Roger I, has a 14th century keep. It was captured by British troops Aug. 5, 1943, in the Second Great War campaign in Italy. Trade is carried on in oil, wine, and flax.

Pater Noster (Lat., Our Father). Latin name for the Lord's Prayer (g.v.). Hence the word paternoster is sometimes applied to the larger beads of the rosary.

Paternoster Row. London thoroughfare. Known first as Paternoster Lane, it runs W. from Cheapside to Amen Corner, Warwick Lane. It was originally inhabited by the makers of prayer-beads, the dealers in which, known as paternosterers, moved here from St. Paul's Churchyard in the 13th century, and the Row was named after them. The modern Paternoster Row, long celebrated as the home of book publishers, was almost totally destroyed in the fire started by German bombers on Dec. 29, 1940. *See Amen Court.*

Paterson. Township of New South Wales, Australia. It stands on Paterson river, 132 m. by rail N. of Sydney, and is the centre of a dairying and citrus fruit district.

Paterson. City of New Jersey, U.S.A., co. seat of Passaic co., and the state's third largest city. It stands on the Passaic R., 15 m. N.W. of New York, and 13 m. above Newark, and is served by

elys. and canal. The river here makes a descent of 50 ft. in one perpendicular fall, providing water power for numerous industries. Known as the Lyons of America, Paterson is the chief silk centre of the U.S.A. Settled by the Dutch in 1679, it was noted for cotton by 1835, and by 1870 was producing half the nation's silk. The Wright aeronautical plant gives other employment. Paterson became a town-ship in 1831, a city in 1851, and is a bishop's see. Pop. 139,656.

Paterson, ANDREW BARTON (1864-1941). An Australian poet. Born at Narrambla, N.S.W., he was educated at Sydney grammar school and graduated in law from the university. He contributed poetry to the Sydney Bulletin, and was a war correspondent in the Philippines, S. Africa, and China. Having also been a farmer and fought in Egypt throughout the First Great War, he became in 1922 editor of the Sydney Sportsman. He published his first book of verse, *The Man From Snowy River*, in 1895; *Rio Grande's Last Race*, 1902; *Saltbush Bill*, 1917; and a collected edition, 1921. He also wrote novels and short stories, the best being *An Outback Marriage*, 1906; *Three Elephant Power*, 1917; *The Shearer's Colt*, 1936. His reminiscences, *Happy Despatches*, appeared in 1934. Paterson is perhaps the most widely read Australian poet of his time; his work is of primitive type and wins response by its rhythmic attraction, simplicity of ballad form, descriptions of action, and a background which suggests the magic of the Australian bush. He died in Feb., 1941.

Paterson, ROBERT (1715-1801). A Scottish Covenanter, known as Old Mortality. Born near Hawick, April 25, 1715, he was a mason by trade, and spent 40 years travelling round the country, erecting or repairing memorial stones on the graves of martyred Covenanters, leaving his wife and family to shift for themselves. He died Jan. 29, 1801. His eccentric life suggested to Sir Walter Scott the theme of his novel *Old Mortality*.

Paterson, WILLIAM (1658-1719). British financier. Born at Tinwald, Dumfriesshire, April, 1658, he left Scotland about 1685. He tramped through England, living for a time in Bristol, and then made his home in the Bahamas. Returning to England about 1690, he entered business life in London, and in 1694 was affluent enough to found the Bank of Eng-

land, the deed on which his fame rests. Less successful was the Darien scheme for the foundation of a new trading port, which he originated after he had left London for Edinburgh. He sailed to Darien in 1698 and returned with the few survivors. Paterson helped to arrange financial relations between England and Scotland after the union in 1707. He died Jan. 22, 1719, having written a good deal on commerce and finance.

Patesi. Sumerian name for the ruler of a city-state in early Babylonia. It regarded him as the steward of the city-god, in whose name he administered its affairs. The office might be inherited, especially when local rule was strong and autonomous. See *Babylonia*.

Pathan. Name popularly denoting the Iranian peoples of E. Afghanistan and the N.W. frontier prov. of Pakistan. The predominant speech is Pushtu; the harsher dialects are spoken by the aristocratic N. tribes, the softer by the democratic S. tribes. The Pathans number perhaps 3,750,000. The term also denotes the early Mahomedan dynasties and architecture at Delhi (13th-15th cent.). See *Afridi*; *Mohmands*; *Waziri*.

Pathé Frères. Émile, Charles, and Théophile Pathé, French originators of the cinema newsreel. Their business was established in Paris in 1900 as *Compagnie Générale Phonographe, Cinématographe, et Appareils de Précision*, and at first sold gramophones. In 1908 Charles introduced the Pathé Journal, the first newsreel, and the following year presented in London the Pathé Gazette. There are now three separate organizations engaged in making and distributing Pathé newsreels: Pathé Cinéma de Paris, Pathé Pictures of London, and Warner Pathé News of New York.

Pathetic Fallacy. Phrase made by Ruskin in *Modern Painters* to condemn the crediting of nature with human emotion: "All violent feelings . . . produce . . . a falseness in . . . impressions of external things, which I would generally characterise as the 'pathetic fallacy'."

Pathetic Sonata. Composition for the piano by Beethoven, his op. 13, in C minor. It was published in 1799 and dedicated to Prince Lichnowsky. Beethoven's own title was *grand sonate pathétique*. The slow movement has been set as an Anglican chant.

Pathetic Symphony. Popular title, first given by the composer's brother, to Tchaikovsky's

6th symphony, in B minor, op. 74. This favourite work is in four movements, the third being in vigorous *alla marcia*. Tchaikovsky was preoccupied with the workings of inexorable fate, and expressed by brilliant orchestration his sense of melancholy and frustration. It was first performed at St. Petersburg, Oct. 28, 1893, a week before he died.

Pathfinder Force. R.A.F. bomber unit of the Second Great War. Its duty was to find the target and identify it with coloured flares, so that other squadrons could drop their bombs within the illuminated area. Pathfinder Force, which included the best navigators and pilots in the service, and was commanded by Air Vice-Marshal Bennett, first went into operation on Aug. 18, 1942. Aircraft were provided with a gyroscopic sight which automatically gave the flare dropper a correct line on the target, even when taking evasive action at high speed. By the end of 1943, 1,000 bombers at a time were dropping 2,300 tons of bombs in 30 minutes on a target illuminated by the pathfinders.

Pathology (Gr. *pathos*, disease; *logos*, discourse). Science which deals with the causes of disease and the changes produced in the body by it. The investigator uses experimental pathology when he produces a disease in animals and studies its effects. Microscopic investigation of the tissues constitutes histology. The observation of morbid processes in sick persons is termed clinical pathology; the study of changes in diseased tissues is known as morbid anatomy.

Pathos (Gr. *pathein*, to suffer). Quality in life and art which touches the emotions, especially pity and compassion. It is usual to speak of pathos as if it were the antithesis of humour, but its appeal is too subtle to be so easily defined. It has, indeed, such affinities with humour that there is more of pathos in some laughter than in some tears. The extremes of tragedy are too terrible to be pathetic; they rise above or fall below an emotion so essentially gentle and personal. The keynote of pathos is simplicity, an entire immunity from self-consciousness and self-assertion. It is "the sense of tears in mortal things," the other side of beauty, youth, and happiness.

Pathos is as inevitably spontaneous as it is elusive. It must be so unpremeditated that it takes

you unawares. It is a wholly artless expression of feeling, and in art must seem so, or it falls from the sublime into the more or less ridiculous.

Patiala. Indian state and town. The former, in the E. Punjab, is the largest of the states in the Patiala and E. Punjab Union (v.i.). At the partition of 1947 it acceded to the dominion of India. It has an area of 5,942 sq. m. and a pop. of 1,936,259. The chief tribesmen are Sikh Jats. The capital is built round the old palace, and is a busy trading centre with some modern buildings. It lies W. of Ambala, with which it has rly. connexion.

Sir Bhupinder Singh, maharaja of Patiala (1891-1938), promoted recruiting in India during the First Great War, represented his country at Geneva, 1925, and at the London conference of 1930, and was chancellor of the chamber of princes, 1926-30 and 1933-36. He was among the keenest cricketers in India. Dying March 23, 1938, he was succeeded by his son, Sir Yadavindra Singh (b. Jan. 7, 1913).

Patiala and East Punjab Union. Federation of Indian states. It was created May 5, 1948, and comprised the states of Patiala, Kapurthala, Jind, Nabha, Faridkot, Malerkotla, Nalagarh, and Kalsia. The union has area 10,000 sq. m. and pop. (1950 est.) 3,320,000, of whom more than one third are Sikhs. See entries under the names of the first six of these states.

Patience. Card game played by a single person. There are many hundreds of such games. In one class the solution depends on pure chance after shuffling the cards. The player continues placing the cards, almost always in ascending or descending sequences of numbers, according to some rule, until all have been grouped, the object being to do this either within a certain number of attempts or after a single deal and lay-out.

Patio, in Spanish domestic architecture. The patio in the House of Pilate, Seville

Patience OR **BUNTHORNE'S BRIDE.** Comic opera by W. S. Gilbert with music by Arthur Sullivan. It was produced at the Opéra Comique, London, April 23, 1881, and transferred to the newly-built Savoy, Oct. 10, 1881, being therefore technically the first of the Savoy operas. In all the piece attained a run of 578 performances. It satirised the fashionable folly that attended the aesthetic movement of the period, but its wit still lives even though that particular form of artistic pretentiousness is dead. Famous songs include *The Magnet* and *the Churn*, *Hey Willow Waly-O*, and the Aesthete's song beginning "If you're anxious for to shine."

Patina. Green coloration seen on bronze or copper articles which have been exposed to a moist atmosphere for a long period. It is imitated by wetting bronze articles with dilute acids, or applying a paint of copper carbonate. Japanese patina is a glossy black with a violet sheen, or golden sheen with shades of red and grey, according to the metal used.

Patino, SIMON (1860-1947). Bolivian magnate. Of Spanish and Indian stock, he was born at Cochabamba in the Andes, and became a clerk in a general store. After acquiring his first mining rights in return for the cancellation of a small debt, he made a vast fortune in tin. At one time his income was estimated at £100,000 a day, exceeding the revenue of the Bolivian government. He became minister in Madrid, and later in Paris. With a fortune estimated at \$75,000,000, Patino died at Buenos Aires, April 30, 1947.

Patio (Lat. *spatium*, space). Spanish word for the courtyard connected with a house. In metallurgy, the patio process is a method of extracting silver from its ores by amalgamation. It is so called from being carried out on the floor of a patio. The ore is brought on to the patio in the state of thick mud, stacked in a heap inside rough walls of clay, and allowed some days to dry. The walls are then taken down and the ore is spread on the floor, mixed with salt and is turned with spades for two or three days, mules being also

kept moving over it. This operation is continued while first a mixture of iron and copper sulphates and then mercury is added until the amalgamation is complete. The mass is then collected and taken to washing boxes in which the slimes are washed away, leaving the silver amalgam behind.

Patkai. Hill range of the Indian sub-continent. It separates Assam from Burma and gives rise to the headwaters of the Chindwin.

Patkul, JOHANN REINHOLD VON (1660-1707). Livonian politician. The son of a Swedish officer, he was born July 27, 1660, in a Stockholm prison, where his parents were incarcerated. Patkul was accused in 1692 of high treason against the Swedish government, and was compelled to leave his country. In 1698 he offered his services to Augustus II of Poland, arranged a coalition against Sweden, and then passed to the service of Peter the Great, on whose behalf he negotiated in 1703 an alliance with Augustus. Later, although a representative of a foreign power, he was arrested, accused by Augustus of double dealing, surrendered to Sweden, and executed Oct. 11, 1707.

Patmore, COVENTRY KERSEY DIGHTON (1823-96). British poet. Born at Woodford, Essex, July 23, 1823, he published a volume of poems in 1844, and was an assistant in the printed book dept. of the British Museum, 1846-66.

He contributed to the leading reviews, and his works include *The Angel in the House*, 1854-62, his most notable poem; *The Unknown Eros*, 1877, a collection of odes; *Amelia*, 1878; *Rod, Root, and Flower*, 1895. A man of difficult temperament, egoist and mystic, he became a Roman Catholic in 1864, and died at Lynton, Nov. 26, 1896. His letters were ed. by B. Champneys, 1900; his life written by E. Gosse, 1905 and D. Patmore, rev. edn. 1949; his poetry evoked studies by O. Burdett, 1921, and F. Page, 1933.

Patmos OR **PATIMA.** Island of the Dodecanese, one of the Sporades group. Lying S.W. of Samos, on the S.E. side of the Aegean, it is famous as the place of banishment of the Apostle John. It became an Italian possession provisionally in

Coventry Patmore, British poet After J. S. Sargent

Patmos. Above the houses is seen the monastery of S. John the Divine, built in 1088

1912 and definitely in 1924, but was transferred in 1947 to Greece. Patmos covers 22 sq. m. Pop. 3,184. See Dodecanese.

Patna. Former Indian state, now merged in Orissa. Administratively it was until 1947 in the Chhatisgarh agency. It has no connexion with Patna in Bihar. It lies between the river Tel on the S.E. and Raipur and Sambalpur on the W. and N., covers 2,530 sq. m., and has a pop. of 632,220. Bolangir was the capital.

Patna. Division and district of Bihar state, India. The div. comprises the three dists. of Shahabad, Gaya, and Patna, and lies S. of the Ganges. It is crossed by the Son, and bounded W. by the Uttar union. Of the dist., practically the whole of the cultivable area is actually growing crops. Area of div., 11,338 sq. m.; pop. 7,265,950. Area of dist., 2,164 sq. m.; pop. 2,162,008.

Patna. City and capital of Bihar state, India. It is situated on the right bank of the Ganges close to the mouths of the three tributaries, Son, Gogra, Gandak. Before the days of rlys. the city was a great trading centre with water transport in five directions. The remains of a pillared hall, erected by the emperor Asoka in the 3rd century B.C., were unearthed in 1912-13. The oldest mosque is that of Sher Shah (1540-45); the Patna Oriental library has a fine collection of Arabic and Persian manuscripts. Here are a university (1917) and a high court. Pop. 175,706.

Paton, JOHN LEWIS (1863-1946). British educationist. Son of J. B. Paton, principal of the Congregational institute, Nottingham, he was born

J. L. Paton, British educationist

member of the consultative committee of the board of Education, and in 1925 was appointed president of the memorial college, S. John's, Newfoundland. He retired in 1933. His biography of his father appeared in 1914. Paton died April 28, 1946.

Patras, Greece. View of part of the town from the harbour

Paton, SIR (JOSEPH) NOEL (1821-1901), Scottish painter. Born at Dunfermline, Dec. 13, 1821, he studied at Edinburgh and London. Successful in the Westminster Hall competitions of 1845 and 1847, he became A.R.S.A. in 1847, and R.S.A. in 1856; and the queen's limner for Scotland in 1866. He painted religious and other subject pictures in the pre-Raphaelite manner, with strong but not always attractive colour. He was at his best in black and white work. Knighted, 1867, he died in Edinburgh, Dec. 26, 1901.

Patos Island. Island in the Gulf of Paria three miles off the Venezuelan coast. Patos, which had been a British possession since 1628, was ceded to Venezuela in 1941, after protracted negotiations. The island has an area of 170 acres, and had a caretaker, who was the sole inhabitant.

Patras. Seaport of Greece. The capital of the department of Achaea, it is in the Morea or Peloponnese. Situated on the slope of a hill overlooking the Gulf of Patras, 13 m. S.W. of Lepanto,

it contains several Jewish synagogues and Greek churches, one of them being traditionally associated with the martyrdom of S. Andrew. The exports include currants, wine, oil, woollen goods, silk, skins, valonia, lemons, honey, and pomegranates. Anciently known as Patrae, it is the only survivor of the 12 cities of Achaea. An early centre of Christianity, it was besieged by the Spaniards in 1532 and 1595. Rebuilt after its destruction by the Turks in 1821, it is now one of the principal Greek ports. During the Second Great War British and Greek regular forces landed here, Oct. 4-5, 1944, without opposition from the Germans, who were by then withdrawing from Greece. There are remains of a Roman aqueduct. Pop. 61,278.

The Gulf of Patras is an inlet of the Ionian Sea, between Hellas and the Morea.

It has a length of 22 m. and a max. width of 14 m. At the Strait of Lepanto, leading to the Gulf of Corinth (q.v.), it narrows to barely 2 m.

Patria potestas (Lat., paternal power). In Roman law, the authority of the head of the household over his own children, or those

adopted by him, irrespective of age. This authority, which normally reduced the children to a condition of life-long dependence, gave the father power over their life and liberty. But it was destroyed by the thrice-repeated sale of a son, the single sale of a daughter, the adoption of a son into another gens or clan, the passing of a daughter into the legal power (*manus*) of a husband, the loss of the rights of citizenship by father or son. The patria potestas was the basis of Roman moral and social strength until Greek influence prevailed.

Patriarch (Gr. *patria*, family; *archein*, to rule). Head of a family or tribe. It is specifically applied to those regarded by the Jews as the fathers of their race, to the presidents of the Sanhedrin, and, after having been adopted by the early Church as the title of the holder of any great see, was given to the bishops of Alexandria, Rome, Antioch, Constantinople, and Jerusalem. One of the titles of the pope is Patriarch of the West; and though the patriarchates of

Constantinople, Jerusalem, Antioch, and Alexandria are sees of the Greek Church, the Holy See continues to appoint bishops to them. These officials, however, except the bishop of Jerusalem, reside in Rome. The title is derived from Acts 7, v. 8. See Archbishop; Exarch.

Patriarchy. Form of social organization under which personal rights, duties, and restrictions are determined from the paternal side. Some social anthropologists prefer the alternative term "father-right." Descent and inheritance may be reckoned along the father's line. The wife may reside with her husband's people, and child-control and choice of mate may be vested in the father. See Family; Matriarchy.

Patricia. District of Ontario, Canada. It is the most N. area in the prov., was formed from parts of Keewatin and the N.W. Territories in 1912, and named in honour of Lady Patricia Ramsay, daughter of the duke of Connaught, then governor-general. The area of the district is 157,400 sq. m. See Canada; Ontario.

Patrician. Member of the ruling order in ancient Rome, as opposed to the plebs or plebeians. They were the descendants of the original citizens, whereas the plebeians were the descendants of those who joined the community later. They had the monopoly of the priestly offices, had the exclusive right of interpreting the law and giving decisions, and alone were eligible for the republican magistracies, while the senate was recruited almost exclusively from their ranks.

A long and bitter struggle was waged by the plebeians (*q.v.*) to break down these privileges. This was at last successful, and from about 300 the patricians survived only as an aristocracy of birth. In the later period of the Roman Empire the dignity was revived as a personal distinction conferred upon eminent personages. In the free cities of the Holy Roman Empire the term was applied to members of families entitled to representation on the council, and was still so used in the 19th century in the Hanseatic towns and some Swiss cantons. See Plebeian; Rome.

Patrick (c. 387–c. 493). Patron saint of Ireland. He was born probably near Dumbarton, Scotland, at Kilpatrick, his father being a Roman named Calpornius, his mother Conchessa being of British origin. Irish raiders carried him into servitude in Antrim at the age

of 16, but, escaping, he became a monk at Tours, was ordained priest by S. Germain of Auxerre, was entrusted by Pope Celestine I with the conversion of Ireland, and went to Wicklow in 433. In spite of hostility, he made his way to Meath, and there met Laoghaire, king of Ireland, at Tara, where he baptized large numbers.

He worked for seven years in Connacht and preached in the other provinces, founding numerous churches, religious houses, and bishoprics. A famous incident recorded of his early labours was the plucking of a shamrock to illustrate the doctrine of the Trinity. Croagh Patrick, at Clew Bay, and the island in Lough Derg, Donegal, were among his places of retreat for meditation and devotion. S. Patrick died at Saul, near Downpatrick, according to some authorities on March 17, 493, though the year is given by the Bollandists as 460. His day is March 17. His literary remains are the valuable Confession, preserved at Dublin, and the letter to Coroticus. There are Lives by J. H. Todd, 1864; J. B. Bury, 1905; W. M. Letts, 1932.

Patrington. Town of the E. Riding of Yorkshire, England. It is 14 m. by rly. S.E. of Hull, and has a trade in seed, corn, and coal. The notable Decorated church has a central spire. Pop. 1,100.

Patriotic Fund. General term for funds raised by public subscription for the relief of sailors and soldiers wounded in war, and their dependants. In the 19th century several such funds were started, the first being that connected with Lloyd's, 1803–26, when over £600,000 was raised. The Crimean War fund touched nearly £1,500,000. Charges of maladministration being made, an Act of 1903 established the Royal Patriotic Fund Corporation, to which the assets were transferred. Funds are administered to benefit dependants of deceased officers, non-commissioned officers, sailors, soldiers, marines, and airmen. There is a Royal Victoria Patriotic school at Wandsworth, for orphaned daughters of servicemen. The office is at 28, Sackville Street, London, W.1. See War Charity.

Patripassians (Lat. *pater passus*, suffering Father). Followers of an early form of the heresy known as Sabellianism (*q.v.*). It arose in the 2nd century, and its main contention was that God the Father became man, and died on the Cross, and that Christ, so far as He was flesh, was Son, and, so far

as He was spirit or God, was the Father. Patripassianism was a development of Monarchianism (*q.v.*).

Patron (Lat. *patronus*, from *pater*, father). Originally, a Roman citizen who had freed or manumitted a slave, the term expressing the new relation between master and freedman. The patron by the act of manumission did not lose all rights over his former slave, who owed him the obedience of a son. In addition, patron and freedman were under mutual obligations of a stringent character. From this arose the practice among the impetuous of seeking the favour of an influential man whose clients or dependants they became, and who accepted the title of patron.

Belief in the protection of the saints brought the practice of adopting particular saints as patrons of churches, guilds, etc., as well as of individuals.

Patronage. Literally, that which a patron can give, a favour of some kind. Patronage is of two chief kinds. The right to bestow benefices in the Church of England is known as patronage, whether it is exercised by bishops or laymen. Political patronage, i.e. the right to appoint persons to offices of state, is much less extensive than it was formerly, but it appertains to most rulers and ministers of state. In the U.K. the existing office of patronage secretary to the Treasury is a reminder of its past importance. See Benefice; Ecclesiastical Law.

Patten (Fr. *patin*, clog). Wooden shoe or clog with an iron ring or thick sole to raise the foot out of the mud. Pattens were worn in the 15th century for cleanly walking in the badly kept streets, and survived as chopines through two centuries. See Boots, col. plate.

Pattenmakers' Company, THE. London city livery company. Its origin was a fellowship of clog-

Pattenmakers' Company arms

makers which flourished in the 15th century. The church of S. Margaret Pattens, Eastcheap, is said to mark the old centre of the industry. The Pattenmakers were first incorporated by charter, Aug. 2, 1670. Their office is at 14, King William Street, E.C.4.

Patteson, JOHN COLERIDGE (1827–71). British missionary. Born in London, April 1, 1827, son of a judge, and educated at Eton and Balliol, Oxford, he was ordained

John C. Patteson,
British missionary

he was murdered, Sept. 20, 1871, on Nukupu, having been mistaken for a slave-dealer. *Consult* Lives, C. M. Yonge, 1898; F. H. L. Paton, 1930.

Patti, ADELINA JUAÑA MARIA (1843-1919). Anglo-Italian singer. Born at Madrid, Feb. 19, 1843, she made her operatic début as Lucia in 1859 in New York, where her parents, Italian musicians, had gone to reside. In 1861 she sang with great success in London as Amina in *La Sonnambula*, and afterwards visited the chief cities of Europe. Madame Patti was for long the most popular soprano in England, probably in the world, and is held by many to have been the greatest who ever performed. Her series of farewell concerts in London lasted from 1895 to 1908. She was thrice married, her third husband being a Swede, Baron Cederström, who owned Craig-y-Nos Castle, Brecon. She died Sept. 27, 1919. Buried first in England, her body was exhumed and interred in Père Lachaise, Paris. Craig-y-Nos Castle is now a sanatorium, for which it was bought in 1924.

Adelina Patti,
Anglo-Italian singer

Pattison, DOROTHY WYNDLOW (1832-78). British philanthropist, known as Sister Dora. Born at Hauxwell, Yorks, Jan. 16, 1832, she was a daughter of the rector and the youngest sister of Mark Pattison (v.i.). In 1864 she joined the sisterhood of the Good Samaritan at Coatham, and in 1865 took charge of a hospital conducted by that community at Walsall. In 1877, during an epidemic of small-pox, she became superintendent of the Walsall municipal hospital. She died Dec. 24, 1878. A statue was erected in Walsall to her memory. *Consult* Sister Dora, M. Lonsdale, 1880.

Pattison, MARK (1813-84). British scholar. Born Oct. 10, 1813, at Hornby, Yorks, he was

educated at Oriel College, Oxford. He associated during his early years with Newman, but later became more liberal in his views. In 1839 he was elected a fellow of Lincoln College, being ordained in 1841. In 1855 he resigned his tutorship, but returned to Oxford in 1861 as rector of Lincoln, remaining there until his death at Harrogate, July 30, 1884. His widow, Emilia Francis Strong, married Sir C. W. Dilke (q.v.).

Pattison wrote lives of Casaubon and Milton, and contributed to *Essays and Reviews* (q.v.). His *Memoirs*, published posthumously in 1885, are almost painful in their frankness; he is sometimes bitter towards others, and always hard on himself. *Consult* *Recollections of Pattison*, L. A. Tollemache, 1891.

Patton, GEORGE SMITH (1885-1945). American soldier. He was born at San Gabriel, Calif., Nov. 11, 1885, and graduated from West Point in 1909. He was aide-de-camp to Gen. Pershing, 1916-17, later commanding a tank brigade. Commanding general, the 1st armoured corps in 1941, he was at

Mark Pattison,
British scholar

because of his outspoken political opinions. He died at Heidelberg on Dec. 21, after a motoring accident. He wrote *War as I Knew It*, pub. posth. 1948. *Consult* *The Man in a Helmet*, J. Wellard, 1947.

Pau. Town of France. The capital of the dept. of Basses-Pyrénées, it stands on the right bank of the Gave du Pau, 66 m. E.S.E. of Bayonne. The chief building is the castle, built in the 14th century by Gaston Phoebus, count of Foix; later it was enlarged, and it was restored by Louis Philippe, although part is still a ruin. It has a noted collection of tapestries. Other buildings include the hôtel de ville, an old Jesuit college, and a museum. In the Place Royale is a statue of Henry IV. Standing at a height of 670 ft., with a delightful climate, Pau is a favourite winter resort. It was the residence of the counts of Foix, while during 1512-89 it was the capital of the little state of Béarn. Henry IV and Marshal Bernadotte were born here. Pop. 46,158.

Paul. Urban dist. of Cornwall, England. It is 2 m. S. of Penzance. The chief building is the church of S. Paul and the main industry is fishing. The Spaniards burned the village in 1593. Near by are remains of a British camp. Pop. 5,813.

Paul. Masculine Christian name. Of Roman origin, it is a

Pau, France. View from the left bank of the Gave, showing the 14th century castle

the head of the western task force when the Allies landed in N. Africa. Lieut.-gen. in 1943, he led the 7th army through the Sicilian campaign. In W. Europe, Patton commanded the U.S. 3rd army, formed Aug. 1, 1944, which cut off the Cotentin pen. and liberated Paris in what was virtually a continuous drive from Normandy to the Siegfried Line, where he was halted by difficulties of supply. He helped to restore the situation in the Ardennes after the German break-through. In 1945 Patton was appointed military governor of Bavaria, but was transferred to the command of the 15th army

contraction of Paucillus, and means small. It became popular throughout Christendom because borne by S. Paul. The form Paulus is sometimes used; Paula, Pauline, Paulina and Paulette are feminine.

Paul. Christian apostle and saint. He was born at Tarsus, Cilicia, about the same time as Jesus Christ was born in Judea. He was originally called Saul, the change being mentioned without explanation in the account of his first missionary journey. He was a Jew of the Dispersion, who had learnt the trade of a tent-maker in Tarsus, a city which specialised in the manufacture of

haircloth. Sent to Jerusalem to train as a rabbi, he studied "at the feet of Gamaliel," but did not absorb that great scholar's tolerant spirit. After the Resurrection he became one of the leading opponents of the followers of Christ, and headed a persecution intended to suppress them, being present at the martyrdom of Stephen. But on his way to Damascus, to further the persecutions, he was converted by a vision of Christ to the faith he was attempting to destroy.

After three years of meditation in Arabia, he went to Jerusalem. The confidence of the disciples was won for him by Barnabas, and he began to preach with great power. The opposition of the Jews was too strong, and he had to move to Tarsus, where he spent some years (of which there is little record) in evangelising his native province. Then Barnabas, whose work at Antioch was proving successful, summoned his help there. Thence he set forth on his first missionary journey, made in a circle round Cilicia. This was attended with great difficulties and astonishing success; but his second mission was by far the most adventurous and influential, carrying the Gospel into Europe, and evangelising the cities of Greece, including Athens and Corinth. For the third journey, covering the same ground, the chief centre was Ephesus.

His aspiration now was to preach the Gospel in Rome, and this hope was fulfilled, though in an unexpected way. Arriving in Jerusalem after his third journey, he was arrested at the instance of the Jews. As a Roman citizen by birth he appealed to Caesar, and therefore had to be sent to Rome for trial before the emperor. On his way he suffered long imprisonment at Caesarea, and at Rome he waited two years for trial. But from prison he kept up ceaseless communication with the churches he had founded all over the Empire. He sent them letters, now known as the Epistles, and received letters from them; their leaders visited him, and his helpers visited them.

It has been questioned whether he was ever freed, but the probability is strong that he was. The two Epistles to Timothy and that to Titus appear to belong to the period after his first Roman imprisonment, and contain mentions of visits to such places as Ephesus and Crete. In the second Epistle to Timothy, written from prison in Rome, he is expecting

not release, but the speedy ending of his course. At Three Fountains, a spot to the S. of Rome, is shown the traditional scene of his beheading.

At the outset of Paul's Christian career, he strongly maintained against the opinion of the Jewish church, as well as of Peter, James, Barnabas, and other associates, the right of Gentiles to full communion in the Church without submission to the Jewish law, and thereby laid the foundation of Christianity as a world religion rather than a Jewish sect. For this, and for his great missionary zeal, he has been called the second founder of Christianity. He occupies a lofty place among both thinkers and men of action. Through faith and love he felt himself one with Christ; and in his own personality it seemed to him that Christ continued to act and suffer. Justification by faith, union with Christ, and the universality of the Gospel became the watchwords of his life and he never wavered from his proclamation of them in phrases that have become part of the everyday consciousness of the Christian world. See Acts of the Apostles; Christianity; Church; and under the various Epistles, e.g. Galatians.

Paul. Name of five popes. Paul I succeeded his brother Stephen II in May, 757. He associated himself with the Frankish king Pepin, and entered into friendly relations with the emperor of the East. He died June 28, 767.

Paul II (1417-71). Pope from 1464 to 1471. A Venetian and the nephew of Eugenius IV, Pietro

Paul II,
Pope 1464-71

Barbo abandoned a secular career on the elevation of his uncle to the papal throne (1431). He was created cardinal in 1440, and was elected pope in suc-

cession to Pius II. As Paul II he instituted the carnival at Rome, built the palace now known as the Palazzo di Venezia, and was a patron of the arts. He died July 26, 1471.

Paul III (1468-1549). Pope from 1534 to 1549. Born Feb. 29, 1468, of an ancient Roman family,

Paul III,
Pope 1534-1549

Alessandro Farnese studied first at Rome and afterwards at Florence, where his association with the court of the Medici laid the foundations of his career. He was made cardinal in 1493 by Alexander VI, and increased in favour under successive popes. On his election to the papacy he was bishop of Ostia. His pontificate coincided with the Counter-Reformation.

He afforded material assistance to the emperor in his struggle against the Protestant princes of the Schmalkalden League, but Charles V's methods of compromise created a breach between them which was never healed. The general council met at Trent in December, 1545, but an outbreak of the plague led to its adjournment to Bologna, and subsequently, as a result of the emperor's demand for its return to German territory, the pope indefinitely suspended its meetings. He died Nov. 10, 1549.

Paul IV (1476-1559). Pope from 1555 to 1559. Born near Benevento, June 28, 1476, a member of the Caraffa family, Giovanni

Paul IV,
Pope 1555-59

Pietro was ordained, and in 1524 resigned his benefices to enter a religious order founded by S. Cajetan. Picked out by Paul III for the work of reform, Caraffa was in 1536 made cardinal, and afterwards archbishop of Naples. He was elected pope in his 80th year. The chief feature of Paul IV's pontificate was an implacable opposition to Spain, which prompted his war with Philip II, his alliance with France, and the enrichment of his worthless nephews with possessions taken from the Colonna family, who supported the Spanish interest. He reorganized the Inquisition, before which he caused to be

summoned even eminent clerics, on the bare suspicion of heresy. Paul IV died Aug. 18, 1559.

Paul V (1552-1621). Pope from 1605 to 1621. Born at Rome, Sept. 17, 1552, Camillo, a member of the

Paul V,
Pope 1605-21

noble Borg-hese family, studied law at Perugia and Padua. He was created cardinal by Clement VIII in 1596, and elected pope in succession to Leo XI.

The chief event of his reign was his quarrel with Venice. In England the pope forbade Catholic subjects to take the oath of allegiance demanded by James I. He died Jan. 28, 1621. See Life, T. A. Trollope, 1861; History of the Papacy, M. Creighton, 1903; History of the Popes, L. v. Pastor, Eng. trans. F. I. Antrobus, 1891-1912.

Paul I (1754-1801). Tsar of Russia. He was born Oct. 1, 1754, the son of Catherine the Great and Peter III, who had such an aversion for him that he refused to acknowledge him. After the murder of Peter in 1762 Catherine seized the throne, and Paul led an obscure existence until her death. Paul began his reign by banishing the counsellors of Catherine. He joined the allied powers against Napoleon, and later entered into an alliance with Napoleon in order to crush the Bourbons. On March 23, 1801, he was assassinated.

Paul I,
Tsar of Russia

Paul I (b. 1901). King of the Hellenes. The younger brother of George II, he was born at Athens, Dec. 14, 1901, and joined the Greek navy. He lived much in England. He was a qualified air pilot, and trained as a parachutist. In 1938 he married Princess Frederica of

Paul I,
King of the Hellenes

Brunswick, a descendant of Queen Victoria. They have a son, Constantine, and two daughters. He succeeded to the throne on the death of his brother, April 1, 1947.

Paul. Prince of Yugoslavia. The son of Prince Arsène and grandson of Alexander Kara-Georgevitch, prince of Serbia 1842-1859, Prince Paul was born in St. Petersburg (Leningrad), April 28, 1893. He studied at Oxford and lived for some time in England. When Alexander I of Yugoslavia was assassinated, Oct., 1934, Paul became head of a council of regency, King Peter (q.v.) being a minor. The dictatorship imposed by Alexander I was still in force, and, while he maintained it, he showed himself in sympathy with liberal elements and with the demands of the Croats. In March, 1941, popular indignation against his signing of an agreement with the Tripartite powers led to a *coup d'état*. On March 27, 1941, Peter assumed power, Paul resigned the regency, and fled with his family to Athens. On Jan. 2, 1942, when he was in Kenya, the Yugoslav government in London annulled his membership of the royal family. But he was included among those members of the royal household who under a decree issued Mar. 9, 1947, were deprived of Yugoslav citizenship.

Paul,
Prince of Yugoslavia

Paul of Samosata. Third century heretic. Born at Samosata, on the Euphrates, he was appointed bishop of Antioch about 260. He was condemned for heresy by the council of Antioch in 264, and was deposed from his bishopric five years later. But the influence of Zenobia of Palmyra maintained him in his position till 272. He taught that the Word was not made flesh, but merely manifested itself in Christ without making Him divine. In his view, the Trinity was merely a triple form of manifestation of God.

Paul-Boncour, JOSEPH (b. 1873). French statesman. Born Aug. 4, 1873, at St. Aignan-sur-Cher, he became a barrister, and was a member of the Waldeck-Rousseau cabinet of 1899 and the Viviani cabinet of 1906-09. He sat first as an independent Republican Socialist deputy, but joined the Socialists in 1911, in which year he was minister of Labour under Monis. After 1919 he became a prominent leader of the Socialist, and after 1931 of the Radical-Socialist party. In 1932

he became minister of war under Herriot. When Herriot refused to sanction repudiation of the French debt to the U.S.A., he succeeded him as premier, Dec., 1932, but resigned the next month. He held the foreign affairs portfolio in the Daladier, Sarraut, and Chautemps governments, 1933-34, attending the world economic conference, June, 1933, and signing the Franco-Russian trade agreement, Jan., 1934. He had been a delegate to the League of Nations from 1924 to 1926, and in 1932 was appointed permanent French delegate there, returning to France on his appointment as minister of state for League affairs, Jan., 1936. He resigned this post six months later. For a time he was out of politics, but returned after the Second Great War, representing France at the United Nations Assembly.

Paul et Virginie. Story by Bernardin de Saint-Pierre. It was first published in 1789 as one of his Studies of Nature. The scene is laid in the island of Mauritius, and the story is of the great affection of the hero and heroine—somewhat conventionalised “children of nature.” The tragic tale is one of the classics of sentimentalism.

Paulet or Poulett. Famous English family, the heads of which are the marquess of Winchester and Earl Poulett. Its earliest members came apparently from the village of Pawlett, near Bridgwater, and one of them, Sir Amyas Poulett, was knighted in 1487. A later Sir Amyas was gaoler of Mary Queen of Scots, and others were noted soldiers.

In 1551 Sir William Paulet was made marquess of Winchester, and in 1689 the 5th marquess was created duke of Bolton. The latter title became extinct when the 6th duke died in 1794, but the marquessate passed to another branch of the Paulets. In 1627 John Poulett, a descendant of Sir Amyas, was made Lord Poulett of Hinton. John, the 4th lord, was made Earl Poulett in 1706, and in 1710-11 was first lord of the treasury and nominal head of a Tory ministry.

Pauli, WOLFGANG (b. 1900). Austrian physicist. Born in Vienna, April 25, 1900, he was educated at the university, and in 1921 was appointed assistant physicist at Göttingen. In 1922 he went to Copenhagen university as a pupil of Bohr (q.v.). Having taught physics in turn at the universities of Hamburg and Zürich, he went in 1935 to the U.S.A., becoming visiting professor of theo-

retical physics at Princeton, and in 1938 lecturer at Michigan university. In 1940 he returned to Princeton, and in 1945 was awarded the Nobel prize for research in the development of atomic energy.

Paulicians. Heretical sect which arose in Syria about 660, under the teaching of Constantine of Mananalis, who assumed the name of Sylvanus. They are variously said to have been named after S. Paul, whose teaching they professed to follow, and after a certain Paul who is said to have preached Manichaean doctrines in Armenia. While they repudiated the alleged apostleship of Mani, they adopted his doctrines of the essential evil of matter and the dualistic origin of the universe. They denied the inspiration of the O.T., and rejected the doctrine of the Atonement. They also repudiated the sacraments.

The Paulicians were constantly persecuted from the 7th till the middle of the 9th century, when they leagued themselves with the Saracens and revolted against the emperor. Finally they were defeated, but continued to give trouble; and early in the 10th century they became powerful in Bulgaria, where their teaching had spread widely. At the close of the 11th century they were scattered by Alexius Comnenus.

Paulinus. English prelate. Born in Rome, he became a monk, and in 601 was one of those sent to England by Pope Gregory I to assist S. Augustine. After working in Kent he went in 625 to Northumbria, where in 627 he baptized the king, Edwin, and became the first bishop of York. After the death of Edwin in 633, he returned to Kent and became bishop of Rochester.

Paulinus, GAIUS SUTONIUS. Roman general. In A.D. 41 he suppressed a revolt in Mauritania, thus extending the Roman power to the base of the Atlas Mountains. In 59 he was appointed governor of Britain, and two years later subdued Anglesey, the stronghold of Druidism. Summoned south to quell the Iceni, who had rebelled under the leadership of their queen, Boadicea (q.v.), Paulinus gained a decisive victory over them near London. The following year he was recalled to Rome, and in 66 was consul. After the death of Galba, he served under Otho, and in 69 was defeated by Vitellius.

Paulistas. Descendants of the first Portuguese settlers in Brazil. Settled mostly round São Paulo,

whence their name, they formed a vigorous and progressive race who opposed with equal energy Indians, Spaniards, and Jesuit missionaries, and successfully opened the country for Portugal as far as the Andes.

Paul Jones. Popular ballroom dance feature, in which partners and tempi are frequently changed. It is named after the sailor, of whose life details will be found under Jones, John Paul.

Paulownia (*Paulownia imperialis*). Tree of the family Scrophulariaceae. It is a native of Japan. It has large opposite, downy leaves and tubular, violet flowers with darker spots, in elongated clusters at the ends of the shoots.

Paul Pry. Character of a three-act comedy of the same name by John Poole, produced at the Haymarket Theatre, London, Sept. 13, 1825. An inquisitive gossip, he tries to learn all about other people's business by eavesdropping or appearing with the half apologetic "I hope I don't intrude," which came to be a catch phrase. The creator of the part was Liston, and later it was often played by Toole. Paul Pry is also the title of a two-act comedy by Douglas Jerrold, produced at the Coburg Theatre, Nov. 27, 1826.

Paul Pry, as acted by John Liston
After G. Clint. A.R.A.

Paulus, FRIEDRICH VON (b. 1890). German soldier. Born at Breitenau, Hesse, he served in the First Great War with an infantry commission and on the staff. After 1933 he was engaged in the development of German armoured forces. He was chief of staff to Reichenau in the campaign against Poland, 1939, and subsequently with the rank of lieutenant-general supervised the training of armies for Russia. Promoted to colonel-general in 1942, he distinguished himself at Kharkov and commanded the 6th Army at Stalingrad, but his forces were surrounded in the Russian counter-offensive of Nov., and he was taken prisoner Jan. 31, 1943,

with his entire staff. He had just been promoted field-marshal. Paulus published a statement on

Paulownia. Leaves and cluster of tubular flowers

behalf of the council of free Germans in Russia, Aug. 8, 1944, and on Nov. 14 broadcast a denunciation of the Nazis and an appeal to the Germans to end the war. After the war he remained in Russia.

Paulus, LUCIUS (OR MARCUS) AEMILIUS. Roman general. Consul in 219 B.C., he was awarded the honour of a triumph for his victory over Demetrius of Pharos, an Illyrian general who had carried on piratical expeditions in forbidden waters, contrary to treaty conditions. Again consul in 216, he lost his life at the battle of Cannae, fought on Aug. 2 against his advice, refusing to leave the field after the defeat of the Romans.

Paulus, LUCIUS AEMILIUS (c. 229-160 B.C.). Roman general. The son of the above Lucius Paulus, he received the surname of Macedonicus from his defeat of Perseus, the last king of Macedonia, at Pydna in 168 B.C. He was one of the best types of the old republican nobility. His son was adopted into the family of Scipio and became known as Scipio Africanus Minor.

Paulus Diaconus OR PAUL THE DEACON. Medieval historian. By birth a Lombard, he was born about 725, and became a member of the court of the Lombard king. Later he entered a monastery, and became a deacon, dying before 800 at Monte Cassino, a Benedictine abbey where he had lived for some time. He was known to Charlemagne, and was one of those who helped in the 8th century revival of learning. The reputation of Paulus rests on his History of the Lombards. A Latin chronicle, it tells the story of the Lombards down to 747, and about the relations between the Franks and the Lombards is the most valuable authority extant. Other writers con-

tinued it. It was first printed in 1514, and has been translated into English and other languages.

Pauperism (Lat. *pauper*, a poor person). State of dependence upon the community through lack of the ordinary means of subsistence. As long ago as in the time of ancient Greece the maintenance of the poor was a matter of state concern. The sale of grain to the poor at low prices, and ultimately its free distribution, marked the decadence of the Roman empire and contributed to its downfall. Feudalism involved the dependence of the serf upon his lord for maintenance, and the Church became throughout the Middle Ages the greatest almsgiver. When the monasteries fell, the poor suffered, but in England vagabondage had been a crying evil long before this. Repressive measures had been tried in vain. Compulsory contributions for the support of the poor began in England in 1535, the duty of relief being put on the parish. A law of 1801, by taxing every parishioner for the relief of the poor in his parish, formed the basis of the English poor law system. See Poor Laws.

Pausanias. Spartan general. After the death of his father Cleombrotus (480 B.C.), he acted as regent for Pleistarchus, the son of Leonidas, and hence is sometimes erroneously called king of Sparta. In 479 he was appointed to the command of the combined Greek force which defeated the Persians at Plataea (q.v.). He then captured Byzantium, whence the Persians threatened the Aegean Sea, but, impressed with the magnificence of the Persian empire, made overtures to Xerxes, offering to assist in the subjugation of Greece, and asking the hand of his daughter. Xerxes received these overtures favourably, and Pausanias began to treat the representatives of the allied states with such arrogance that they transferred their allegiance from Sparta to Athens.

Meanwhile suspicion had been aroused, Pausanias was recalled to Sparta, and twice stood his trial for treason. He was acquitted on each occasion, but an intercepted letter to the Persian monarch placed his guilt beyond doubt. After an unsuccessful attempt to provoke a Helot revolt, Pausanias took refuge in a temple, which was walled up with a view to starving him to death. At the last moment, in order that the sacred place might not be polluted by death, he was brought out, and expired. c. 471.

Pausanias (c. A.D. 150). Greek traveller and geographer. Perhaps a native of Lydia, he travelled extensively in Greece, embodying the results of his journeys in a work in 10 volumes, *The Itinerary of Greece*. Modern research largely confirms the accuracy of the *Itinerary*. Pausanias travelled also in Egypt, Syria, Palestine, and Italy.

Pause. In music, a sign placed over a note or rest to indicate that it is to be sustained *ad libitum* beyond its written value. It is also used for a rest.

Pavane (Ital. *pavano*, from Lat. *pavo*, peacock). Stately dance tune in duple time, joining with the galliard in the earliest kind of suite. Thomas Morley, in *A Plaine and easie Introduction to Practicall Musicke*, 1597, wrote of the Pavane as "a kind of staide musicke, ordained for grave dauncing . . . everie straine is plaid or sung twice. A straine they make to contain 8, 12, or 16 semibreves as they list, yet fewer than eight I have not seene in any pavan. . . . After everie pavan we usually set a galliard." Modern examples have been composed by Fauré and Ravel.

Pavia. Prov. of N. Italy, in Lombardy. It is bounded N. by Milan, N.W. by Novara, S.W. by Alessandria, and S.E. by Piacenza. Mountainous in the S., it stretches N.W. from the Ligurian Apennines to the valley of the river Po. Fertile tracts in the N. and centre are watered by the Ticino, Sesia, and other tributaries of the Po. There are many canals, the chief linking up the Ticino with the Olona. Area, 1,287 sq. m. Pop. est. 500,000.

Pavia. City of Italy. The capital of the prov. of Pavia, it is the ancient Ticinum. It stands on the left bank of the Ticino, near its junction with the Po, 22 m. by rly. S. of Milan. A magnificent 14th century covered bridge spanned the river, but was severely damaged in an air raid, Sept. 5, 1944. The cathedral was founded in 1487 and the façade finished in 1898. S. Michele, one of the finest specimens of the Lombard basilica, dates from the 11th century. In it some of the

medieval emperors were crowned kings of the Lombards. The original church, which was in existence as early as 661, was burned down in 1004; its successor was restored in 1863-76.

The university is a handsome building dating from 1490, but Pavia was a centre of learning by the 9th century. Attached to the modern edifice is a well-stocked library and a botanic garden. The Palazzo Malaspina houses a collection of paintings, engravings, and historical relics. The Castello, built by Galeazzo Visconti about 1360, is a huge rectangle with arcades, which formerly contained a priceless collection of armour and antiquarian relics; it was looted by the French in 1500, and was long used as a barracks. Near by is the Certosa di Pavia. Manufactures are unimportant, but there is trade in silk, wine, olives and olive oil, corn, hemp, and Parmesan cheese. Pop. 51,741.

Founded by Gauls, Pavia was the capital of the kingdom of the Lombards until 774, when it was captured by Charlemagne. It fell into the hands of the Visconti in the 14th century, and thereafter shared in the fortunes of Milan. It was sacked three times by the French, and occupied by Austria in 1706, 1746, and 1814, and retained by them until 1859, when it became Italian. See Certosa.

Pavia, BATTLE OF. Victory of Charles V over the French, Feb. 24, 1525. After a protracted siege of the city of Pavia by Francis I of France, an imperial army was collected for its relief and the battle opened without the city walls. The day was going in favour of the French when their Swiss mercenaries deserted in a body. Troops emerged from the city and took the French in the rear, and after a bloody contest the latter were routed with a loss

Pavia, Italy. Part of nave and pulpit of the cathedral

of 10,000 men, Francis himself being taken prisoner. The battle ended the French invasion of Italy.

Pavilion. Word derived indirectly from Lat. *papilio* (butterfly) and used at first for a tent of a rather elaborate kind. It was given to the temporary erections at tournaments and festivities, e.g. at the Field of the Cloth of Gold, 1520. Today it is chiefly used for a building attached to a sports or recreation ground.

Paving. Surface covering of path, yard, terrace, court, or street. Solid interior floorings are also sometimes termed pavings. Early pavings were of cobble stones and paving stones (flags) laid on earth. Stone flags are now laid on sand, fine ashes, or concrete. They are usually bedded in mortar. Pre-cast concrete slabs are now often used, or bricks laid on edge are bedded and jointed in cement mortar on a concrete foundation. Concrete, sometimes reinforced, poured on a prepared ground surface is widely used for paving paths, yards, and roads. Temporary wood or steel edge forms are fixed with pegs and a screeding board is moved over these edges to finish the concrete surface. Expansion joints are spaced at intervals of from 15 to 30 ft. To give a hard wearing surface the top inch or two of concrete may incorporate small granite chippings in a mix called granolithic.

Quarry tiles or burnt clay laid on concrete are sometimes used for paving terraces and verandas. Concrete tiles incorporating aggregates of coloured stone and marble are likewise used. Tarmacadam, a mixture of tar or bitumen and stone chippings, is also frequently used for paths, pavements, and roads, or asphalt (coloured for ornamental purposes) may be utilised, laid either on concrete or well rolled ballast.

While similar materials may be used for interior pavings, the principal materials are granolithic; quarry tiles; black, white, and coloured clay tiles; terrazzo and marble mosaic; marble slabs; jointless composition. These are all laid on a concrete foundation.

Granite setts and wood blocks, once widely used for street paving, are not now favoured, because they are responsible for excessive traffic noise and for wheel skids when the surface is wet.

Paviors' or Pavioours' Company, THE. London city livery company. Referred to in Strype's Stow, ed. 1755, as "no doubt a

Paviors' Company arms

130, Mount St., W.I. See An Account of the . . . Pavioours, C. Welch, 1909.

Pavlograd. Town of Ukraine S.S.R. It is 40 m. E. of Dniepropetrovsk, on the river Volocha, and the Kursk-Sevastopol rly. Here have been numerous flour mills, tobacco and brick works, and considerable trade in grain and cattle. Captured by German forces in Oct., 1941, Pavlograd was retaken by Russian troops on Feb. 20, 1943. A German counter-attack forced the Russians to leave again on March 9; but the Germans were finally driven out on Sept. 19. Pop. est. 50,000.

Pavlov, IVAN PETROVITCH (1849-1936). Russian physiologist. Son of a village priest in Ryazan, he was born Sept. 27, 1849, and educated at a theological seminary and St. Petersburg (Leningrad) university. He qualified as a doctor in Germany. Appointed director of physiological studies at the medical institute of St. Petersburg in 1890, he was professor 1897, and in 1907 was one of four scientific members of the academy. A series of papers on digestion, written over many years, won him a Nobel prize in 1904. After the Revolution he became director of the academy of medicine. His work on the nervous system increased his fame and he was acclaimed, particularly by the Behaviourist school of psychology in the U.S.A., among the most brilliant of modern scientists.

Pavlov is most widely known for his experiments on the reflexes of animals, which proved that reflex action could be conditioned by stimuli other than that which normally called it forth. Dogs, subjected for a period to the stimulus of a ringing bell every time they were fed, eventually salivated when the bell was rung alone. In 1934 the Soviet government gave Pavlov 1,000,000 roubles for the

Ivan Pavlov, Russian physiologist

company of antiquity," but without any record of incorporation, and by Maitland in 1739 as a company by prescription, this guild was reconstructed in 1889. The office is at

extension of his laboratories, and an annual pension of 20,000 roubles. He died Feb. 27, 1936.

Pavlova, ANNA (1885-1931). Russian dancer. Born at St. Petersburg (Leningrad), Jan. 31, 1885, she trained at the imperial ballet school there, and became prima ballerina at the Marinsky Theatre. She made her London debut at the Palace Theatre in 1910, dancing with Mordkin in *Les Papillons* and *Valse Caprice*. She appeared with Diaghilev's company in Paris, but love of tradition and classicism resulted in her dissociating herself from contemporary ballet, and forming her own company. In such dances as *Le Cygne*, probably her most famous piece, her genius was realized to the full. Pavlova was a supreme exponent of the classic manner; her magnificent virtuosity was matched only by grace and exquisite sense of style. She carried out world tours and frequently went to the U.S.A., though she made her permanent home at Hampstead. She died Jan. 22, 1931. *Consult* Anna Pavlova, by her husband, V. Dandré, 1932; also Pavlova, the Genius of the Dance, W. Hyden, 1931.

Anna Pavlova, Russian dancer

Pavlovo. Tn. of the R.S.F.S.R. in Gorky region, 45 m. by rly. S.W. of Gorky, on the river Oka. Long one of the most important industrial centres of Russia, it has been called the Russian Sheffield. There are factories of locks, knives, and ironware, also soapworks.

Pavo or Peacock. Ancient southern constellation named by Bayer. It possesses several double stars, notably Zeta Pavonis.

Pawl. Device used in engineering to control movement. It consists of a wedge-shaped catch pivoted at its centre and moving either freely or spring-controlled. The pointed end of the pawl engages with the ratchets of a cogged wheel or rack, and can give limited motion to the wheel or rack or prevent reverse motion. It is fitted on winches, capstans, and other winding machines. The tension of the mainspring of a watch or clock is held during winding by a pawl.

Pawn. Chessman, one that is not a "piece." Each player begins with eight pawns, which he places one in front of each of his pieces. The pawn moves only one square

forward at a time, except that its first move may be two squares. It captures an opposing man one square forward diagonally. A pawn reaching the far side of the board becomes any piece its owner chooses. See Chess illus., p. 1996.

Pawnbroker. Person licensed to lend money at interest on the security of articles deposited with him. The origin of pawnbroking may be traced to early times, both in Europe and in Asia. In Christendom, however, the practice was philanthropic in character, rather than commercial, since the *mont de piété* was originally an Italian institution, supported by the popes, and based on loans to the poor, free of interest. Various attempts were made, the earliest in 1361, to introduce this benevolent system into other countries, but in the end interest was everywhere charged by pawnbrokers, though the rates were controlled by legislation.

Pawnbroking and banking often went together, and in England, in the reign of Edward I, certain Italian traders gained a foothold on or near the site of Lombard Street. The origin of the three golden balls as the pawnbroker's sign is doubtful; it is at any rate improbable that, as one story goes, they are derived from the arms of the Medici, though that family gained much power by profitable loan transactions with needy potentates. The Lombards enjoyed their monopoly of pawnbroking until exorbitant charges brought their expulsion in the reign of Elizabeth, and the first year of her successor brought the first controlling legislation. Further regulating Acts were passed in 1756, 1783, 1800, 1856, 1859, and 1860, and these were consolidated in the Act of 1872.

For loans over £10 a pawnbroker is subject to the same rules as moneylenders, for those not over £10 to the Pawnbrokers Acts, 1872 and 1922. His profit on loans of 40s. or under is $\frac{1}{4}$ d. for the first month and for each succeeding month or part of month, on every 2s. or fraction of 2s.; he may charge for the pawn ticket, and also, at the time of the pledge, charge $\frac{1}{4}$ d. for each 5s. or part of 5s. lent. On loans over 40s. he may charge $\frac{1}{4}$ d. for each month or part of month on each 2s. 6d. or fraction of 2s. 6d. Special contracts, however, may be made with loans exceeding 40s.

Every pawnbroker must take out an annual licence granted by the local authority at a cost of £7 10s. He must also display his rates of interest, and keep his

books in good order. The act also sets out certain things which the pawnbroker must not do, e.g. take an article in pawn from an intoxicated person.

Pledges may be redeemed at any time within one year and seven days, on production of the pawn ticket and payment of the loan and accrued interest. Articles unredeemed within the specified term, if pawned for 10s. or less, become the absolute property of the pawn-

Paziuba Palm. Head of leaves; inset: left, fruit; right, aerial roots

broker, and cannot be redeemed after the time has expired. Those pawned for over 10s. may be redeemed even after the time has expired, unless already disposed of. Full records of all articles sold must be kept for three years for inspection on demand by the holder of the ticket, who may also demand from the pawnbroker, within the same period, any sum received from the sale in excess of the charges due and the expenses of the sale of articles pawned for over 10s. If the sale results in a deficit, the pawnbroker may sue for the difference.

Pawnbrokers are liable for loss by fire, or damage by neglect to pledges in their possession. They also have to exercise great caution with regard to goods which may have been stolen.

Pawnee. Confederacy of North American Indian tribes, formerly in Nebraska. Taking part in the Caddoan migration from the S.W., they came into contact with the Algonquins, who enslaved their captives, and in the 17th century bartered them to the white colonists. Hence Pawnee came to denote any aboriginal slave. Only a few hundreds remain, in Oklahoma.

Pawtucket. City of Rhode Island, U.S.A., in Providence co. It stands at the head of navigation on both banks of the Blackstone (known locally as the Pawtucket or Seekonk), 4 m. N. of Providence. It is served by the New York, New Haven, and

Hartford rly., and there is steamship connexion with New York. The state's second largest city and manufacturing centre, it forms virtually a single community with Providence and Central Falls. Pawtucket Falls, 50 ft. high, provide water power. Pawtucket has textile manufactures of all materials and varieties, and contains dyeing, bleaching, and finishing works. It became a city in 1885. Pop. 75,797.

Paziuba Palm (*Iriartea ventricosa*) OR ZANONA PALM. Tall tree belonging to the family Palmae, found in the Amazon region and Guiana. The trunk, which attains a height of 60 to 100 ft., has a considerable bulge in girth about half way up, and throws out aerial roots about 6 ft. from the ground. The leaves are 12 to 20 ft. long, divided into two rows of leaflets.

Paxo OR PAXOS. Smallest of the seven chief Ionian Islands, Greece. With dimensions 5 m. by 2 m. and a rocky surface, it produces fruits and olive oil. The capital is Gaios, on the E. coast.

Pax Romana (Lat., Roman peace). Term applied to the condition of the Roman empire from the accession of Nerva, A.D. 98, to the death of Marcus Aurelius, 180. This period was one of profound peace. The analogous phrase Pax Britannica came into use during the 19th century to denote the peace maintained by British military strength, in particular by the R.N., which kept the high seas open for all peaceful traders.

Paxton, Sir Joseph (1801-65). British architect. Born at Milton Bryant, Beds, Aug. 3, 1801. the

son of a small farmer, he was appointed superintendent of the gardens at Chatsworth in 1826. Here he built the conservatory and fountains, and when the Great Exhibition of 1851 was planned the former served as a model for the Crystal Palace. Paxton was knighted in 1851, and represented Coventry in parliament from 1854 until his death at Sydenham, June 8, 1865.

Pay As You Earn. Term for a system of income tax deduction on wages and salaries. It was introduced in April, 1944, under the Income Tax (Employment) Act, 1943. All employers had to

Sir Joseph Paxton, British architect After Oakley

deduct from payments of wages and salaries the instalments of tax payable by the employee. Previously the tax had been assessed after the expiration of the period during which it had been earned; half-yearly demands for payment were normally received by the individual several months after he had received the remuneration, which sometimes meant hardship. Some employers had introduced voluntary schemes to mitigate this hardship by deducting tax weekly or monthly, before this plan became compulsory.

Assessment of liability to tax was related to current earnings, varying with the earnings from week to week or month to month. Each individual had a code number dependent on the tax allowances to which he was entitled by personal circumstances. The employer was supplied with tax tables for all the code numbers of his employees and had for each employee a tax deduction card, showing the gross pay to date and the tax payable on it. Each employee should receive an annual assessment based on his income return and tax payments during the preceding year. Arrears of tax may affect the code number.

Paymaster. An administrative officer in the navy and army. In the navy the grades range from assistant paymaster (under four years' standing), corresponding to sub-lieutenant, to the paymaster-in-chief, who has equivalent rank to executive captain. They may be distinguished by a white stripe added to the gold cuff stripe or stripes. See Royal Army Pay Corps.

Paymaster-General. Government official in charge of a small department which pays out public money in accordance with the votes of parliament, and as requisitioned by the Treasury. He is a member of the government, but not of the cabinet, and is unpaid. He was first appointed after 1660, and perquisites and commissions long made his office perhaps the most lucrative in the public service. In 1835 the office was reorganized and is now of secondary importance. See Treasury.

Payment of Members. Term used for the payment of salaries to members of a legislature. In England the payment of members' expenses, as distinct from salaries, dates from Norman times, and was at first defrayed from the constituencies, but lapsed during the Stuart period, when a seat in

the house of commons was regarded as a privilege. With the growth of the Liberal party in the 19th century and the return of members who did not have private incomes, various proposals to pay them were made, and on Aug. 11, 1911, a salary of £400 a year was sanctioned by parliament. In 1921, a bill was introduced to exempt these salaries from income tax, but was defeated by a vote of the house. In 1931, during the financial crisis, the figure was reduced to £360, but it was increased to £380 in 1934 and restored to £400 next year. In 1937 it was raised to £600 a year, and in 1946 to £1,000 a year, of which half was to be tax free. By the same legislation, rly. season tickets were allowed to members for daily journeys between their homes and Westminster during sessions.

Most British dominions pay the members of their legislatures. Members of the upper and lower houses of the Canadian parliament receive \$4,000 a session with travelling and other expenses allowed; a deduction of \$25 a day is made for every day beyond 15 when a member does not attend. Members of the New Zealand legislative council receive £375 a year, and of the house of representatives £750 a year; travelling expenses are allowed, and there is a deduction for non-attendance. Members of the senate and house of representatives in the Australian Commonwealth are allowed £1,000 a year with free rly. passes. In New South Wales the legislative council receive no salary but may travel free on rlys. and trams; while members of the legislative assembly each receive £375 a year, free passes on rlys. and trams, and a postal allowance of £30 a year. Queensland pays its legislators £850 annually plus travelling expenses and an allowance for stationery and postage.

Representatives and senators of the U.S. congress each receive about £2,000 a year with travelling, postal, and clerical expenses. See Member of Parliament.

Payne, (BEN) IDEN (b. 1881). British theatrical producer. Born at Newcastle-upon-Tyne, Sept. 5, 1881, he was educated at Manchester grammar school, and joined Benson's company in 1899. After helping Miss Horniman to organize her company for the Gaiety Theatre at Manchester, he produced there, 1907-11. During the First Great War he produced

plays in the U.S.A., becoming visiting professor at the drama school at Pittsburgh and the state university at Iowa. He was director of the Shakespeare memorial theatre, Stratford-on-Avon, 1935-43, then of the American Shakespeare Company.

His daughter, who acted as Rosalind Iden, born in Manchester July 29, 1911, was for years in Shakespearean repertory as leading lady to Donald Wolfit, whom she married in 1948. See Acting illus. p. 77.

Payne, JOHN HOWARD (1791-1852). American actor and playwright. He is chiefly remembered as the author of *Home, Sweet Home*, introduced into the opera Clari, 1823. He was U.S. consul at Tunis, 1842-45, and from 1851 until his death.

Paysandú. Department of W. Uruguay. It is situated E. of the Uruguay river, which separates it from the Argentine prov. of Entre Ríos. It is rich in minerals, yielding gold, silver, copper, and iron. Sheep and cattle are reared, and the vine is cultivated. Area, 5,115 sq. m. Pop. 84,265.

Paysandú, the capital, was founded in 1772 on the E. bank of the Uruguay river, 282 m. by rly. N.W. of Montevideo. It has large abattoirs and carries on a trade in livestock. Pop. 31,000.

Payta. Seaport of N. Peru, in the dept. of Piura. It exports cotton, cotton-seed, goat skins, and hides. The port is specially equipped for traffic in petroleum. There is a short rly. to Piura, the capital of the dept. Pop. 4,000.

Pea (*Pisum sativum*). Annual climbing herb of the family Leguminosae. Its seeds and pods are edible, and form one of the most popular vegetables. The origin of the garden pea is unknown, but it is said to have been introduced into England from S. Europe in 1548. The seed is best sown monthly from Feb. to May or June, in a deep rich soil with a little lime. Seeds are sown

Pea. Pods of green pea, showing ones split open
Courtesy of Carters

about 3 or 4 ins. deep and 1 in. apart diagonally for the dwarf kinds, and at a greater distance for the taller sorts, while the rows are from 18 ins. apart for the dwarf kinds and from 4 to 6 ft. apart, according to height; for the taller growing varieties. The plants are usually trained upon brushwood, known as pea-sticks, or across horizontally stretched wires or strings. Dwarf peas need no training, but are apt to be spoiled by violent rains. The variety known as sugar pea has edible pods. -See Fruit; Sweet Pea.

Peabody. City of Massachusetts, U.S.A. It is in Essex co., 2 m. by rly. W. of Salem. It contains the Peabody Institute, with a fine library and lecture hall. The city is mainly concerned with leather industries, and besides boots and shoes produces gloves, electrical appliances, and cotton goods. Formerly known as South Danvers, it assumed its present name in 1868 in honour of George Peabody (v.i.). It became a city in 1916. Pop. 21,711.

Peabody, GEORGE (1795-1869). American philanthropist. Born at South Danvers, Mass., Feb. 18, 1795, he was employed as a lad in a dry goods store, setting up in business for himself in 1814. Branches were opened in New York and Philadelphia, and in 1837 Peabody came

George Peabody
American
philanthropist

to London, where, retiring from the American business in 1843, he set up as a merchant and banker. The large fortune he had amassed in America he employed in philanthropic work. He gave £150,000 for the London poor, and £500,000 to establish the Peabody buildings. In 1866 he founded the Peabody museum of natural history at Yale, Conn., and the museum of archaeology and ethnology at Harvard. He died Nov. 4, 1869; after lying in state in Westminster Abbey, his remains were taken to America. His statue is behind the Royal Exchange. South Danvers was renamed Peabody in 1868.

Peabody Museum. There are two institutions of this name in the U.S.A., each founded by George Peabody in 1866. (1) The Peabody museum of archaeology and ethnology at Harvard has sent out more than 450 expeditions to various parts of the world, with notable

results in Mayan archaeology and the ethnology of the Pacific Islands, Africa, S. America, and the plains and N.W. coast of N. America. (2) The Peabody museum of natural history at Yale is primarily interested in research and teaching in connexion with palaeontology, zoology, and mineralogy. It has one of the foremost collections of dinosaurs in the U.S.A.

Peabody Trust. Fund established in 1862 by George Peabody, who gave or left a total sum of £500,000 to trustees to build houses for the working classes of London. Blocks of buildings were erected in various parts of London until there were 30 of them. By the end of 1946 the trust owned dwellings with over 20,000 rooms, in which 19,432 persons lived.

Peace. River of Canada. Rising W. of the Rockies in the mountains of British Columbia, it passes through the Rockies and flows mainly N. and N.E. through the N. of Alberta. Just N. of Lake Athabaska it joins the Slave, and the united stream empties itself into the Great Slave Lake. Its length is 1,054 m., and its chief tributaries are the Beaton, Finlay, Smoky, Little Smoky, and Parnip. The river is navigable beyond Dunvegan except for 2 m. near Vermilion Falls. Its basin covers 117,000 sq. m. The Peace River district, which straddles the provs. of British Columbia and Alberta, is rich agriculturally and in minerals, especially coal.

Peace, CHARLES (1832-79). British criminal, born in Sheffield, May 14, 1832. He received his first sentence for robbery in 1851. In 1854 he received four years' penal servitude for burglary, and afterwards always worked alone for fear of betrayal. Peace had a remarkable power of disguise. The loss of two fingers of one hand suggested to him the use of a false arm with a hook, an identity mark which he put on and off at pleasure.

On Nov. 29, 1876, Peace committed at Bannercross, near Sheffield, the murder for which he was hanged. At large after a term of penal servitude, he was living under his own name, next door to an engineer named Arthur Dyson. Bad blood arose between the two

men over Mrs. Dyson, and Peace shot the husband. He then disappeared, and, under the name of John Ward, started a career of burglary in the London suburbs, living in a large house in Peckham and passing as a rich man.

Charles Peace,
British criminal

One early morning in 1878, a policeman named Robinson came across Peace at work in the grounds of a large house on St. John's Hill, Wandsworth. Peace shot and wounded him but was nevertheless secured and, as John Ward, was convicted at the Old Bailey, Nov. 19, of attempting the life of a policeman, and sent to penal servitude for life. The woman with whom Peace had been living, however, betrayed him, and he was tried at Leeds winter assizes for the murder of Dyson, and sentenced to death. He confessed to many burglaries and at least one murder, that of Constable Cook at Manchester in 1876, for which crime a man named Habron was suffering penal servitude for life at the moment of Peace's confession. Peace was hanged at Leeds, Feb. 25, 1879.

Peace Ballot. Referendum organized in Great Britain in 1935 by the League of Nations Union. Five questions were asked: (1) Should Great Britain remain a member of the League? (2) Are you in favour of an all-round reduction of armaments by international agreement? (3) Are you in favour of the all-round abolition of national military and naval aircraft by international agreement? (4) Should the manufacture and sale of arms for private profit be prohibited by international agreement? (5) Do you consider that, if a nation insists on attacking another, the other nations should combine to stop it by (a) economic and non-military measures; (b) if necessary, military measures?

Lord Cecil announced the results at the Albert Hall, June 27, 1935. Over eleven and a half million ballot-papers were returned. The voting is shown below.

Question	Yes	No	Doubtful	Abstentions	Christian Pacifist	Total
1	11,090,387	355,883	10,470	102,425	14,121	11,559,165

5 (b)	6,784,368	2,351,981	40,893	2,364,441	17,482	

Peacehaven. Town of Sussex, England, about $6\frac{1}{2}$ m. S.E. of Brighton, and 3 m. S.W. of Newhaven. It stretches about $\frac{1}{2}$ m. along the South Downs on the Brighton - Newhaven - Eastbourne road. It came into existence as a product of speculative building shortly after the First Great War, and remained largely undeveloped. It is chiefly composed of small villas, bungalows, and huts, built without regard to plan or to its fine position at the summit of the chalk cliffs facing the English Channel.

Peace Pledge Union. British branch of the War Resisters' International, founded in Oct., 1934, by Canon H. R. L. Sheppard, George Lansbury, and Brig.-Gen. F. P. Crozier. Members, who pay a voluntary contribution towards the expenses of the union, sign a pledge to renounce war and never to support or sanction another. Membership reached 140,000 in 1939; during the Second Great War over 70,000 members were registered as conscientious objectors, while several thousand refused to accept the awards of the tribunals and were imprisoned. Some accepted non-combatant war service. The offices are at 6, Endsleigh Street, London, W.C.1, and there are branches throughout Great Britain.

Peach (*Prunus Persica*). Small fruit-bearing tree of the family Rosaceae. It is a native of Asia, was cultivated before the Christian era, and was introduced into Britain in the 16th century. The flowers are pink, white, and red, and the peach fruit is large, pale yellow and crimson in colour, with softly hairy skin. The nectarine, a variety, is much smaller and smooth-skinned.

Peach. Flowers and, top, fruit and section

There are two types of peaches, known as freestone and clingstone. In the former the flesh parts readily from the stone, but in the latter

fibrous cords from the stone hold the flesh around it. In Great Britain out-of-door peaches will thrive in favoured situations on walls with a S. or S.W. aspect. The fan-shaped trees are planted about 15 ft. apart, in well-drained turfy loam, with a little lime added. If the walls are not trellised or wired, the branches must be trained. Peaches require plenty of water in the summer time, and protection from winter frosts. Red spider is the principal pest. Under glass, peaches are started in pots in a temperature ranging between 45° and 60° , between Jan. and March. The potting mixture consists of loam, crushed bones, and well-rotted manure, and the trees need watering freely during spring and summer. Pruning is rather drastically performed when the shoots are about 2 ins. long. The fruit itself is thinned when it is about the size of a grape. Propagation is by seeds or grafting. There is a double-flowered peach (*Persica vulgaris flore pleno*) which is grown as an ornamental shrub, for the sake of its blossoms, in sunny borders. It thrives in any ordinary soil, and has white flowers.

Peach Palm (*Bactris minor*). Tall slender tree of the family Palmae. It is a native of the

Peach Palm. Spray of fruit of *Bactris gasipa*; inset, single fruit

Amazon region. The trunk is armed with sharp spines, and the leaves are from 2 to 4 ft. long, divided into two rows of slender leaflets a foot long. The egg-shaped, peach-like, scarlet and orange fruit is in large bunches.

Peacock (*Pavo*). Genus of the pheasant family. The common peacock (*P. cristatus*) is a native of India and Ceylon. It was introduced into Europe at an early date, and was a favourite table bird with the Romans and in the medieval period.

The peacock is one of the handsomest of birds, especially at the

breeding season, when the male displays his gorgeously eyed train for the delectation of the hens. This train is not the tail, but a prolongation of the upper tail-cover feathers, and when spread may be seen to be supported by the true tail feathers. The peacock breeds readily in captivity. The green or Java peacock is a native of Burma, Malay Peninsula, and Java, and is about the same size as the common peacock, but with a more brilliant plumage. See Bird colour plate.

Peacock, THOMAS LOVE (1785-1866). British poet and novelist. Born at Weymouth, Oct. 18, 1785,

T. Love Peacock, British author

he left school early to enter business in London, but in his leisure acquired a good knowledge of the classics. In 1812 he met Shelley, and was closely associated with him, and appointed his executor. In 1819 Peacock entered the service of the East India Company, rising to be chief examiner 1836-56. The best of his poems is *Rhizophne*, 1818, which shows the influence of Shelley, but he deserves to be remembered rather for satirical novels, such as *Headlong Hall*, 1816; *Nightmare Abbey*, 1818; *Maid Marian*, 1822; *Crotchet Castle*, 1831. He died at Halliford, near Chertsey, Jan. 23, 1866. One of his daughters married George Meredith (*q.v.*). Peacock's works were edited by H. Cole, 1875, and R. Garnett, 1891; and his life was written by C. van Doren, 1911, and J. B. Priestley, 1927.

Peak. Wild tableland of Derbyshire, England. It is in the N.W. of the county, forming the S. end of the Pennine Chain. Its highest point is Kinder Scout (2,088 ft.), other heights being Axe Edge, near Buxton (1,860 ft.), and Mam Tor (1,700 ft.). Castleton is regarded as the capital of the Peak, and Chatsworth is known as the palace of the Peak. Peveril Castle, near Castleton, figures in Scott's *Peveril of the Peak*. The Peak has no definite limits, although it may be described as the district N. of Buxton. It is a wild, moorland area, watered by a number of streams that feed the Derwent. On it are stone quarries, and grouse are shot on the moors. Peak Forest is a rly. station 36 m. N.W. of Derby. The Peak Cavern is a cave at Castleton, which goes 500 yards

into the limestone. High Peak is a parl. div. of Derbyshire.

Peake, FREDERICK GERARD (b. 1886). British soldier and administrator. Born at Melton Mowbray, he was educated at Fareham and the R.M.C., Sandhurst. Commissioned in the Duke of Wellington's Regiment in 1906, he served in India until 1913, when he was seconded to the Egyptian army to serve with the camel corps. In 1916 he transferred to the R.F.C. Inspector-general of the Trans-jordan gendarmerie, 1921, he became director of public security in the country, 1923. Peake raised the Arab Legion, which he commanded until his return to England in 1939. In 1942 he became acting inspector of constabulary for England and Wales.

Pea Nut (*Arachis hypogaea*). Herb of the family Leguminosae, better known as the ground nut (*q.v.*) or monkey nut.

Pear (*Pyrus communis*). Tree of the family Rosaceae. It is a native of Great Britain, and from E. Europe to the Himalayas. The soil in which the pear thrives best is a deep, rich loam, free from clay subsoil. When once established pears liberally repay a weekly dose of solution of nitrate of soda during the summer months. They are propagated in the same way as apples, chiefly by grafting, but the best stock to employ is the quince (*q.v.*), except for standards.

Late pears should never be left on the trees after the middle of Nov., but picked and carefully stored in a well aired room, on wooden shelves, care being taken

that one fruit does not touch another. They may be artificially ripened when desired by placing them on a sunny shelf in a heated greenhouse. The pear, particularly in an uncooked state, should be avoided by

Pear. Fruit of cultivated variety

persons with a tendency to biliousness. Pears are grown in the S. and W. of England for the manufacture of perry, a mildly alcoholic beverage prepared in the same way as is cider from apples. See Perry.

Pearl. Secretion deposited by many bivalve molluscs, oysters and mussels, and a few univalves, in the form of a great number of thin layers of calcium carbonate, one upon the other. Whether

found as oval, spherical, or irregularly shaped independent objects, as "blisters" attached to the shells, or as the smooth

fera), which also is the principal source of mother-of-pearl, and another kind, *M. fucata*. These yield white, yellowish white, bluish white, reddish, grey and black pearls. The finest blacks, which are much esteemed, come from the South Seas and the gulf of Mexico. The hammer oysters of the Gambia ls. yield bronze tinted pearls. Pale rose coloured pearls with velvety lines come from the Bahamas. Garnet red, pale and dark brown ones are obtained from the fan mussel (*Pinna nobilis*), blue from the edible mussel, violet from the ark shell (*Arca Noae*), and purple from the *Ammia cepa*.

Pearl. 1. Opening shells to find pearls. 2. Shell containing a fine pearl, found off Turtle Island, 1909. 3. Cluster of Japanese pearl oysters

inner lining of the shells, called mother-of-pearl, the main composition is identical, though in some instances special colouring matter is present. The beautiful iridescent play of colour, pearly lustre or "orient," is due to irregular refraction caused by obstruction to light by the numerous thin layers. Pearls of fine shape are formed within the mantle, or fleshy substance, of the mollusc, while irregularly shaped pearls and blisters are formed between the fish and the shell or even on the shell itself.

Pearls dissolve in acids, discolour if exposed to alkali, or even to constant warmth against human skin. They are light in weight and comparatively soft, the degree of hardness being between 3 and 4. The best pearls are produced by the pearl oyster (*Meleagrina margariti-*

In the trade pearls are known as pear, bell, or drop, according to their shape; those of irregular form are known as buttons, fancy, blisters, or baroques. Paragons are of the size of small walnuts; cherries, or cherry stones, seed, shot, and dust are the smallest.

Imitation pearls are fashioned out of mother-of-pearl, but are easily detected, as the layers are not fully concentric. The finest imitation pearls are made on a principle discovered by Jacquin, of Paris, in 1680. He used hollow beads of colourless glass, coated with a mixture of gelatin and the tiny silvery scales of the bleak (*q.v.*), and filled with wax to give solidity.

"Cultured" pearls are produced by introducing into the flesh of the oyster, usually under the liver, a foreign substance which the oyster

covers with nacre. The Japanese were noted for their development of this branch of the industry.

Most pearl fisheries are found within the tropic seas. In ancient times pearls came chiefly from India and the Persian gulf. Other current sources are the Sulu sea, the coasts of Ceylon and Australia, the shores of Central America, Bahrein, Borneo, Aru Is., New Guinea, Labuan, Timor, New Caledonia, the bay of Mulege, the gulf of California, La Paz, the Caribbean sea, the gulf of Mexico, and Venezuela. River pearls are found in temperate climates in the northern hemisphere; pearls were found in Scotland in 1355. Principal Scottish rivers which have yielded pearls are the Spey, Tay, South Esk, and Forth. Pearls are also found in many parts of the U.S.A., notably in the Mississippi and in Warren co.

Fishing is generally undertaken by divers from boats, armed with knives and bags attached to belts round their waists to contain the oyster shells. In other instances baskets are lowered and hauled up by ropes. Many fishers wear diving dresses, which enable them to remain longer in deep water. In Australia, where pearl oyster beds are laid down in shallow waters, dredging is also adopted. See Australia; Bahrein Islands.

Bibliography. The Great Barrier Reef of Australia: Its Products and Potentialities, W. Saville-Kent, 1893; Report on the Pearl Oyster Fisheries of the Gulf of Manaar, W. A. Herdman, 1903; Book of the Pearl, G. F. Kunz and C. H. Stevenson, 1908; Pearls, W. J. Dakin, 1913.

Pearl. English poem. It was written about 1370 by the unknown author of Sir Gawayne and the Green Knight, Cleanness, and Patience. Pearl, written in 101 stanzas of 12 lines, tells how the author, grieving at the death of his infant daughter, whom he calls his pearl, sees her in a vision as a grown maiden standing on the farther bank of a river. She comforts and instructs him, and finally shows him the New Jerusalem. Consult editions by I. Gollancz, 1891; C. G. Osgood, 1906; Pearl rendered into Modern English, C. G. Osgood, 1907.

Pearl. River of Mississippi, U.S.A. Rising in Winston co., it follows a winding course of 295 m. to the Rigolets, a channel communicating between lakes Borgne and Pontchartrain. It drains an area of 7,250 sq. m. and is navigable for small craft for about one-third of its length, while larger vessels reach Gainesville. In 1816

the Pearl river convention met to petition congress for Mississippi's admission to the union.

Pearl. Group of islands in the Bay of Panama, Central America, belonging to the republic of Panama. The largest are San Miguel, Del Rey, San José, and Pedro Gonzales, and there are numerous islets. They were so named from the pearl fisheries, which are actively prosecuted.

Pearl. Type, half the size of long primer, a size smaller than ruby and a size larger than diamond. It is known also as 5 point, and about 15 lines make an inch in depth. It is called both *Parisienne* and *Sédanoise* in French, *Perl* in German, *joly* and *pearl* in Dutch, and *occhia di mosca* in Italian.

Pearl Ash OR POTASH. Crude, impure potassium carbonate. It was formerly obtained by burning waste wood, extracting the ashes with water, and evaporating the solution in earthenware pots. Most of the potassium carbonate today is made from potassium chloride by heating with magnesium carbonate, water, and carbon dioxide under pressure to give a double salt of potassium and magnesium. This is decomposed by heating and the potassium carbonate recovered from the filtrate. Pearl ash is used in the manufacture of glass and soap.

Pearl Fruit (*Margyricarpus setosus*). Small shrub of the family Rosaceae. It is a native of the Andes. The alternate leaves are broken up into awl-shaped leaf-

lets. The inconspicuous, small green flowers are produced at the base of the leaves, and are succeeded by the minute pearly fruits which give the plant its name.

Pearl Harbour. Port of Oahu, one of the Hawaiian group of islands in the Pacific Ocean. Situated 7 m. W. of Honolulu, the

Pearl Harbour. Air view of the U.S.A. naval base in the Pacific, four years after the Japanese attack in 1941.

port is landlocked and provides deep anchorages. Pearl Harbour is the principal U.S. naval base in the Pacific, and has adjacent to it a number of army and marine corps flying fields. Here on Dec. 7, 1941, Japanese aircraft attacked the harbour installations and units of the U.S. Pacific fleet, so bringing the U.S.A. into the Second Great War (*v.i.*).

Pearl Harbour, ATTACK ON. At 7.55 a.m. (local time) on Dec. 7, 1941, Japanese midget submarines and carrier-borne aircraft made a devastating attack on the U.S. warships and installations at Pearl Harbour. The attack took place before the Japanese declaration of war, which was not made until some hours later, and while Japanese envoys in Washington were still negotiating with the U.S. secretary of state.

As Pearl Harbour lies nearly 4,000 m. from Japan, and some 2,000 m. from the Japanese mandated Caroline and Marshall Is., the forces taking part in the attack must have received their orders some days previously. Although many warnings had been issued to the military and naval commanders at Hawaii, no attempt had been made to put the Pearl Harbour defences at readiness.

There was a complete lack of cooperation between Admiral Kimmel, the naval commander, and Lt. Gen. Short, the army commander. The army's aircraft warning service was not operating; no regular

Pearl Fruit. Flower-bearing branch of this small shrub. Inset, left, leaf; right, fruit

reconnaissance or inshore patrols were maintained by either service; neither the A.A. nor coastal batteries were manned or supplied with ammunition; and the anti-torpedo net closing the harbour was open. An attack by Japanese submarines and the possibility of Japanese sabotage in Hawaii had been envisaged and a few minor precautions taken; but both commanders, being convinced that the risk of air attack was negligible, deliberately ignored orders from Washington. Shortly after 6.30 a.m. on Dec. 7 a small Japanese submarine was sunk by a U.S. patrol plane and the U.S.S. Ward in the prohibited area of Pearl Harbour, and at 7.45 a.m. a second midge submarine was sighted inside the harbour net defences. On neither occasion did the naval authorities issue an alert or take any precautions. At 7.2 a.m. an n.c.o. under training at the aircraft warning station, which normally closed down at 7 a.m., picked up a large flight of aircraft at a distance of 130 m. N.E. of Oahu. When this was reported 18 mins. later to the central information centre, no action was taken.

The formation, consisting of 21 torpedo-dropping aircraft, 30 dive bombers, and 15 horizontal bombers, divided into three sections, one attacking the naval aerodrome at Kaneohe bay, another the army air bases at Wheeler and Hickham Field, and the third the warships in Pearl Harbour. The dive bombers concentrated on the airfields, and in eight attacks put out of action 150 of 202 naval aircraft and 97 of 273 army fighters and bombers. Owing to the cratering of the runways, few of the surviving army aircraft were able to take off to oppose the enemy. Of the 52 naval aircraft undamaged, 38, in addition to 7 patrol planes already up at the moment of attack, became airborne and engaged. By a coincidence, 18 U.S. reconnaissance bombers from a U.S. carrier arrived at Kaneohe bay while the raid was in progress; four of these were shot down and one disabled, but the remainder took the air.

The attack on Pearl Harbour, where 86 warships of the Pacific fleet were at anchor, was also made in eight runs. One of the battleships immediately opened machine-gun fire and brought down two torpedo planes. Within 10 mins. all ship-borne A.A. batteries had come into action.

The first phase of the Japanese attack lasted half an hour. From 8.25 a.m. until 8.40 a.m. there was a comparative lull. This was ended by a dive and precision bombing attack which destroyed the port and airfield installations. At 9.45 the Japanese withdrew, having lost 40 of their 105 aircraft engaged. Three Japanese submarines of 45 tons were accounted for.

For their comparatively light losses, the Japanese had achieved their object of immobilising for a time the U.S. Pacific fleet. Five battleships, three destroyers, a minelayer, and a large floating dock were either sunk or so seriously damaged that they were militarily useless. Three battleships, three cruisers and a number of smaller craft were temporarily out of action. Of the vessels listed as sunk or damaged, only one battleship became a total loss, and by Dec., 1942, most of the others had been salvaged or repaired. Losses in personnel were particularly heavy: naval and marine corps casualties were 2,117 killed, 876 wounded, 960 missing; those of the army 226 killed and 396 wounded.

On Dec. 16, 1941, Admiral Kimmel and Lt.-Gen. Short were relieved of their commands, and on March 1, 1942, the U.S. war and navy depts. announced that both officers would be court-martialled on charges of dereliction of duty, but that the court martial would be postponed until such time as public safety and interest permitted. No court martial took place, however.

The raid on Pearl Harbour gave Japan air and sea supremacy, and effectively prevented any immediate linking of U.S. and British Far Eastern naval forces.

So insistent was the public demand for an explanation that eight separate inquiries concerning the disaster were made between 1941 and 1945. The final inquiry issued its report, a document of 492 pages, on July 20, 1946, and placed the blame squarely on the two local commanders.

Documents captured during the occupation of Japan and the examination of Japanese officials proved that a surprise attack on Pearl Harbour was originally proposed and planned early in Jan., 1941, by Admiral Yamamoto, c.-in-c. of the imperial navy. Early in Sept., 1941, these plans were incorporated into a secret operation order, issued in Nov., when Japan finally decided upon war with the U.S.

The disaster of Pearl Harbour united the diverse elements in the U.S.A. in determination to wage war until Japan and her allies were destroyed, and enabled President Roosevelt to mobilise the country's manpower and resources on a scale which would have been impossible in the First Great War.

David Le Roi

Pearlite. Constituent of steel, an intimate mixture of ferrite and cementite. It was first described by H. C. Sorby, who called it the pearly constituent of steel. It may be either granular or lamellar in structure, and, if the latter, the lamellae may be alternately hard and soft. If the polished surface of a steel containing pearlite is etched with acid, and then viewed obliquely in white light, the surface presents a mother-of-pearl appearance; hence the name pearlite. It is characteristic of steel which has cooled slowly from a high temperature. The term is also used to describe similar lamellar microstructures in other alloys. See Steel.

Pearl Powder. Crystalline form of calcium sulphate employed in paper making for hardening the surface of paper. It is also known as pearl hardener. A powder made from fish scales, used for giving the effect of pearl to celluloid and xylonite, is known commercially as pearl powder. The term is also used for a cosmetic consisting of bismuth oxychloride.

Pearse, PATRICK HENRY (1879-1916). Irish politician. He was born in Dublin, Nov. 10, 1879, his father being English. A leader of the Gaelic revival as a means of advancing Irish Nationalism, he toured Europe and the U.S.A. and then founded a school near Dublin. Here, however, after the transport strike of 1913, the study of arms accompanied that of language, for Pearse was active among the Volunteers. At the Easter rebellion of 1916 he was in command, and though he ordered surrender when the civilian dead numbered 400, he was executed by British authorities, May 3.

Pearson, SIR CYRIL ARTHUR (1866-1921). British newspaper proprietor. Born Feb. 24, 1866, at Wookey, Somerset, son of the Rev. A. Cyril Pearson, he was educated at Winchester. He began journalism as sub-editor of Tit Bits, founded Pearson's Weekly in 1890, Home Notes in 1894, Pearson's Magazine in 1896, and the Daily Express (*q.v.*) in 1900. Somewhat later he acquired a controlling

Sir C. A. Pearson,
British newspaper
proprietor

amalgamated with the last named the *St. James's Gazette*. Over-taken by blindness, he retired from journalism in 1912 and devoted himself to the welfare of those similarly afflicted, especially of soldiers and sailors, organizing *St. Dunstan's (q.v.)* of which he was the first chairman. He was made a baronet in 1916 and a G.B.E. in 1917. Died Dec. 9, 1921.

Pearson, JOHN (1613-86). English divine. He was born at Great Snoring, Norfolk, Feb. 28, 1613, and educated at Eton and King's College, Cambridge, of which he became a fellow. In 1640 he was appointed rector of Thorington. In 1654 he became weekly preacher at S. Clement's, Eastcheap, London, and there delivered the sermons which in 1659 he published under the title of *An Exposition of the Creed*. In 1660 he became master of Jesus College, Cambridge, in 1661 professor of divinity, in 1662 master of Trinity College, and in 1673 bishop of Chester. He died July 16, 1686.

Pearson, KARL (1857-1936). British scientist. He was educated at University College School, London, and King's College, Cambridge, and was called to the bar at the Inner Temple, 1882. His interests, however, were largely scientific, and he studied the theories of evolution and heredity, especially from the mathematical standpoint. He was professor of eugenics and director of the laboratory of national eugenics in the university of London. Pearson wrote many books on science, including *The Chances of Death and Other Studies in Evolution*, 1897; *The Grammar of Science*, his most important work, 1899, rev. ed., 1911; *The Life and Letters of Francis Galton*, 1914. He died April 29, 1936.

Peary, ROBERT EDWIN (1856-1920.) American explorer. Born May 6, 1856, he entered the U.S.

navy as a civil engineer in 1881. Arctic exploration had long been his study and during 1891-92 he carried out a sledging expedition of 1,300 m. from McCormick Bay to the N.E. coast of Greenland. Other voyages followed between 1893 and 1897; in 1898 he surveyed and charted the coast N. of Greenland, and in 1902 and 1905 he made attempts to reach the Pole. In 1908 he began the voyage which,

according to his own account, led to his discovery of the N. Pole, April 6, 1909, although some doubt at first existed whether he

actually reached it. Promoted rear-admiral, 1911, he died at Washington, Feb. 19, 1920. See *Arctic Exploration*; Cook, F. A.; *Consult* North Pole, R. E. Peary, 1910; Peary, W. H. Hobbs, 1937.

Peary Land. Desolate ice-bound tract of N. Greenland. It was discovered by Lockwood and Brainard in 1882. The neighbouring fiords were explored in Rasmussen's second Thule expedition, 1916-17. It was named after Peary, the explorer, who spent a considerable period in surveying this region.

Peasantry (Fr. *paysan*, from Lat. *pagensis*, countryman). General term for the rural population of a country labouring on the land for wages, or holding and tilling small plots of land for themselves. See *Allotment*; *Labourer*; *Métayer System*; *Small-holdings*.

Peasants' Revolt. Rising of the peasantry in England in 1381. There was at this time much discontent due to the enactment of the statute of labourers, a consequence of the Black Death, and to other causes. The imposition of a poll-tax brought matters to a head. On May 30 there was an outbreak at Brentwood. On June 2 a more serious movement began. In Kent Wat Tyler, supported by John Ball, appeared as its leader.

Maidstone and Dartford were centres of disorder, while Essex and other eastern counties were also in revolt. Manor houses and manor rolls were destroyed, lawyers singled out for vengeance. The Kentish and Essex rebels marched to London, burned the prisons and other buildings in Southwark, crossed London Bridge, and murdered Simon of Sudbury, archbishop of Canterbury, and the treasurer, Sir Robert Hales. At

Mile End Richard II met them and persuaded some of them to go home. Next day, June 15, there was another meeting at Smithfield, where Tyler was stabbed by the lord mayor, but Richard quieted his followers, who dispersed on the strength of his promise that their grievances should be removed. This, however, was not kept. Meanwhile, the Norfolk rebels had been crushed at N. Walsham by the bishop of Norwich. See *England: History*; Tyler, W. *Consult* *Rising in E. Anglia* in 1381, E. Powell, 1895; *The Great Revolt of 1381*, C. Oman, 1906; *London Bridge is Falling*, P. Lindsay, 1934; *Nine Days that Shook England*, H. Fagan, 1938.

Peasants' War. Rising of the peasantry which took place in Germany in 1522-25. It was due mainly to economic causes, and broke out in the Black Forest area. The rising, however, spread to Franconia, and was especially successful in Thuringia. Roused to action, the princes collected an army, and, led by Philip of Hesse, defeated the Thuringian rebels at Frankenhäusen in May, 1535, their leader, Thomas Münzer, being killed. See *Germany: History*.

Pease. Name of a family famous in the industrial life of N. England. The first to attain wealth and position was Joseph Pease, a woollen manufacturer at Darlington about 1760. His son, Edward (1767-1858), helped George Stephenson in his rly. enterprises and became connected with the coal, iron, banking, and other industries in and around Darlington. His sons, Joseph and Henry, were both members of parliament, Joseph being the first Quaker to sit therein. Of the next generation the most prominent members were Sir Joseph Whitwell Pease (1828-1903), created a baronet in 1882, and his brother, Arthur. Both sat in parliament, as did their sons.

Sir Joseph's elder son, Sir Alfred E. Pease, was a great hunter and sportsman, and the younger, Joseph Albert was made Lord Gainford (*q.v.*) in 1916. Arthur's son, Herbert Pike Pease, held office on the Unionist side, and later in Lloyd George's coalition government. In 1923 he became Lord Darynton and was an ecclesiastical commissioner. Earlier Peases were Quakers and advocates of peace and the abolition of slavery.

Peat. Spongy substance of vegetable origin common to almost every temperate country. The larger part of British peat appears

R. E. Peary,
American explorer

John Pearson,
English divine

to be composed of mosses, hill peat being mainly sphagnum and andromeda, while lowland is principally hypnum moss. The formation of peat depends upon a particular combination of climatic and topographical conditions. There must be a soil which will retain water at or near the surface, a sufficiently low temperature to prevent rapid evaporation, a temperature not too low to prevent the growth of vegetation, yet low enough to check too rapid a decay. The average temperature best suited for the formation of peat ranges from 42° to 48° F.

The process which converts plant substances into peat is similar to that which has formed the coal measures, but the oldest peat deposits are, geologically speaking, modern compared with coal. Peat bogs cover an area of about 6,000,000 acres in the British Isles, Ireland alone possessing 3,000,000 acres. They vary greatly in depth, in Ireland rarely exceeding 20 ft., while in parts of Wales and on Dartmoor the deposits are as much as 40 ft. deep.

Pure peat, thoroughly dry, contains from 49 to 64 p.c. of carbon,

and has a calorific value rather more than half that of a similar weight of black coal. In most areas peat is cut by hand, with a long, narrow, very sharp shovel. Freshly cut, it contains as much as 80 p.c. of water. The turves or sods are stacked edgewise, leaning one against another, and dried by sun and air. The mechanical cutting of peat has been introduced in some countries, e.g. Eire, Germany, and Russia, where the product has been used for steam generation. Peat can

be burned in its natural air-dried state, milled and compressed into briquettes, or as a dried powder. Other uses are to produce gas for gas engines; as peat moss litter in agriculture and horticulture; and for the extraction of certain kinds of wax. Consult Peat and its Manufacture, Björling and Gissing, 1907; Winning and Utilisation of Peat, A. Hansding, 1921; The Winning, Harvesting and Utilisation of Peat, H.M.S.O., 1948.

Pebrine or **MUSCARDINE**. Disease affecting silkworms. It was formerly ascribed to the attack of a fungus, but is now known to be caused by a microscopic single-celled protozoan (*Nosema bombycis*). The disease manifests itself by the appearance of dark spots on the skin, the larva becomes languid and stunted, with defective appetite. Most die in the larval stage, but a few contrive to spin a loose cocoon and pupate. If moths emerge from the pupae they are feeble, and their eggs transmit the disease to the next generation. The disease, which is both contagious and infectious, and has at times been epidemic in the silk-producing districts of France and Italy, can be combated only by killing the sick insects. It is prevented by cultivating the larvae out of doors on netted trees. It is estimated that before Pasteur

established its true nature, the disease involved the French silk industry in a loss of £40,000,000.

Pecan (*Carya illinoensis*). Alternative name for the American hickory nut (q.v.).

Peccary (*Pecari*). Genus of ungulate mammals with only three toes on the hind foot. They are natives of America from Paraguay to Arkansas and Texas. Although much resembling small pigs in appearance and gregarious habits, they have no tails. The bones above the foot unite to form a cannon-bone. The most

Peccary. The collared peccary, a tailed mammal of America

familiar species is the collared peccary (*P. angulatus*).

Peck. Measure of capacity for liquids and dry goods. It is equal to two gallons. Under the Weights and Measures Act, 1878, the measure must not be heaped.

Peckham, District of London. It is part of the bor. of Camberwell, and was anciently a manor and village, in the parish of S. Giles. It is mentioned in Domesday Book, and was formed early in the 7th century. It comprises Peckham Rye and lies N. of Honor Oak, where stood the boundary oak between Kent and Surrey; W. of Hatcham, where is now New Cross; S. of Rotherhithe; and E. of Camberwell Green. Peckham Road, Peckham High Street, and Queens Road (formerly Deptford Lane) connect Camberwell with New Cross. In Camberwell Church Street is S. Giles's church, and in Peckham Road are Camberwell town hall, school of arts and crafts, and the site of the central library. At the corner of Lyndhurst Way is Peckham House, an 18th century mansion, now devoted to the cure of nervous disease. In the vicinity are the S. Metropolitan gas works, founded 1833, and the Licensed Victuallers' Asylum, founded 1824.

As a manor Peckham was successively the property of Westminster abbey, Bishop Odo of Bayeux, William Rufus, Henry I, and Robert, 1st earl of Gloucester. King John hunted in its park, and literary figures such as Donne, Goldsmith, and Browning were residents. From 1840 Peckham lost its rural attractions, being rapidly built over and industrialised. Peckham Rye Park, opened 1894, still preserves some

Peat. Women bagging peat. The conical heaps are termed ruckles, and the peat is set out in this way to dry. Above, left, cutting blocks of peat at Wedmore, Somerset

of the ancient charm in its 42 acres. The Rye is an ancient common of 64 acres, through which ran the "river or "rhee"; it is now mostly devoted to allotments. For details of the interesting experiment in social medicine conducted in Peckham, see Pioneer Health Centre.

Pecksniff, SETH. Character in Dickens's novel *Martin Chuzzlewit*, who has become the recognized personification of unctuous hypocrisy. An architect and surveyor by profession, he exudes pious, moral, and charitable sentiments, while practising every kind of petty meanness to gain his own selfish ends.

Pecock, REGINALD (c. 1395–1460). English bishop. He was educated at Oxford, where he became fellow of Oriel College, and in 1431 he was appointed master of Whittington College, London. He became bishop of St. Asaph in 1444, and was translated to Chichester six years later. He engaged in bitter controversy against the Lollards, preaching against church reform at Paul's Cross, and his utterances brought him into such disrepute that his books were publicly burnt, his name was removed from the privy council, and he was compelled to recant publicly and resign his bishopric in 1458. His later days were spent in retirement at Thornhay Abbey.

Pecos. River of U.S.A. Rising in the N.E. part of New Mexico, it flows first S.E. and then S. into Texas along the W. scarp of the Llano. There it again assumes a S.E. course, finally entering the Rio Grande, about 37 m. N.W. of Del Rio. It is 800 m. long, but is of little commercial value apart from irrigation. At Hondo and Carlsbad are two irrigation projects of the U.S. national reclamation service, the canals and ditches of which irrigate 30,000 acres. Since 1936 the reclamation service has carried out extensive experiments in erosion control.

Pécs. Town of Hungary. Formerly known as Fünfkirchen (Ger., five churches), it is 105 m. S.S.W. of Budapest, and has a large and interesting cathedral. Two of the churches were originally Turkish mosques. The university, one of the best-known in Hungary, was founded at the end of the Middle Ages, and before the Second Great War had over 1,000 students. There is an academy of law. Industries include weaving, tanning, and papermaking; there are large coal mines in the district. Pécs existed in Roman times, and

during the Middle Ages appears under its Latin name of *Quinque Ecclesiae*. During 1543–1686 it was under Turkish rule. During the Second Great War it was one of a number of important places captured by Tolbukhin from the Germans, Nov. 29, 1944.

Pecten. Genus of marine bivalve molluscs (*Lamellibranchiata*). It includes about a dozen British species, some of which are used as food and are commonly called scallops or clams. The species are exceedingly numerous, of world-wide distribution, and found at all depths down to about 3,000 fathoms. The valves, which have usually an unequal pair of ear-like expansions at the hinge, are variously ribbed and brightly coloured. The animal does not use its foot for locomotion, young specimens fitting through the water like butterflies by opening and closing the valves, and when older attaching themselves to rocks, etc., by byssal threads spun by the foot.

Pectin. Gelatinous substance related to the sugars, mucilages, and gums. It is found in such fruits as apples and gooseberries, and in fleshy roots, e.g. carrots and beets. It is this body which causes jams made from fruits to set into a jelly. To supply the natural deficiency in strawberries, cherries, etc., the manufacturer of jams sometimes adds other gelatinising materials, or combines apple and gooseberry pulp with fruits deficient in pectose bodies. Pectin has a nutritious value similar to that of starch. It may be valuable in the treatment of diarrhoea.

Pectoral (Lat. *pectus*, breast). Object worn or laid upon the breast. Ancient

Pectoral Cross, as used in the Church of England
By courtesy of the Warham Guild

a pylon-shaped plaque was placed upon the breast of the embalmed body. See Breastplate.

Peculiar (Lat. *peculiaris*, one's own). Ecclesiastical law term for a parish or church that is not subject to the jurisdiction of the ordinary or bishop of the diocese. Some of these, like the Chapels Royal and Westminster Abbey, are royal peculiars under the direct control of the sovereign, while others were subject to the archbishop or to the greater abbeys. Before the Reformation there were about 300 such peculiars in England, but they have now been largely abolished. The court of peculiars is a branch of the court of arches. See Ecclesiastical Law.

Peculiar People. Protestant sect, founded in 1838 by John Banyard. Found mainly in Kent and the E. counties of England, their conspicuous tenet is their refusal to make use of medical treatment in case of sickness, and their reliance on prayer and anointing with oil to effect a cure.

Pedal Point. In music, a note that is sustained regardless of any changes of harmony especially in a figure. It is generally, but not invariably, in the bass and the notes customary for it are the tonic or the dominant, which may be used together, forming the so-called pastoral pedal. Owing to its frequent use in organ music the French term is *point d'orgue*.

Peddar Way. The traditional name for the best preserved Roman road in East Anglia. Traceable for 12 m. from near Ixworth, Suffolk, to Hookham Heath, Norfolk, it runs thence almost straight for 33 m. through Castle Acre to Ringstead. Here it turns and continues to the Roman camp near Brancaster. See Britain.

Peden, ALEXANDER (c. 1626–86). Scottish Covenanter. He became minister of New Luce, Galloway, in 1660, was ejected 1662, and thereafter won a reputation as a wandering preacher-prophet. He visited Ireland, was imprisoned on the Bass Rock, 1673–78, and died at Sorn, Jan. 28, 1686. Buried at Auchinleck, his body was disinterred by dragoons and buried again at the foot of the gallows at Cumnock. See Covenanters.

Pedestrian Crossing. Passage across a road at which pedestrians who wish to cross have certain rights over the vehicular traffic. Pedestrian crossings in Great Britain are marked off with rows of studs on the road surface, and are of two kinds, controlled (i.e. by traffic-lights or a policeman) and uncontrolled; the latter are marked by Belisha Beacons (*q.v.*). At uncontrolled crossings the pedestrian

Pecten. Marine bivalve

has a legally established right of way over vehicular traffic, which by [the Pedestrian Crossing Places Regulations, 1934, is compelled to approach the crossings in such a manner that it can stop to allow a pedestrian free passage across the road.

Pedestrian crossings were introduced into the U.K., 1934, by L. Hore-Belisha (*q.v.*), then minister of Transport. Similar crossing-places existed earlier in Paris and elsewhere. In Melbourne since 1925, and in New York, Germany, and the Scandinavian countries, pedestrians are liable to punishment if at controlled crossings they cross in defiance of traffic-lights or policeman.

Pedestrianism (Lat. *pedestrus*, going on foot). Art of walking. It may be regarded as including walking races over relatively short distances, in which the competitor matches his speed, staying power, and judgement against other competitors; and long distance walks, lasting many days, in which the competitors match themselves against the clock. Of the latter type the outstanding performer was Robert Barclay (*q.v.*). Rules, records, etc., applying to race walking will be found under Walking.

Pediculosis. Affection of the skin caused by the presence of the louse. These animals are insects of the order Anoplura and are exclusively parasites of mammals. There are two genera found on man: *Pediculus humanus*, which has two races, the head and the body louse, named *capitis* and *corporis* respectively; and *Phthirus pubis*, the crab louse. The eggs are laid in small capsules or nits on the hairs of the head or body and are difficult to remove. The lice pierce the skin of the host and draw blood, producing an irritation which may cause scratching and dermatitis and impetigo. The main danger from the louse is that it transmits typhus.

The most effective means of control is by the use of D.D.T. preparations in the form of a dust. This method does not affect the eggs, so a second application may be necessary to kill the young larvae as they emerge. The use of garments impregnated with D.D.T. is even more effective, since the power of killing lice is retained for some weeks after washing. This method was used by British forces during the Second Great War. Derris root also kills eggs.

Pediment (formerly periment, perhaps a corruption of pyramid). In classic architecture, the trian-

Pediment of the Panthéon, Paris

gular crown of a portico at the front or rear of a building. The space within the triangle is called the tympanum (*q.v.*), and is often filled with sculpture. The term is also used of similar formations over doors and windows. In Gothic architecture the height of a pediment equals, or exceeds, its breadth, and it is then known as a gable (*q.v.*). Otherwise, the ordinary pediment is enclosed by the long horizontal line following that of the cornice and two raking lines of equal length meeting above it. See Architecture.

Pediment. In geology, a gently sloping, smooth rock floor, which may or may not be covered with a veneer of sand or rock fragments and which occurs at the foot of steep mountain ranges in deserts. Isolated rock masses which have escaped the general planing down processes of erosion may rise from the pediment as steep-sided hills referred to as inselberge.

Pedipalpi. Order of creatures of the class Arachnida, phylum Arthropoda. It consists principally of the whip-scorpions, which differ from the true scorpions in having the head and thorax combined, as in the spiders, from which they differ, however, in having the abdomen segmented. The feelers (*palpi*) are more or less developed into nippers (*chela*). The first pair of legs are much longer and more slender than the others. There are no poison glands. The animals are found in damp situations in the hotter parts of the world. They are insect-feeders.

Pedlar. General term for an itinerant vendor of small wares. The word is of uncertain origin, but may be connected with the old and still colloquial *ped*, a basket. In the U.K. a pedlar is one who sells goods, or his skill in handicraft, *e.g.* tinkering, chair-mending, etc., on foot, without a horse or ass, being thus statutorily distinguished from a hawker, who uses a horse. A pedlar has to obtain annually a certificate from the police. The term pedlars' French is applied to the secret jargon of thieves and vagabonds, and so to any meaningless rigmarole.

Pedometer. Instrument for estimating distance traversed on

foot by counting steps taken. It comprises (1) a pendulum which swings with each forward movement of the leg to which the pedometer is attached;

and (2) a train of wheels actuated by a pawl on the pendulum. The amplitude of the pendulum swing must be adjusted to suit the normal stride of the wearer, and this is effected by a micrometer screw limiting the swing. The instrument is usually watch-shaped, and has dials indicating miles, tens and hundreds, besides a main dial calibrated in yards. For short distances its readings are very approximate, but for longer ones it is a useful means of measuring routes, as in military surveying, or in map-making.

Pedro (1334-69). King of Castile, called the Cruel. Son of Alphonso XI, he was born at Burgos, Aug. 30, 1334. By his many crimes, including the torture of his treasurer, Samuel Levi, and the murder by his own hand of Abu Said, usurping king of Granada, and by the suspicious circumstances of his wife's death, he incurred the hatred of his subjects; and his illegitimate brother, Don Enrico, known as Henry of Trastamare, invaded Castile with the assistance of French bands commanded by Bertrand du Guesclin. Pedro fled to Bayonne, where he obtained the help of Edward, the Black Prince. The Castilian and English troops were victorious at the battle of Navarrete in 1367, but after the Black Prince's departure Don Enrico returned and killed Pedro in a quarrel, March 23, 1369.

Pedro I (1798-1834). Emperor of Brazil, 1822-31. He was son of John VI of Portugal, and on his father's return from Brazil to Portugal, 1821, was left as prince-regent of the former country. Joining the party demanding independence, he was proclaimed emperor in 1822, and in 1825 the independence of Brazil was recognized. On the death of his father in the following year he became king of Portugal, but at once abdicated in favour of his daughter, Maria. After an outbreak in Rio de Janeiro he abdicated the Brazilian throne, April 7, 1831, and returned to Portugal.

Pedro II (1825-91). Emperor of Brazil, 1831-89. He was born at Rio de Janeiro, Dec. 2, 1825, son of Pedro I, and was proclaimed emperor on his father's abdication, 1831. The empire settled down to a

long period of peace under him until he was dethroned after the revolution of 1889, when he retired to Europe. He died in Paris, Dec. 5, 1891. In 1921 the remains of Pedro II and his wife were taken to Rio de Janeiro for re-interment. A study by M. W. Williams was published in 1938.

Peebles. Royal and mun. burgh and co. town of Peeblesshire, Scotland. It stands on the river Tweed,

Peebles arms

23 m. S. of Edinburgh by rly. Anciently a residence of the Scottish kings, Peebles occupies a well-sheltered position in the valley of the Tweed and attracts many visitors. Queensberry Lodging, which belonged to Lord Yester, was purchased in 1857 by William Chambers, who gave it to the town; through the generosity of Andrew Carnegie it was reconstructed and enlarged. The new buildings, reopened in 1912, contain the council chambers, town hall, library, museum, and art gallery. There are a hydropathic establishment and a good golf

Peebles, Scotland. Parish church, built in 1887

course. Tweed and woollen cloth are manufactured. Market day, Tues. Pop. 5,853.

Peeblesshire OR TWEEDDALE. Inland county of Scotland. Its area is 347 sq. m. From the valley of the Tweed, which has its source in the S.W. and traverses the entire breadth of the county E., the surface rises on each side in a succession of grass-clad hills scored by fertile valleys. In the S. there has been much afforestation. On

Peeblesshire. Map of this inland county of S. Scotland

the S. border is Broad Law (2,754 ft.), the highest summit in the county. The chief streams are the Biggar, Manor, Lyne, and Eddleston, all affluent to the Tweed. Peebles is a pastoral county, and sheep-rearing is a main occupation. British Rlys. afford transport facilities. Peebles is the county town. In conjunction with part of Midlothian one member is returned to parliament. Pop. 15,050.

LITERARY ASSOCIATIONS. The co. town claims several celebrated sons. William and Robert Chambers were born there; as also were Thomas Smibert (1810-54), poet and miscellaneous writer, editor of Chambers's Journal, 1837-42; John Veitch (1829-94), author of History and Poetry of the Scottish Border and poems inspired by Tweedside; and Henry Calderwood (1830-94), writer on philosophy. The county has been rich in writers of famous song. Robert Crawford (d. 1733), author of Tweedside and other well-known songs, lived at Auchinames. James Nicol (1769-1819), poet and miscellaneous writer, was born at Innerleithen. John Buchan (Lord

Tweedsmuir) was also a native of the co. Sir Walter Scott used the co. as a background for The Black Dwarf and St. Ronan's Well. It also inspired Thomas Tod Stoddart (1810-80) and J. C. Shairp in The Bush Aboon Traquair.

Peekskill. City of New York, U.S.A., in Westchester co. It stands on the E. bank of the Hudson, at the S. end of the Highlands, 41 m. N. of New York City, and is served by the New York Central rly. Known as the "largest village in the U.S.A." before becoming a city in 1940, it is finely placed, with Crugers Park and the Blue Mt. reservation of the Westchester state parks to the S. and Bear Mountain park, 4 m. N. on the opposite bank. Settled by the Dutch, 1667, it was burned by the British, 1777. Pop. 17,311.

Peel OR PEELE. In medieval architecture, a small tower or keep. They were found commonly on the borders of Scotland and Wales, and served as places of refuge for the inhabitants in case of raids.

Peel. Coast town and watering-place of the Isle of Man. It is 11 m. N.W. of Douglas, on the local railway. There are manufactures of sails, nets, boats, etc., but the people are principally engaged in the fisheries. Joined to the mainland by causeway is St. Patrick's Isle, which contains the ruin of Peel Castle, mentioned in Scott's Peveril of the Peak, and the remains of S. German's cathedral, a cruciform structure dating partly from the 12th century. Market day, Sat. Pop. 2,476.

Peel, WILLIAM ROBERT WELLESLEY PEEL, 1ST EARL (1867-1937). British politician. Eldest son of the 1st viscount Peel (v.i.), he was born Jan. 7, 1867, educated at Harrow and Balliol College,

Peel, I.O.M. View showing ruins of Peel Castle, mentioned in Scott's Peveril of the Peak

1st Earl Peel,
British politician

Oxford, and called to the bar in 1893. In 1900 he was elected to the L.C.C., becoming chairman in 1914. He was Unionist M.P. for S. Manchester, 1900-06, and for Taunton from 1909 until he succeeded to the viscounty in 1912. After active service in the First Great War he was appointed to the national service department in 1917, was under-secretary for War and Air, 1919, and chancellor of the duchy of Lancaster, 1921. Secretary for India, 1922-24 and 1928-29, he was on the India and Burma round-table conferences, presiding over the latter; was chairman also of the wheat commission, 1932, and the commission on Palestine, 1936. Advanced to an earldom in 1929, he died Sept. 28, 1937, and was succeeded by his only son, Arthur (b. May 29, 1901).

Peel, ARTHUR WELLESLEY PEEL, 1st Viscount (1829-1912). British statesman. Born Aug. 3, 1829, youngest son of Sir Robert Peel, he was educated at Eton and Balliol College, Oxford, and became Liberal M.P. for Warwick in 1865. He was parliamentary secretary to the poor law board, 1868-71; patronage secretary to the Treasury, 1871-73; and under-secretary for home affairs, 1873-74. In 1884 he was chosen Speaker, an office he held with distinction until 1895, when he retired, and was created a viscount. Chairman of the commission on

Arthur Wellesley Peel
Elliot & Fry

on licensing laws, 1896, he signed a minority report advising the reduction of the number of licensed houses, compensation being raised by a tax on them instead of on the general public; this proposal was ultimately the basis of legislation passed in 1904. Peel died Oct. 24, 1912, and was succeeded in the viscounty by his son William (v.s.), who became 1st earl Peel.

Peel, GERALD GRAHAM (1877-1937). British composer. Born at Pendlebury, Manchester, Aug. 9, 1877, and educated at Harrow and University College, Oxford, he became a pianist and composer of songs. The latter included In Sum-

mer time on Bredon, and other Songs of a Shropshire Lad (settings of A. E. Housman's poems); The Lute-Player; Kew in Lilac Time; and a song-cycle, The Country Lover. Peel died Oct. 16, 1937.

Peel, JOHN (1776-1854). English huntsman. Born at Caldbeck, Cumberland, Nov. 13, 1776, he died

John Peel, the Cumberland huntsman
From a print

there, Nov. 13, 1854, and is buried in the churchyard. He indulged a passion for fox-hunting for over 55 years, and is the hero of the song D'ye ken John Peel? written by John Woodcock Graves about 1828. *Consult Songs and Ballads of Cumberland*, ed. S. Gilpin, 1866; *John Peel*, J. M. Denwood, 1932.

Peel, SIR ROBERT (1788-1850). British statesman. He was born near Bury, Lancs, Feb. 5, 1788, the son of a wealthy cotton manufacturer, and was brought up in an atmosphere of intelligent Conservatism. He was educated at Harrow and Christ Church, Oxford, and after a brilliant university career entered parliament in 1809. At 24 he became secretary for Ireland; six years later he retired from the Liverpool ministry, but was chairman of the bank committee which carried the resumption of cash payments in 1819. In 1822 he returned to the ministry as home secretary and carried several valuable reforms, including a great reduction in the number of capital offences, improvements in the prisons, and the establishment of the Metropolitan Police, who received the popular appellations of Peelers and Bobbies after his names.

When Canning became prime minister in 1827, Peel and Wellington refused to join him, and

thenceforward Peel may be regarded as the leader of the Tory party in the house of commons. He joined the Wellington ministry, 1828, and supported the duke in passing Catholic emancipation, being convinced against his will of the necessity for that measure by the election of O'Connell for Clare. When Wellington in 1832 endeavoured to form a Tory ministry to pass a less drastic reform bill than that of Grey, the effort was made abortive by Peel's refusal to join; only after Grey's bill was passed did he accept it as an irrevocable *fait accompli*. In 1830 he had succeeded to a baronetcy, and he was M.P. for Westbury until 1833, then until his death for Tamworth.

Twice, in 1834 and in 1839, Peel was called to office as prime minister, but each time was obliged to resign after a few weeks; not till 1841 was he able to take office with a decisive Conservative majority behind him in the commons. For five years he was prime minister. He advanced in successive budgets along the path towards free trade upon which Huskisson had entered before him—on the principle of increasing revenue by reducing tariffs so that goods were cheapened and the demand for them increased, whereby an actual increase of revenue was attained. He taxed incomes over £150 a year, and carried in 1844 the Bank Charter Act. Irish Catholics were permitted to endow their own religion; and the boundary between Oregon and Canada was settled.

The Corn Law, however, was the grand problem—the problem of maintaining the prices deemed necessary for the preservation of the agricultural industry, and at the same time meeting the demand for cheap bread. Peel relied upon the sliding scale, but this proved a failure. Events were hurried by the rains of July, 1845, which "rained away the Corn Laws" and brought the potato blight. The Irish potato famine of 1845, coupled with the gradual working upon his mind of the arguments of the Anti-Corn Law League, convinced Peel that cheap bread was more necessary than the protection of agricultural interests.

Since the ministry had taken office as a protectionist government, Peel was unwilling himself to

Sir Robert Peel,
British statesman

introduce a measure repealing the Corn Laws, though he succeeded in persuading most of his colleagues in the cabinet of the necessity for the change. But a Whig or Liberal cabinet could not be framed, and Peel himself courageously introduced the measure which was supported by the Whigs and vigorously opposed by the no-surrender section of the Tory party. At the very moment when the bill for the repeal of the Corn Laws passed its final stage Peel was defeated in the house on an Irish question and resigned, June 29, 1846. The Liberals came into office and were there maintained by the general support of the Peelites, with whom they coalesced in 1852. Sir Robert, though outside the ministry, remained the most notable figure in the house until he died on July 2, 1850, from injuries caused by a fall from his horse. His statue is in Parliament Sq. See Corn Laws.

Bibliography. Speeches in the House of Commons, 4 vols., 1853; Memoirs, ed. Earl Stanhope and E. Cardwell, 1856; Political Life, T. Doubleday, 1856; Memoirs of Peel, F. Guizot, 1857; Lives, F. C. Montague, 1888; J. R. Thursfield, 1898; Peel from his Private Papers, ed. C. S. Parker, 1899; Life and Times, T. Lever, 1942.

Peele, George (c. 1558-98). English poet and dramatist. Son of a London silversmith, he was educated at Christ's Hospital and Broadgates Hall and Christ Church, Oxford. His court pastoral, *The Arraignment of Paris*, influenced A Midsummer Night's Dream, his historical play *Edward I*, Shakespeare's *Henry IV*, and his *Old Wives' Tale*, the theme of Milton's *Comus*. His works, which also include the scriptural *David and Bethsabe* and a number of pageants, possess poetic beauty, glow of fancy, and fervour of patriotism, but no high creative faculty. They were edited by A. H. Bullen, 1888.

Peenemünde. German research station on the Baltic coast, 60 m. N.W. of Stettin. Spread out among woods along a 4½-m. stretch of shore, the establishment specialised in aircraft, radiolocation, and armament development, being the most important centre of its kind in Germany. It was heavily bombed by the R.A.F., for the first time Aug. 17, 1943, when Gen. von Chamier-Glisenski and a number of other scientists were killed. An air photograph taken here, Nov. 8, 1943, showed an experimental flying-bomb on a landing ramp, confirming, with other air photographs, information,

already received in London through underground channels, of the production of pilotless air-planes. Peenemünde was occupied May 5, 1945, by the Russians, in whose zone of occupation it subsequently lay; the Russians continued experiments here.

Peeping Tom. Name given to the inquisitive tailor of Coventry who looked out on Lady Godiva, and hence applied to any idly inquisitive person. See Godiva.

Peep o' Day Boys. Organization of Protestant Ulstermen formed to resist the Catholic Defenders. They were so named from their habit of breaking into the houses of their victims at dawn. Their violence caused much trouble in Ulster, 1784-95. From 1790 many Peep o' Day Boys were absorbed in Orange lodges.

Peerage (Lat. *par*, equal). Literally, the body of peers. The word is now applied, however, to peers and members of their families, i.e. to those who can succeed to titles. In the U.K. there are five ranks in the peerage, duke, marquess, earl, viscount, and baron. Baronets have never been ranked as peers.

The possession of a peerage is confined to countries ruled by a monarch, because the root idea is that of personal service to him. Spain has had and Sweden has peerages like that of the U.K. Austria and Hungary had them before the First Great War. France had a peerage before the country became a republic. A peer of France was one on whom the king conferred that dignity, and from 1814 to 1848 there was a chamber of peers.

Originally a peer simply meant an equal, but its present use dates from the time it was restricted to the possessors of hereditary titles. This came about through the separation of the greater and lesser barons in the 13th century. The former, members of the house of lords, secured the right to be tried by their equals, or peers, and thus became known as peers. A peer and a member of the house of lords are not quite the same, as the bishops and the law lords are lords of parliament, but not peers. Peers are created by letters patent, prescribing the conditions under which a title may descend.

A peerage may be limited to sons and their descendants, or be extended, as was that of Earl Roberts, to daughters, or, as was that of Earl Kitchener, to a brother. The early peers owed their position to tenure of land, but this was soon superseded by a writ of

summons. There are peers of Scotland, whose numbers cannot be increased; peers of Ireland who can sit in the house of commons; and peers of the U.K. A woman can be a peeress, but does not sit in the house of lords. A peerage is said to be dormant when the heir does not assume the title. It becomes extinct when the heirs, according to the patent, fail. Baronies can fall into abeyance. A peerage cannot be created for life; but a lord of appeal in ordinary may be appointed for life. Proposals for reform of the house of lords in 1948 included suggestions that there should be power to create life peers and that the peeresses should be permitted to sit in the house, but these were not accepted. Peerages, or works giving biographical details of peers and their families, include those of Burke, Coke, and Debrett. There is also a Jacobite peerage. See Baron, Duke, etc.; Law Lord. Lords, House of; Title.

Peer Gynt. Dramatic poem by Ibsen, first published in 1867. Peer Gynt himself is one of the half mythical and fantastical personages from the peasant life of modern Norway, a typical man of indecision, ever afraid of doing the irretrievable. The work is alternately satirical, fantastic, and finely poetical. English translations have been made by Archer and Norman Ginsbury; and Ralph Richardson played the lead in a revival at the New Theatre, 1944. Grieg made the drama the theme of a well-known suite.

Peewit or **Pewit.** Either form is another, and onomatopoeic, name for a green plover. See Plover.

Pegasus. In Greek mythology, the winged horse which sprang from the blood of the Gorgon Medusa, when her head was struck off by Perseus. Pegasus created Hippocrene, the spring of the Muses, with a kick of his hoof, but his further connexion with the Muses, often alluded to in modern poetry, has not been traced earlier than the Italian poet Boiardo (d 1494). See Bellerophon.

Pegasus. In astronomy, one of the constellations. It is easily recognizable by the four stars which mark a great square, and is contiguous to the zodiacal constellations Pisces and Aquarius. The top left-hand corner of the square is not in Pegasus, but in the constellation of Andromeda. The others are Alpha, Beta, and Gamma Pegasus, whose ancient names were Markab, Scheat, and Algenib. The constellation contains a number of

variable stars, double stars, and a well-known stellar cluster.

Peggotty. Name of a family in Charles Dickens's novel *David Copperfield*. Clara, the devoted nurse of David, is always called Peggotty to distinguish her from Clara, David Copperfield's mother. Daniel Peggotty, her brother, is a great-hearted boatman, whose household, living in an old boat on Yarmouth beach, included his nephew Ham Peggotty, his niece Little Em'ly, and the forlorn Mrs. Gummidge.

Pegmatite (Gr. *pēgma*, anything fastened together). In geology, a rock of quartz and feldspar, etc., occurring in granites, etc., and having a coarse texture. Pegmatites occur as dikes or veins and often contain valuable minerals, e.g. garnet, beryl, boron, uranium, cerium, as well as oxide of iron. From them is obtained feldspar for porcelain ware, mica, etc.

Pégoud, ADOLPHE (1887-1915). French aviator. Daring in experiment, he was the first to fly upside down, at Juvisy, Sept. 1, 1913, and three weeks later he first looped the loop. Joining the French flying corps in the First Great War, he was killed near Belfort in an air battle, Aug. 29, 1915.

Pegu. Div., dist., and town of Burma. The div. comprises the lowland N.W. of the Gulf of Martaban, across the valley of the lower Sittang to that of the Irawadi above the delta. The dist. occupies the W. side of the lower valley of the Sittang, and rice is the sole crop. The town is on the Pegu river and is the rly. junction N.E. of Rangoon for the lines to Moulmein and Mandalay. It was formerly the capital of the Pegu empire, overthrown by Burma, 1757. Captured from British Imperial forces by the Japanese, Feb. 28, 1942, Pegu was retaken by the British 14th army, April 30, 1945, the Japanese making a stand there to guard their last escape route for motor transport from Lower Burma to Siam. Area, division, 13,258 sq. m.; district, 4,404 sq. m. Pop., division, 2,961,249; district, 582,959; town, 25,400.

Péguy, CHARLES PIERRE (1873-1914). French writer. He was born at Orléans, Jan. 7, 1873, and early became interested in social problems, publishing under the name of Pierre Deloire a treatise, *De la Cité Socialiste*, 1897. In the same year he collaborated with Marcel Baudoin in a poetic drama, *Jeanne d'Arc*. He later became director of a Socialist bookshop in Paris, and

agitated for a revision of the Dreyfus verdict. At his bookshop in the Rue de la Sorbonne he published *Les Cahiers de la Quinzaine* during 1900-14. His other works include *Le Mystère de la Charité de Jeanne d'Arc*, 1910; and *La Tapisserie de S. Geneviève et de Jeanne d'Arc*, 1913—mystical writings which much influenced his contemporaries. Péguy was killed in the battle of the Marne, Sept. 5, 1914. *Consulti Notre Cher Péguy*, J. and J. Tharaud, 1926; P. and Les Cahiers de la Quinzaine, D. Halévy (trans. R. Bethell), 1946.

Pegwell Bay. Inlet of the coast of Kent, England. It is 1 m. W. of Ramsgate harbour, and is famous for shrimps. Prominent features include the beacons marking the channel into Richborough harbour. A flat stretch below the chalk cliffs has been laid out as gardens. The bay formed the subject of a painting by William Dyce, exhibited in 1860 and purchased 1894 by the National Gallery.

Peiho or Haiho. River in Hopeh prov., China. It rises in the spurs of the Inshan Mts., and after an E. course it turns S.E. and, flowing to the W. of Peking, empties at Taku into the Gulf of Chih-li. The Peiho, with the other rivers that join it at Tientsin, 47 m. from its mouth, drains an area of 56,000 sq. m., which suffers from time to time from extensive floods. In 1901 the Chinese government undertook to improve conditions below Tientsin, and numerous works have been completed.

Peiping (Ch., northern peace). Name given by the Chinese to Peking (q.v.) during 1928-49.

Peipus or OZERO CHUDSKOE. Lake of N.W. Russia. It lies between Estonia S.S.R. and the Leningrad region of R.S.F.S.R., and is divided into three parts, Lake Peipus proper, Lake Pskov, and the so-called Warm Lake, a narrow channel connecting the two. Its total length is 90 m., and it discharges its waters into the Gulf of Finland by the Narova. In early times it formed the chief frontier between the Slavs and the Finnish Chuds, whence its local name, lake of the Chuds. Its fish is sold in local markets and in Leningrad. When the Germans invaded Russia on June 22, 1941, their armies advanced rapidly to the Stalin line, the right flank of which was protected by Lake Peipus. After fruitless attempts at forcing the line frontally, the Germans swung their left wing to advance on both sides of the lake. By the end of Aug. the Germans had gained con-

trol of Estonia and directly threatened Leningrad. Early in 1944 the Russians began an offensive against the Germans in Estonia, and by Feb. had passed Lake Peipus.

Peirithous. In Greek legend, king of the Lapithae (q.v.). He led his army to battle with Theseus, but on seeing each other the two leaders embraced, and thereafter became the firmest of friends. After taking Helen from Sparta, they descended into Hades to carry off Proserpine or Persephonē as a wife for Peirithous. They were seized by Pluto, from whom Theseus was afterwards rescued by Hercules, but Peirithous remained for ever in chains.

Peirse, SIR RICHARD EDMUND CHARLES (b. 1892). British air officer. Educated at Monckton Combe school, H.M.S. Conway, and King's College, London, he was commissioned in the R.N.A.S. in 1914, and received, 1915, the D.S.O. for attacks on German submarine bases at Ostend and Zeebrugge. In 1919 he received a permanent R.A.F. commission and was awarded the A.F.C. Deputy director of operations and intelligence 1930-33, he was appointed to command British forces in Palestine and Transjordan in 1933, becoming deputy chief of the air staff in 1937. In 1940 he became chief of Bomber Command, initiating the strategic bombing of German war industry. On March 5, 1942, he was appointed A.O.C.-in-C. India, and in Dec. commander of all Allied air forces in S.E. Asia. He was knighted in 1940 and retired from the R.A.F. in 1945.

Peisistratus or PISISTRATUS. Tyrant of Athens (560-527 B.C.). A kinsman of Solon, he at first supported his relative; but, being ambitious of power, allied himself with the "Men of the Mountains," the poorest and most dissatisfied class in Athens. Appearing one day in the market-place covered with blood, he declared that he must have an armed bodyguard.

The guard was voted to him by his supporters, and when it had increased from 50 to 400 men he seized the Acropolis and assumed the supreme power. Though twice driven out by opposing factions, by 545 he firmly established himself as autocrat of Athens. His rule was enlightened and beneficent and he was a generous patron of art and literature.

Pekan (*Martes pennanti*). Fishermarten, wood-shock, or black fox of N. America. It is a carnivorous mammal of the family *Mustelidae*, allied to the pine-marten and the

Pekan, the large North American marten

sable. It is the largest of the martens, the head and body measuring 2 to 2½ ft. and the tail 14 to 18 ins. It has a distinctly fox-like appearance, and is blackish brown in colour. Formerly plentiful throughout the U.S.A., it now occurs only in the N.E. It is found also in British Columbia.

Pekin. City of Illinois, U.S.A., the co. seat of Tazewell co. It stands on the Illinois R., 10 m. S.S.W. of Peoria, and is served by rlys. Built in a farming and coal mining area, it ships grain, maize, and coal, and manufactures flour, corn products, malt, cereals, and yeast. Lincoln practised law here. Pop. 19,407.

Peking (Ch., northern capital). Capital of China. It is situated 70 m. N.W. of Tientsin at an alt.

of 120 ft. and has an est. pop. of 2,000,000. The ancient capital of Yen, and then called Yenking, the town occupied a site to the S.W. of the present Tartar city, coinciding with part of the present Chinese city. After he had conquered N. China Kublai Khan built a new town on the site of the present Tartar city, and made it, 1264, capital of his Chinese empire. To this city the Chinese gave the name Taitu (great residence); the Mongols called it Khan Baligh (imperial city), the Cambaluc of Marco Polo.

In 1368 the first emperor of the Ming dynasty transferred his capital to Nanking (southern capital), and Taitu was renamed Peking or Peiching. In 1421 Peking again became capital of the whole country, and remained so until 1928 when the Nationalists from the South captured it and, removing the capital to Nanking, changed Peking's name to Peiping (northern peace).

Soon after the so-called China incident started in 1937, the Japanese occupied Peiping, Aug. 19, without a struggle, and there they set up a puppet govt. in Dec., which administered more and more of China as it came under Japanese control. The Japanese built a new residential and factory area to the W. of the old city.

After the Allies defeated Japan in 1945, Peiping remained in the hands of the Nationalists until they surrendered it to the Communists, Jan. 22, 1949. It was chosen capital of Communist China and reverted to the name Peking, Sept. 29.

The present walls of the Tartar city were built in 1421, and those of the Chinese city in 1544. The two cities are rectangular in shape. The outer walls, 24½ m. long, enclose many fields and woods; the wall of the Tartar city is 14 m. long, about 41 ft. high, 50 ft. wide at the top and 62 ft. at the base. It is pierced by nine gates, three of which lead to the Chinese city, which has seven additional gates. Inside the Tartar city is the imperial city, also contained within separate walls, 6 m. in length,

Peking, China. 1. The Hall of Supreme Harmony at the centre of the Forbidden City. 2. The Arrow Tower, one of the city's gateways. 3. Chi'en Mén Street. 4. Temple of the Happy Year, adjacent to the 15th cent. Temple of Heaven

while a moat and a brick wall in the centre of the imperial city mark off the so-called "forbidden city," in which are situated the imperial palaces and the pleasure grounds (including three lakes) of the winter and summer palaces. In the Tartar city are the municipal offices, as well as the old legation quarter.

Among the buildings of interest in Peking are the observatory, dating from the 13th century, the Lama temple, the temple of Confucius, and the hall of the classics. The Chinese city is the commercial section of Peking. It also contains the temple of heaven, 1421, and the temple of agriculture. Peking is connected by rly. with Hankow, on the Yangtse, and with Mukden via Tientsin; a third line runs N.W. to Kalgan and towards Kueihuaoheng.

Pekingese. English name for the lion dog of China. This was bred (possibly from a much larger dog of similar appearance used for hunting in the Chinese countryside) for the court in the Summer Palace of Peking, where it was jealously guarded. The sleeve dog, small enough to be carried in a mandarin's sleeve, weighed five lb. or less; the pillow dog weighed about 10 lb. Five lion dogs left behind by the court when it fled at the looting of the Summer Palace in 1860 were brought to the U.K., one being presented to Queen Victoria. A pair brought in and exhibited in 1896 started a lasting fashion for these hardy, individual, game little dogs. There are several Pekingese clubs. See Dog colour plate.

Peking Man. Popular name for *Sinanthropus Pekinensis*, a skull found at Choukoutien, 37 m. S.W. of Peking, China, on Dec. 2, 1929 by a group of Chinese and American anthropologists working for the Rockefeller foundation. The skull dates from the Pleistocene period (*q.v.*), and is of a creature midway between the orang utan and man. The brain development appears to have been greater than that of the Trinil (*q.v.*) skull, and the brain case is considerably thinner than that of the Piltdown (*q.v.*) skull. The Peking skull, taken to Tokyo university as loot during the Japanese occupation of China, was later returned to the national geographical survey society of China. See Man.

Pelagic Animals. Those marine animals which swim or float freely in the surface waters or lower depths without being attached to weeds or rocks. The

term is chiefly used for the teeming, often transparent creatures on which larval fishes feed.

Pelagic Deposits. Deposits found in oceanic depths and derived from the remains of plankton. Skeletons form globigerina, radiolarian, and other types of deep-sea ooze beyond the limit where material derived from the land can be deposited. Associated with the oozes of organic origin is the Red Clay, which is the insoluble residue of wind-borne dusts, meteoric dust and particles, sharks' teeth, and whales' carbones.

Pelagius (c. 360-420). British theologian. When first heard of he was living as a studious recluse at Rome. Thence in 410 he was driven by the Goths to Africa. He also visited Palestine. An earnest student of earlier literature, Greek and Latin, pagan and Christian, he gradually came to hold views which brought him into conflict with some of the greatest writers of the day, *e.g.* Augustine and Jerome. He was acquitted of heresy in 415, but after death was excommunicated, 431.

Pelagianism taught that sin was not transmitted from Adam down through the human race, but that each child born into the world was morally clean; that if he sinned he did it by the force of example; that it was possible for him not to sin; and that for all his good deeds he accumulated merit with God. These views were c. A.D. 409 embodied in a commentary on the Epistles of S. Paul in Latin, the original form of which was discovered in 1906—the oldest surviving book by a British author.

Pelargonium.

Genus of flowering and ornamental-foliaged plants, including half-hardy succulent and shrubby perennials of the family Geraniaceae. A notable section of the *Pelargonium* family is miscalled geranium (*q.v.*) by gardeners. Most pelargoniums

are natives of S. Africa, a few of Australia, and they were introduced into Great Britain at different dates from 1632.

Pelagians. Name loosely given to the people who inhabited ancient Greece before the arrival of the Achaeans (*q.v.*). Their exact identity is uncertain. Probably they were of Mediterranean type, a dolichocephalic or long-skulled

dark people of a kind still found in many parts of Europe and N. Africa.

Pelée, MONT. Volcano in Martinique, French West Indies. Small ebullitions had been recorded in 1762 and 1851, but in 1902 and 1929-32 violent eruptions occurred. They were accompanied by the explosive emission of glowing clouds which poured down the mountain sides, burning everything in their paths. On May 8, 1902, one such cloud completely destroyed the city of St. Pierre, killing 30,000 people. During this eruption the viscous lava of the volcano was forced slowly from the crater in the form of a great spine or obelisk which rose to a height of 800 ft. above the crater rim. The spine rapidly weathered and collapsed. In 1929-32 the lava formed a dome-shaped mass (tholoid), the top of which rose above the general level of the crater.

Peleus. In Greek legend, king of the Myrmidons in Thessaly, and father of Achilles. His wife was Thetis, a sea-deity, daughter of Nereus. Their wedding was of great magnificence, all the gods being invited, except Eris, the goddess of Discord.

Pelew OR PALAU. Group of islands in the Pacific lying E. of the Philippines and W. of the Carolines; they consist of 26 islands, mostly of coral, covering 170 sq. m. Formerly belonging to Germany, after the First Great War they were placed under a Japanese mandate. Japan later used them as air and naval bases. For administrative purposes the

group became known as the W. Carolines. They yield phosphate, copra, bêche de mer, and turtle shell. Pop. 12,802.

On March 30, 1944, U.S. warships and aircraft attacked shipping and installations on the islands, further attacks being made later in the year. After a

three-day intensive bombardment from sea and air, U.S. Marines landed on Peleliu on Sept. 15, meeting fierce Japanese opposition. On Sept. 17, a further landing was made on Anguar, which was captured after three days. Troops took Garakayo in Oct. and by the middle of that month the Americans were in occupation of ten of the individual

Pelargonium. Flower cluster of this decorative plant

islands and in virtual control of the whole group, although the Japanese regained possession of Ngerengong on Nov. 13. The garrisons still resisting in the Pelews were among the Japanese forces whose surrender was received at Truk on Sept. 2, 1945.

Pelham, HENRY (c. 1696–1754). British statesman. Younger son of Thomas Pelham, made Baron Pelham in 1706, he was educated at Westminster and Hart Hall, Oxford. His eldest brother was Thomas Holles-Pelham, who became duke of Newcastle, and the two were inseparably associated in public life. Henry became M.P. for Seaford, 1717, and in 1721 a lord of the Treasury under Walpole. From 1722 he sat for Sussex continuously. In 1724 he was made secretary of War, and in 1730 paymaster of the forces. In 1743 he became prime minister and chancellor of the exchequer. During his term of eleven years, he followed the policy of Walpole, economy at home and peace abroad; but he lacked force and had to maintain his position by corruption. He died March 6, 1754. See Newcastle, Duke of.

Henry Pelham, British statesman

Pelican (*Pelecanus*). A small genus of about eight species of large birds. Their extended wings measure from 10 ft. to 15 ft. between their tips. The hind toe is turned forward and united by a web to the other three. They eat fish, which they seek in shallow waters of rivers and lakes, and the structure of the bill and neck is well adapted to the capture of

Pelican. The white species of this bird

such prey, the long upper mandible being hooked at the tip, and the lower mandible carrying a large pouch formed by the loose, naked skin of the neck. When the bag is full, the bird retires to a rock to consume the contents, or to the nest, where the young feed themselves by thrusting in head and neck. The nest, with two white eggs, is placed on the ground among reeds. The genus is found in Europe, Asia, Africa, and America.

Pelion. Mountain range of ancient Greece. It is in the Thessalian district of Magnesia, near the coast, S.E. of Mt. Ossa. It is famous in Greek mythology as the scene of the conflict between the gods of Olympus and the giants, who are said to have piled Pelion and Ossa on Olympus to reach the sky. Pelion was also the reputed home of the centaur Chiron (*q.v.*).

Pelissier, AIMABLE JEAN JACQUES, DUC DE MALAKOFF (1794–1864). French soldier. Born Nov. 6, 1794, he succeeded Canrobert as commander-in-chief in the Crimea, 1855. Having directed the siege and capture of Sevastopol, he was made marshal of France and duc de Malakoff. Ambassador in London, 1858, he returned to Algeria as governor in 1860, and died there, May 22, 1864.

Pelissier, HENRY GABRIEL (1874–1913). British comedian. Son of a London diamond merchant, he belonged to a family of French origin. He was educated at a Society of Friends' school at Scarborough. Studying music first in a somewhat casual fashion, he began to write songs, and soon became known as an entertainer. He established the troupe of players called the Follies (*q.v.*). Pelissier was the first husband of Fay Compton. He died Sept. 25, 1913.

Pelitic Rocks. Rocks which are, or have been, composed chiefly of clay and impurities. Examples are slates, mica schists, and shales. See Clay.

Pella. Ancient town of Macedonia. It was situated 21 m. N.W. of the mouth of the Axios (Vardar). The birthplace of Alexander the Great, it was the last capital of the kings of Macedonia.

Pellagra (Ital. *pelle*, skin; *agra*, rough). Endemic disease occurring almost universally, but rare in Gt. Britain. It is commonest where maize is the staple diet, among those who eat little protein. The cause is a deficiency in the diet of factors in the vitamin B complex, chiefly riboflavin and nicotinic acid. This

Pelion, Greece. The mountain range and the town of Volo

deficiency may occur in chronic alcoholics. The disease generally begins with the appearance of pigmented patches on the backs of the hands, which are at first taken for sunburn. This may be associated with a mild degree of sore throat, diarrhoea or constipation, and giddiness. These patches disappear in a week or two and the skin underneath then appears normal, or perhaps whiter than the adjacent skin. Loss of weight and nervous symptoms occur. After a year or more there is probably a return of symptoms in a more severe form. The treatment consists of adding to the diet red meat, milk, eggs, liver, fresh fruit, and vegetables, and brewers' yeast.

Pellegrini, CARLO (1839–89). An Italian caricaturist. Born at Capua, he served in Garibaldi's army, came to England in poor circumstances in 1865, and became caricaturist to Vanity Fair. Between 1869 and his death he contributed hundreds of portraits of notabilities to that journal over the signatures Singe or Ape. He died in London, Jan. 22, 1889.

Pelletier, MARY EUPHRASIA (1796–1868). French saint. Rose Virginie Mourain was born at Noirmoutier, Vendée, July 31, 1796. She was educated there by Ursuline nuns, and in 1814 entered a convent at Tours, of which she became superior in 1825. She founded houses of refuge known as Homes of the Good Shepherd at Angers, Poitiers, and Grenoble, and in 1841 established foundations in Paris and London. By 1855 these homes had been extended throughout Europe. She died at Angers, April 24, 1868, was beatified in 1933, and canonised May 2, 1940.

Pelletierine. Liquid alkaloid contained in the bark of the pomegranate (*Punica granatum*). Pelletierine tannate, a mixture of tannate salts of the alkaloids of the bark, is a remedy for tape-worm.

Pellico, SILVIO (1788-1854). Italian poet, dramatist, and patriot. He was born at Saluzzo, Piedmont, June 24, 1788. Having edited a paper which was suppressed by the Austrians owing to its liberal opinions, he was suspected of association with the Carbonari, was arrested on Oct. 15, 1820, and in 1822 sentenced to death, but the sentence was commuted to 15 years' imprisonment. He was released under the amnesty of 1830, and wrote a simple narrative, *Le Mie Prigioni*, 1832, the publication of which caused something of a sensation. It was translated into English by T. Roscoe, 1833, as *My Ten Years' Imprisonment*, and remains Pellico's best known work. He wrote also a number of plays and poems, the most successful being his tragedy, *Francesca da Rimini*, 1818, which won the admiration of Byron. He died Jan. 31, 1854. *Consulti* Life. I. Rinieri, 1899-1901.

Silvio Pellico

of 1830, and wrote a simple narrative, *Le Mie Prigioni*, 1832, the publication of which caused something of a sensation. It was translated into English by T. Roscoe, 1833, as *My Ten Years' Imprisonment*, and remains Pellico's best known work. He wrote also a number of plays and poems, the most successful being his tragedy, *Francesca da Rimini*, 1818, which won the admiration of Byron. He died Jan. 31, 1854. *Consulti* Life. I. Rinieri, 1899-1901.

Pellitory (*Parietaria officinalis*). Perennial herb of the family Urticaceae. It is a native of Europe and Asiatic Russia. From a short, woody rootstock, usually between the masonry of old walls, rounded reddish branching stems arise, with alternate oval or lance-shaped, downy leaves. The tiny greenish flowers are produced in short sprays from the base of the leaf-stalks. Under the influence of sunshine, or slight irritation, the anthers explode and little clouds of pollen are seen.

Pells (Lat. *pellis*, skin). Old name for sheepskins. When prepared, the records of the exchequer were written thereon in early days. The clerk of the pells was an official who kept a record of all monies entering and leaving the exchequer. The office was abolished in 1834. *See* Exchequer.

Pelopidas (d. 364 B.C.). Theban general and statesman. In 385 B.C. Epaminondas (q.v.) saved his life in a battle with the Spartans near Mantinea, and the two became devoted friends. It is said that Pelopidas, though a man of wealth, adopted a simple life in order that Epaminondas, who was a poor man, might be able to associate with him on equal terms.

By 379 Pelopidas had liberated his native city from its Spartan garrison, and he took a leading part

in the subsequent struggle with Sparta. He did invaluable service with his Sacred Band, a picked body of Theban youths. During the latter part of his life he engaged in expeditions in the North against Alexander, the tyrant of Pherae, and also went on an embassy to the Persian king. In 364 he again came into conflict with Alexander of Pherae, and after the victory of Cynoscephalae met his death while impetuously endeavouring to kill his old enemy with his own hand.

Peloponnesse or **PELOPONNESUS** (Gr. island of Pelops). The S. portion of Greece, also called Morea. It is connected with the N. portion by the isthmus of Corinth. Its original inhabitants were Pelasgians, who were overrun successively by Achaeans and Dorians. Anciently it was divided, mainly by its mt. ranges, into seven states, Achaea, Corinthia, Elis, Argolis, Messenia, Laconia, and Arcadia, all of which had a seaboard except Arcadia. *See* Greece; Sparta.

Peloponnesian War. Name of the war between Sparta and Athens, in which nearly all the rest of

Pellitory. Leaf-stalk with flowers. Inset, flowers surrounded by bracts

Greece was involved. It lasted 431-404 B.C.; its ostensible cause was the quarrel between Corcyra and its mother city Corinth, in which Athens supported the former and Sparta the latter. In reality, it was a struggle between the democratic Ionians of Athens, the islands, and the maritime towns, and the oligarchical, continental Dorians, represented by Sparta.

It may be divided into three periods. (1) The Archidamian War (431-421), so named from Archidamus, king of Sparta, who commanded the forces against Athens. In this the honours of war were equally distributed. The chief incidents were the plague at Athens, the capture of Sphacteria, the defeat of Cleon by Brasidas, and the heroic resistance of the Plataeans under siege. The peace of Nicias arranged a cessation of hostilities for 50 years, but it only

lasted five months. (2) 421-412. This period was marked by the transference of the seat of war to Sicily, the result of which was the disastrous Sicilian expedition, instigated by the ambition of Alcibiades. (3) The Decesean War (412-404), so called from the occupation of Decesea, 14 m. N.E. of Athens, by the Spartans.

The scene of interest lies mainly in the East. The exile of Alcibiades caused him to take the side of the enemies of Athens, and the king of Persia intervened on the side of Sparta. The decisive victory of Aegospotami enabled Lysander to capture Athens in 405, with the result that the "long walls" were destroyed, her navy burnt, and her colonies lost. The effect was to confer the temporary hegemony of Greece upon Sparta. There is no doubt that the importance of the war has been exaggerated, owing to the detailed account given by Thucydides, and that it had little effect upon the general history of the world. *See* Greece: History.

Pelops. In Greek legend, the son of Tantalus, king of Phrygia. Being expelled from his native country, he migrated to Pisa, where he became king. He was said to have been killed by his father, and his flesh put before the gods to eat at a banquet. Hermes, however, restored Pelops to life. At Pisa he became one of the suitors of Hippodamia, daughter of King Oenomaus, the condition of winning her being that he should enter for a chariot race with her father, in which unsuccessful competitors were put to death. Pelops won the race by bribing Myrtilus, the king's charioteer, to remove the lynch-pin from his master's chariot wheel. When Myrtilus subsequently claimed the reward promised, Pelops threw him into the sea. As he disappeared Myrtilus cursed Pelops and all his house. This curse caused the succession of tragedies among the descendants of Pelops, such as the crimes of Atreus and the murder of Agamemnon.

Pelorus Jack. Local name bestowed on a grampus (q.v.) that was in the habit for years of accompanying vessels through French Pass, between Wellington and Nelson, New Zealand. Travelers looked for it eagerly, and the Maori regarded it as a friendly

Pelops, legendary king of Pisa. British Museum

minor deity. The legislative council passed a resolution for its protection. The name was derived from Pelorus Sound, where it usually picked up vessels. It was probably not an individual but a succession of grampuses, as these cetaceans frequently follow ships.

Pelota (Lat. *pila*; Span. *pella*, ball). Ball game played in Spain and Spanish America with the cesta, or curved basket attachment for the right hand. The game originated with the Basques of France, and was imported into Spain in 1858, hence Pelota Basque or Vasca, though the game is known in Spain as *el bñe á cesta*, or basket play. The hard ball weighs 120 grammes (about 4 oz.), is made of rubber and wire, and is covered with leather. It is struck violently with the cesta against two walls of cement at right angles, known as the frontón and the pared respectively, in much the same way as in the English game of fives (*q.v.*). The rules are numerous and complex, and played by teams of skilled professionals, three aside, it is an exciting game.

Pelotas. Town of Brazil, in the state of Rio Grande do Sul. It stands near the Lagoa dos Patos (*q.v.*), 25 m. by rly. N.W. of the town of Rio Grande do Sul, and is a junction for São Lourenço. It is a commercial centre for coastal trade, and has flour mills, soap and glass factories, and exports preserved meats, hides, tallow, and horns. It was formerly known by the name of São Francisco de Paulo. Pop. est. 60,000.

Peltasts. Type of light-armed foot soldier of ancient Greece. They bore a spear of moderate length, and took their name from the *pelta*, a crescent-shaped shield with rounded ends. The peltasts were a lighter arm than the hoplites, who bore a long spear and sword, and wore helmet, breastplate, and circular shield.

Peltier Effect. Difference in electrical potential developed when two metals are placed in contact and heated. Advantage of this effect is taken in the measurement of temp. by means of a thermocouple, in which two wires of different metals or alloys are connected at two places. If one of these junctions is kept at a constant low temperature and the other junction heated, then the electromotive force produced is proportional to its temperature. See Pyrometry; Thomson Effect.

Pelvis (Lat., basin). Bony girdle which connects the trunk with the lower extremities, sup-

Pelota. Players in the Spanish ball game, before the frontón wall. Inset, the cesta or basket attachment with which the ball is struck

ports the weight of the body, and contains the pelvic viscera. The pelvis consists of the two innominate or hip bones, one on each side, which meet in front, and are separated behind by the sacrum, terminating in the coccyx.

According to anatomists, the pelvis is divided by a plane which passes through the promontory of the sacrum and the upper border of the junction formed by the pubic bones. The upper part of the pelvis is sometimes spoken of as the false pelvis, and the lower part as the true pelvis, the line between them forming the brim or inlet of the pelvis, while the space between the inferior terminations of the constituent bones forms the outlet of

coloured granite and gneiss and covered with numerous glaciers, it has the form of a horse-shoe open to the E. Mont Pelvoux, 12,945 ft. alt., is one of the highest peaks of the Alps.

Pemba. Island situated off the coast of Tanganyika Territory, Africa. It is a British possession, 35 m. N.E. of the island of Zanzibar. Of coral formation, it has an area of 372 sq. m., and is divided into three dists., Weti, Chake-Chake, and Mkoani. It is administered by the Zanzibar government. The chief products are cloves, copra, and rubber. Pop. est. 100,000 See Zanzibar.

Pemba Bay or **POMBA BAY.** Bay on the coast of Mozambique. About 120 m. N. of Mozambique town, it is one of the finest harbours in the world. Its area covers 40 sq. m. On the shores is the settlement of Porto Amelia (*q.v.*).

Pemberton, SIR MAX (1863-1950). British author. Born at Birmingham, June 19, 1863, he went to Merchant Taylors' and Caius College, Cambridge. He published his first novel, *The Diary of a Scoundrel*, in 1891. He edited *Chums* 1892-93, and *Cassell's Magazine* 1896-1906. His first notable story was *The Iron Pirate*, which ran as a serial in *Chums*, 1893, followed by others of the same kind,

Sir Max Pemberton, British author Elliott & Fry

Pelvis (male), seen from above

the pelvis. Fracture of the pelvis is a frequent condition in modern warfare and in motor and other accidents. It is always dangerous and tedious to cure. The measurements of the pelvis are of great importance in childbirth, and X-rays are used to assist prognosis. The pelvis is wider in woman than in man.

Pelvoux. Mountain group of France. It is on the frontiers of the depts. of Isère and the Hautes-Alpes, and is bounded by the valleys of the Romanche, Drac, and Durance. Composed chiefly of rose

Sea Wolves, 1894, and Kronstadt, 1898. Among other works were *The House Under the Sea*, 1902; *Captain Black*, 1911; *Prince of the Palais Royal*, 1921; *The Mad King Dies*, 1928. He wrote also a memoir of Northcliffe, 1922; *Life of Sir Henry Royce*, 1934; and his own memoirs, *Sixty Years Ago and After*, 1936. For the theatre he provided light entertainment with *The Dancing Master*, *The Finishing School*, *Lights Out*, *The Bells of St. Valoir*, and (in collaboration) *My Lady Frayle*, and *Hello, Ragtime*. A director of *Northcliffe Newspapers*, he was knighted in 1928. He died Feb. 22, 1950.

Pembroke. Mun. borough, seaport, and market town of Pembrokeshire, Wales. The name is a

corruption of Penfro, a peninsula in the neighbourhood. It stands on the S. side of Milford Haven, 42 m. W. of Swansea, and is served by rly. The borough

includes Pembroke Dock (*q.v.*). The chief objects of interest are S. Mary's Church, with an old and massive tower; the remains of a Benedictine house, Monkton Abbey; and the castle, in which it is said Henry VII was born, and which remains in a good state of preservation. Underneath the keep is the Wogan, a large cave leading to the shore. Monkton Abbey church is still used.

A castle was built at Pembroke about 1100, and as the seat of powerful earls the town became important. It was the county town and the chief port for communication with Ireland. It began to decline after Tudor times, but prosperity revived when Pembroke Dock was established. Market day, Sat. Pop. 12,008. Pembroke is also the name of a suburb of Dublin.

Pembroke. Town of Ontario, Canada. It stands on Lake Alouette, a widening of the Ottawa river, 220 m. W. of Montreal; and is served by the C.P.R. and C.N.R. Industries include lumber mills, sawmills, brickyards, and tanning. Algonquin national park lies 12 m. W. Pop. 11,159.

Pembroke, EARL OF. British title held by the family of Herbert. In the Middle Ages, as Pembrokeshire was a palatine county, it was an important office. The first earl was Gilbert de Clare, created in 1138, and the second his son Richard, known as Strongbow. In 1176, on Strongbow's death, it

passed to his son-in-law, William Marshal (*v.i.*). The Marshal earls held it until 1245. When the family became extinct William de Valence secured the earldom by marriage, but his male line failed in 1324. Humphrey, duke of Gloucester, and Jasper Tudor held the title.

In 1408 Sir William Herbert was made earl of Pembroke, but his son William exchanged it for another title. In 1551 another Sir William, of an illegitimate branch, was made earl, and the title has since been held by his descendants. The 3rd earl, separately noticed, was the one whose name is associated with Shakespeare. Philip, 4th earl, was in 1605 made earl of Montgomery, and later earls have since borne the double title. In 1913 Reginald Herbert (b. Sept. 8, 1880) became 15th earl. His chief seat is Wilton House, near Salisbury, and his eldest son is called Lord Herbert.

Pembroke, WILLIAM MARSHAL, 1ST EARL OF (c. 1146-1219). English statesman. Second son of John le Marechal, he was knighted in 1173, after being for some years a member of the household of Henry, the eldest son of Henry II. In this capacity, till the prince's death in 1183, Marshal figured prominently in the quarrels between the king and his sons. He married Isabel de Clare, an alliance which brought him the earldoms of Pembroke and Striguil. He was among those who persuaded John to sign the Great Charter. On the king's death (1216) he became regent, and held that office till his own death, May 16, 1219. He was buried in the Temple Church, London. *Consult* Life, T. L. Jarman, 1930.

Pembroke, AYMER DE VALENCE, EARL OF (c. 1260-1324). English soldier. He succeeded his father William, a half-brother of Henry III, as earl of Pembroke in 1296. On the death of Edward I, 1307, he was for a short time guardian of Scotland, filling the same position again in 1314. He took an active part against Piers Gaveston, whom he captured at Scarborough, 1312. Pembroke held a command at Bannockburn, 1314, was guardian of England during the king's absence, and one of the judges who sentenced Lancaster to death. He died at Compiègne, June 23, 1324.

Pembroke, MARY HERBERT, COUNTESS OF (1561-1621). Fourth daughter of Sir Henry and sister of Sir Philip Sidney. She was born at Ticknell Palace, Bewdley, Oct. 27, 1561. In 1577 she became the third wife of Henry Herbert,

2nd earl of Pembroke. One of the most learned women of her time, and a patroness of Spenser, Daniel, Breton, Jonson, and other poets,

Mary Herbert,
Countess of
Pembroke

she is said to have made Wilton House (*q.v.*) like a college. Sidney wrote his *Arcadia (q.v.)* for her; and she edited, revised, extended, and published the first printed edition of that

work. She translated *A Discourse of Life and Death* from the French of Plessis du Mornay. She died Sept. 25, 1621, and was buried in Salisbury Cathedral; she was the subject of the famous epitaph "Underneath this sable hearse," attributed to both Jonson and Browne of Tavistock. *Consult* Life, F. B. Young, 1912.

Pembroke, WILLIAM HERBERT 3RD EARL OF (1580-1630). English politician, born at Wilton, April 8, 1580. He had Samuel Daniel as tutor before going to Oxford university, where Pembroke College is named after him. He succeeded to the title in 1601, and soon was in disgrace over an intrigue with Mary Fytton. He became lord chamberlain to James I, held office under Charles I, and was chancellor of Oxford. A poet, he is described by Aubrey as the greatest Maecenas to learned men of any peer of his time. To him and his brother Philip, "incomparable pair of gentlemen," the Shakespeare First Folio was dedicated, and he has been doubtfully identified with the Mr. W. H. to whom Shakespeare's sonnets are addressed. He died at Wilton, April 10, 1630. *See* Shakespeare.

Pembroke College. One of the colleges of the university of Cambridge. It was founded in

1347, in memory of her husband, by Mary, widow of Aymer de Valence, earl of Pembroke, and daughter of Guy, count of Chatillon and St. Pol. Known as Pembroke

Pembroke College,
Cambridge, arms

Pembroke arms

Hall, or Mary Valence Hall, it received benefits from Henry VI. Pembroke was the first Cambridge college to have a chapel of its own; the new chapel, by Wren, 1664, was enlarged by Sir Gilbert Scott in 1880-81. Ridley, Grindal, Whitgift, Andrewes, the younger Pitt, Sir Henry Maine, and the poets Spenser, Crashaw, and Gray were Pembroke men.

Pembroke College. One of the colleges of the university of Oxford. It was founded in 1624 by James I. The money was provided by Thomas Tesdale and Richard Wightwick, and an old hall, Broadgates, was reconstituted

Pembroke College, Oxford, arms a mark of esteem for the earl of Pembroke, then chancellor of the university. The buildings are in S. Aldate's, opposite Christ Church. The head is the master, and for long was also a canon residentiary of Gloucester. Preference is given in respect of certain scholarships to candidates from the Channel Islands. The most famous name in the college records is that of Johnson. Others are Sir Thomas Browne, Shennstone, Blackstone, and Whitefield.

Pembroke Dock. Dockyard of Pembrokeshire, Wales. It stands on the S. side of Milford Haven, 2 m. W. of Pembroke, of which borough it forms part, and is served by rly. In 1814 the government transferred here the dockyard from Milford. The dockyard, which covered 90 acres, was closed in 1925; reopened in the Second Great War as a repair base, it was closed again in 1946.

Pembrokeshire. S.W. maritime county of Wales. It has a splendid rugged and irregular coast, the indentations including St. Bride's Bay and Milford Haven, while herein are the bold headlands of St. David's Head, St. Ann's Head, and others. Its area is 614 sq. m. Off the coast are some small islands, Caldy being best known, and Skokholm and others famous for sea birds. The surface is undulating and scored with valleys, but there is a range of hills in the N. The Teifi, which divides it from Cardiganshire, the Nevers, and the two Cleddaus, E. and W., are the chief rivers. To the E. lies Carmarthenshire. Haverfordwest is the county town; Fishguard is a modern port and Newport an old one; Tenby a holiday resort. The chief industry

is rearing cattle. The county is in the diocese of St. David's and sends one member to parliament.

Called Dyfed, Pembrokeshire was ruled by the princes of Wales until some time after the Norman conquest. The Norman barons then built numerous castles here. In the 12th century Flemings settled; they left a mark on the cottage architecture and the fishing boats. Pembrokeshire was soon divided into a Welsh part in the N.W. and an English part in the S.E. The latter became known as little England beyond Wales. It was made a palatine earldom, remaining so until 1536. Outstanding castles are at Manorbier, Pembroke, Picton, and Carew. Pop. 87,206.

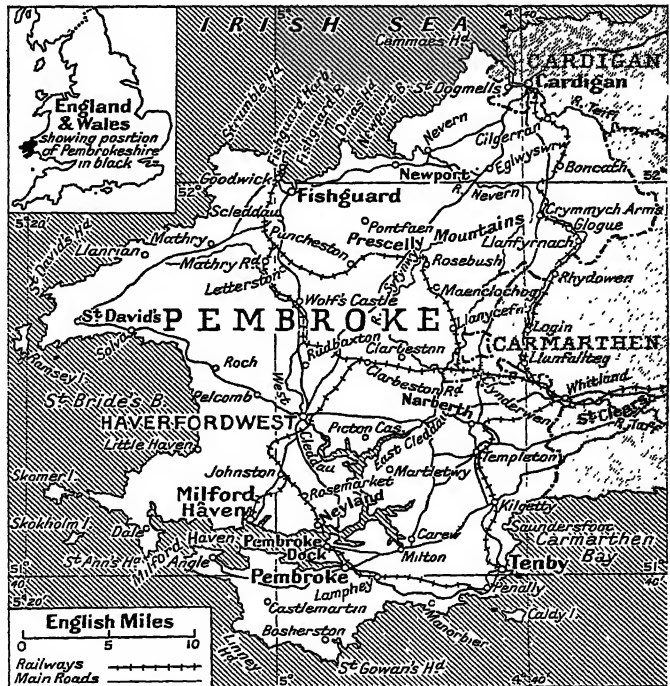

Pemmican. Preparation of food originally made by the American Indians with lean meat denuded of all fat, dried in the sun and wind, and pounded into a paste. When dry it will keep good for an indefinite period.

Pemphigus (Gr. *pemphix*, bubble). Group of diseases of the skin characterised by the formation of blisters or blebs. Acute malignant pemphigus is a disease met with in butchers and others who handle carcases; it is a bacterial infection. Chronic pemphigus is

usually seen in elderly, debilitated persons; its cause is unknown. The eruption generally appears first on the lips or front of the chest. Large areas of the body may be affected. The disease is serious and may end fatally. *Dermatitis herpetiformis* is another form of pemphigus often associated with exposure, cold, and exhaustion. The condition gives rise to severe itching. Its essential cause is probably infection by a virus.

Pen. Instrument for writing with a fluid. The earliest writing instruments were the brushes of the Chinese and Egyptians, and the stylus of the Greeks and Romans. The origin of the quill for writing is uncertain, but it was for many centuries the chief writing instrument, holding its own till the middle of the 19th century. The constant necessary resharpening of quills led to attempts to make them durable by tipping them with various substances and imitating them in metal.

The first steel pen was made by Wise, of London, in 1803, but this was not a commercial success till Gillott, Mitchell, and Perry, between 1820 and 1830, began manufacturing an improved form by machinery. The pens are cut from steel sheets into blanks, the latter

Pembrokeshire. Map of the south-western county of Wales, containing Milford Haven, the finest natural harbour in the United Kingdom

Pen and pen-making. Processes in the manufacture of a steel pen. Top, left, rolled sheet of steel from which blanks are cut; right, scrap metal remaining after blanks are cut. Bottom, left to right: blank; pierced pen; marked or stamped with maker's name; raised or curved; after hardening; tempered; soured; ground; after point has been slit; coloured

By courtesy of Perry & Co., Ltd.

stamped or pressed into shape, hardened by plunging into hot oil, tempered, polished, and the point divided by a special shearing machine. In all some sixteen processes are required to make an ordinary steel pen or nib. Power presses allow several processes to be combined in one operation. Gold is used for the nibs of fountain pens, as it is more flexible, the points being made more durable by the addition of iridium. Special types of pens are used for ruling, duplicating, lithography, drawing, ticket writing, etc. See Fountain Pen; Ink; Writing.

Penal Code. Name given to a code of laws concerning crimes and offences and their punishments. The term includes the systematic arrangement of the laws, and most civilized nations have embodied their laws in some such code, the most famous of modern times being the Code Napoléon of France, which has served as a model for other European nations.

More specifically, the term is used for those penal laws of the 17th and 18th centuries which were passed against Roman Catholics in England and Ireland. Under these laws R.C.s were forbidden to acquire land by purchase, and those educated abroad in the R.C. faith were debarred from succeeding to real property, their estates passing to the next Protestant heir. The most severe penal laws were abolished in 1780, and most were done away with by various Acts in the 19th century. See Catholic Emancipation; Criminal Law; Toleration.

Penal Servitude. In English criminal law a form of imprisonment which superseded transportation, when the Penal Servitude Act was passed, 1853. Persons sentenced to penal servitude

were sent to convict settlements and not to local prisons. At first penal servitude was imposed only for sentences of under 14 years, persons sentenced for longer periods being transported, but by 1857 transportation had ceased in practice and penal servitude could be imposed instead of transportation for all sentences. When first introduced it involved three different punishments. The first part of the sentence (nine months) was served in solitary confinement, the second part on public works outside the prison at some harbour such as Portland or Chatham or in a convict settlement such as Dartmoor, and during the third part the convict, if of good behaviour, was released on ticket-of-leave under police supervision. The minimum sentence was 3 years (increased to 5 years in 1864 but reduced to 3 years again in 1891), and the maximum was for life. Changes made during the second half of the 19th century brought about a classification of prisoners and remission of up to a quarter of the sentence for good behaviour. Solitary confinement gradually disappeared in practice after a report of a committee under Herbert Gladstone in 1898; it was abolished only in 1922. The employment of convicts on work outside the prison became increasingly difficult, so that there was eventually little difference between penal servitude and ordinary imprisonment.

The Criminal Justice Act, 1948, abolished penal servitude and substituted simple imprisonment in every case.

Penance (Lat. *poenitentia*, repentance). Ecclesiastical term for the turning of a sinner from sin to repentance; for the acts that form the visible proof of repentance;

for the penitential discipline of the Church, and, in the R.C. communion, for the sacrament for the remission of sin committed after baptism, a remission effected by true supernatural sorrow, sincere confession, satisfaction, and priestly absolution. In the R.C. Church confession of mortal sin is held to be an absolute duty, and the sinner is bound to seek for absolution. This has been the case since the Lateran Council of 1215. Originally the expiatory part of penance involved heavy and lasting penalties. The wearing of sackcloth and ashes was once adopted as a sign of repentance; sometimes delinquents were required to make confession and express sorrow while standing in church clad in a white sheet. In process of time, however, the penalties came to be confined to prayers, fasting, and almsgiving. At one time it was possible for others than the person upon whom penance was imposed to do penance for him, if not altogether, at least in part. Rules, called Penitentials, were drawn up for the guidance of the confessor. See Absolution; Confession.

Penang. Settlement of the Federation of Malaya, until 1946 part of the Straits Settlements. From 1800 Penang included the district of Province Wellesley (*q.v.*) on the mainland and the Dindings to the S. Penang island lies about 2½ m. off the W. coast of the Malay peninsula, adjacent to Province Wellesley; measuring 15½ m. by 10½ m., it has an area of 110 sq. m. and a pop. (1941) of 247,460, of whom 166,974 were Chinese, 41,853 Malayan, 31,916 Indian, and 2,464 European. Penang island was bought from the native state of Kedah in 1785, and in 1826 was incorporated with Malacca and Singapore; the three became one crown colony 1867-1946. Penang's name was formerly Prince of Wales Island. It has good roads and a hill-railway; the chief town is Georgetown, with a fine harbour, a tin-smelting works, a racecourse, and golf-links.

Penang suffered heavily from air attacks in the Second Great War. A series of Japanese raids, Dec. 11-13, 1941, reduced the administration of the island to a state of chaos; European women and children were evacuated, and the native population panicked. On Dec. 19, following the loss of Kedah and Province Wellesley on the mainland, British troops were withdrawn from Penang. Although the tin-smelting works and power-station had been destroyed,

the Japanese used the radio station. See Malaya, Federation of.

Penang Lawyers (*Licuala acutifida*). Shrub of the family Palmae. It is a native of the island of Penang, Malaya. Its stems are about five ft. in length and about an inch thick. At the top there is a tuft of fan-shaped leaves, with prickly stalks. The name belongs properly to the stout walking-sticks into which the stems are converted after scraping and straightening.

Penarth. Urban dist., watering-place, and seaport of Glamorganshire, Wales. It stands on the

Penarth, Glamorganshire. Air view of the town and harbour

Ely, where it falls into Cardiff Bay, 4 m. S.E. of Cardiff and 166 m. W. of London. It has a rly. station. There are a pier, a fine esplanade, and several parks. Penarth was nothing but a small village before 1859, when work was begun on its tidal harbour. Pop. 16,720.

Peñas, GULF OF. Large opening of the Pacific, indenting the coast of Chilean Patagonia. It is 80 m. wide at its mouth and penetrates inland about 70 m., containing the islands of Xavier and Guaianeco.

Penates. Household gods of the ancient Romans. See Lares.

Pencil (Lat. *penicillum*, a little tail). Instrument for writing and drawing. The word is now chiefly used of the "black lead" or similar pencils, i.e. those pencils made of wood and containing a central core of lead, graphite, coloured chalk, slate, or other material. The modern black lead pencil contains no lead, the writing material being graphite and clay.

The earliest writing pencils were made with lead, graphite pencils being introduced into Great Britain in the 16th century. In the modern methods of manufacture, the graphite is reduced to a powder mixed with clay and water to the

consistency of dough, and forced through dies the diameter of the finished lead. The long graphite and clay sticks are dried, cut into pencil lengths, and then heated until all the moisture is thoroughly driven off. The greater the amount of clay in the mixture the harder the pencil. The hardness or softness is usually indicated by the letters H (hard) and B (black); the usual range is from 6B to 4H, and the commonest degree for everyday use is the medium known as H.B. The softer forms are preferred by artists, the harder by draughtsmen.

The graphite-clay sticks are then inserted into semi-circular or semi-hexagonal parallel grooves, cut in a slab of wood which is ultimately divided into a number of pencils. A similar grooved slab is laid on the first, glued firmly, the separate pencils cut apart, shaped, polished, varnished, etc. The whole process from beginning to end is carried out by machinery.

Coloured pencils are made of chalk, clay, etc., with colouring pigments added; copying-ink pencils are made of graphite with an aniline dye added; while slate pencils may be either unprotected rods of slate or wooden pencils with a slate core. There is also the metallic holder in which the "lead" is propelled and repelled by a screw, and refills can be supplied. See Graphite.

P.E.N. Club. International literary association, the letters of whose name stand for poets, playwrights, essayists, editors, and novelists. Founded in 1921 by

Mrs. C. A. Dawson Scott, it aims at international cooperation and friendship between men of letters. Centres were established in most world capitals, and by 1948 there were some 60. Congresses, held annually until the outbreak of the Second Great War, were resumed in 1946. Lectures, discussions, readings, and social gatherings are among the normal activities. The international presidency was held by Galsworthy, 1921-33; Wells, 1933-36; Jules Romains, 1936-39. Maurice Maeterlinck was elected in 1947. Presidents of the English centre have included J. B. Priestley, H. W. Nevinson, Storm Jameson, and Desmond MacCarthy.

Penda (c. 577-655). King of Mercia. He became king about 628, and soon defeated the West Saxons at Cirencester. A heathen warrior, in 633 he helped to defeat and kill Edwin, king of Northumbria, and in 642 he slew in battle another Northumbrian king, Oswald. In 654 this last champion of paganism slew Anna, king of the East Angles, and invaded Northumbria, but was defeated and slain, Nov. 15, 655. See Mercia.

Pendant. In architecture, a rigid hanging ornament, often elaborate, suspended from the summit of a Gothic vault, or from the bottom of a roof post or other constructional member below a ceiling. The term is also used for an ornament hung from the neck. See Gothic Architecture.

Pendennis. Novel by Thackeray published in 1850 with the full title, *The History of Pendennis, His Fortunes and Misfortunes, His Friends and His Greatest Enemy*. The author utilised experiences of his own early life in narrating the story of his hero, and sketched several of the characters from actual people, e.g. the clever, shiftless Captain Shandon, who was based on W. Maginn (q.v.).

Pencil. Successive stages in the making of a lead pencil. 1. Rough wood. 2. Wood when grooved. 3. Grooved wood with lead in position. 4. Block of wood made up of 2 and 3 placed together, enclosing lead in grooves. 5. Ends of block levelled. 6 and 7. Stages in moulding the block into pencils. 8. Pencil painted and polished. 9. Finished bundle

Penderel. The name of an English royalist family. The five sons of William Penderel—a yeoman of Boscobel, Salop—Richard, Humphrey, John, William, and George, helped Charles II after the battle of Worcester, 1651, to disguise himself and hide in an oak and also in their houses for a week, Sept. 3-9. At the Restoration they were highly honoured and granted pensions.

Pendine Sands. Stretch of sand between Saundersfoot and Pendine along Carmarthen Bay, Carmarthenshire, Wales. It was used for speed trials by racing motorists during the 1920s, and Parry Thomas was killed while racing here in 1927.

Pendlebury. District of Lancashire, England, part of the bor. of Swinton (*q.v.*).

Pendle Hill. A landmark of Lancashire, England. The hill is 1,831 ft. high, and stands some 1,500 ft. above the surrounding country near the Yorkshire border. The hill extends in a ridge from N.E. to S.W. with its steeper side towards the valley of the Ribble, and is usually ascended from Clitheroe. It gives its name to the Pendleside Series in geology. The Lancashire Witches of 1612 were reputed to hold their grand council at Malkin Tower on the hill.

Pendleside Series. In geology, the name given to a series of rocks between the upper division of the Carboniferous limestones and the millstone grits. The series consists chiefly of black limestones and shales. It is so called from its development at Pendle Hill, Lancs.

Pendulum. Rigid body free to swing on a horizontal axis under the influence of gravity. A simple pendulum is the name theoretically given to a pendulum which consists of a particle of matter suspended from a point by a weightless string. The time taken for such a simple pendulum to make one complete beat is $2\pi\sqrt{l/g}$ where l is the length of the string, and g is the acceleration due to gravity. This law applies only for small oscillations, and for such the period of beating is constant at any particular place. Since, however, it varies with g , the same pendulum taken to different parts of the earth, or to different altitudes, serves as a means of calculating the force due to gravity.

Pendulums of the same length, swinging through small arcs, have the same period, the period not being dependent upon the amplitude of the arc. The period is directly proportional to the square

root of the length: thus a pendulum of a length to beat seconds (the so-called "seconds pendulum") is four times as long as one to beat half-seconds. Only when the pendulum is hung by a flexible filament, or connected to its support at the top by a similarly flexible material, is it isochronous, i.e. absolutely regular in tempo of beat. The flexible connexion allows the pendulum virtually to shorten as it swings in a longer arc (but still within strict limits), thus counteracting any small increase in the arc. The curve traced out by the pendulum is a cycloid one.

Any solid object suspended from a horizontal axis performs oscillations similar to those of a simple pendulum, and in dynamics is called a compound pendulum. A compensation pendulum is one which is compensated against changes of temperature. The various methods used include employing together metals which have differing coefficients of expansion; in place of these "compensated pendulums," it is now usual to employ a metal little affected by change in temperature.

Besides its use in clocks and for obtaining the value of g , the pen-

ure the velocities of shot or bullets. The bob of the pendulum is replaced by a wooden block into which the shot or bullet is fired. The distance through which the block moves and the consequent time of oscillation of the pendulum enables the velocity of the projectile to be calculated. See Atwood's Machine; Ballistics; Clock; Foucault.

Penelopë. In Greek legend, wife of Odysseus (*q.v.*). The long absence of her husband caused a number of suitors for her hand to come to the royal palace at Ithaca, where, in spite of her refusals, they lived riotously. She promised to make up her mind as soon as she had finished a garment, of which she secretly unwove each night as much as she had woven in the day. *Pron.* Pe-nellopy.

Penelope. From a Greek sculpture in the Vatican

Peneplain (Lat. *pene*, almost). Ex-

tensive area which has been worn down by erosion to a nearly level surface, across which sluggish rivers flow along meandering courses. Elevation of a peneplain by earth movements will cause rejuvenation of the rivers, which will excavate valleys in the original surface. This latter can then be traced in the accordant summit level of flat-topped hills and ridges. Many such ancient peneplains can be recognized in Wales, Africa, etc., and three can be identified in the Appalachian Mts. of eastern U.S.A.

Penetanguishene or **PENETANG.** Town of Ontario, Canada. It is on the C.N.R., on an inlet of Georgian Bay, 92 m. N. of Toronto. Gateway to the islands of Georgian Bay, it is a popular summer resort. During the war with the U.S.A. the town was fortified as a Canadian naval station. A regiment of French scouts, the bulk of the garrison, was rewarded with a grant of land and exemption from taxation, a privilege still enjoyed by their descendants. Pop. 4,521.

Peneus. Ancient name for the river of Greece now known as the Salambria (*q.v.*) or Salamvria.

Penge. Urban dist. of Kent, England. Adjoining Sydenham on the Surrey border, it is 6 m. S. of London and connected with it by rly. and bus. Formerly a detached hamlet of Battersea, and until about 1830 merely a common, Penge was in part absorbed for the

Pendulum. Compensation is provided (Fig. 1) by the differing coefficients of expansion of metals a and b , or (Fig. 2) by expansion of mercury columns

dulum has been used in the famous experiment of Foucault to show the rotation of the earth. A ballistic pendulum is one used to meas-

Crystal Palace and in part given over to the builder. The Watermen's and Lightermen's Asylum dates from 1839 and has a museum of marine curiosities. The Empire Theatre is well known for repertory. The Penge Case was a *cause célèbre* in 1877, when there appeared at the Old Bailey, on a charge of murder, Louis and Patrick Staunton, the latter's wife, Elizabeth Ann, and her sister, Alice Rhodes. The victim was Harriet Staunton, wife of Louis, a woman of weak intellect, with a fortune of £3,000. All four prisoners were convicted and sentenced to death. Alice Rhodes was pardoned, the sentences on the other three being commuted to penal servitude for life. The case is famous for the defence by Sir Edward Clarke (*q.v.*), described in his Autobiography. Penge was heavily bombed in Sept.-Nov., 1940, and by flying bombs in the summer of 1944. Pop. 27,762.

Penguin. Name given to the flightless sea-birds of the order Sphenisciformes. They are sea-

Penguin. Yellow-crowned species, found in the Southern Pacific and Antarctic Oceans

birds with boat-shaped bodies, legs placed very far back, the toes webbed, and the wings useless for flight. The latter are entirely without quills and the feathers covering them are small and scale-like. They are incapable of flexure, but are worked from the shoulder with a somewhat rotatory action as efficient paddles. The feathers of the body form a thick, close coat, but these also approach to scales in character. The birds stand perfectly erect, and with their great paddles held loosely at their sides present a grotesque appearance

when they assemble in thousands at their breeding places. Macaroni penguins (*Eudyptes*) have long, curling crests on their heads. A "jackass" or braying penguin is found at the Cape of Good Hope. The bird's range extends from the equator to the Antarctic.

Penguin Books. Popular series of pocket-sized paper-backed reprints and original works, the first series of their kind to appear in Great Britain. The first batch of ten volumes was issued July, 1935, and the price of 6d. was retained in all subsequent books until the Second Great War. The Pelican books, in the same format, but devoted to educational, philo-

sophical, and technical works, were first issued May, 1937. The publishers are Penguin Books Ltd., founded by Allen Lane, and the enterprise was further developed in the Puffin books (for children), an edition of Shakespeare, guide-books, and periodicals such as Penguin New Writing, Penguin Film Review, Penguin Music Magazine.

Penguin Island. English translation of *L'Île des Pingouins*, title of the satirical survey of modern French history published by Anatole France (*q.v.*) in 1908. Told in a series of fables, the book recalls the finesse of Voltaire without his cruelty or viciousness.

PENICILLIN AND OTHER ANTIBIOTICS

Sir Alexander Fleming, F.R.S., Prof. of Bacteriology, S. Mary's Hosp., London

An account of the discovery, nature, and use of penicillin by the scientist who first described it, and who shared the Nobel prize for medicine in 1945 for his part in the discovery of this drug

The idea that one microbe can interfere with the growth of another is not new. Bacterial antagonism was first demonstrated by Pasteur and Joubert in 1877 when they showed that if their culture medium was contaminated by certain bacilli, the bacillus of anthrax would not grow. In the next few years a very considerable literature appeared on antagonism and a new word *antibiosis* was coined by Vieullemin to denote inhibition or destruction of one microbe by the action of products formed by another. The organism which produced the active substance was called the *antibiot*. The word *antibiotic* has since frequently appeared, but it is only since the success of penicillin that it has come into common use to denote substances made by living organisms in their growth which have a powerful inhibitory or lethal effect on micro-organisms.

Antibiotics have been used at intervals for over 50 years in the treatment of infections. Of the earlier antibiotics the most notable was Pyocyanase, an antibacterial substance produced by the microbe of blue pus, *Bacillus pyocyanus* (now known as *Pseudomonas aeruginosa*). In 1898 this was found to destroy a large number of microbes, and especially the diphtheria bacillus. It was recommended for application to infected areas and for a time had a considerable vogue. The results, however, were not very dramatic, and it disappeared from medical practice.

More and more instances of bacterial antagonism were described and the literature on the

subject grew; but as time went on it became more academic. All bacteriologists were familiar with these antagonisms and in his routine cultures a clinical bacteriologist could notice instances of bacterial antagonism every week. This familiarity with antagonism did not help the discovery of penicillin—it rather hindered it, for the fact that one microbe inhibited another was so common that the matter seemed hardly worth pursuing.

In 1928 a culture plate of staphylococcus prepared by the writer became contaminated with a colony of a mould. Around this mould the colonies of staphylococci appeared to be undergoing dissolution (Fig. 1).

This so excited the writer's curiosity that he obtained the mould in pure culture and investigated its action on different

Penicillin. Fig. 1. Culture-plate showing the dissolution of staphylococcal colonies in the neighbourhood of a penicillium colony. A, Penicillium colony. B, Staphylococci undergoing lysis. C, Normal staphylococcal colony

bacteria. Some of the mould spores were planted on one side of a culture plate, and after it had de-

Penicillin. Fig. 2. Various bacteria streaked radially to a four-day-old colony of *P. notatum* on agar. The bacteria are: 1, *Staphylococcus*; 2, *Haemolytic streptococcus*; 3, *E. diptheriae*; 4, *B. anthracis*; 5, *B. typhosus*; 6, *B. coli*.

veloped for a few days various bacteria were inoculated in streaks radially to the mould colony. Some of these were found to grow right up to the mould colony while others were completely inhibited for an inch or more (Fig. 2).

Then the mould was grown on a fluid medium. Here it grew as a felted mass on the surface, with a clear fluid underneath. This fluid was embedded in a "gutter" cut from a culture plate and bacteria were streaked perpendicularly to the gutter. Some of them grew right up to the gutter, but with others the growth stopped an inch or more away (Fig. 3).

These two experiments showed that this mould produced in its growth a substance which had no effect on the growth of some microbes, but, was strongly inhibitory on many others; and it was of great interest that among the microbes which were most strongly affected were many of those which most commonly infect man.

The mould, on examination, was found to be a penicillium and eventually it was found to be *Penicillium notatum*, a species described by Westling and allied to *P. chrysogenum*. It was for the reason that this antibacterial substance was produced by a penicillium that it was named penicillin. Other moulds were examined but none of them produced this active substance.

Further experiments showed that penicillin actually killed certain bacteria; and the very first observation was one of dissolution of the bacteria. Penicillin is thus bacteriostatic, bactericidal, and bacteriolytic.

It had been found that all the antiseptics in common use were more toxic to the white cells of the blood (leucocytes) than they were to bacteria. Penicillin, while it was very active against some bacteria, had no injurious effect on leucocytes. In this it was unique, and it was this property which suggested its possibilities as a therapeutic agent. But penicillin was an unstable substance. Its activity disappeared in a few days or weeks, according to the conditions in which it was kept, and it was not known how it could be sterilised.

In 1932 Clutterbuck, Lovell, and Raistrick showed that this same strain of mould would produce penicillin in a simple medium consisting of a few salts and some glucose. They also showed that it could be extracted in acid ether; but circumstances prevented them from pursuing the work to the stage of producing an effective concentrated penicillin. It was only in 1940 that Florey and Chain and their collaborators in Oxford,

Penicillin. Fig. 3. Various bacteria streaked perpendicularly to penicillin "gutter".

using the same mould, succeeded in concentrating penicillin something like 1,000 times and stabilising the concentrate by drying. This penicillin concentrate was tested on experimental infections in mice, and it was found that extremely small doses (much smaller than any of the sulphonamides) would cure infections of streptococcus and staphylococcus, and that penicillin had no poisonous action on the animal. Then in the next year, after enormous labours, the Oxford workers prepared enough concentrated penicillin to treat some patients suffering from serious septic infection. The results were dramatic—so dramatic that there was no doubt that penicillin was the most powerful chemotherapeutic agent against the common septic infections.

The problem now was to prepare penicillin in quantity and, as the

Second Great War was seriously hampering possible large-scale production in the U.K., Florey took all his information to the U.S.A. and succeeded in interesting the authorities there. Valuable research work was done at the north-western regional laboratory in Peoria by Coghill and others, and soon the large pharmaceutical houses in the U.S.A. established production plants.

Advances were made in several directions:

(1) *In culture medium.* It was found that the addition of "corn steep liquor" to the simple medium used by Raistrick and the Oxford workers gave a greatly increased yield of penicillin. Other improvements were later made, such as the addition of substances which would otherwise have to be synthesised by the mould in its growth.

(2) *Method of culture.* At first all penicillin was prepared by growing the mould on the surface of a shallow layer of fluid in some kind of flat bottle. It was found later that if the fluid was properly agitated and aerated the mould would grow throughout the medium in large tanks. This diminished the labour and increased the yield and became the method generally adopted.

(3) *Strain of mould.* Until 1944 all penicillin was made from the strain of *Penicillium notatum* which the writer had isolated in 1928 at S. Mary's Hospital, Paddington. It was, however, inconceivable that this unselected strain should be the best penicillin producer, and an intensive search was made for better strains. One was found in Peoria which, in deep culture, gave a much better yield. A still better natural mutant of this strain was selected, and this was treated with X-rays and ultra-violet light with the result that still better strains were evolved.

The result of all these improvements was that the crude culture fluid before purification contained in 1948 about 100 times as much penicillin as it did in 1941.

CHEMISTRY OF PENICILLIN. The formula is as follows:

The mould can make at least four different penicillins, known in the

U.K. as 1, 2, 3, and K, in the U.S.A. as F, G, X, and K. These differ only as regards a radicle (R in the formula). The radicles in these four penicillins are:

British names	U.S. names	Radicle
1	F	$\text{CH}_3 \text{ CH}_2 \text{ CH}-\text{CHOH}_2$
2	G	
3	X	$\text{OH} \text{ } \text{CH}_2$ 
K	K	$\text{CH}_3 \text{ CH}_2 \text{ CH}_2 \text{ CH}_2 \text{ CH}_2 \text{ CH}_2 \text{ CH}_2$

These penicillins differ somewhat in their antibacterial power, and K is much less effective than the others in the treatment of disease. It should not appear in large proportion in any commercial penicillin.

The formula shows an unusual β lactam ring and when penicillin is acted on by strong chemicals or by some metals or by penicillinase this ring is broken and the antibacterial power is lost. Penicillinase is a substance made by many bacteria, and its presence in an infected area may be of considerable importance in practical medicine.

Penicillin is an acid which readily forms salts and the sodium, calcium, and potassium salts are in common use.

UNIT OF PENICILLIN. The Oxford workers established a unit which became known as the Oxford unit. This has been accepted as an international unit and corresponds to 0.0006 mg. of pure penicillin 2 (G). One million units is, therefore, equal to 0.6 gr. of this substance.

PROPERTIES OF PENICILLIN. It is issued as a dry powder and in this state is relatively stable. When, however, water is added it becomes unstable, and even in a refrigerator it will not maintain its activity for long. As was shown by the early experiments, it has a selective action, affecting some bacteria only. While penicillin treatment can be extraordinarily effective if the infecting bacterium is sensitive, it is quite without effect on an infection with an insensitive microbe.

RESISTANT STRAINS OF BACTERIA. Even when nearly all strains of a microbe such as staphylococcus are very sensitive, there are a few naturally resistant strains. Widespread penicillin treatment destroys many of the sensitive strains, the resistant ones are unaffected, so the percentage of the latter has increased. Bacteria can also be made resistant by exposure

to sublethal concentrations of penicillin. It has been shown, however, that by association with other microbes, some at least of the resistant strains rapidly regain their sensitivity.

CLINICAL USES. Penicillin has been used successfully for the treatment of all infections due to penicillin-sensitive microbes. These include, among others, the common septic infections, pneumonia, meningitis, venereal disease, endocarditis, actinomycosis, and anthrax. In some infections such as gonorrhoea the infection is eradicated in a few hours; in others, such as syphilis, endocarditis, or actinomycosis, some weeks of constant treatment may be necessary.

OTHER ANTIBIOTICS. In 1939, before penicillin was popularised, Dubos described tyrothricin, an antibiotic derived from the *Bacillus brevis*. This had a powerful action on Gram-positive microbes but little action on the Gram-negatives. Unfortunately it was too toxic for internal administration, but it has been extensively used as a local application in septic infections. It is stable in solution.

The remarkable success of penicillin in treatment led to an intensive search for other antibiotics. Large numbers have been found. These are produced by flowering plants, fungi, moulds, actinomycetes, bacteria, and protozoa. Very few have practical value.

Gramicidin S, produced in Russia by a bacillus, is akin to tyrothricin and is used for the same purposes. Many other antibiotics have been derived from spore-bearing aerobic bacilli but none of them has been sufficiently developed to come into extensive use. One of them, "Aerosporin," has been recommended for the treatment of whooping cough.

Apart from penicillin, the only antibiotic in common use for systemic treatment is streptomycin. This is produced by an actinomycete (*streptomyces griseus*). It is a basic substance forming salts with acids. It affects a wider range of organisms than does penicillin and the tubercle bacillus in particular is sensitive to its action. It is of value for the more acute forms of tubercular infection, such as meningitis and miliary tuberculosis, but even with streptomycin treatment, the benefit in most cases is only temporary. It differs from penicillin also in having some

toxic action on the human body, especially on vestibular function, so that doses have to be carefully controlled. Something better is necessary before the scourge of tubercular infection is brought under control. Consult The Story of Penicillin, G. Lacken, 1945; Penicillin: its Practical Application, Sir A. Fleming, 1946.

Penicillin Act. An Act of parliament passed in 1947. It prohibits the sale or supply of penicillin by any one except certain qualified persons—e.g. a doctor or a dentist.

Penicillium (Lat. *penicillus*, pencil). Genus of fungi, including some of the common moulds which destroy foodstuffs and organic substances of many kinds. Several species are used in brewing and in making stilton and gorgonzola etc., cheeses. The most useful is perhaps *Penicillium notatum*, from which is obtained penicillin (q.v.).

Penicuik. Police burgh of Midlothian, Scotland. It stands on the N. Esk river, 10 m. S. of Edinburgh, with a rly. station. The buildings include the tower of the old church of S. Kentigern. Penicuik House, of the 18th century contains objects of historic interest. The name means cuckoo's hill. Pop. 5,000.

Penillion. Ancient form of singing peculiar to Wales. To the music of a harp playing a series of traditional airs the singer (or singers in turn) improvised songs in counterpoint, not necessarily in the same metre, changing the counterpoint as often as the harpist changed the air. In modern penillion singing the counterpoint is usually rehearsed, and often sung by a chorus in unison. *Proem* (approx.) pen-ith-leon.

Penington, Sir Isaac (c. 1587-1661). Lord mayor of London. Son of a wealthy merchant, he turned

Sir Isaac Penington, Lord Mayor of London

his attention to politics, zealously espousing the Puritan cause. He was elected M.P. for the City in 1640, and quickly became prominent by uncompromising speeches. As lord mayor for 1642, he raised immense loans in the City for his party, was one of the bitterest opponents of Laud, and sat as a commissioner at the trial of the king, but would not sign the death warrant. In the same year, 1649, he was a member of the council of

state. At the Restoration, Penington was brought to trial and condemned to death, but the sentence was commuted to imprisonment, and he died in the Tower, Dec. 17, 1661. His eldest son, Isaac Penington (1616-79), became a leader of the Society of Friends.

Peninsula (Lat. *pene*, almost; *insula*, island). Projecting piece of land almost surrounded by water. Peninsulas are commonly formed by the submergence of mountainous regions, especially if the mountains of the sunken land mass are arranged in long chains, e.g. the Italian, Balkan, and Malay peninsulas. Most peninsulas point S., but exceptions pointing N. are Yucatan, Mexico; Jutland; Taimyr, Siberia; and Cape York.

Peninsular and Oriental Steam Navigation Company. British steamship line, usually

P. & O. Co. Flag.
Top, white; bottom, yellow;
left, blue; right, red

called the P. and O. The original Peninsular company was founded in 1834, to trade with the Iberian peninsula. The house flag incorporated the old Portuguese royalist and Spanish colours. In 1840 the co. was incorporated under its present title. From its incorporation the company has held the British government mail contracts to Egypt, India, and later the Far East, and in 1852 was given that to Australia. In 1851 the first screw steamer was run, and the line has always kept abreast of modern developments, though the passage through the Suez Canal has limited the size of vessels to 25,000 tons. In 1910 the Blue Anchor line was purchased, and the group controls nearly 2,000,000 tons of shipping. P. and O. ships acted as troopers and transports in many wars. The head offices are at 122, Leadenhall Street, London, E.C.3.

Peninsular War. Struggle carried on by Great Britain as the ally of Spain and Portugal against France, 1808-14. This name was given because it was waged in the Iberian peninsula. The Spanish people, over whom Napoleon had placed his brother Joseph, rose in revolt and secured the surrender of a French force at Baylen in July, 1808. The Portuguese had joined the movement, and the directors of British policy, having realized the possibility of striking at France through Spain, sent out Sir A.

Wellesley (later duke of Wellington). He landed in Portugal with a force of 12,000 men, routed a small army at Roliça, and won a battle at Vimeiro. But Sir Hew Dalrymple, in supreme command, restrained an advance, and signed with Junot the convention of Cintra, by which the French undertook to evacuate Portugal. One reason for Dalrymple's delay was the knowledge that Sir John Moore was on the way to the seat of war with 10,000 men.

The war continued, however, and Napoleon himself came to Spain. Moore, now in command, invaded that country, with the intention of cutting the French communications. Orders were given him to join with a force under Sir David Baird, and large armies of Spaniards being in the field, successes were hoped for. But Napoleon routed the Spanish forces with great rapidity and ease, and advancing towards the British he quickly changed the situation. Having joined Baird and fought a cavalry action at Sahagun, Moore decided to retreat, and followed by the enemy, under Soult, he made his memorable march to Corunna. There, Jan. 16, 1809, he turned and defeated Soult. Moore was killed, but his army was embarked.

The next stage began with the return of Wellesley, who in April landed at Lisbon, fought his way across the Douro, and on July 27 won the battle of Talavera. Failing to secure the effective cooperation of the Spaniards, who had lost heavily in a series of battles in their own country, or to secure reinforcements from home, he abandoned Spain, and during the winter constructed the defensive lines of Torres Vedras to cover Lisbon. Drawing the enemy after him, he fell back thereto, fighting on Sept. 27, 1810, the battle of Busaco, after which the French captured the frontier fortresses of Badajoz and Ciudad Rodrigo.

Wellington early in 1811 returned to the offensive. He detailed a force to attack Badajoz, and in May won the battle of Fuentes d'Onoro and captured Almeida. Albuera quickly followed, but throughout the year Badajoz and Ciudad Rodrigo defied all his efforts. In 1812, however, both were stormed, and Wellington entered Spain. On July 22 he won the great battle of Salamanca and occupied Madrid, which was captured, after a first attempt had failed, in Aug.; but an advance of the French armies forced him to fall back to the frontier of

Portugal. Following another pause, which he used to reorganize the armies of his Spanish and Portuguese allies, he was successful on June 21, 1813, at Vittoria. As a result of the greatest battle of the war, the French were driven into their own country. The last stage was the passage of the Pyrenees and the advance into France. There several battles were fought, notably for the possession of San Sebastian. Then in Oct. Wellington crossed the Bidassoa and secured the fortress of Pampeluna. A strong French position on the Nivelle was the next objective, and it was only after some hard fighting in Dec. that this river was passed. Some desperate fighting for the possession of Bayonne followed. This included the battles of the Nive, four days of combat in Dec., the passage of the Adour, and the battle of Orthez in the following Feb.

The retreating French next stood before Toulouse, which was entered after another victory in April, when the abdication of Napoleon ended the war.

The British losses were put down as 36,000. The French lost heavily, too, while this "running sore," as Napoleon called it, was one of the chief causes of his overthrow. See Albuera; Badajoz; Ciudad Rodrigo; Wellington, etc. *Consult* History of the War in the Peninsula and S. of France, Sir W. Napier, new ed. 1886; History of the Peninsular War, C. Oman, 1902-11.

Penis (Lat. *pendere*, to hang). Male organ of micturition and copulation. It consists of two long, narrow bodies: the *corpora cavernosa* is a network of erectile tissue, below which is the *corpus spongiosum* enclosing the urethra or tube from the bladder. The end of the *corpus spongiosum* is called the glans or head and is covered by the prepuce or foreskin, except when the latter has been removed by circumcision. The opening in the glans is termed the meatus. In some animals, notably dogs and all felines, the anterior half of the penis contains a penial bone.

Peñíscola. Town of Spain, in the prov. of Castellón de la Plana. It stands on the Mediterranean, 5 m. by road S. of Benicarló and 80 m. N.N.E. of Valencia. Built on a rocky islet connected with the mainland by a narrow isthmus, it is called the Gibraltar of Valencia. Originally a Moorish fortress, it was captured by James I of Aragon in 1233.

Penistone. Market town of the W. Riding of Yorkshire, England. It stands on the Don, 12 m. from Sheffield by rly. The church of S. John the Baptist is an old building, and there is a grammar school, founded in 1392. The industries include steel works, sawmills, and vinegar brewing. Stone and coal are worked in the neighbourhood. It gives its name to a division returning one member to parliament. Market days, Mon. and Thurs. Pop. 5,977.

Penitentiary. Word used in several senses. Commonly it is synonymous with prison. In the R.C. Church a penitentiary is a priest attached to cathedral churches, whose duty is to deal with the punishment passed on penitents for grave sins. The word is also used for the central office in Rome dealing with such questions, presided over by the grand penitentiary. See Prison.

Penjdeh OR PANJDEH. Village of Turkmen S.S.R. It stands near the union of the rivers Kushk and Murghab. Here, in March, 1885, an incident occurred which nearly led to war between Great Britain and Russia. The boundary line between Afghanistan and Russian Turkistan was being marked out, when an Afghan force, having refused to withdraw, was attacked by the Russians and driven away. Great Britain looked at the matter as the protector of Afghan interests, but the excitement soon died away.

Penkridge. Town of Staffordshire, England. In the rural dist. of Cannock, it stands on the little river Penk, W. of Cannock Chase, 6 m. S. of Stafford. Served by rly., it has an agricultural trade, while stone is quarried in the neighbourhood. The church of S. Michael and All Angels was once a collegiate church. Pop. 2,550.

Penmaenmawr. Urban dist. and watering place of Carnarvonshire, Wales. It is about 4 m. W.S.W. of Conway, and has a rly. station. It is visited for the beautiful scenery around. Penmaenmawr Mt., 1,550 ft. high, is the N. extremity of the Snowdon range. On it stood, until demolished in 1920, the remains of a large British fort. Pop. 4,000.

Penn. Village of Buckinghamshire, England. A picturesque place in typical Chiltern country, it has given its name to the district associated with William Penn (*q.v.*), the Quaker founder of Pennsylvania. It is about 2½ m. N.E. of High Wycombe, and a place of pilgrimage for American

visitors. The parish church contains several monuments to the Penn and Curzon families. At Jordans, at Chalfont St. Giles, famous for its Quaker meeting-house, is the grave of Penn.

Penn, SIR WILLIAM (1621-70). English sailor. He was born probably at Bristol, and held his first command in the navy in 1644, on the parliamentary side. In 1651-53 he was engaged in the pursuit of Prince Rupert, and in the 1st Dutch War rendered distinguished service as second in command to Blake. In 1654 Penn was sent to the West Indies on an expedition which failed in its first objective, the capture of San Domingo, but took Jamaica. On his return Penn was committed to the Tower for reasons which remain obscure, but was shortly released. He accompanied Montagu, afterwards 1st earl of Sandwich, in the Naseby to bring Charles II back to England at the Restoration, being knighted by the king as he came on board. Appointed a commissioner of the navy, he served under the duke of York, and died Sept. 16, 1670.

Penn, WILLIAM (1644-1718). English Quaker, founder of Pennsylvania. The son of Sir William Penn (*v.s.*), he was born in London, Oct. 14, 1644, and while studying at Christ Church, Oxford, became converted to Quakerism, and was expelled in 1661. He spent some years in France, Italy, and Ireland, and even engaged in military duties, but by 1668 had become once more closely identified with Quaker life and doctrine, and was imprisoned, 1668-69, for publishing an unlicensed tract, and again in 1670-71 for infringing the Conventicle Act.

He inherited a considerable fortune from his father, preached the Quaker message in England, Holland, and Germany, and was able to use his social influence on behalf of his persecuted co-religionists. In 1676 he took a leading part in the foundation of a Quaker colony in West New Jersey, and followed this up five years later by securing from the duke of York a grant of the territory which was to form the state of Pennsylvania (*q.v.*), and as governor drew up its memorable constitution, establishing freedom of worship within its boundaries. In 1682 he crossed to America to take possession of his territory, fixed on the site for its capital, to be named Philadelphia (*q.v.*), and at Shakumaxon made his famous treaty of friendship with the local Indians.

Penn remained in Pennsylvania until 1684, and again from 1699 to 1701, but his later life was passed in supporting the efforts of the Friends in England. He was intimate

After B. West

with James II, and was thus again able to use his influence to secure the release of the imprisoned Quakers and a measure of tolerance. His alliance with James, unbroken by the revolution of 1688, led to his arrest in 1690, and from 1692 to 1694 he was deprived of his colonial powers. His later years were clouded by ill-health and money troubles, caused by his expenditure on his religious work and by an untrustworthy agent at home. Penn died at Ruscombe on May 30, 1718, and was buried at Jordans, Bucks.

He was a man of solid and upstanding character, deeply religious, and with a fine clarity of style. Although he lacked in judgement in some respects, the accusations of double-dealing made against him have only weak foundations. See Society of Friends. Consult Quaker and Courtier, Mrs. C. Grant, 1908.

Pennant OR PENNON (Lat. *penna*, plume). Term applied to a long flag narrowing to a point,

Pennant, flown at masthead

sometimes forking at the end. In this sense, a pennant was formerly borne on a lance by a knight bachelor, sometimes with his armorial bearings upon it. It was used in British lancer regiments. Section leaders' cars in armoured squadrons carry a pennant. In the nautical sense the pennant, or pendant, is a long streamer-like flag flown at the mast of a vessel in commission, and lowered when the vessel goes out of commission. A broad pennant, short and forked, is flown to show the ship of the commodore of a squadron. Pennants are worn on British airliners carrying mail. See Flag.

Pennant, THOMAS (1726-98). British naturalist. Born at Downing, Flintshire, June 14, 1726, he was educated at Wrexham and at Queen's College, Oxford, but took no degree. His British Zoology was started in 1761, the first part

appearing in 1766. This work was followed by his *History of Quadrupeds*, 1781, which established

Thomas Pennant,
British naturalist

his reputation as a naturalist. Many of Gilbert White's letters in the *Natural History of Selborne* are addressed to him. He died Dec. 16, 1798. His best known works are *Tours in Scotland*, 1771-90; *Tours in Wales*, 1778, ed., with memoir by Rhys, 1883; *Account of London*, 1790; *Outlines of the Globe*, 1798-1800. Consult his *Literary Life*, 1793.

Pennatula OR SEA PEN. Genus of horny corals (Alcyonarian Anthozoa) which present an appearance similar to a quill-pen, i.e. to the wing-feather of a large bird. It is really a colony of polyps. There is a central stalk of horny lime, of which the lower part may be buried in the sea-bed, while from the upper portion branches spread out on each side and are fringed with polyps. Some of the species are luminous, as the small British *Pennatula phosphorea*, of a dull purple colour and only a few inches long. It is found in warmer seas up to a foot in length.

Pennell, JOSEPH (1860-1926). American etcher, lithographer, and author. Born at Philadelphia, July 4, 1860, he studied at the local academy and school of industrial art. He spent much time in Great Britain, and was the author, with his wife, Elizabeth Robins, of the standard life of the artist Whistler, and besides being represented in galleries all over the world, was a prime authority on lithography. Great industrial undertakings, e.g. the Panama Canal, and British munition works during the First Great War, furnished many subjects for his art. He died April 23, 1926. His wife wrote a *Life of Pennell* (2 vols.), 1930.

Pennine Alps. Division of the Alps on the borders of Switzerland and Italy. They lie between the Bernese Alps on the N. and the Graian Alps on the S.W., with the Lepontine Alps on the E., dividing the Rhône and Dora Baltea valleys. They include some of the loftiest summits in Europe, such as the Great St. Bernard, Grand Combin, Dent Blanche, Matterhorn, and Monte Rosa.

Pennine Chain. Mountainous region of N. England. It forms the

S. portion of the Central Uplands of Britain, and extends S. from the Scottish border as far as the great curve of the Trent; the S. portion is the Peak. Its continuity is broken by the Tyne and Aire Gaps, which facilitate communication between E. and W. On the N.W. it is continuous with the Cumbrian upland, the lowest point being the Shap saddle between Edendale and the flats round Morecambe Bay. Geologically, it is an uplift of carboniferous rock which has been denuded down to the lower members of the series, the millstone grit and mountain limestone, and is in the main a rugged, bare moorland with many peat bogs; the coal measures have disappeared from the heights,

Pennatula. Polyps of Pennatula phosphorea, greatly magnified
F. Martin Duncan

but occur in great extent on both sides of the uplift in the coalfields of N. England. The loftiest summits are Cross Fell, 2,893 ft., Mickle Fell, 2,591 ft., Wharfedale, 2,414 ft., Ingleborough, 2,373 ft., and Kinder Scout, 2,088 ft. In 1947 it was announced that the minister of Town and Country Planning had approved the so-called "Pennine Way," a 250-mile footpath from the Peak to the Scottish border.

Pennisetum. Genus of mostly annual grasses of the family Gramineae. They are natives of tropical and sub-tropical regions, and are grown chiefly for ornament, many of the species forming handsome tufts, with arching leaves and plummy flower-spikes.

Pennsylvania. State of the U.S.A., known as the Keystone state, owing to its central position among the 13 original states along the Atlantic coast. Its area is 45,333 sq. m., and it lies adjacent to the states of New York, New Jersey, Delaware, Maryland, West Virginia, and Ohio. Philadelphia, the chief city, on Delaware R. (the latter forming part

of the E. boundary) is the third largest city in the U.S.A., and second greatest port.

The surface varies from the flat country of Lancaster, Chester, and Bucks cos., to the ridges of the Allegheny Mts. Besides the Delaware, the chief rivers include the Susquehanna and Ohio systems and tributaries of the Potomac. It is traversed by various ranges of the Appalachians, one sector of which extends through the centre from N.E. to S.W. and another in the W., the highest point being Mt. Davis (3,213 ft.).

Possessing immense mineral wealth, Pennsylvania is responsible for half the nation's steel output, and one-third of the coal. Pittsburgh is the greatest single iron-and-steel producing centre. In a 500 sq. m. area in the N.E. is the world's largest anthracite deposit. Important industrial areas comprise those of Philadelphia-Camden, Pittsburgh, Reading, Scranton, and Wilkes-Barre; other centres include Chester, Altoona, Johnstown, Lancaster, York, and McKeesport.

The state leads in buckwheat production; other farm products include eggs, winter wheat, maize, oats, rye, potatoes, tobacco, and fruits. Half of Pennsylvania is forested. There are 16 rly. systems, including the Pennsylvania, New York Central, Erie, and Baltimore, and Ohio.

The state has 105 institutions of higher education, of which the best-known include the universities of Pennsylvania and Pittsburgh, Pennsylvania State College, and Bryn Mawr and Swarthmore College, the last two being women's colleges.

The Delaware valley and adjacent lands were claimed by the English, Dutch, and Swedes, but the latter made the first permanent settlement on the site of Chester in 1643. This region came under Dutch control in 1655 and under British after New Netherland changed hands in 1664. Pennsylvania's growth as an individual state was due to William Penn, who gave it that liberal and democratic basis which helped its rapid development. The old proprietary government was converted into a state in 1776, this constitution being revised in 1790. Lancaster succeeded Philadelphia as the capital in 1799, and Harrisburg became the capital in 1812. The state sends two senators and 33 representatives to congress. Pop. 9,900,180. Consult Penn-

sylvania: a History (4 vols.), G. P. Donahoe, 1926.

Penny. British bronze coin, one-twelfth of a shilling. Originally the penny was a silver coin, of which 240 weighed a pound, in imitation of the Roman denarius. Hence the pennyweight (dwt.), the 240th part of 1 lb. troy. Also known in Anglo-Saxon times as the *sceat*, it is called penny (A.S. *pening*, *pending*, perhaps meaning little pledge) in the laws of Ine (q.v.). Until the reign of Edward I the coin was indented with a cross, enabling it to be divided into half-pennies and farthings. Silver pennies were coined until the reign of Charles II, but steadily decreased in weight. The first copper pennies were struck by Charles II in 1665. The coin was designed by Philip Roetier, who used as model for Britannia on the reverse Frances Stuart, mistress of Charles and later duchess of Richmond (Pepys's diary, Feb. 25, 1667). In 1672 copper half-pennies and farthings were coined. The bronze-alloy penny was introduced in 1860. A penny is legal tender for amounts up to one shilling only. Silver pennies are no longer struck except for issue as royal alms on Maundy Thursday. The Royal Mint annually strikes an average of 60,000,000 pennies; but in 1923-24-25, 1933, 1941-42-43, none was struck. See Numismatics.

Penny Bank. Name given to a class of savings bank that receives deposits as low as a penny. Many such were established in Great Britain during the 19th century, including the National Penny Bank, and later they were set up in connexion with elementary and other schools. In some cases arrangements are made by which the money invested can be transferred to the P.O. Savings Bank. One of the largest is the Yorkshire Penny Bank. See Savings Bank.

Penny-farthing. The popular name given to the "ordinary," an early type of bicycle. Introduced in 1870, it had a front wheel much larger than the rear wheel. The name penny-farthing was given long after the machine had gone out of use, and was due to the comparison between the two wheels in size. See Bicycle illus.

Penny-royal (*Mentha pulegium*). Perennial herb of the family Labiatae. A native of Europe, N. and W. Asia, and N. Africa, it has a creeping rootstock, and branching, leafy stems. The small leaves are oval or oblong, with toothed edges. The tubular,

two-lipped, lilac flowers are borne in whorls around the upper part of the stems. From the fresh tops and leaves an oil is distilled which is used in medicine.

Pennywort or **PENNY-LEAF.** Name given to a wall plant known as the Wall Pennywort (q.v.); also to the white-rot or marsh pennywort (*Hydrocotyle vulgaris*).

Penobscot.

Largest river of Maine, U.S.A. Rising close to the Canadian border, it flows E. to Chesuncook Lake then S.E., and finally S. to the Atlantic, which it enters through Penobscot Bay. It is about 360 m. long and navigable for 25 m. Bangor is at the head of

tidal water. Many paper and pulp mills are dependent on the river for water power; the greater part of the basin, 8,500 sq. m., is forested. Penobscot Bay is divided into two portions by a chain of islands, which are covered with the estates of summer residents. The bay is 30 m. long, 21 m. wide.

Penology (Gr. *poine*, punishment; *logos*, science). Study of the punishment of criminals. With every advance in civilization the punishment and reclamation of the criminal have proceeded on lines which have mitigated force and substituted methods of reformation. The death penalty, torture, solitary confinement, and segregation were all obvious forms of forcible repression of crime, by striking terror into the mind of the criminal, which were tried from the earliest times. Russia with her Siberia, France with her Îles du Salut, and Great Britain with her penal settlements in America and Australia, are notable instances of repression by segregation. At the beginning of the 19th century in the British Isles there were some 200 offences punishable with death, and a corresponding state of affairs existed in other countries.

The failure of severe punishment to prevent many minor crimes, the large number of recidivists, and the insanitary and evil atmosphere of prisons of that date turned the attention of reformers to other methods. John Howard, Elizabeth Fry, William Wilberforce, and others began to study and suggest reforms, which culminated in the 20th cen-

tury in a very marked change in the treatment of criminals, including the abolition of capital punishment (q.v.) in some countries and its suspension in others. See Prison and Prison Reform.

Penrhyn. District of Carnarvonshire, Wales. It adjoins Bangor, being near the N. entrance to the Menai Strait. It is chiefly known

Penrhyn, N. Wales. Keep and garden front of the 18th century castle
Penrhyn

for its connexion with the slate quarries, the slate being shipped from Port Penrhyn on the strait. Penrhyn Castle, the seat of Lord Penrhyn, stands in a park, 7 m. in circumference, through which the Ogwen flows. An imposing building, it was erected late in the 18th cen-

tury; of Mona marble, it is in the Norman castellated style. One of the Welsh kings is said to have had a palace here.

Penrhyn or **TONGAREVA.** Coral atoll in the S. Pacific, belonging to New Zealand. It is 720 m. N. of Rarotonga in the Cook Islands—about lat. 9° S., long. 158° W.—and is noted for its pearl fishery. The lagoon has an area of 90 sq. m., a quarter of which is covered with pearl shell. It was discovered in 1788 and annexed to New Zealand in 1901. Pop. 654.

Penrhyn Powder. A typical high-density permitted explosive. It contains 7-10 p.c. nitroglycerine and about 60 p.c. ammonium nitrate, and is used for blasting hard coal or driving through softer rock. See Permitted Explosives.

Penrith. Urban dist. and market town of Cumberland, England. It stands on the Eamont, 18 m. S.E. of Carlisle, and is served by rly. The road A6 passes through on the way to Scotland. S. Andrew's church has an old tower. There are a 14th century grammar school and the ruins of a castle. Two inns are old buildings, one showing a room in which Richard III slept. In the neighbourhood are Edenhall and Brougham Castle, while there is a fine view from Penrith Beacon, 940 ft. high. The chief industry is brewing, and there is a trade in the agricultural produce of the district.

Penrith is a very old place and was given a fair and market early in the 13th century. One of the Nevilles, then lords of the town, built the castle as a defence against

the numerous raids of the Scots. In the 18th century clocks and watches were made here, while cloth and linen were woven on hand looms. Market day, Tues. Pop. 9,850.

Penrith. Town of New South Wales, Australia, in Cumberland co. It is 34 m. W. of Sydney by rail, and stands at the foot of the Blue Mountains in the valley of the Nepean river. It is one of the oldest settlements in Australia. Pop. 4,000.

Penrose, DAME EMILY (d. 1942). British educationist. She was educated at Somerville College, Oxford, and was the first woman to obtain a first class in classics. In 1893 she became principal of Bedford College, and in 1897 head of Royal Holloway College (later a school of London university). Principal of Somerville from 1907, she retired in 1926, and was created D.B.E., 1927. She died Jan. 26, 1942.

Penry, JOHN (1559-93). Welsh writer, a native of Brecknockshire. He was imprisoned in 1587 for writing a pamphlet describing the immorality then prevalent in Wales. In 1588 he set up a printing press which he moved about the country, and from which he issued the Martin Marprelate pamphlets. Forced to flee from Scotland in 1590, he returned to preach at a separatist church in London in 1592. Penry was hanged May 29, 1593. A Life, by W. Pierce, appeared in 1923.

Penryn. Mun. bor. and market town of Cornwall, England. It stands on the estuary of the Penryn river, which here falls into Falmouth Harbour, 2 m. N.W. of Falmouth, and has a rly. station. The chief industries concern stone and concrete products, market gardening, and distribution of cereals, also granite which is polished here and exported. Penryn has a town hall and a parish church. Here are the ruins of Glasney Church, a collegiate foundation, once a centre of literary activity.

In the Middle Ages Penryn was a flourishing seaport. It was made a borough in the 13th century, was granted fairs and markets, and had a considerable foreign trade. From 1553 to 1918 it was separately represented in parliament, Falmouth being united with it for this purpose from 1832. It is adminis-

Penryn arms

Penshurst, Kent. Penshurst Place, the mansion of Lord de L'Isle and Dudley, where Sir Philip Sidney was born in 1554

tered by a mayor and corporation. Market days, Thurs. and Sat. Population 4,000.

Pensacola. City and port of entry of Florida, U.S.A., the co. seat of Escambia co. The fifth largest city in the state, with a fine natural deep-water harbour defended by three forts, it stands on Pensacola Bay, about 6 m. from the gulf of Mexico and 50 m. E. by S. of Mobile, Alabama, and is served by the Louisville and Nashville and other rlys., by several lines of steamers, and by an airport. Here are a navy yard, est. 1824, and a naval hospital; Pensacola navy air station, largest aviation training school in the world, lies near. The city trades in coal, fish, cotton, and timber. Settled by Spaniards in 1696, it was alternately in the hands of the French, Spaniards, and British before it was acquired by the U.S.A. in 1821. In 1861 the Confederates held the navy yard for a time. Pensacola became a city in 1895. Pop. 37,449 (about a quarter negro).

Pensacola Bay. Inlet on the coast of Florida and Alabama, U.S.A. Escambia Bay and East Bay are extensions on the E. side of the bay, which is 12 m. long and 2½ m. in average breadth, and has an entrance breadth of less than 1 m. Its mean depth is about 30 ft. One of the largest harbours in the Gulf of Mexico, it is a winter rendezvous of the U.S. navy. On its banks are tourist camps.

Penshurst. Village of Kent, England. It is 5 m. S.W. of Tonbridge, and 33½ m. S.S.E. of London, with a rly. station, 2 m. N. The church, dating from about 1200, but much restored, has old brasses and other monuments. The village hall and club are modern. Penshurst's chief glory is Penshurst Place, which, with its park of 350 acres, has inspired poets from the days of Jonson and Waller to those of E. B. Browning and Swinburne. Heterogeneous in architecture, with grey walls and battlemented towers encrusted with lichen and moss, its feudal hall 64 ft. long, has a central hearth and steep, timber-supported roof.

The manor, once owned by the family of Penchester or Pencestre—there is an effigy of Sir Stephen de Penchester in the church—became the property of Sir John de Pulteney (d. 1349), who built the hall, Humphrey, duke of Gloucester, and others. It passed in 1552 to Sir William, grandfather of Sir Philip Sidney, the hero of Zutphen, whose descendants still possess it. Pop. 1,673.

Pension. Periodical payment made to a person, usually after retirement from regular work. Originally pensions were granted by the king, by members of the nobility, and by the rich to those who had served them faithfully, to scholars, artists, etc., who had sought their patronage, and to less wealthy friends and dependants. One British king—Charles II—became a pensioner of the king of France. In contemporary society most pensions are paid out of corporate funds or income, administered by the govt., local govt. authorities, boards of directors, and other bodies.

The possibility of qualifying for a pension is a condition, often an attraction, of many forms of employment, both in the public service and in industry and commerce. There are, however, two types of pension: those which become payable after a prescribed number of years of service or after disability consequent on service; those which are payable only when the individual has attained a prescribed age, usually not less than 60 years. The former are commonly called service pensions; the latter, superannuation pensions.

In the U.K., service pensions are payable to members of H.M. forces, the police, H.M. prison service, and similar services at home and abroad, where physical fitness is indispensable for effective service. Superannuation pensions are general in other cases. A minimum length of service is prescribed. The pension to be paid is normally calculated at the rate of 1/60 or 1/80 or other fraction of the salary for each year of service, subject to a stated

maximum. The superannuation scheme may provide for a lump sum to be paid on retirement, for a disability or "breakdown" allowance before the attainment of pensionable age, and for some payment to a widow or other dependent. The pension may be conditional on retirement, at least from employment paid out of public funds. A service pension is not as a rule affected if the pensioner takes up other work.

Pensions may be non-contributory or contributory. Contributory pension schemes are usual outside the forces and the civil service. Non-contributory pensions can be regarded wholly as a form of deferred pay.

Forces and Civil Service

Pensions payable to members of H.M. forces are varied from time to time by royal warrant or order in council. The conditions in the different branches of the services are set out in the relevant regulations of the service. Pensions to civil servants are governed by a number of Superannuation Acts, 1834 to 1935. To become eligible for a pension a civil servant must be appointed to an established office and either be appointed directly by the crown or be admitted with a certificate of appointment from the civil service commissioners. In 1938 more than half the total of persons employed in the civil service were unestablished, that is, non-pensionable. The pensions of teachers in state schools are governed by the rules made under the Teachers' Superannuation Act, 1937. Those of employees of local govt. authorities are subject to the Local Government Superannuation Act, 1937. Such bodies as the B.B.C., the transport commission, the electricity commission, and the national coal board have each their own pension scheme.

Most contributory pension schemes of public bodies involve (a) contributions from employees, (b) contributions from employers, and (c) sometimes contributions from H.M. Treasury, the three sets of contributions being paid into a pension fund, the balance of which is invested. Contributory pension schemes organized by private businesses, however, frequently take the form of a group pension insurance. When this is so, the contributions of employees and employers are paid to an insurance company, which assumes responsibility for the payment of the pensions.

The association of pension rights with a particular employer tends to restrict the mobility of labour. A person who can take fresh employment only by sacrificing, say, ten years of his pension qualification is much less inclined to transfer than he would otherwise be. For this reason the growing practice of private pension schemes is not without serious economic disadvantages. Speaking generally, civil servants, teachers, and local govt. officers can transfer within the service or from one branch to another without total loss of pension rights. That is not the case within banking, insurance, or commerce or industry generally.

In the U.K. an ex-cabinet minister can claim a pension. An ex-lord chancellor is entitled to a pension of £5,000 a year, irrespective of the term of office: this is compensation for surrendering professional income either as a judge or as a barrister when assuming this political office, which may be held for only a short time. A judge of the high court may be granted a pension of two-thirds of his salary after 15 yrs.' service or on earlier disability. County court judges may qualify according to their length of service for a pension up to $\frac{3}{4}$ of their salary. The holder of a Victoria Cross is entitled to a pension of £10 a yr., which may be augmented to £75 in case of need.

OLD AGE PENSIONS IN THE U.K. The harshness with which poor relief was administered in the 19th century focused attention on the plight of the aged poor; and towards the end of the century various committees and commissions considered what could be done to alleviate their lot. In 1908 the Old Age Pensions Act, effective from Jan. 1, 1909, was passed. Under it a man or woman of 70 yrs. of age could qualify for a weekly pension varying, according to the other income possessed, from 1s. to 5s. a week. The pensions were payable out of state funds. By March, 1909, there were 500,000 old age pensioners. During the next 38 yrs. the amount of the pension was from time to time increased.

In 1925 the Widows, Orphans, and Old Age Contributory Pensions Act established the first national scheme of contributory pensions payable at 65 yrs. of age. Under the National Insurance Act, 1946, a person who failed to qualify for a contributory retire-

ment pension might be granted a non-contributory old age pension, provided (1) he or she was a British subject or had been a naturalised British subject for 10 yrs., (2) was 70 yrs. of age or more, (3) had resided in the U.K. for at least 12 of the previous 20 yrs., (4) had a total yearly income (calculated according to certain rules) of not more than £89 5s. The amount of the old age pension varied according to this total income from a minimum of 2s. to a maximum of 26s. for one person and 42s. for a man and wife. (Consult pamphlet obtainable at any post office.) Non-contributory old age pensions were not to be granted to those becoming 70 yrs. of age after Oct., 1961. Under the Blind Persons Act, 1920, the blind became eligible for old age pensions at 50 yrs. of age, reduced in 1938 to 40 yrs.

Pensions for All

The National Insurance Act, 1946, which came into operation July 5, 1948, applied from that date to every person in the country who is over school-leaving age and under 65 yrs., if a man, and under 60 yrs., if a woman. It provided for the payment of retirement pensions, irrespective of means, to an insured man at 65 yrs. of age, to his wife at 60, and to any insured woman at 60. To qualify, the insured person must have paid 156 weekly contributions and have a yearly average of 50 contributions. The full retirement pension was 26s. a week for an insured person, and 16s. for an insured man's wife. From 65 to 70 for men, 60 to 65 for women, the pension was payable only on retirement from regular, normal employment; occasional earnings up to £1 a week entailed no reduction of pension. A person qualified for a retirement pension could increase the rate of pension ultimately payable by 2s. a week for each year of employment up to five continued beyond the retirement age.

OTHER COUNTRIES. A scheme of old age pensions was instituted both in Germany and in Denmark in 1891. In 1942 24 countries besides the U.K. had national old age pension schemes; these were generally contributory, although Australia, Canada, Denmark, France, S. Africa, and Uruguay granted non-contributory old age pensions subject to a means test, and New Zealand and the U.S.A. granted both types of pension. Norway had a universal old age pension

tax, the pension being subject to a means test. In the U.S.S.R. non-contributory old age pensions were paid to men at 60 after 25 years' service and in some industries at 50 yrs., and to women at 55 after 20 yrs.' service. Retirement is not a condition of pension. In Russia and in other countries except New Zealand and Eire, O.A.P.s were not at a flat rate for all classes of people, but were related either to the individual's earnings or to his income grade. See Insurance, National.

H. Watson

PENSIONS IN U.S.A. In 1947 the Veterans Administration, responsible since 1930 for carrying out congressional legislation regarding pensions for ex-service men, paid out \$1,731,972,783 to 2,354,297 ex-service men and 566,468 widows; 18,351 of these cases dated back to the Civil War, 3,087 to the Indian wars, and 47 to the Mexican war of 1856. Claims arising from such remote periods are due to marriages of ex-soldiers in their old age to young brides, who thereby became entitled to support as long as they themselves lived. In 1945 there was still on the rolls the widow of a man who fought in the war of 1812. At first, the award of a service pension depended upon the incurring of certain disabilities during military or naval service, however short. Later, service in war was accepted as a sufficient qualification. Pensions have been freely granted to men who served only a few weeks, never saw a battle, and never suffered from wounds or disease. In 1932 the U.S.A. was carrying on her pensions pay-roll as veterans of the First Great War 13,000 men who did not enlist until after the armistice of 1918. This was because peace between the U.S.A. and Germany was not officially ratified until July 2, 1921.

Many states of the union have granted civil old age pensions, payable from state funds or from county funds, or in part from each, helped by federal grants-in-aid authorised by the Federal Security Act of 1935. In several states there are mothers' pensions corresponding to British family allowances.

The most remarkable incident in the history of U.S. civil pensions was an agitation, started in 1934, during the great depression, by Francis E. Townsend, a Californian physician, who proposed an "old age revolving pensions plan," under which every U.S. citizen over 60 would receive \$200 a month for life, on condition that

he or she (1) retired from all paid employment, (2) had no criminal record, and (3) undertook to spend each month's instalment in the U.S.A. within 30 days of its receipt. Most of the cost was to be met by a tax on all sales, wholesale and retail. Within a short time 25 million signatures were appended to petitions asking congress to adopt this plan, and many elections were won by its advocates. The popularity of the scheme, which caused much worry in Washington, did not long survive a congressional committee investigation, which showed that its leading promoters were deriving large incomes from the funds of Townsend clubs.

Pensionary. Name of a former official of the Netherlands. He was so called because his remuneration was described as a pension. The chief Dutch and Flemish cities had their pensionaries, the first appearing in the 15th century. They were responsible for the business of the city, their duties being not unlike those of a town clerk. In the province of Holland there was in the 17th century a high official known as the grand pensionary or pensionary of the council, and he became one of the chief persons in the United Provinces. Although appointed only for a term of years, he was in importance second to the stadtholder. The office was abolished in 1795.

Pensions, MINISTRY OF. A British government dept. It was formed in 1916 to assess and pay the pensions of service personnel and merchant navy men disabled in wartime, and of the dependents of such men killed in war. During the Second Great War a civilian scheme was also introduced covering civil defence personnel. The ministry is concerned solely with pensions arising out of war; "service pensions" to retired members of the forces are administered by the dept. of the service concerned, and old age, widows', etc., pensions by the ministry of National Insurance. Head offices are at 18, Great Smith Street, Westminster, S.W.1.

Pentacle. Five-pointed star, drawn with a continuous line, used by occultists as a mystic emblem, and supposed to have power against evil spirits. It is also called a pentagram and a pentalpha.

Pentameter (Gr. *pente*, five; *metron*, measure). In prosody, a metrical line of 5 feet of whatever kind. In English heroic verse it consists of five accentual iambses. In classical elegiac verse, composed

of alternate hexameters and pentameters, the pentameter is divided into two clean-cut halves of 2½ feet each, of which the first may be dactylic or spondaic, but the second must contain two dactyls. Schiller defined the two in an illustrative distich which Coleridge rendered in English as follows:

In the hexameter rises the fountain's silvery column;

In the pentameter aye falling in melody back.

See Poetry.

Pentane. Hydrocarbon of the paraffin series (C₅H₁₂). It occurs in considerable quantity in American crude petroleum, and is prepared by purifying the fraction which distils over at 45° C. Pentane is employed in the standard lamp formerly used in testing the illuminating power of coal gas, a mixture of air and pentane vapour producing a light equivalent to that given by 10 standard candles.

Pentateuch (Gr. *pente*, five; *teuchos*, volume). Term used by Christian scholars from the time of Tertullian and Origen to designate collectively the first five books of the O.T. (Genesis, Exodus, Leviticus, Numbers, Deuteronomy). These books were called by the Jews "the five-fifths of the law." Some scholars contend that the sixth book (Joshua) is inseparable from the other five, and that it is better to use the term hexateuch. See Bible; Hexateuch.

Pentathlon. Series of five events in the athletic festivals of ancient Greece—foot race, long jump, throwing the discus and the javelin, and wrestling. A special prize was awarded to the competitor who excelled in the series.

Pentaur, POEM OF. Ancient Egyptian epic composition. Written by a court poet of unknown name, it describes Rameses II's Hittite campaign, culminating in the battle of Kadesh, about 1288 B.C. Versions were incised upon temple walls at Luxor and Karnak. From a papyrus copy made by a scribe of that name, now in the British Museum, authorship was mistakenly attributed to Pentaur.

Pentecost (Gr. *pentecostē*, the 50th). Jewish festival, also known as the Feast of Weeks. It is observed on Sivan 6-7, and was so called because it was celebrated 50 days from the morrow of the Sabbath after the Passover (*q.v.*). It coincides with the Christian Whitsuntide (*q.v.*).

Pentelicus OR PENTELIKON OROS. Mt. in ancient Greece, 12 m. N.E. of Athens. It was famous for its quarries of white marble, which are still worked.

Pentland Firth. Navigable strait separating the Orkney Islands from Caithness, Scotland, and connecting the North Sea with the Atlantic Ocean. Its passage is rendered dangerous by a strong tidal current flowing from W. to E. at the rate of from 6 to 10 m. an hr., and by eddies or whirlpools at the change of tide. The channel measures 14 m. in length and from 6 to 8 m. in breadth. The Pentland Skerries, at the E. entrance, consist of two islets, on one of which is a lighthouse, with light visible at 19 m., together with a number of smaller rocks.

Pentland Hills. Scottish hill range. It extends for about 16 m. south-west through Midlothian, Peeblesshire, and Lanarkshire, and has a breadth of from 4 to 6 m. The highest summits are Scald Law (1,898 ft.) and Carnethy (1,980 ft.). Springs in the hills provide Edinburgh with excellent water. See Edinburgh.

Pentlandite. Ore mineral of nickel, nickel iron sulphide, often approximating to 2FeS.NiS . It occurs as bronze-yellow masses or grains associated with nickeliferous pyrrhotite, niccolite, etc., at Sudbury, Ontario, and elsewhere.

Pentonville. Dist. of London. A ward of the bor. of Islington, and once part of Clerkenwell, it was, by gift of the Mandeville family, a possession of the priory of S. John of Jerusalem. It is named after the estate of Henry Penton, M.P. (d. 1812), which began to be built upon about 1773.

Pentonville prison, in Caledonian Road, was built to the plans of Sir Joshua Jebb in 1842. It was the first of what were known as model prisons for solitary confinement of convicts. The majority of executions in the London area were carried out at Pentonville. The prison was badly damaged in 1942 by German bombs, and the prisoners were transferred to Wandsworth and Wormwood Scrubs. It was later, during war conditions, used for the billeting of homeless civilians, and reopened as a prison in 1946.

Pentstemon. Genus of herbaceous plants, belonging to the family Scrophulariaceae, also known as Beard-tongue (*q.v.*).

Penumbra (Lat. *pene*, almost; *umbra*, shade). The lighter shadow surrounding the darker central portion (or umbra) of any shadow thrown by an opaque object illuminated by an extended source. It is specifically applied in astronomy to the shadow thrown by the earth or moon. Where the penumbra of

Penzance, Cornwall. Market Jew Street, the principal street of England's westernmost seaport

the moon falls on the earth, a partial eclipse of the sun is seen; within the umbra a total eclipse is seen; in an annular-eclipse of the sun the umbra of the moon falls short of the earth. See Eclipse.

Penza. Town of R.S.F.S.R., chief town of the region of the same name. It stands at the confluence of the rivers Penza and Sura, and is on the Morshansk-Syzran rly. It has been the centre of the timber trade, and manufactures matches and paper. Pop. 157,145.

Penzance. Mun. bor., market town, seaport, and watering-place of Cornwall, England. It stands at the head of Mounts Bay, 330 m. S.W. of London, and 10 m. N.E. of Land's End, and is the terminus of the British rlys. (W. region). The most westerly town in England, Penzance has a mild climate and is much visited in both summer and winter. In the public buildings are several museums, including that of the Royal Geological Society of Cornwall; other edifices are the free library and school of art, market house, and infirmary. There is an old market cross, the Morrab pleasure grounds, and a statue to Sir Humphry Davy, a native. Its harbour, formed by two piers, can accommodate large vessels, and has wet and dry docks. St. Michael's Mount can be visited from here, and it is the port of departure for the Isles of Scilly (*q.v.*). The industries include market gardening, fishing for mackerel and pilchard, and the shipping of tin, etc. Penzance began as a fishing

centre and later was made a port. It was damaged by the Spaniards in 1595, and was made a borough in 1614. From 1663 to 1838 it was one of the towns where tin was coined. The name is derived from two Cornish words, *pen*, head, and *zawn* creek. It has been assumed that it was derived from *sans*, holy, holy head; hence the head of S. John the Baptist which appears in the seal. Market days, Tues. and Thurs. Pop. 20,019.

Peonage (Sp. *peon*, a day-labourer). Term used for the system of labour once prevalent in Spanish America. Under the system the Indians were given the status of minors by the Spanish government, with the intention of protecting them from oppression. It had exactly the opposite effect. The system spread to the U.S.A., but was abolished in 1867. The name peon still survives in South America for a workman of native or mixed blood.

Peony (*Paeonia*). Genus of hardy perennial herbs, some of which are evergreen, of the family Ranunculaceae. They are natives of Asia, S. Europe, and America. *P. officinalis* and *P. albiflora* were introduced into Great Britain in 1548. They range in height from 2 to 5 ft., and their colours vary from white to crimson, though there is a yellow variety. They are raised from seed sown in autumn, in pots or pans of sandy soil in cold frames, and planted out in the spring. The taller species (*P. moutan*), known as the tree peony, also as the Chinese or mountain peony, should be planted in spring in deep, rich soil, and protected from frosts with a layer of fern, bracken, straw, or other similar material.

Penzance. Seal of the borough council

Peony. A Chinese variety, *Paeonia lutea*

People's Palace, Mile End Road. The building in east London, opened in 1888 to replace its predecessor, which had been burned down 1881

People's Palace. Institution in Mile End Road, E. London, England. The original foundation was a bequest by J. E. B. Beaumont (1774-1840), to provide for the recreation and moral and intellectual advancement of the working classes in the East End of London. Large donations to the endowment fund were subsequently made, the Drapers' Company being a conspicuous benefactor, and by June, 1886, a sum of £75,000 had been raised. The original buildings, opened by Queen Victoria in 1887, included the large Queen's Hall. This was destroyed by fire in 1931, and a new building was opened in 1936. From 1945 to 1948 it was leased to the B.B.C. Later it resumed the performance of plays and the giving or orchestral concerts for the people of E. London. Sir Walter Besant (*g.v.*) took an active interest in the founding of the People's Palace, of which he gave a suggestive forecast in his novel, *All Sorts and Conditions of Men*, 1882.

Peoria. City of Illinois, U.S.A., the co. seat of Peoria co. It stands on the W. bank of the Illinois river, 160 m. by rly. S.W. of Chicago, and is served by the Chicago, Burlington, and Quincy, and other rlys. It has a R.C. cathedral, and upwards of 400 acres of parks. It carries on a busy river trade, manufactures glucose, starch, flour, wagons, motor cars, foundry products, and agricultural implements, and is the leading whisky distilling centre in the U.S.A. Founded in 1819, and named after the Peoria Indians, Peoria became a city 1845. Pop. 104,969.

Pepi or **PERY.** Name of two Egyptian kings of the VIth dynasty. Pepi I, the Phiofs of Manetho, during a vigorous reign of 50 years (c. 2595-2542 B.C.), worked the Sinai turquoise mines and the

Assuan granite quarries, and undertook a maritime expedition up the Palestine coast. At Hieraconpolis Quibell unearthed a life-size bronze of him, with eyes of brilliant inlay, and an inscribed sceptre of pure copper. His son Pepi II is supposed to have reigned 94 years (2538-2444 B.C.).

Pepin or **PIPPIN.** Name of three Frankish rulers. Pepin I was mayor of the palace to the king of Austrasia early in the 7th century. His grandson, Pépin II, or Pepin of Heristal, made himself the most powerful person in the Frankish kingdoms, both of which, Neustria and Austrasia, came under his sway, although he did not dethrone the existing kings. He died Dec. 16, 714. His grandson, Pepin the Short, was the son of Charles Martel and the father of Charlemagne. In 751 he removed the Frankish monarch Childeric and made himself king, thus paving the way for the empire of Charlemagne. He died Sept. 24, 768. See Carolingians; France; Franks.

Pepper (*Piper nigrum*): Climbing shrub of the family Piperaceae. It is a native of the E. Indies, and

Pepper. Leaves and pendulous flower sprays. Inset, fruit

has a wavy stem and large, broad oval, alternate leaves. The minute flowers—without sepals or petals—are crowded in hanging sprays. The little roundish red fruits ultimately become black, when they are the peppercorns of commerce. Ground to powder they form black pepper; white pepper is produced from fruit of which the outer fleshy coat has been removed before ripening. See Cayenne Pepper.

Peppercorn. Berry of the pepper plant, used as a synonym for something of little or no value. A

peppercorn rent is a term in English law for a nominal rent.

Peppermint (*Mentha piperita*). Strong-scented perennial herb of the family Labiatae. It is a native of Europe, and has creeping under-

Peppermint. Branch with foliage and flowers. Inset, single flower

ground stems which send vertical branches into the air. The opposite, coarsely toothed leaves are oval or broad lance-shaped, the flowers purple, in loose spikes. Oil of peppermint, extensively used as a gastric stimulant in certain forms of dyspepsia, is distilled from the leaves. See Mint.

Pepper-root (*Dentaria diphylla*). Perennial herb of the family Cruciferae. It is a native of N. America, and has a long branching rootstock. The leaves are divided into three oblong-oval, coarsely toothed leaflets, and the four-petalled flowers are white. The crisp rootstock has a hot, pungent flavour somewhat resembling that of watercress.

Pepper Tree (*Drimys aromatica*). Small aromatic evergreen tree of the family Magnoliaceae. A native of Tasmania, it has oblong leaves with transparent dots, and white flowers, the sexes being separate. The many-seeded, globular fruit is sometimes used as a substitute for pepper, but all parts of the tree are pungent to the taste. See Peruvian Mastic Tree.

Pepper Tree. Leaves and fruit. Inset, flowers

Pepsin. Type of proteolytic enzyme which attacks the peptide linkages of proteins to hydrolyse them into still complex but more readily diffusible proteoses and peptones. A pepsin is present in gastric juice which in the presence of free hydrochloric acid digests proteins, *e.g.* of meat; similar agents are common in plants, especially in seeds of *e.g.* hemp, flax, barley. For medicinal purposes it is extracted from the stomach of freshly killed pigs and the rennet bags of sheep. See Digestion; Pancreas; Trypsin.

Peptones. Substances formed by hydrolysis of proteins, *e.g.* by pepsin. They give positive results with all chemical tests for proteins. Those formed during digestion help to nourish and build up the tissues. See Pepsin; Protein.

Pepys, SAMUEL (1633-1703). English diarist and Admiralty official. Born in London, Feb. 23,

Samuel Pepys

After John Hayle in the National Portrait Gallery, London

1633, fifth son of John Pepys, tailor and member of an old East Anglian family, he was educated at S. Paul's school and Trinity Hall and Magdalene College, Cambridge. Befriended by a relative, Sir Edward Montagu, later earl of Sandwich, he held several offices in connexion with the Admiralty, including that of secretary. He was imprisoned in the Tower in 1679, and in the Gatehouse, Westminster, 1690, on flimsy charges. He represented Castle Rising, 1673, and Harwich, 1679, in parliament, and proved an untiring and patriotic official. He was master of Trinity House, 1676 and 1685; master of the Clothworkers' Company, 1677; and president of the Royal Society, 1684-86. Superseded in 1689, he died at Clapham, May 26, 1703,

and was buried in the church of S. Olave, Hart Street.

Among the MSS. preserved with Pepys's library at Magdalene College was that of his famous Diary, written in cipher, Jan. 1, 1659-May 31, 1669. In this work, the most intimate human document of its kind, he supplies a vivid picture of his own character, his insatiable inquisitiveness, meannesses, and vanity, reveals also his higher qualities, to which his brother diarist, John Evelyn, pays a warm tribute, and throws in valuable sidelights on the court, official, and social life of his time. He was a student of music, in which he found consolation in trouble, and was an inveterate playgoer. He suffered from stone and from failing eyesight. The Diary was first deciphered by John Smith, 1819-22, and first published 1825. *Pron.* Peeps.

Bibliography. Diary and Correspondence of Samuel Pepys, with Life and Notes by Richard, Lord Braybrooke, 4th ed., 4 vols., 1854; Do., Deciphered, with Additional Notes, Mynors Bright, 6 vols., 1875-79; Do., ed. with Additions by H. B. Wheatley, 10 vols., 1893-99, 8 vols., 1904; S. P. and the World He Lived In, new ed. 1905, and S. P., Citizen and Clothworker, 1897, H. B. Wheatley; S. P. as a Naval Officer, 1914, and S. P. and the Royal Navy, 1920, Tanner; Lives, E. H. Moorhouse, 1909; J. Drinkwater, 1930; A. Bryant, 1933-35.

Perak. State of the federation of Malaya, on the W. coast of the Malayan pen. with Kedah to the N., Kelantan and Pahang to the E., and Selangor to the S. Formerly one of the Federated Malay States, it completely surrounds the Dindings, a detached part of Penang (*q.v.*). The chief river is the Perak. Rubber is cultivated, especially at Matang, and rice and fruit grow in the valleys. Tin is mined at Taiping and Ipoh. The main W. trunk road and rly. pass through the state by way of Taiping, Kuala Kangsar, and Ipoh, with branch lines to Matang and Teluk Anson.

In 1826 Great Britain and Siam agreed by treaty that the native ruler of Perak should be left undisturbed. In 1874, by the treaty of Pangkor, the sultan agreed to the appointment of a British resident. The next year

Perak, Federation of Malaya. Characteristic scenery on the Perak river

the resident was murdered; British troops sent in to restore order were eventually replaced by an armed police.

The area of Perak, including the Dindings, is 7,980 sq. m. The pop. was estimated in 1941 at 992,691. Perak was attacked by the Japanese in the Second Great War, Dec., 1941. A column pushing S. from Kedah and Province Wellesley was joined by another driving across the peninsula down the Grik road towards Kuala Kangsar, and on Dec. 29 British troops evacuated Ipoh. Early in Jan., 1942, the Japanese forced the Bernam river, and held the whole of Perak until Japan's surrender in Aug., 1945. See Malaya, Federation of.

Per capita: Per stirpes (Lat., by heads; by stocks). Terms used by lawyers in dealing with questions of inheritance. An example will best illustrate the meaning. X, by his will, leaves his property to trustees, to pay the income to his three children, A, B, and C, for life, and after their death amongst their children *per stirpes*. A has one child; B has two children; C has three children. A's child will inherit one-third; B's two children one-third between them; and C's three children one-third amongst them. Had the division been *per capita* and not *per stirpes*, all the six grandchildren of X would have had equal shares.

Perception (Lat. *per*, through, thoroughly; *capere*, to take, grasp). A philosophical term with various meanings. It was formerly used for cognition (knowledge), or as the equivalent of consciousness generally. Again, it was limited to the act of perceiving anything by the senses. More accurately, it is the mental process which refers sensations to an object identified as having aroused previous similar sensations—a chair, table, tree. Perception is more complex than mere sensation (*q.v.*)

and involves earlier experience; it is more stable than the idea of a thing, which in the absence of the object is liable to modification. Perception is less definite than apperception (*q.v.*). See *Metaphysics*.

Perceval, Sir. In medieval romance, a knight of the Arthurian cycle and central figure of one of the Grail romances. The son of a knight who has been slain, he is brought up by his mother in the forest, where he grows up uncivilized. Brought to court, he slays an enemy of the king, and after many adventures recovers his father's estate. See *Grail*, *Holy*.

Perceval, SPENCER (1762–1812). British statesman. Born Nov. 1, 1762, second son of the 2nd earl of Egmont, he was educated at Harrow and Trinity College, Cambridge. After some progress at the bar, he entered parliament as Tory member for Northampton

Spencer Perceval,
British statesman

in 1796. As a debater he proved himself an able opponent of Fox. On Pitt's retirement in 1801 Perceval became solicitor-general, and attorney-general in 1802. He was leader of the house after Pitt's death in 1806, and became chancellor of the exchequer in 1807, to which office was added that of premier in Sept., 1809. Perceval was assassinated in the lobby of the house of commons on May 11, 1812, by Bellingham, a crazy bankrupt.

Perch (*Perca fluviatilis*). Fresh-water fish of the order Perciformi. It is a native of the U.K.,

Perch, a fish common in European
and North Asiatic rivers

the greater part of Europe, and much of N. Asia. It is distinct in form, having a somewhat oblong body with the back humped above the pectoral fins. There are two dorsal fins, of which the anterior is the more conspicuous, both from its superior size and its strong, sharp-pointed rays. The back is coloured a dark ashy green, paling along the

sides to a whitish tint below. At intervals along the sides is a series of broad vertical bands of dark brown; whilst the ventral, anal, and tail fins are some tint of red. Ordinarily the perch attains a length from 9 to 12 ins., and a weight of 2-3 lb. See *Climbing Perch*; *Fish*.

Perch (Lat. *peritica*, a pole). Measure of length, an alternative name for the rod or pole. See *Rod*.

Perche, COL DE LA. Pass of the Pyrenees. It lies on the frontiers of France and Spain, beyond Mont-Louis, and between the valleys of the Têt and the Segre. Its height is 5,175 ft. The Spaniards were defeated here by the French in 1793.

Perched Blocks. In geology, name given to isolated rocks which have been transported by glacial action and left perched on an apparently insecure base. Such rocks, often also called erratic blocks, occur typically in glaciated districts, and are found in N. Europe, the Alps, and parts of Great Britain.

Percheron. French breed of heavy draught horse, named from the old province of Perche (now the depts. of Orne and Eure-et-Loir). Of a grey colour and standing about 16 hands, it has a large but neat head, magnificent neck, and clean limbs. It has been well described as a trotting cart-horse. Percherons were much used for the horse-drawn omnibuses of London. See *Horse colour plate*.

Perchloric Acid (HClO_4). Colourless, fuming, volatile liquid obtained by the action of sulphuric acid on potassium perchlorate. When a few drops of the acid are placed on paper or wood they at once set it on fire.

Percival, JOHN (1834–1918). British schoolmaster and cleric. Born at Brough, Westmorland, son of a yeoman, he was educated at Appleby and Queen's College, Oxford. He was ordained in 1860, and became a master at Rugby. In 1862 he was chosen first headmaster of Clifton College, and the creation of this public school was the great work of his life. President of Trinity College, Oxford, 1878–87, he then became headmaster of Rugby until 1895. Then he was made bishop of Hereford, and remained there until his death, Dec. 3, 1918. Percival was an advanced Liberal in lay and ecclesiastical politics and in theology.

Percolation. Process of driving vegetable matter of its soluble constituents, by allowing

Percolation as applied in the manufacture of soda. See text

a solvent to trickle slowly through. The method is used in pharmacy for exhausting vegetable drugs of their active constituents, and the same principle is used in preparing coffee as a beverage. The vessel used is called a percolator. The figure shows how the principle of percolation is applied in the manufacture of soda in Shanks's vats. Ball soda or caliche, *a, a, a*, rests on a layer of ashes on the perforated false bottom, *b*, of the percolator. Fresh water is supplied through pipes, *c*, while *d* is a drain for weak liquor or waste water. The water percolates from vat to vat and finally issues at *e* as strong liquor.

The term is also applied when surface water, *e.g.* rain, passes downwards through the soil. Estimates of natural percolation, expressed as a depth in hundredths, etc., of an inch of water, are usually obtained by drawing off daily the amount which drains through a cu. yd. of earth contained in a metal gauge.

Percussion. Musical term applied to the sounding of a discord after preparation and before resolution. Percussion instruments are those in which sound is set up either by being struck with sticks (gong, and all drums), hammers (pianoforte, dulcimer, glockenspiel, xylophone, etc.), a steel rod (triangle), or clappers (bells), or, being in pairs, by being struck against one another (cymbals, castanets, etc.). Most of these have definite pitch of varying compass, but the gong, bass and side drums, tambourine, triangle, cymbals, and castanets are merely noise-producers. Percussion bands (drums, cymbals, triangle, tambourines, etc. with piano accompaniment) are often formed in schools in order to train the sense of time and rhythm in young children.

Percussion Cap. Small case of explosive, which may be ignited by the shock of a blow and is used to convey ignition to the propellant charge of a gun or rifle. Fulminate of mercury was discovered

by Howard in 1799, and about 15 years later the first successful percussion caps were made. In the old muzzle-loading guns, the percussion cap was a separate copper case containing fulminate of mercury, which was placed on a hollow nipple, the bore of which communicated with the powder chamber. When the hammer fell, it exploded the fulminate, and the flash ignited the powder.

The next efforts to improve firearms were made with the object of combining powder, shot, and means of ignition in one cartridge, which could be inserted in the breech, and in 1836 the pin-fire breech-loader was introduced by Lefauchaux. In this construction a projecting pin at right angles to the main axis of the cartridge was driven in by the fall of the hammer, a pellet of fulminate being exploded by the shock and igniting the powder. Central-fire ammunition, in which a percussion cap was fixed in the centre of the base of the cartridge and used in central-fire hammer guns, was introduced by both English and French gunsmiths about 1853, but the first really successful gun on this principle was made by Daw, in 1861.

In modern ammunition this principle is retained, and the cap containing the composition is driven by the hammer on to an anvil held in a cage in the cartridge case. The flame produced on firing the cap brings about rapid ignition of the primer, which fires the main propellant. The composition is usually a mixture of mercury fulminate (20); potassium chlorate (34); antimony sulphide (43); and sometimes a small addition of sulphur and black powder. *See* Ammunition; Cartridge; Explosives.

Percy. Name of a noble English family. It was founded by William de Percy, who was granted large holdings in the northern counties by William the Conqueror. He died near Jerusalem in 1096. Henry, 12th Baron Percy, was in 1377 created earl of Northumberland. His son, Sir Henry, known as Hotspur (1364-1403), was among the supporters of Henry IV against Richard, being made warden of the east marches and justiciar of N. Wales. His deeds against the Scots at Otterburn, 1388, are celebrated in the ballad of Chevy Chase. In 1403 he rebelled against the king, declaring that Richard II still lived, but was killed at Shrewsbury, July 21, in battle against the royal forces. The story is told in

Shakespeare's Henry IV, part I. Twice forfeited, the estates were restored to the 4th earl in 1469. In 1537, as the heads of the family had taken part in the Pilgrimage of Grace, the title was lost, and it remained in abeyance until in 1557 Thomas Percy was created, by patent, Baron Percy, and the next day earl of Northumberland, which title again lapsed, through failure of heirs male, in 1670.

The line of the Percys was then continued through the duchess of Somerset, daughter of the last earl, to Algernon Seymour, her son, subsequently duke of Somerset. He died in 1750, as earl of Northumberland, and his son-in-law, Sir Hugh Smithson, Bart., was created duke in 1766. The succession passed to his son Hugh, who took the name of Percy. The present 10th duke is his descendant. Lord Eustace Percy, seventh son of the 7th duke, who was born March 21, 1887, became a diplomatist and was Conservative M.P. for Hastings, 1921-37. He was minister of Health, 1923-24; president of the board of Education, 1924-29; minister without portfolio, 1935-36. *See* Northumberland, Earl and Duke of; *consult* History of the House of Percy, G. Brennan, ed. W. A. Lindsay, 1902.

Percy, S. Esme (b. 1887). English actor. Born in London, Aug. 8, 1887, he was educated at Windsor and Brussels. His first appearance in England was at the Theatre Royal, Nottingham, 1904, with Benson's company, and in 1905 he played Romeo at the Royalty, London. He took many leading rôles in Shakespeare and Shaw. Having served in France during the First Great War, he remained in Germany with the army of occupation until 1923. In 1924 he became general producer to Macdonald's Shaw repertory. Percy, who lost an eye when attacked by a dog in 1937, was in great demand as a broadcasting actor.

Percy, Thomas (1729-1811). British prelate and man of letters. Born at Bridgnorth, the son of a

Thomas Percy,
British prelate

grocer, April 13, 1729, he was educated at Christ Church, Oxford. Devoting himself to the study of old literatures, he published, in 1765, the famous *Reliques* (v.i.). His translation of P. H. Mallet's *Northern Antiquities*, published in

1770, aroused a similar interest in old Norse records. Dean of Carlisle in 1778, and bishop of Dromore in 1782, he was an original member of Johnson's literary club, and died Sept. 30, 1811.

Percy's Reliques. Old songs, ballads, and other pieces prepared by Thomas Percy (v.s.) published in 1765 as *Reliques of Ancient English Poetry*. The foundation of his work was a folio MS. of about 200 poems, which had been compiled about the middle of the 17th century, and was found at Shifnal, Shropshire; but to the pieces selected from that folio Percy added many gathered from other sources, and also some later poems. Though he freely adapted and expanded poems, his work marks an important stage in literary history, the starting point of the modern study of ancient poetry, and a powerful factor in the romantic revival. The folio MS. on which he primarily drew is now in the British Museum; its full text was published 1867-68.

Perdiccas (d. 321 B.C.). Distinguished general of Alexander the Great, whom he accompanied in his Persian campaigns. On the death of Alexander in 323 B.C. he became chief minister to his successor, Arrhidaeus. He embarked on a campaign against Ptolemy, the ruler of Egypt, but this miscarried, and Perdiccas was put to death by his own soldiers.

Of three early kings of Macedonia of this name, the second played a part in the Peloponnesian war, first as an ally of Sparta, afterwards of Athens.

Perdita. Character of Shakespeare's tragi-comedy *The Winter's Tale*. The daughter of Leontes and Hermione, king and queen of Sicily, she is exposed at birth by the orders of her father, who doubts her paternity, on a desolate shore in Bohemia. Found by an old shepherd she is brought up as his daughter. Her speech on the flowers appropriate to different ages is celebrated. *See* Florizel; Robinson, Mary.

Perdu, MONT. Peak in the Pyrenees (q.v.). It is in the Spanish territory of Huesca, and lies S.E. of the Pic du Midi, its alt. being 10,994 ft. A glacier descends from the summit in three ridges.

Pereda, JOSE MARIA DE (1833-1906). Spanish author. He was born near Santander, Feb. 6, 1833, and began life as an engineer, turning to journalism and literature in 1858. *Escenas Montañesas* (Mountain Scenes), 1864, is a typical work. Pedro Sanchez, 1883, and

Sotileza, 1884, are perhaps his best works of fiction. He died March 1, 1906.

Père David's Deer (*Cervus davidianus*). Chinese species of deer. It is so named because it was

ancient Taphros, 60 m. S.E. of Kherson, on the N. of the isthmus. In the 15th century, Perekop formed part of the Tartar defences of the Crimea; it was captured by the Russians in 1783, and until the

Revolution was administered by the government of Taurida. During 1919-20 it was the scene of fighting between counter-revolutionaries and Bolsheviks. In the Second Great War German forces attacked the Russian positions on the isthmus which were breached Oct. 28, 1941. The town of Perekop was retaken by the 4th Ukrainian army, Nov. 1,

1943, the route of escape by land for the German forces still in the Crimea being cut off.

Père-Lachaise. Cemetery of Paris. Situated in the N.E. of the city, in the Boulevard de Ménilmontant, it is the oldest and largest extra-mural cemetery of Paris, covering about 212 acres. The ground occupied by it formerly belonged to the Jesuits, and the cemetery received its name from Père François de La Chaise (*q.v.*), who was superior of the order in Paris. On the suppression of the order the ground was sold and passed through a number of hands, until in 1804 it was purchased by the municipality and converted into a cemetery.

The cemetery is celebrated by reason of the famous people buried there, and its noteworthy monuments. On the right of the principal entrance is the Jewish cemetery, where the tomb of Elisa Rachel (*q.v.*) is the most noted. A little farther to the right is the tomb of Abélard and Héloïse. In a prominent central position is the handsome monument to Casimir-Périer. Other graves are those of Béranger, Balzac, La Fontaine, Molière, and de Musset among literary figures of France; Macdonald, Lefebvre, Masséna, Davout, Ney, and Foy among soldiers. Many English are buried here, including Sir Sydney Smith. A fine chapel occupies the site of the former Maison de Mont Louis, headquarters of the Jesuits. There is also a Muslim cemetery with a mosque. See Abélard; Bartholomé, P. A.; Cemetery; Paris.

Perennial. Plant that lives through a number of years. Trees and shrubs are all perennial, so the term is restricted in its application to herbaceous plants which live on from year to year, to distinguish them from annuals and biennials. The growth above ground of the true herbaceous perennial dies down in autumn, and fresh growth starts from the rootstock in spring. Some kinds form tufts of evergreen leaves. See Botany; Plant.

Perez, ANTONIO (1539-1611). Spanish statesman. An illegitimate son of Gonzalo Perez, the king's

Antonio Perez,
Spanish statesman

Père David's Deer, a Chinese species
W. S. Berridge, F.Z.S.

first noticed by the Père David in the emperor of China's park near Peiping. Its chief character lies in its antlers, which fork early into two equal branches, of which only the front one divides. See Deer.

Peregrine Falcon (*Falco peregrinus*). Bird of prey formerly much used for the sport of hawking. A native of Great Britain, and found in most other parts of the world, it nests chiefly on sea cliffs, and lays three or four mottled red-brown eggs. The young birds migrate in autumn to other lands. Adult birds have the crown of the head and the moustaches bluish black, the back and upper parts bluish grey, and the lower parts pale salmon colour barred transversely with brown. The size is about that of the rook, the male or tiercel 15 ins. in length, and the female a fifth larger. Exceptionally speedy, the bird is graceful in flight. Its prey is chiefly larger birds, including pigeons, grouse, and duck. See Eggs colour plate; Falcon; Hawking.

Peregrine Pickle. Novel by Smollett, published in 1751, with the full title of *The Adventures of Peregrine Pickle*, in which are included *Memoirs of a Lady of Quality*. It is a broadly humorous narrative, following the adventures of the hero from birth to marriage. The *Memoirs of a Lady of Quality*, which form the long 81st chapter, were written by Frances, Viscountess Vane (1713-88), who paid Smollett for their insertion in his story.

Perekop. Town and isthmus of Ukraine S.S.R. The town is the

murder of Escobedo, secretary of Don John of Austria, governor of the Netherlands, and was repudiated by Philip when inquiry into the murder was pressed. An attempt by the king's agents to remove Perez to a prison of the Inquisition was resented as an infringement of public rights, and Perez escaped into Aragon, where a popular movement in his favour led to drastic action by Philip. Perez, who had been sentenced to death in his absence, crossed the Pyrenees and organized an unsuccessful raid on Spanish territory. Later he became intimate with Bacon in England, but he died in Paris, Nov. 3, 1611. *Pron.* Payreth.

Perez de Ayala, RAMÓN (b. 1880). Spanish writer and diplomatist. Born at Oviedo, Aug. 9, 1880, he was educated at the university there. He entered the diplomatic service, and under the republic was ambassador to Great Britain, 1931-36. Then he was appointed director of the Prado museum at Madrid. An important Spanish novelist, he introduced backgrounds of Old Castile into his tales, which included *La Paz del Sendero*, 1904; *Prometeo*, 1916; *Luna de Miel*, *Luna de Hiel*, 1923, and its sequel, *Los Trabajos de Urbano y Simona*, 1923; *El Ombligo del Mundo*, 1924; *Tigre Juan*, 1926; *El Curandero de su Honra*, 1926. *Las Mascaras*, 1920, contains critical essays.

Perez-Galdos, BENITO (1843-1920). Spanish writer. He was born at Las Palmas, Canary

Islands, May 10, 1843, and published in 1868 *La Fontana de Oro*, the first of a series of books called *Episodas Nacionales* which dealt in fictional form with the history of 19th century Spain, and eventually comprised some 47 volumes, the last being completed in 1912. His other works included *Mariandela* and *Gloria*. He died Jan. 4, 1920.

Perfect (Lat. *perfectus*, complete). Musical term used in several senses: (1) Of intervals, the normal unison, octave, fifth, and fourth are reckoned as perfect, instead of major, owing to the simplicity of their ratios of vibration and their lowness in the harmonic series. (2) A perfect cadence is one in which the dominant chord is followed by the tonic chord. (3) Triple time was considered perfect by the musical theorists of the Middle Ages, and was indicated by a circle.

Perfect. In grammar, a tense of the verb denoting an act completed in time just past or still continuing, or a state or condition brought about by a previous action. Originally, it was a special kind of present; in "I have come to see" the action is past, but is continued in its effects. In most of the old Indo-European languages the perfect was formed by reduplication and vowel-change. In the Teutonic languages reduplication is very rare, and most of the oldest verbs simply change the vowel (give, gave), while so-called weak verbs add to the base (love, love-d, from "do"). The pluperfect (Lat. *plus quam perfectum*, more than perfect) indicates that an action was completed before another past action.

Perfectionism. Doctrine which teaches that it is possible for the Christian by the grace of God to be kept entirely free from sin. Similarly, Buddhists teach that by meditation and mortification a devotee may be entirely set free from sin. As a mere theory, the perfectibility of Christians is a matter of opinion in the Christian Church. The early Methodists, and some sects at the present day, urge it as a practical matter which concerns all true Christians. The doctrine is based upon the various precepts of the N.T., which urge Christians to aim at perfection.

Perfectionists. American sect, founded by John Humphrey Noyes about 1845. He established a community of his followers at Oneida (*q.v.*) in 1848. He taught a form of perfectionism, according to which the members of the community were so established in holiness

that they could neither fall into sin nor make any further spiritual progress. Whatever they did was good—a principle which introduced Antinomianism in its worst form. They practised community of wives as well as of goods, and had a system of "complex marriage" which was practically free love. They found it necessary in 1880 to abandon these communistic practices, and divided their property among the members, who became shareholders in the Oneida Community, Ltd.

Performing Rights Society. Association of composers, authors, and publishers of music, formed in 1914 to collect fees for the public performance of copyright works. It is a company limited by guarantee, makes no profits for itself, and pays no dividends, the whole of the fees collected, beyond the cost of administration, being paid to the composers, authors, and publishers concerned. It grants licences to public places of entertainment and to the B.B.C. by which, on payment of an annual fee, they may perform any of the works which the society controls. It does not grant licences to singers, orchestras, or bands. In all, 50,000 places of entertainment in Great Britain are thus licensed. The Society's offices are at Copyright House, 33, Margaret St., London, W.1.

Perfume (Lat. *per*, through; *fumus*, smoke). Scent arising from a sweet-smelling substance. In Egypt, different kinds of perfumes were offered on the altar at dawn, noon, and evening. Purification was carried out by the fumigation of temples and dwellings by the burning of scented substances. In their religious processions they burnt myrrh, cinnamon, iris, and other strong scented substances. Perfumes were pressed into the service of the dead, and the process of embalming was carried out with the costliest spices. The Hebrews took with them, from Egypt, the use of incense and other perfumes, and throughout Western Asia the use of perfumes was general for ceremonial and domestic purposes.

Perfume is obtained from the flowers, leaves, and in some cases roots and wood of plants and is extracted by steam distillation by expression (steeping in water and pressing by solution in petroleum ether with subsequent vacuum distillation), or by maceration, *i.e.* steeping in fat and filtering.

The production of perfumes is an important industry in the S. of

France. At Cannes jasmine, tuberose, and rose are the principal products. Nice is a centre for violets, and Nîmes for thyme, rosemary, and lavender. In Italy bergamot and iris are dealt with, and English mint and lavender are considered the best.

There are really two branches in the manufacture of perfumes, usually carried on in different centres: perfumery proper, which is naturally carried on chiefly on the spot, as the plants must be fresh to give the best results; and the mixing of the essences secured with fat for pomades and other preparations, with alcohol for liquid scents, and with various other materials for toilet preparations. As there is no means of scientifically assessing odours, and nomenclature is dependent on personal judgement, the art of the perfumer is a subtle one.

The rise of organic chemistry towards the end of the 19th century resulted in the isolation and, in many instances, the chemical synthesis of substances to which natural perfume materials owe their origins, *e.g.* essential oil of almonds is substantially benzaldehyde; vanilla owes its characteristic odour to methyl protocatechuic aldehyde, etc. Many new odorous materials were discovered, *e.g.* ionone (violet) and nitro musks. Later improvements in technique produced such substances as phenyl ethyl alcohol (contained in otto of roses), the tertiary alcohols and their esters, used for lilac, jasmine, hyacinth, etc.

Perga or **PERGE**. Ancient city of Pamphylia, and a centre of the worship of Artemis. It is memorable as a place visited by S. Paul on his first missionary journey. Its ruins lie about 10 m. N.E. of Adalia, Asiatic Turkey.

Pergamino. Town of Argentina, in the prov. of Buenos Aires. It is an important rly. junction, 76 m. S. of Rosario and 140 m. N.W. of Buenos Aires. Pop. 20,500.

Pergamum or **PERGAMUS**. Ancient city of Mysia, Asia Minor. The modern Bergama, it is situated about 20 m. from the sea, on the N. bank of the Caïcus. It became important in the first half of the 3rd century B.C., a kingdom being established there by Philetaerus in 280 B.C. The kingdom reached the zenith of its power under Eumenes II in 190 B.C., who was tactful enough to identify himself with the all-conquering Romans, and received from them most of W. and central Asia Minor. Under Eumenes the great library

Pergamum. 1. The imposing Greek theatre. 2. The ruined gateway to the Roman amphitheatre. 3. Statue of the Dying Gaul, an example of the Pergamene school, now in the Capitoline Museum, Rome. 4. Restoration of the south wing of the great altar of Zeus

was founded, said to rival that of Alexandria. He also beautified the city with fine buildings and sculptures. In 133 B.C. Attalus III, the last king, died, and by his will the kingdom passed to the Romans. Extensive excavations were made by the Prussian government, 1871-78. Among fine buildings found was the great altar of Zeus, with colossal reliefs of the battle between the gods and giants, which was taken to Berlin. Another famous example of the statuary of the Pergamene school is the Dying Gaul, falsely called the Dying Gladiator, in the capitol at Rome.

Pergola (Ital., arbour). Name given to a trellis erection spanning a garden walk, upon which flowers and creepers are trained. It was introduced from Italy. The best climbers for a pergola are vines, roses, honeysuckles, clematis, wistaria, aristolochia, and jasmine.

Pergolesi, GIOVANNI BATTISTA (1710-36). An Italian composer. Born at Jesi, near Ancona, Jan. 3, 1710, he studied composition at Naples and showed facility in extemporising chromatic passages on the violin. He became prominent with a sacred drama, *La Conversione di S. Guglielmo d'Aquitania*, 1731. Of great lyrical beauty is his *Stabat Mater*, probably composed in the year of

his death. Of his operas, notable for comic intermezzi, the most famous is *La Serva Padrona*, 1732. He died March 17, 1736.

Peri. In Persian mythology, a fairy-like being of a race between angels and demons. They are harmless and beautiful, but are excluded from Paradise. The story of Paradise and the Peri—told in Moore's *Lalla Rookh*—relates how one peri secured admission into the abode of the blessed.

Periander (c. 665-585 B.C.). Tyrant of Corinth, 625-585 B.C., and one of the seven wise men of

ancient Greece. Though at first his government was beneficent, he degenerated into an oppressive despot. Thrasybulus, tyrant of Miletus, consulted by him, is said to have taken the messenger through a cornfield, cutting off as he went the tallest ears of corn. Periander accordingly rid himself of the noble families of the city. He was a generous patron of art and literature, and founded colonies in Macedonia.

Pericarditis. Inflammation of the pericardium. It may occur in the course of Bright's disease, rheumatism, or fevers, or may result from injury, or an extension of inflammation from the lungs, heart, or other organs. Suppurative pericarditis may occur in the course of septicemia and pyemia. The most marked symptoms are pain, increase of pulse rate, difficulty in breathing, and coughing. Acute pericarditis may terminate in complete recovery, in sudden death, or in chronic pericarditis with the formation of adhesions and dilatation of the heart. Penicillin and the sulpha drugs are used in treatment where the condition is due to germs.

Pericardium (Gr. *peri*, around; *kardia*, heart). Fibro-serous membrane which encloses the heart. The base of the pericardium is

Pergola. An attractive pergola constructed from stone and wood

attached to the central part of the diaphragm or big horizontal muscle which separates the abdomen from

Pericardium. Diagram showing relative position of the pericardium to the heart

the thorax, and the apex surrounds the commencement of the aorta or main blood-vessel of the body. Immediately in front of the pericardium is the middle piece of the sternum or breastbone, and the cartilages of the fourth to the seventh ribs on the left side. The pericardium contains in health a small amount of lymph, the function of which is to lubricate the two surfaces and thus facilitate the movements of the heart.

Pericles (c. 490–429 B.C.). Athenian statesman. Son of Xanthippus, soldier and politician, he was born in Athens, and educated by the finest teachers. An aristocrat, he allied himself with the democratic party, and set out to destroy the system of despotic oligarchy. One of his first recorded public appearances was as a lawyer against Cimon, head of the aristocratic party. He worked with Ephialtes, leader of the popular party, to limit the power of the governing Areopagus in 462. The next year Ephialtes was assassinated, his colleague became supreme, and, after the downfall of Cimon, he was accepted for the next 30 years as the greatest man in the state.

Pericles wished to secure a mighty and prosperous federation of autonomous Greek states. But he was also a patriot, desiring to see Athens a strong central power round which the other states could rally. He was perhaps the first man to grasp that democracy depends for its success upon bold and resolute leadership, and that the ruled must maintain their interest in the ruling. Therefore he flung open all offices of state, in 457, to the poorest citizens; he provided salaries for the holders of offices and improved the ad-

ministration of justice by paying both magistrates and jurors.

A policy of expansion raised the prestige of Athens higher than ever. Pericles terminated the long Persian war by a truce in 453, recalling Cimon from exile. For the rest of his life Pericles was annually elected commander-in-chief. In 431 the Peloponnesian war broke out between Athens and Sparta. This was fatal to Athens, for reasons for which Pericles was in small part to blame. A naval disaster, followed by unsuccessful overtures for peace, completed the demoralisation of the Athenians, and they turned against their leader—in spite of his renowned funeral oration—deposed him from his magistracy, and fined him. His calm dignity restored him to favour, but his health was undermined, and in the autumn of 429 he died. He had made Athens the most celebrated city in the

Pericles, Athenian statesman
From a bust in the British Museum

world. To Pheidias he entrusted the supervision of the building of the Parthenon, Odeum, Erechtheum, Propylaea, and other public and sacred edifices.

Bibliography. Thucydides, books i and ii, are the chief sources; Plato, Aristotle, and Plutarch contain useful references. *Consult also* The Age of Pericles, W. W. Lloyd, 1875; P. and the Golden Age of Athens, E. Abbott, 1901; and a study by C. Mackenzie, 1937.

Pericles, PRINCE OF TYRE. Romantic play attributed to Shakespeare. The greater part was probably written by George Wilkins, Shakespeare's handiwork being seen chiefly in Acts 3–5. It is based on adaptations by John Gower and Laurence Twine of the early Greek romance of Apollonius of Tyre. The play deals with the loss by Pericles of his wife and daughter and their reunion. First

acted at The Globe in 1608, and popular as late as 1630, it has seen only few revivals. Wilkins, in 1608, published a novel which he said was based on the play. Pericles was first printed in 1609, but not admitted to Shakespeare's collected works until the second issue of the Third Folio in 1664.

Peridot. Variety of chrysolite or olivine, a magnesium-iron-silicate. Found in N. America, the Levant, etc., and alternatively known as Job's tears, peridot is always some shade of green. It commonly appears in the form of small pebbles, and is used as a gem.

Peridotite. Name given to a group of ultra-basic crystalline igneous rocks, rich in magnesia. They consist chiefly of olivine, together with augite, biotite, hornblende, hypersthene, and magnetite, etc. Quartz and feldspar are absent. Peridotites on decomposition pass into serpentine, most of which has been so formed. Corundum, platinum, red garnet, and diamonds are all found in peridotites. *See* Igneous Rocks; Olivine; Serpentine.

Perigee (Gr. *peri*, around; *gē*, the earth). Point in the moon's orbit at which the moon approaches nearest to the earth. The term is sometimes applied to the position of any heavenly body when it approaches in its orbit nearest to the earth. It is the opposite point of apogee. *See* Moon.

Périgord. One of the provinces into which France was divided before the Revolution. It is now represented by the depts. of Dordogne and Lot-et-Garonne. Before the 14th century it was feudatory to Aquitaine, and as such was an English possession. After the expulsion of the English it was united to the crown of France. *Pron.* Pay-ree-gor.

Périgueux. Town of France. The capital of the dept. of Dordogne, it stands on a height on the right bank of the Isle, about 80 m. E.N.E. of Bordeaux, and is a junction of the Orléans rly. It has locomotive works, and manufactures agricultural machinery, furniture, woollens, hats, etc. A considerable trade is carried on in wine, and truffles are a speciality. The cathedral of S. Front, 984–1047, built perhaps in imitation of S. Mark's at Venice, is a fine example of Byzantine architecture. Other important buildings are the church of S. Étienne and the prefecture. Périgueux, the ancient capital of the Gallic Petrocorii, was the Vesunna of the Romans, relics of whose rule remain in a great tower

and an amphitheatre. It was besieged by the English in 1356, and was sacked by the Huguenots, who occupied it from 1575 to 1581. Pop. 40,865.

Perihelion (Gr. *peri*, around; *helios*, the sun). In astronomy, the point in the orbit of a planet or comet at which it makes its nearest approach to the sun. It is opposite to aphelion, the farthest distance, the line joining the two being known as the line of apsides. See Aphelion; Apsides.

Perim. Rocky island in the straits of Bab-el-Mandeb under British control. It commands the entrance to the Red Sea, and is situated 97 m. W. of Aden. It is about 5 sq. m. in area, and is a coaling depot for the mercantile marine. It was held by the British 1799-1800, occupied 1857, and is now administered as a dependency of Aden. See Bab-el-Mandeb.

Perimeter (Gr. *peri*, around; *metron*, measure). Line or lines bounding a closed geometrical figure, or any area or surface. In a military sense it denotes the outer rim of a hastily fortified position, and consists of trenches, barbed wire, and light weapon pits. Notable examples in the Second Great War were at Tobruk and on the landward side of Dunkirk to cover the withdrawal of the B.E.F. An aerodrome perimeter is a road encircling the flying field and enclosing the runways; at military aerodromes it includes fortified posts.

Perineum. That part of the body which forms the external floor of the pelvis (*g.v.*). It may need repair after childbirth, during which it may suffer tearing.

Period (Gr. *peri*, around; *hodos*, path). Historically, a cycle of years or events, *e.g.* the Louis XV period, the Commonwealth period, etc. In astronomy, a definite cycle, like the lunar period or Metonic cycle of 19 years; also the time required for a celestial body to complete a revolution in its orbit, *e.g.* the earth's period is 365 days, etc. In mechanics, the interval of time between the same recurrent phases of an oscillation or vibration, *e.g.* that of a pendulum or a tuning-fork. The complete repetition of an alternating voltage is called a cycle or period. The term is also used for the completion of any series of recurring events, *e.g.* a sunspot period. The time of a complete roll of a ship from starboard to port or vice versa is termed a period, as is the interval between the beginning and full operation of a chemical re-

action. A periodicity is the regular recurrence of the same phenomena in the same times.

Periodical. Name given to any publication issued at regular intervals, though generally used in contra-distinction to a daily newspaper (properly a journal) to imply a weekly, fortnightly, monthly, or quarterly magazine. British periodicals were ordered to suspend publication for two weeks in Feb., 1947, during a fuel crisis. See Magazine.

Periodic Law OR PERIODIC TABLE. Conception in chemistry, first put forward in 1804 by J. A. R. Newlands. The numbers of chemical elements in the Periodic Table are given in p. 1987. See Chemistry; Mendeleev.

Perioeci (Gr. *perioikoi*, those who dwell around). Intermediate class in the Spartan state, descendants of the pre-Dorian population with an admixture of other elements. They were above the Helots (*g.v.*) or serfs, could farm their own land and engage in trade, but had not the political rights of the full Spartan citizens, though they were liable for military service. *Prom. Perry-oky.*

Periostitis (Gr. *peri*, around; *ostea*, bones). Inflammation of the periosteum or fibrous membrane which invests bones. Acute periostitis is most frequently the result of an injury. It may also develop from inflammation in the neighbourhood of the bone, *e.g.* periostitis of the jaw from a carious tooth. The symptoms are pain, and redness and swelling of the limb over the site of the inflammation. Penicillin and the sulpha drugs control the situation if the germs present react to them.

Peripatetics (Gr. *pervpatetikos*, walking about). Name given to the followers of Aristotle. They were so called either because their master and his successors were in the habit of delivering their lectures walking about in the Lyceum, or from its walks (*peripatoi*). The chief Peripatetics are Theophrastus, Eudemos, Aristoxenus, Strato, Andronicus of Rhodes, and Alexander of Aphrodisias.

Peripatus. Caterpillar-like animal about 3 ins. long with

structure intermediate between that of annelids and arthropods. It is believed to be related to the progenitors of all air-breathing Arthropoda. The cylindrical body has a soft, velvety skin; it is segmented and bears between 17 and 40 pairs of short conical limbs, each ending in a pair of hooked claws. Peripatus is green, brown, or reddish-orange above and flesh-coloured below. The head bears a pair of antennae, two simple eyes, and a pair of horny jaws. Breathing is by short air tubes over the general body surface. There are a central

Peripatus. An animal intermediate between the Annelids and Arthropods

nervous system and a long tubular heart with lateral openings into the perivisceral blood-space.

Originally the creature was classed as a slug, owing to its copious ejection of slime, which serves to capture insects. Later thought to be a worm, it is now generally regarded as an arthropod

of a separate class of its own—Onychophora. Most of the 60 or more known species produce living young, only a few being oviparous. Peripatus occurs in S. Africa, S. America, W. Indies, Malaya, Australia, and New Zealand. It inhabits moist forests and is intolerant of dryness.

Periscope (Gr. *peri*, around; *skopein*, to watch). Apparatus for observing from a concealed position or enabling an observer to see over obstructions. It consists essentially of reflecting mirrors or prisms at each end of a metal tube. One mirror or prism receives from the object light which, after reflection, falls on the lower mirror, whence it is reflected in the direction of the observer's eye. The submarine periscope has additional lenses in the tube itself and a special eyepiece. The trench or field periscope of the First Great War

Periscope. Diagrams illustrating submarine, Fig. 1, and field, Fig. 2, periscopes. In each the image, entering at A, is reflected down by prism B to prism C, thence to eyepiece D. In submarine instrument: E is valve to shut out water if periscope is shot away; F, wheel to rotate instrument

Periscope. A naval officer at the eye-piece of a submarine periscope.

consisted simply of two mirrors fixed at the ends of a collapsible wooden or metal framework. See Submarine.

Peristalsis (Gr. *peri*, around; *stalsis*, compression). Rhythmic contractions which travel like waves along muscular fibres, exhibited only by involuntary muscles. Peristalsis of the intestine mixes the contents with the digestive juices and forces the material along the canal. The movement is worm-like, one set of muscles relaxing while another contracts. Heart movements are a more complicated form of peristalsis.

Peritoneum (Gr. *periteinein*, to stretch around). Serous membrane which lines the walls of the abdominal cavity and is reflected over the internal organs, so as to cover them more or less completely. The part lining the cavity is known as the parietal layer, and that covering the organs as the visceral layer. Folds of the peritoneum which are connected with the stomach are called omenta. The largest of these connects the stomach with the transverse colon, and is known as the greater omentum. The term mesentery is applied to any fold of the peritoneum which attaches the intestine to the posterior wall of the abdomen. Reflections of the peritoneum from the abdominal walls on to viscera other than the intestine are called ligaments.

Peritonitis. Inflammation of the peritoneum. It results from injury of the membrane or extension of disease from one of the

abdominal organs. Hence it may arise from appendicitis, obstruction or ulceration of the bowel, strangulated hernia, cancer, etc. Often the infecting organism is the *Bacillus coli*, which is normally present in the intestine, and, when the walls of that canal are injured or diseased, is able to make its way through to the peritoneum. Tubercular peritonitis is another form common in children. Peritonitis may be general, affecting a large extent of the membrane, or local, i.e. limited to the neighbourhood of an inflamed organ, and it may be acute or chronic.

The symptoms of acute peritonitis are severe and continuous pain in the abdomen, often with a rise of temperature and vomiting. In acute untreated cases a fatal termination may occur within a few hours. Where perforation of the bowel is suspected, operative treatment is the best hope. Chronic localised peritonitis may be treated with penicillin and the sulpha group. See Abdomen.

Perivale. District of Middlesex, England. It lies S.E. of Greenford and N.W. of Ealing, and the river Brent, the Grand Union canal, Western Avenue, and rlys., both steam and electric, pass through it. Now comprising factories and residential blocks, its history goes back at least to Geoffrey de Mandeville, a 12th cent. lord of the manor. The tiny church is mainly E.E., 14th cent., but restored in 1875. It has a wooden western tower. Greenford Parva is an alternative name.

Periwig. Word derived from the French *perruque*, meaning an artificial head of hair. It is usually shortened to wig (q.v.).

Peritoneum. Diagram showing the general relation of the peritoneum to the adjacent organs

Periwinkle (*Littorina littorea*). Marine snail with thick calcareous shell. It is abundant on all parts of the British coasts, in the intertidal zone, whence thousands of tons are annually sent to inland towns for food. The mollusc has a distinct muzzle extended in front of a pair of tentacles or antennae, at the base of which are the eyes. Its principal food is marine algae, which is rasped by the efficient tooth ribbon. Periwinkles, or winkles, are found at low-water mark in all parts of the world.

Periwinkle (*Vinca minor*). Perennial herb of the family Apocynaceae. It is a native of Europe and W. Asia. It has

Periwinkle. Single flowers and glossy leaves of the Lesser Periwinkle, *Vinca minor*

tough trailing stems about 2 ft. long, which root from the base of the paired oval varnished leaves. The blue-purple, salver-shaped flowers are borne singly, chiefly on shorter erect stems. The style expands above into the broad stigma which almost closes the mouth of the tube. The greater periwinkle (*V. major*), familiar in gardens, is similar, but larger in all parts. It is a native of Europe and N. Africa. See Flower.

Periyar. River of Travancore, India. It rises in the Sivagiri Hills and flows N.W. and W. to the Arabian Sea. The upper waters of the Periyar have been diverted to the valley of the Vaigai for irrigation purposes. A dam, 176 ft. high, has made a reservoir of 8,000 acres, whence the water is led through a mile-long tunnel to the Suruli Valley and thence to the Vaigai.

Perizzites or **Pherezites** (perhaps villagers). One of the early peoples of Palestine. The name occurs in late insertions in the Hexateuch. They may have been Canaanite cultivators.

Perjury. Wilfully swearing falsely in a judicial proceeding after having taken a lawful oath, ad.

ministered by someone having authority to administer it, on a matter material to the issue. A mere slip of the tongue, or a hasty or exaggerated expression, will not amount to perjury. The statement need not be known to be false, if a person who knows nothing of the matter takes it upon himself to swear that it is true when it is not true. The matter sworn to must be, in some way, material to a point at issue—e.g. the actual subject matter of the trial, or the damages, or the credibility of the witness. Perjury is a misdemeanour, and so is subornation of perjury, i.e. procuring another to commit perjury. Both are punishable by fine and imprisonment. *See* Oath.

Perkin, Sir William Henry (1838–1907). British chemist. He was born in London, March 12, 1838, and educated at the City of London School and the Royal College of Chemistry. In 1856, while endeavouring to prepare quininesynthetically, he obtained a beautiful mauve dye or Perkin's purple, so founding the aniline dye industry. Perkin devised a process for making alizarin from anthracene, and produced several other aniline dyes. He was the first to prepare the perfume coumarin synthetically. He retired in 1873, the rest of his life being devoted to physical and chemical researches. Knighted in 1906, he received the Davy medal of the Royal Society, and died July 14, 1907. *See* Dyes; Greenford.

Perkins, Frances (b. 1882). American politician. Daughter of a Maine lawyer, she was born at Boston and educated at Mount Holyoke College, the university of Pennsylvania, and Columbia university. As chairman and afterwards industrial commissioner of the N.Y. industrial board, she made a reputation which led to her appointment in 1933 by F. D. Roosevelt as secretary of Labour. She thus became the first woman to enter an American cabinet. In that position, which she held until 1945, she took a leading part in carrying out the labour policies of the New Deal. In 1941 she was chairman of the I.L.O. conference in New York. She wrote several books on social problems, as well as *The Roosevelt I Knew* (1946). The wife of Paul Caldwell Wilson, an engineer and statistician, in her public work she always retained her maiden name.

Perlis. Northernmost state of the federation of Malaya, bounded by Siam to the E. and Kedah to the

S., with 25 m. of coastline on the bay of Bengal. Formerly one of the unfederated Malay States, it was acquired by Great Britain from Siam in 1909, and includes the island of Langkawi. Rubber, rice, tin, and coconuts are the chief products, and there are guano deposits. The W. line of the Singapore-Siam rly. passes through the state. Kangar, on the river Perlis, is the chief town. The area is 316 sq. m. Of a pop. est. in 1940 at 57,776, there are 46,133 Malays, 8,432 Chinese, and 1,178 Indians. Perlis fell without resistance to the Japanese in the Second Great War, being cut off by the advance into Kedah in 1941, and remained in Japanese occupation until Japan's surrender, Aug., 1945. *See* Malaya, Federation of.

Perlite. Igneous rock of perlitic structure. Glassy of texture, the rock easily breaks up into small rounded masses that have a pearly lustre and give it the alternative name of pearlstone. *See* Hyalite.

Perlitic Structure. In geology, name given to the presence in volcanic rocks of small concentric fissures or cracks. These cracks form planes of decomposition, breaking the rocks up into round fragments like pearls, which give the structure its name.

Perm. A Russian city. In the Sverdlovsk region of the R.S.F.S.R., it is the second largest town of the Urals and stands on the river Kama 240 m. by rly. N.W. of Sverdlovsk. Its prosperity is mainly due to copper mines discovered in the 17th century. There is also trade in silk and cotton goods, and in tea, leather, sugar, and fur. Koltchak captured Perm from the Bolsheviks in 1918. Pop. 255,196.

Permanganates. Salts of permanganic acid. The best known is potassium permanganate, a purple-coloured substance used in solution as a disinfecting agent, and also as an oxidising agent in analytical chemistry. In combination with sulphuric acid, potassium permanganate is used as a photographic reducer and as a bleach after first development of additive colour transparencies. The acid is unknown in the pure state, but exists as a crimson, strongly acid solution. Its chemical formula is KMnO_4 .

Permeability. The property of a solid which permits the passage of a fluid through it. Most solids are permeable, the degree of permeability varying from that given by spaces of molecular dimensions to that of large masses traversed by cracks. Filtration is a related phenomenon, since a filter is a

permeable substance. The permeability of rocks is of great importance, as it controls the rate of passage of fluids through the subterranean reservoir and is a major factor affecting the productivity of wells. The first detailed investigation was made by D'Arcy, 1856, who formulated an empirical law which bears his name. A unit of permeability used in petroleum reservoir studies is also named after him. In the laboratory determinations of permeability are made on samples recovered when drilling wells, but results are often misleading because they neglect the effect of large cracks and fissures.

In magnetism, permeability is the ratio of flux density to magnetising force. For air and non-magnetic substances it is unity; for magnetic substances it is not constant but varies with flux density. The metallic elements iron, nickel, and cobalt may have a permeability as high as 2,000, 300, and 250 respectively; special alloys attain values as high as 100,000.

Permian System. The geological period which comes after the Carboniferous and before the Triassic, i.e. at the end of the Palaeozoic era, about 200 million years ago. The name is derived from Perm in Russia, in which district Murchison studied rocks of this age. The period was characterised in Great Britain and Europe as one of desert conditions, inland drainage, and mountain building. The rocks are largely coarse sedimentary breccias, sandstones, marls, etc., of reddish colour due to staining by iron oxide. Limestones, dolomite, rock salt, gypsum, anhydrite, and potash salts also occur. In England red sandstones, etc., are the usual rocks of this period, but E. of the Pennines is an important group of magnesian limestones stretching from Durham to Nottingham. This group is water-bearing, and is also used as a building stone. Because of their normal colour and the fact that they overlie the coal measures, the Permian strata are sometimes called the New Red Sandstone.

In Europe the Permian has largely a twofold character and has in consequence been termed the Dyas. These two subdivisions are the Rothliegendes below, and the Zechstein above. In Germany there occurs near the base of the Zechstein a thin black shale which contains copper, locally in workable amounts, known as the Kupferschiefer. Above this are thick beds of rock salt, gypsum, and potash salts of great industrial

importance. Permian rock salt and gypsum also occur in the U.S.A. These deposits indicate evaporation of salt-water lakes or lagoons from which the various salts were precipitated. See Carboniferous System; Triassic System. Consult The Permo-Triassic Formations, R. L. Sherlock, 1948.

Permitted Explosives. Explosives used for blasting in Great Britain may be either permitted or non-permitted. Most commercial explosives made are used in mines under the Coal Mines Act, and more than 75 p.c. of these are of the permitted type. In British coal mines, only permitted explosives may be used where inflammable gas has been found within the previous three months in such a quantity as to be indicative of danger. The same restriction applies to dry and dusty seams. Permitted explosives in this sense are those prescribed by the board of Trade. The explosives must have passed certain tests to be placed (1) on the Home office list of "authorised explosives," implying that they are reasonably safe to manufacture, handle, transport, and use, and (2) on the board of Trade (mines department) list of permitted explosives, implying that they are reasonably safe against the possibility of ignition by fire damp or coal dust if used with due care. The authorised list is published annually. Other information is given in the annual report of H.M. inspectors of explosives, published by H.M. Stationery Office.

Tests are carried out at a research station at Buxton (hence Buxton test). The explosive is fired from a steel cannon into a cylindrical gallery 5 ft. in diam. containing a 9 p.c. methane air mixture in gas tests and coal dust in other tests. Five 8-oz. shots of the unstemmed explosive and five 28-oz. shots stemmed with a lag plug are fired into the gas mixture or coal dust and must not cause ignition.

SHEATHED PERMITTED EXPLOSIVES. In 1914 Lemaire introduced the sheathed explosive. The safety sheath consists of an annular ring of inert material surrounding the central core of explosive. Many different materials have been tried, but in the U.K. powdered sodium bicarbonate has been adopted. In 1938 bicarbonate felt was developed, which can be rolled around the cartridge of permitted explosive. Sheathed explosives now represent about 50 p.c. of the usage of permitted explosives. The safety sheath produces finely dis-

persed material which functions as a flame trap and prevents propagation of flame. See Explosives.

C. E. H. Bawn, Ph.D.

Permittivity. Alternative term for Specific Inductive Capacity (q.v.).

Permo-Carboniferous. In geology, term used for the borderline rocks of the Permian and Carboniferous series, and for the period of mountain building which occurred at that time. See Carboniferous System; Permian System.

Permutation. The act of changing one thing for another, or more literally, through another. Hence, the changing of the order in which things are arranged. In mathematics, the different arrangements of things. Thus three figures, taken two at a time, provide six different numbers of two digits each. Four dissimilar things can be arranged in $4 \times 3 \times 2 \times 1$ different ways, i.e. 24 permutations; for the first position can be filled by any of the four things; the second position, by any of the remaining three things; the third position, by either of the remaining two things; and each of these possibilities can be combined with each of the others. (The number $4 \times 3 \times 2 \times 1$ is called factorial 4, and may be written either $4!$ or $4\downarrow$). Thus, to generalise, n dissimilar things taken n at a time provide $n!$ permutations, or n dissimilar things taken r at a time provide $n(n-1)(n-2) \dots (n-r+1)$ per-

binations of b and c . Combinations are groups or selections of the same things, irrespective of the order in which they are arranged; thus six permutations provide only three combinations. The number of combinations of n dissimilar things taken r at a time can be calculated from the expression:

$${}^nC_r \times r! = {}^nP_r; \text{ that is, } {}^nC_r = {}^nP_r / r! = \frac{n(n-1)(n-2) \dots (n-r+1)}{1.2.3 \dots r}$$

Permutations and combinations are of importance and interest in the theory of probability, games of chance, football pools, statistical method, and algebraic work in connexion with series.

Pernambuco. Maritime state of N.E. Brazil. Situated S. of Parahyba and N. of Alagoas, it is well forested, fertile, and thickly peopled. There are plantations of cotton, sugar, coffee, cocoa, and rice; tobacco, cereals, and fruits are also cultivated. The chief exports include timber, dye-woods, drugs, rubber, and gold. The E. part of the state is served by rlys. The river São Francisco flows along part of the S. boundary, and many small rivers water the state. Its area is 49,560 sq. m. Pop. 2,674,683. *Prov. Pairnumbooko.*

Pernambuco OR RECIFE. Seaport and town of Brazil, capital of the state of Pernambuco. It stands on the Atlantic coast, 380 m. N.E. of Bahia, and is a terminus of rly. lines running to the N., S., and interior, besides being the nearest

Pernambuco, Brazil. Air view of the town and port, the capital of the state of Pernambuco

mutations. The number of permutations of n dissimilar things taken r at a time is commonly written nP_r .

The letters a, b, c , taken 2 at a time, provide 6 permutations ab, ba, ac, ca, bc, cb ; but it will be noticed that the first two permutations are combinations of a and b , the next two are combinations of a and c , and the last two are com-

S. American port to Europe. There is a regular bus service to Parahyba and a bi-weekly air service to Rio de Janeiro. The third city of importance in Brazil, it comprises three regions: (1) the old settlement of Recife, still the chief commercial centre, founded in 1504 and occupied by the Dutch 1630-54; it is situated on a sandy penin-

sula, and connected with the mainland by bridges: (2) São Antonio, on the island of São Antonio, formed by the rivers Biberibe and Capiberibe; (3) Boa Vista, on the mainland, the residential section. Pernambuco has some of the finest churches and public buildings in Brazil. Wide avenues and lofty modern buildings have replaced the narrow streets and one- or two-storey houses. The harbour is a port of call for numerous liners. It is a cable station, and there is a wireless station at Olinda, in the vicinity. Called the Venice of America on account of its many waterways, Pernambuco exports sugar, cotton, rum, coffee, cocoa, hides, rubber, and dye-woods. Pop. est. 350,000.

Pernov or **Pärnu**. Seaport of Estonia S.S.R. It stands on the bay of the same name, an arm of the Gulf of Riga, at the mouth of the Pernava. It is a rly. terminus and has connexions with Riga and Leningrad, also a trade in grain, flax, hemp, and leather. Founded in 1255, it became Russian in 1710. Pop. 21,000.

Perón, Juan Domingo (b. 1895). Argentine statesman. Born at Lobos, in the prov. of Buenos Aires, Oct. 11, 1895.

Juan Perón,
Argentine statesman

he studied at the national military college and was commissioned in the infantry. In 1930 he was appointed to the war ministry and the chair of military history at the staff school. Promoted lieutenant-col., he was in Chile as military and air attaché, 1937-38. During 1939-41 he visited Europe, studying mountain warfare with the Italian army.

Perón played a leading part in the revolution of 1943, and after a short period at the war ministry was made president of the national department of labour, which he reorganized. In 1944 he was made secretary for war and soon nominated as vice-president. Although he won popularity with the working classes some saw him as a possible dictator, and when a series of demonstrations was organized he resigned, Oct. 8, 1945, and was arrested. But the cabinet was reformed to exclude elements hostile to Perón, whose popularity was heightened by accusations brought by the U.S.A. that he had tolerated Nazi activities in Argentina.

A combination of the Labour party and the Radicals elected him to the presidency, Feb. 24, 1946, by a large majority. He was restored to the active list of the army as brig.-gen. He put in train far-reaching schemes of social reform. The extension of the franchise to women, which his wife Eva had long advocated, was enacted Sept., 1947. See Argentina in N.V.

Péronne. Town of France. In the dept. of Somme, it stands on the right bank of that river, 94 m. N.N.E. of Paris. The chief building is the church of S. Jean, dating from the 16th century, and there are the ruins of a castle. Péronne was formerly the capital of Santerre, and was afterwards in Vermandois. A fortified town, in 1465 it was surrendered to Charles the Bold, and it was in the castle here, described in Quentin Durward, that he kept Louis XI of France a prisoner. Wellington took Péronne in 1815, and in 1871 it was bombarded and entered by the Germans. They held it again during the First Great War from Sept. 24, 1914, until March 18, 1917, when they withdrew, causing immense damage; the Grande Place was wrecked, and the historic town hall reduced to ruins. The Germans recaptured Péronne on March 24, 1918, to be finally driven out by the Canadians on Sept. 1. In the Second Great War the town fell to the rapid advance of German armour on May 18, 1940. It was captured by the Allies in the autumn of 1944 against negligible resistance.

Perovskite. In mineralogy, name given to calcium titanate, CaTiO_3 . Pale yellow to brown in colour, with a metallic lustre, the mineral is found in metamorphic rocks and alkaline basalts.

Peroxide. Compound of oxygen with another element which contains a higher proportion of oxygen than the normal oxides. Examples include barium peroxide (BaO_2) and hydrogen peroxide (H_2O_2). The latter compound is the one frequently referred to as peroxide, and is a powerful oxidising and disinfecting agent used in dilute solution for bleaching the hair. See Hydrogen Peroxide.

Perpendicular (Lat. *perpendiculum*, a plummet). Term used for something exactly upright. In geometry, it is used to indicate a line which is at right angles to a given line or surface.

In architecture, the Perpendicular period refers to the phase of Gothic architecture which began

towards the end of the 14th century and lasted till the Renaissance, about 1560. It was peculiar to England, and its principal characteristic was verticality. Even the window tracery consisted of vertical members, the mullions being carried straight up through the head of the window, which was in its turn much larger than its predecessors of the Decorated or Early English styles. Arches had two arcs or four, the latter type being known as four-centred; columns were composite or clustered, with small capitals, generally moulded; roofs were of the hammer beam type, at first heavier than before. The Perpendicular period witnessed a great increase in the use of panelling, an enhanced richness in the decoration of the choir-stall, and the perfection of fan tracery vaulting.

The western part of the nave of Westminster Abbey is Perpendicular architecture at its best; one may cite also Henry VII's chapel at Westminster, S. George's chapel, Windsor, and the choir of Gloucester cathedral. The period produced fine domestic buildings. See Arch; Architecture; Bath; Gothic Architecture; Ilminster illus.

Perpetual Motion. Action of an imaginary machine which, once set in motion, continues for ever without further impetus, unless stopped by some external force. Such a machine is inconceivable, since by the law of the conservation of energy it is not possible to do work without the expenditure of energy in some form. Many attempts have been made to produce perpetual motion machines, but none has been successful. Those which have apparently succeeded have depended upon the forces of nature, e.g. a water wheel at Niagara. See Energy; Motion.

Perpetuating Testimony. Term used in English law. Any person who has a contingent right or claim to any honour, title, office, or real or personal property, which right or claim will arise only in the future, may bring an action to take the evidence of persons who are able to testify to the truth of his right or claim, and who might, and probably would, be dead before the event happened, or the time arrived when the claim would mature. Similarly, when a witness in a criminal case is dangerously ill, his evidence may be taken by a magistrate (e.g. in hospital) in the presence of the accused, and if the witness dies his deposition may be read at the trial.

Perpetuity. Legal term for a condition rendering an estate inalienable for ever, or for a very long time. This is especially repugnant to English law, which will not allow a man so to settle, or leave by will, his property as to tie it up for ever. Property can be tied up in this way only during a life or lives in being, and for 21 years after. The rule against perpetuities was established long ago by the judges on public grounds, as destructive to the commonwealth and an impediment to commerce. See Entail; Thellusson, Peter.

Perpignan. Town of France. The capital of the dept. of the Pyrénées-Orientales, it stands on the right bank of the Têt, about 40 m. S. of Narbonne. On a height overlooking the town is the citadel which encloses the old castle of the counts of Roussillon. The most important buildings are the cathedral of S. Jean, founded by Sancho II, king of Majorca, 1324; the loge, now occupied by the Mairie; and the old university, containing a public library and a museum. Trade is carried on in wine, wool, cloth, and cork-bark. In the Middle Ages Perpignan was the capital of the county of Roussillon, and belonged to Aragon from 1172 to 1475. The French conquered it in 1642. It was permanently united to France in 1659. Pop. 74,984.

Perranporth. Town of Cornwall, England. It is about 8 m. N.W. of Truro on Perran Bay, famous for its sands and cliff-scenery. The town owes its name to S. Piran, one of S. Patrick's missionaries. At Perranzabuloe, 2 m. S.E., is the church of S. Piran, the remains of which comprise a stone oratory, uncovered in 1835 after being buried by the sand for centuries. It was built by Celtic missionaries who deposited in the oratory the remains of the saint. S. Piran's Round, 1½ m. E., is a vast arena where miracle plays were performed in medieval times.

Perrault, CHARLES (1628-1703). French author. Born in Paris, Jan. 12, 1628, and educated at the Collège de Beauvais, he

followed his father's profession, the law, became secretary to Colbert, and signalled his admission to the Academy in 1671 by a long poem, *Le Siècle de Louis XIV*, which pre-

cipitated a six years' dispute with Boileau on the respective merits of the ancients and the moderns. He wrote memoirs and other works, but his fame rests on a series of fairy tales, which he made his own by the delightful style in which they were written. They include *Puss in Boots*, *Little Red Riding Hood*, *Cinderella*, *The Sleeping Beauty*, etc. Issued in volume form, 1697, as *Histoires ou Contes du Temps Passé*, by Perron Darmancon, they achieved immense popularity and had many imitators. Perrault died May 16, 1703. In 1910 the French government erected to his memory, in the Jardin des Tuileries, Paris, a monument by G. Pech. *Pron.* Perro.

Perrier. Mineral spring of France. Near the village of Vergèze, in the dept. of Gard, it is 10 m. from Nîmes. The spring was discovered by the Romans, and a Roman well is still in existence.

Perrin, JEAN (1870-1942). French physicist. Born in Lille, Sept. 30, 1870, and educated at the École Normale in Paris, he became a reader in physical chemistry at the Paris university, and in 1910 professor of sciences there. He wrote on the molecular phenomena of oscillation and the Brownian movement in kinetics. Admitted to the academy of sciences in 1923, he won the Nobel prize for physics in 1926 for work on the discontinuity of the structure of matter and his discovery of the equilibrium of sedimentation. In 1938 he announced the existence of transuranium, an element with an atomic weight greater than that of uranium. Perrin was an active politician of the Left; in 1936 Léon Blum made him under-secretary for scientific research, and in 1939 he was president of a committee for scientific research. In 1941 he went to the U.S.A., where he worked for the Free French, and died April 17, 1942.

Perrot, GEORGES (1832-1914). French archaeologist. Born at Villeneuve St. Georges, Seine-et-Oise, Nov. 12, 1832, he studied in Paris. He proceeded to Athens in 1855, and in 1861, in company with the architect E. Guillaume, made archaeological explorations in Asia Minor, including Ançyra and several Galatian and Hittite sites. He occupied a chair of classical archaeology in Paris, 1875, and in 1904 became perpetual secretary to the Academy of Inscriptions. His outstanding work, written with the architect C. Chipiez, is a *History of Art in Antiquity*, 10 vols., 1882-1914. He died June 30, 1914.

Perrot, SIR JOHN (c. 1527-92). English courtier. Born in Pembroke-shire, the supposed natural son of Henry VIII, he came to London in his 18th year, and attracted the attention of the king, who promised him preferment. After the death of Henry, he was made a knight of the Bath by Edward VI, and accompanied a mission to France to arrange the young king's marriage. Under Mary, Perrot was imprisoned for his religious views, but, reinstated by Elizabeth, he became first president of Munster in 1570. There he quickly suppressed the rebellion of Fitzmaurice Fitzgerald, returning to England, 1573, to defend himself against home enemies. He was lord deputy of Ireland 1584-88. Tried for treason, he received the death sentence, June 26, 1592, but died in the Tower in Sept.

Sir John Perrot, English courtier

Perry (Old Fr. *peré*, from Lat. *pirum*, a pear). Alcoholic liquor obtained from fermented pear-juice. It is largely made in France, especially in Normandy and Brittany, and in England, in the counties of Worcester, Gloucester, Hereford, Devon, and Somerset. Made in a similar way to cider (*q.v.*), it is a fine, pale-coloured, sweet and aromatic beverage, containing 5 to 9 p.c. of alcohol.

Perry, FREDERICK JOHN (b. 1909). English lawn tennis player. Born at Stockport, May 18, 1909, he went to school at Ealing. By 1929 he was world champion at table tennis. Turning to lawn tennis, he played from 1931 in the British Davis Cup team and won the

F. J. Perry, English lawn tennis player

American singles and French doubles in 1933. In 1934 he was the first Englishman to succeed in the Wimbledon singles since 1909, beating the holder, Jack Crawford. The next two years he beat G. von Cramm in the final. Perry was champion of the U.S.A. in 1934 and of France in 1935. He became a professional in 1937. He was renowned for a forehand drive, especially in return of service. Perry wrote *My Story*, 1934; mar-

Charles Perrault, French author

ried the American actress Helen Vinson; and became an American citizen in 1940.

Persano, CARLO DI PELLION (1806-83). Italian sailor. Born at Vercelli, March 11, 1806, he entered the Piedmontese navy and rapidly rose to flag rank. He distinguished himself at the sieges of Messina, Gaeta, and Ancona, 1860-61, and in 1862 became minister of marine. In supreme naval command in the war against Austria, 1866, he was defeated at the battle of Lissa, and although not solely to blame for the disaster, was made the scapegoat and degraded. He died July 28, 1883.

Perseid Meteors. Shower of meteors, which have their radiant point in the constellation of Perseus. The shower appears in August and lasts two to three weeks. It was first recorded in the 6th century. The shower follows the same path as Tuttle's comet, (*q.v.*) and has been calculated to have a width of 30,000,000 m.

Persephonē or PROSERPINE. In Greek mythology, daughter of Zeus and Demeter, the goddess of agriculture. She was carried off while gathering flowers by Pluto, the god of the underworld. The story of Demeter's search for her lost daughter is told under the entry Demeter. Persephonē was allowed to spend six months of the year in the underworld, and six months with her mother. The rape of Persephonē is symbolical of the process of agriculture, her abduction to the underworld representing the sowing of the seed, and her return to her mother the growth of the corn. As the wife of Pluto, Persephonē was queen of Hades. The Garden of Proserpine is a well-known poem by Swinburne. *See* Demeter. *Prom.* Per-seffonee.

Persepolis (Gr., city of the Persians). Capital of the ancient Persian empire after Pasargadae. It was situated in the valley of the Medus or Murghab, near the Carmanian desert, 35 m. N.E. of the modern Shiraz. The vast ruins attest the magnificence of its architecture. The palaces and other public buildings are built on a terrace of masonry some miles from the city proper, and were approached by splendid stairways. The great hall alone covered 2½ acres. Persepolis was founded, according to some accounts, by Cyrus the Great, according to others by Cambyse. It was taken by Alexander the Great in 331 B.C., and the story goes that the burning of the palace of Xerxes was the act of Alexander himself, who in a

drunken frolic, instigated by the courtesan Thais, applied the fire with his own hand. This is referred to in Dryden's *Alexander's Feast*. *See* Persia.

Perse School. English public school. Its foundation dates from 1615, under the terms of the will of Stephen Perse (1548-1615), of Cambridge, which provided, among other objects, for the building of a free grammar school for the benefit of the town of Cambridge. It was erected soon after his death in what was then known as Free School Lane, behind Corpus Christi College. About 1842 new buildings were erected, and in 1873 a school for girls was established under the Perse foundation. In 1890 the school was removed to a more convenient site on the Hills Road, the old site and buildings being purchased by the university. Part of the original structure is still preserved. The buildings and grounds have often been enlarged. A notable headmaster was W. H. D. Rouse, 1902-28.

Perseus. In Greek legend, son of Zeus and Danaë, daughter of Acrisius, king of Argos. Polydectes, king of Seriphus, wishing to marry Danaë, was desirous of getting rid of Perseus, and sent him to Libya to secure the head of Medusa, the Gorgon. With the help of Athena, Perseus succeeded in his task, and on his return journey passed through Ethiopia, where he saved Andromeda (*q.v.*) from the sea-monster, and made her his wife. Reaching Seriphus, and finding that Polydectes had been treating his mother unkindly, he turned the king and his whole court into stone by showing them the Gorgon's head. He subsequently presented the head to Athena.

Perseus now returned to his original home at Argos, to see his grandfather, Acrisius, taking with him Danaë and Andromeda. At Larissa he accidentally killed Acrisius, as an oracle had foretold, with a quoit. Perseus became king of Argos, and subsequently exchanged it for Tiryns; he is also regarded as the founder of Mycenae. *See* Cellini, B.; Gorgon.

Perseus. In astronomy, a N. constellation extending from Cassiopeia to Taurus. It is traversed by the Milky Way, and contains the eclipsing variable star Algol or Beta Persei. The constellation also contains a number of other variables and many double stars. On Feb. 22, 1901, a new star suddenly appeared in the constellation (*see* Nova), and remained visible for nearly four months. Perseus is

notable for two fine star clusters, N.G.C. 1039 and h Persei.

Perseverance. Term used in Christian theology to denote the persistency of the Christian life in the believer. The doctrine of the final perseverance of the saints is one of the characteristic features of the theological systems of S. Augustine and Calvin. It is impossible, according to this principle, for the true Christian ever to relapse from the faith. According to the teaching of Calvin, as formulated by the synod of Dort, "of this preservation of the elect to salvation and of their perseverance in the faith, true believers do and may obtain assurance whereby they arrive at the certain persuasion that they ever will continue true and living members of the Church."

This belief is the natural corollary of the doctrine of predestination, as set forth by Calvin. If the Christian is a man who has been predestined by God to eternal life, then it is, of course, impossible for him to lose his predestined reward. The doctrine of final perseverance was rejected by the Arminians. John Wesley wrote a tract in which he sought to prove that this belief was not in accord with the teaching of Scripture. He shows that Hebrews 6, vv. 4-6, definitely points the possibility of relapse, as also does 2 Peter 2, vv. 20-21, and that other N.T. passages only promise conditional security, e.g. John 15, vv. 1-6, Romans 11, vv. 20-22. *See* Calvinism; Grace.

Pershing, JOHN JOSEPH (1860-1948). U.S. soldier. Of Alsatian descent, he was born in Mis-

Gen. Pershing,
American soldier

souri, Sept. 13, 1860. Graduating from West Point in 1886, he became a 2nd lt. in the 6th cavalry regt., and served against the Apache and Sioux Indians during the next three years. Appointed instructor in tactics at West Point in 1897, he resigned in 1898 to take part in the Spanish-American war. After a period at the war dept. he was sent to the Philippines, and with the rank of gen. commanded the expedition against the Moros of Mindanao in 1902. As military attaché at Tokyo, he was in Manchuria with Kuroki's army during the Russo-Japanese war in 1905. After further service in the Philippines he was given command of

the El Paso patrol on the Mexican border; his wife and three daughters lost their lives in the burning of the Presidis, Aug. 27, 1915. He later led the expedition sent in pursuit of Villa in 1916. On May 18, 1917, he was named c.-in.-c. of the American Expeditionary Force with the rank of lt.-gen., arriving in France in June. He was awarded the G.C.B., 1918. In 1919 he received the freedom of the City of London. Promoted gen. in that year, he became chief of the staff two years later. In 1924 he retired, and on Oct. 17 laid the congressional medal of honour on the grave of the unknown warrior at

Westminster. Dying July 15, 1948, he was buried in the Arlington national cemetery. He wrote *My Experiences in the World War, 1931*.

Pershore. Market tn. of Worcs, England, on the Avon, 8 m. by rly. S.E. of Worcester. The chief building is the abbey church of the Holy Cross, with a fine tower and an Early English choir. Pershore is in the plum country. Vegetables are also grown. Other industries are the manufacture of agricultural machinery and jam. Cattle and horse fairs are held. An abbey was founded here about 690. At one time the town sent two members to parliament. Pop. 3,443.

and turquoise in Khorassan, and rock salt near the gulf are known, but have been but little exploited. The country is rich in oil, which is worked by foreign companies, the chief of which is the Anglo-Iranian. The chief exports are petroleum, carpets, opium, raw cotton, fruit, animals, rice, and wool.

Cotton goods, sugar, tea, and vehicles form the bulk of the imports. Most of the trade is with the British Empire, Egypt, and Russia.

Apart from a number of old trade routes, such as Enzeli-Teheran, Kasvin-Hamadan-Chanikin, Shiraz-Ispahan-Sultanaabad, Kerman-Meshed and Kerman-Yezd-Teheran, there is the Trans-Persian rly., completed in 1938, linking the Persian gulf with the main oilfields at Dizful-Shushtar, Burujird, Teheran, and the S.E. bight of the Caspian sea. It is planned to link it with the Julfa-Tabriz rly., which is Persia's only other rly. apart from short local lines at Resht and Bushire. Shipping to the extent of about 10 million tons in the gulf and 600,000 tons in the Caspian uses Persian ports.

GOVERNMENT. Persia is divided into 10 provinces, Ustans, under governors-general, with 76 districts, Shahristans, under governors. The 1906 constitution provided for a parliament, Majlis, comprising a national assembly and a senate. Amendments in 1949 empowered the shah to dissolve the Majlis and hold fresh elections, and to amend the constitution without summoning an assembly. Electoral franchise is granted to all males over 20, but those elected must be between 30 and 70. All foreign trade is a state monopoly. The currency is the rial, worth about 130 to the £. Nearly two-thirds of Persia's export results from the activity of the Anglo-Iranian Oil Co. (*q.v.*) Imports, in 1945-46, were 3,000 million rials, exports 1,700 million.

The standing army is 90,000 strong, relatively well equipped; there is an air force of 180 aircraft, mainly British, and a U.S. military mission in Teheran. Naval forces consist of small coastal vessels.

HISTORY. The first inhabitants of the country in historical times appear to have been of Sumerian stock, but at a later date an Aryan race descended upon Iran, who, in the course of time, conquered the aborigines and laid the foundation of an Aryan kingdom. On the fall of the Assyrian Empire this Aryan people, known as the Medes, became the heirs of its political power, and to a great extent

PERSIA: IN ANCIENT & MODERN TIMES

Various Contributors

Further information will be found in the articles on the cities, e.g. Teheran, the mountain ranges, and other physical features of Persia. See the biographies of Cyrus and other rulers; also Alexander the Great; Shites; Sufism; Xerxes; Zend-Avesta; Zoroastrianism

Persia (Persian, *Iran*), is today a constitutional monarchy with a democratic parl. govt. Its area is 628,000 sq. m., mainly of high table-land of 3,000-5,000 ft., bordered by huge mountain ranges, of which the highest peak, the Demavend, in the N.W., reaches

Persian arms

18,700 ft. Large parts of the interior consist of deserts (*desht*), of which the great salt Desht-i-Kevir alone covers about 45,000 sq. m., and the sand wastes of Desht-i-Lut in the S.E. and similar stretches at least as much. Of the few rivers, the Karun in the W. is the only one navigable. The population is est. at between 12 and 16 million, but exact figures are unobtainable as a large part of the pop. consists of nomadic tribes.

Three-quarters of the people are Shia Mahomedans, one-tenth as many adhere to the Sunni sect, the rest are Jews, Armenians, and Nestorians.

Most of the level country in Persia is comprised in the two great provinces of Kerman and Khorassan. The main cities are the capital Teheran (pop. 700,000), Tabriz (215,000), Ispahan (205,000), Meshed (180,000), Shiraz (130,000), Resht (125,000), and Hamadan (100,000).

The climate generally prevailing is one of great aridity combined with excessive heat, although on some of the uplands extreme cold prevails. At Teheran in the N.

(4,000 ft.) the mean temp., on the average, varies from 34° F. in Jan. to 85° F. in July; at Jask, on the gulf of Oman, from 67° F. to 90° F. Between the mountain ranges and the Caspian there is an abundance of rainfall. The Persian gulf seaboard, however, is sultry and unhealthy.

Because of the general aridity, trees and large shrubs are infrequent, except on the rainyslopes adjacent to the border seas. Date palm cultivation flourishes along the shores of the Persian gulf; cedars, oaks, beech, and box grow extensively on the N. slopes of the Elburz range. Food products include the cereals wheat, barley, and millet, and milk, which is usually taken curdled or fermented, but rarely pure. The lowlands yield wool, silk, cotton, olives, opium, and tobacco, the trade in the last two being so profitable that ground needed for foodstuffs is given to these crops. The higher ground is

Persian flag; green, white, red

pastoral country, from whose sheep and goats is gained the wool for the celebrated carpets.

In the N., lions, leopards, jackals, and cheetah are hunted; the bustard is found almost everywhere. There are pearl fisheries in the Persian gulf. Mules, camels, and small horses are reared. Deposits of coal and iron in the Elburz, copper, lead, and other metallic ores in Kerman, copper

PERSIA: REMAINS AND RECONSTRUCTIONS OF ITS ANCIENT ARCHITECTURE

of its civilization. Media became a powerful empire under Cyaxares (d. 584 B.C.), who overthrew both the Assyrians and the Scythians. When he came to the throne the paramount power of the East was Semitic, but he left it Aryan. His son, Astyages, was attacked by an army of Persians under Cyrus, and in 550 the empire of Media passed into the hands of the kindred Aryan people of Persia.

Decline of the Empire

After conquering Croesus, king of Lydia, and overthrowing Babylon, Cyrus was assassinated by Tomyris, queen of the Massagetae. Cambyses, his eldest son, succeeded him in B.C. 529. He invaded Egypt, which he brought under tribute, but his mind became unhinged and he destroyed himself. Darius, a usurper, attacked and reduced the Greek cities of Thrace and Macedonia and refounded the Persian Empire on a more solid basis. Xerxes in 481 launched a great attack upon Athens, but received a check through the defence of Thermopylae by the Spartans. He won a naval engagement at Artemisium, after which he succeeded in taking Athens, but he was badly beaten in a sea-fight off Salamis and retreated in great disorder to Persia. Artaxerxes and Cyrus the Younger saw the beginning of the decline of the Persian Empire. The rise of Macedonia under Philip and Alexander brought about the temporary fall of Persia. Persepolis and Pasargadae were occupied in 330, and the victorious Macedonian tide swept E., Hellenising a very large portion of Central Asia.

At the death of Alexander, his empire almost at once fell into dismemberment, and what is now Persia was ruled by the dynasty of the Seleucids, descendants of one of the generals of Alexander. The Parthians, a Turanian tribe from the N., whose home lay within the modern provinces of Khorassan and Astrabad, produced the Arsacid dynasty, about 249 B.C., who gradually seized the whole of Persian soil, but it was menaced by the surrounding barbarians. It had, however, relations with China and Rome on either side, and the latter power invaded it in 53 B.C. Successive Roman generals invaded Parthia, and after long-continued fighting, in which victory inclined, now to one, now to the other side, a truce was observed.

The Parthian power gradually declined, and its place was taken by the Sassanian dynasty, which marked a new and splendid epoch in Persian history. Under its sway, Iran recovered its independence

instead of constituting one of the provinces ruled by a Parthian king. Once its king, Ardashir, had fully established his power, he threw down the gauntlet to the Romans, and inflicted a heavy defeat upon them. He was also instrumental in reviving the Zoroastrian religion, with its picturesque rites of fire-worship. His successor, Shapur, defeated the Romans on several occasions, and in A.D. 260 captured Valerian, the Roman emperor. He was, however, beaten by Odenathus of Palmyra, whose country became a buffer state between Persia and Rome.

The Sassanian dynasty included a number of brilliant kings, of whom Shapur the Great (310-381) who also carried on war with Rome, is the most notable. His successors had a long and arduous struggle with the White Huns, Bahram (d. 448), mentioned by Omar Khayyām as a great hunter, defeating them with tremendous loss, as did his descendant Firuz, who, however, was finally worsted by them in A.D. 483, when Persia fell under their dominion. The Sassanian dynasty, however, ultimately succeeded in crushing the White Huns in 523. During the period of this dynasty commercial and artistic relations were founded with China, to the lasting benefit of both Persian and Chinese art. With the coming of Noshirwan in 531 peace was concluded with Byzantium, but was soon broken by that monarch, who captured Antioch in 540, and spread terror throughout Syria, extorting an enormous indemnity.

Coming of the Turks

In this reign we first hear of the coming of the Turks from Central Asia. Noshirwan committed the folly of poisoning certain Turkish envoys, whereupon their countrymen invaded Persia. They were, however, easily repulsed. Once more Byzantium made war upon the Persian monarch, who surprised the invaders by night, and inflicted a crushing defeat upon them. Hormazd, son of Noshirwan by the daughter of the Khan of the Turks, exhibited tyrannical tendencies and entangled himself in war with Byzantines. His Turkish kinsmen took advantage of this, and invaded his realm, but were badly beaten, 588, and lost an enormous booty. Tired of the irregularities of Hormazd, his nobles conspired against him, and he was assassinated.

His son, Chosroes II (*q.v.*) was beaten in the field by his late father's enemies, but in 591 was restored by a Byzantine army. Taking advantage of the confusion in the Byzantine empire, he invaded Syria

in 611, sacked Antioch, and took Damascus, Jerusalem, and Alexandria. In 623, however, Armenia, then a dependency of Persia, was invaded by Heraclius, and Chosroes was taken by surprise. He fled, and was never afterwards able to rally. Finally he was taken prisoner, and put to a lingering death. The most magnificent of the Persian monarchs, he had no capacity for administration, and was scarcely a match for the brilliant Heraclius.

Arab Conquests

The Persian empire, worn out by the long struggle with Byzantium, and with only a boy as heir to the throne, was nearing its end. During a period of anarchy, in 633 the Arab leader Khalid led a Beduin army against Iran, defeated the Persian forces, but retired later. The Arabs returned, however, under Mothanna, and Yezdigird, the last of his line, was entirely broken at the battle of Nehavend in 642. For some years Persian resistance continued, but finally the Arabs poured into Iran, which became a dependency of the Ommyad Turks. These conditions obtained until 749, when a revulsion against Arab methods and language set in.

The Abbasides, a rival family to the Ommyads, conspired against the latter, and massacred many of their adherents. The Abbasides found their strongest adherents in Persia, but still rebellion broke out from time to time. During the Golden Age of Islam, which perhaps found its apogee in the reign of Haroun Al Raschid, Persia was still entirely under the regime of the Caliphate, but national feeling had never become extinguished, and the Zoroastrian religion continued to be practised in secret. But the Seljuk Turks had now occupied Transoxiana, and thus threatened the Arabian empire. Finally, they prevailed, and in 1037 founded a dynasty.

The Crusades affected the fortunes of Persia only indirectly, but undoubtedly Persia, as a great repository of art, science, and mysticism, exercised, like Byzantium, much influence upon the European invaders, whose dress, horse-equipment, miniature painting, art of design, tapestries and mode of thought were all directly influenced by Persian models.

The picture of Persian history grows darker during the devastating invasion of the Mongols, who swept over W. Asia and Europe like a destroying wind. Invading Turkistan in 1218, they advanced to Transoxiana under Jenghiz Khan, and onward to Merv and Khorassan, which they speedily overran. They devastated W. and

N.W. Persia, nearly exterminating the population. Later on the Caliphate was extinguished, and Persia became a Mongol principality under Mangu in 1251.

This inaugurated what is known as the reign of the Il-Khans of Persia. Its greatest monarch was Ghazan Khan (1295), who conducted campaigns in Syria and S. Persia, and had intimate relations with Byzantium and the W. powers. This condition of affairs lasted until the coming of Tamerlane, who, as governor of Mongolia, observed the state of anarchy into which Transoxiana had fallen and determined to annex it. He fitted out an expedition for this purpose in 1360, overran Persia and Mesopotamia, as well as a large part of India, and from his fourth son, Shah Rukh, sprang the line of the Timurid dynasty of Persia, which, at first virile and devoted to the arts, ended in a series of *rois fainéants*. This state of affairs was relieved by the appearance of Babar, who, after vindicating his right to the throne as a boy, seized also upon Kabul in 1504, and carried out several expeditions into India, a feat of arms which resulted in the founding of the dynasty of the Moguls.

First English Embassy

The Safavi dynasty arose towards the end of the 15th century. Ismail, its founder, was a popular favourite in Persia because of his partiality to the Shia doctrine. He annihilated the last of the Timurids, drove the Uzbeks out of Khorassan and Merv, and expelled an invasion of the Turks under Selim the Grim. In 1534, during the reign of Tahmasp, Persia was once more invaded by the Turks under Solymun the Magnificent, but the results of the campaign were indecisive, and a peace treaty was concluded in 1555. This reign is marked by the first English embassy to Persia under Anthony Jenkinson.

Then followed the spacious times of Shah Abbas I (*g.v.*), the Great, grandson of Tahmasp. Nominally governor of Khorassan, and as a child a puppet in the hands of his advisers, he succeeded in gaining the Persian throne, and was soon afterwards menaced by a Turkish invasion. He made peace with the Turks, however, to concentrate against the Uzbeks. Reorganizing his army, he carried out several successful campaigns against Turkey during 1602-27.

The rounding of the Cape of Good Hope opened up the East by sea, and in 1507 the Portuguese sent an expedition against the port

Persia. Map of the country, showing its important strategic position in relation to the Persian Gulf, the Middle East, and the U.S.S.R.

of Hormuz, the modern Bandar Abbas, where they established themselves in 1515. England began to trade with Persia by sea in 1614, her chief quest being for silk. The English assisted the Persians to clear the Portuguese out of Hormuz. Towards the middle of the 17th century the Dutch began to open up trade at Isfahan and were followed by the French, who, like other Europeans, regarded Persia as a regular mine of wealth to be exploited. The Safavi dynasty now began to decline. The Uzbeks and Turks were once more troublesome, and the first Russian embassy to Persia in 1664 boded little good for the future.

The rise of the war-like Afghan race in the hill-country to the N.E. had for some time been a source of uneasiness to the Persian rulers who had been attacked by them. Kandahar was then a Persian province which had as its governor Gurgin Khan. But he was deposed by a conspiracy of Mirvais, an Afghan chief, who, falling upon the Persian troops who occupied Kandahar, put them to the sword. Out of these circumstances arose the independence of Afghanistan, which newly consolidated power began to make raids into Persia, conquering it, and overthrowing the Safavi dynasty, 1722. Later, however, it was expelled by Shah

Mahmud. In 1724 W. Persia was overrun by the Turks. They were defeated in 1726 by Ashraf, who also routed the Afghans in 1730.

In 1736 Nadir Kuli, a great soldier, was crowned shah of Persia. He did more than any of his predecessors to consolidate the Persian power. On his assassination he was succeeded by Ali Kuli, first king of the short-lived Zand dynasty. Aga Mohammed Khan founded the Kajar dynasty, 1794, and beat back more than one Russian invasion. He was followed by descendants of the same family for 120 years. In 1801 Russia annexed Georgia. Disastrous campaigns followed which ended in the treaty of Turkmanchai in 1828, whereby Persia lost Armenia to Russia. From 1830 to 1860 Persia made every effort to recover provinces in Afghanistan to balance her losses to Russia.

These campaigns were viewed with apprehension by the princes of India, who foresaw that if Persia were successful, she would merely make a road for Russia to the country S. of the Hindu Kush. They therefore addressed themselves to the task of keeping Afghanistan outside the spheres of influence of both Russia and Persia. This led to misunderstandings between Great Britain and Persia, and to the Anglo-Afghan alliance

of 1855. Reluctantly Great Britain declared war against Persia in 1856, and peace was concluded in the following year, the shah agreeing to recognize the independence of Afghanistan.

Russia now began to advance in Central Asia with giant strides. In 1849 she had occupied the valley of the Syr Daria, in 1867 she annexed the khanate of Kokhand, and by 1873 had conquered Khiva. In 1881 the Turcomans were crushed by Skobelev at Geok Tepe. This state of affairs was not improved by the question of the boundary of Seistan which arose between Persia and Afghanistan in 1863, and which was not settled until 1872.

"Spheres of Interest"

Rivalry between Russia and the U.K. for influence in Persia, in which a Russo-Persian loan treaty of 1900 gave Russia a great start, led to an Anglo-Russian treaty of 1903 guaranteeing Persia's integrity. After Shah Muzaffer-ed-Din (1896-1907) had been forced by public unrest to grant a constitution and parliament, 1905-06, in 1907 Russia and the U.K., in another treaty, split Persia into two "spheres of interest," Russian in the N., British in the S., with a small independent strip between. Shah Mohammed Ali (1907-09), having dissolved parliament after a bombing attempt had been made upon his life in Feb., 1908, was dethroned, and succeeded by his 11-year-old son Ahmed Mirza (1909-25).

Though officially neutral during the First Great War, Turkish-German infiltration and leadership in tribal warfare led to a Russian and British occupation of their respective spheres of interest, and to fighting, in which the German consul and Sir Percy Sykes (*q.v.*), also the Shah's detention by Russian forces, played a part. After the war the Soviet government spontaneously annulled the 1907 treaty and gave Persia a free hand; a new treaty with the U.K. failed to win the Majlis's consent, and British forces were withdrawn.

Ahmed Shah, last of the Kajar dynasty, had become a mere puppet when, in 1921, Reza Khan, originally a private of the N. Persian brigade of kosacks, acquired the command as minister of war, and later supreme power as premier-dictator. Ahmed Shah left for France, where he died in 1930. After first trying to establish a republic and creating a small but up-to-date military force, Reza, with the surname Pahlevi, had himself crowned shah in Dec.,

1925. He adopted many of the steps taken by Kemal Ataturk for the modernisation of Turkey, with whom he made a treaty of friendship and alliance in 1926. These included compulsory education in a country where the pop. was then over 95 p.c. illiterate; general conscription for military service; and the adoption of family names. He also began the building of a great railway across the whole country, from Bandar Shahpur on the Persian gulf to Bandar Shah on the Caspian sea, 872 m.; it was completed in 11 years at a cost of £30 million and opened in Aug., 1938. In May, 1928, he obtained the cancellation of the capitulations and introduced a modern legal system, based on the French. Treaties of friendship were concluded with Russia in 1921 and 1927, and with Afghanistan in 1927.

In his efforts to avoid the influence of both Great Britain and Russia, Reza Shah favoured German enterprise, *e.g.* by entrusting Junkers with the creation of an air line. Thus, when the Second Great War began Persia was a haven for Nazi agents. When Hitler attacked the U.S.S.R., British and Russian troops entered Persia, Aug., 1941, expelling Axis elements. Reza, compromised by those elements, abdicated Sept. 16, 1941 (he died in S. Africa in 1944), in favour of his son Mohammed Reza Shah Pahlevi (b. 1919).

Anglo-Russian Supply Line

Meanwhile, on Aug. 29, 1941, the British and Russian forces had met at Senna, and Teheran was entered by both British and Russians, Sept. 17; but a month later the Russians withdrew to Kazvin and Pahlevi, the British to Hamadan and Sultanabad. New airfields and fortresses were constructed, communications improved, and Bandar Shahpur was developed as a port.

In Aug., 1942, the German advance in Caucasia threatened Persia, and the Allied force known as Paiforce (*q.v.*) was created to defend the oilfields and maintain the line of Anglo-Russian communication, and supply. Over 4,000,000 tons of material was dispatched to the U.S.S.R. through Persia. The highest figure for any one month was 51,000 tons in Feb., 1943. Teheran was the scene of the first conference between Churchill, Roosevelt, and Stalin, at the end of Nov., 1943. An Anglo-Russian treaty of Jan. 29, 1946, which guaranteed the integrity of Persia and the evacuation of the country within six months, led to Persian

conflict with Moscow when an "independence" movement fostered by the pro-Russian Tudeh party tried to separate from Persia the important N.W. province of Azerbaijan. An oil agreement of April, 1946, granting priority to the U.S.S.R. of oil deposits in the N., brought about the Russian evacuation.

Internal Divisions

In home affairs Persian post-war history became one of recurrent unrest, anti-foreigner movements, autonomy demands (*e.g.* among the big tribes of the Qashgai, Bakhtiari, Haiat Daudi), and changes of government. After the Teheran conference had proclaimed Persia's independence as a reward for her declaration of war against the Axis, Sept. 9, 1942, and against Japan, Feb. 28, 1945, Persia joined the United Nations and appealed to it in May, 1946, in her quarrel with Moscow. From Oct., 1946, the Tudeh party were eliminated from the cabinet, and in Jan., 1948, the Majlis rejected the oil agreement with the U.S.S.R. Following an attempt on the life of the shah, martial law was imposed and 20 Tudeh party leaders tried and imprisoned in March-May, 1949. A seven-year economic plan was instituted the same year.

LANGUAGE AND LITERATURE.

The language of Persia is connected with the great Indo-European linguistic system, of which, indeed, it is one of the oldest exemplars. It is written in a variety of the Arabic alphabet, Tarik. Persian literature takes a high place among the literatures of the world. The old Persian inscriptions and the Zend Avesta take us back to the sixth century B.C. and possibly earlier. The Pahlevi tongue belongs to the Sassanian period from the third to the sixth century A.D. Persian in its modern form is perhaps a thousand years old. It was really a renaissance of the old national feeling in the country which brought it into being a century or two after the Arab conquest, and it was responsible for the brilliant outpourings of Firdausi, Sadi, Hafiz, and Omar Khayyam. Among the greatest writers are the romantic poet Nizami (d. c. 1203), the dervish Jelal-ul-din Rumi (1207-73), and the mystic Jami (d. 1492). Of later writers Feth Ali Khan, Tabari, and Vassaf deserve mention.

The poetry of this richly endowed and imaginative people surpassed in bold and extravagant

hyperbole, fantastic imagery, and emotional appeal. The Persian poet heaped metaphor upon metaphor. He was incapable of seeing that what was intrinsically beautiful in itself might appear superfluous and lacking in taste when combined with equally graceful but discordant elements. But there is no doubt as to his eminent ability to coin beautiful phrases, and the mystic and philosophical spirit in which these are couched has perhaps never been surpassed.

Among the most famous poets of Persia were the Sufis or mystics, whose spirit has permeated Persian literature and the Persian mind to a remarkable extent. Sufism has been called the offspring of Neo-Platonism, but it has more probably been sophisticated by Brahmanic or Buddhist influences. It commenced to flourish towards the end of the 10th century, and regarded God not only as the sole source of good, but of being and beauty as well. The great Sufi poet is Jelal-ud-Din, whose *Masnavi* has influenced thought in Persia and Turkey.

Bibliography. Cambridge Ancient History, vol. iv, 1926-27; History of Ancient Persia, R. W. Rogers, 1929; Literary History of Persia, E. G. Browne, new edn., 4 vols., 1928; History of Persia, Sir P. Sykes, new edn., 1930; Persia, Sir A. T. Wilson, 1932; Persia and the Powers, A. H. Hamzavi, 1945.

Persian Gulf. Arm of the Indian Ocean, the ancient Persicus Sinus. It stretches N.W. from the gulf of Oman on the S. to the Shatt-el-Arab and the adjacent regions on the N., is more than 500 m. long, and has an area of 75,000 sq. m. It is bounded S. and W. by Arabia, N.W. by Iraq, and N. and E. by Persia. For the most part its shores, flat on the W. and rising into headlands and heights on the E., are sterile. Its one great river is the Shatt-el-Arab. Its chief islands are the Bahrein group on the W., Babian (Bubiyan) and Abadan on the N., and Kishm on the E. Its harbours are Koweit, Bushire, Lingah, Bandar Abbas, and Basra.

In the 17th century the British and the Portuguese contended for the mastery of the gulf. Early in 1622 the British captured a Portuguese fort on Kishm, and afterwards, in union with a Persian force, captured and destroyed Hormuz, the h.q. of the Portuguese. See Basra; Iraq; Persia.

Persimmon OR VIRGINIAN DATEPLUM (*Diospyros virginiana*). Small tree of the family Ebenaceae, native of N. America. It has

rather thick, oval-oblong, alternate leaves and pale yellow, bell-shaped flowers. The plum-like yellow fruits become sweet and edible after exposure to frost. The wood is hard and blackish. See Ebony.

Persistent Offender. In English law, a person over 21 years of age having several criminal convictions, formerly called Habitual Criminal (*q.v.*). Offenders of 16 to 21 years may be sent to a Borstal institution. Under the Criminal Justice Act, 1948, a persistent offender over 21 convicted of an offence punishable by 2 years' imprisonment or more, who has been twice previously convicted of a like offence since he was 17, may be sentenced to corrective training for 2-4 years. A persistent offender over 30 convicted of such an offence, who has been thrice previously convicted since he was 17 and was on at least two of these occasions sentenced to Borstal training, imprisonment, or corrective training, may be sent to preventive detention for 5-14 years. Alternatively, a persistent offender convicted of such an offence, who has been twice previously sentenced to Borstal or imprisonment or once previously to corrective training, may be required for 12 months after discharge from prison to keep in touch with a society appointed by the Prison Commissioners. If sentenced to 12 months' imprisonment or more, he must be required after discharge to keep in touch with such a society or to report monthly at a police station. Failing in this he is guilty of a criminal offence, and may be arrested without warrant and sentenced to up to 6 months' imprisonment.

Persius (A. D. 34-62). Roman satiric poet, whose full name was Aulus Persius Flaccus. Born of a noble family at Volaterrae, in Etruria, Dec. 4, 34, he studied Stoic philosophy in Rome under Cornutus, and died Nov. 24, 62. He left six Satires, consisting of 650 hexameter lines which display original genius, in spite of their immaturity, excess of literary allusion, and obscure style. There are verse translations by Dryden and Gifford.

Person (Lat. *persona*, theatrical mask). In grammar, the word person is used to indicate the distinction between the person speaking (first person or "I, we") the person spoken to (second person or "thou, you"), and the person or thing spoken of (third person, or "he, she, it, they"). See Trinity.

Personal Equation. The correction applied to observations made by a particular person to compensate for some known inaccuracy of observation—e.g. he may unconsciously always read an instrument too high or too low.

Personality (Lat. *persona*, theatrical mask, character). Etymologically, the quality which enables a being to sustain a part in life. Generally, those qualities which distinguish human beings from things, or one human being from another or, in a narrower sense, existence as a conscious being.

Persons, as opposed to things, are individual, conscious, intelligent, and free. Thus the idea of personality is connected with the moral law; it carries with it the possession of rights and duties, the obligations of which can only be appreciated by beings who are free and intelligent.

According to certain thinkers the word personality is meaningless, and the distinction between persons and things is artificial. Things alone exist; persons are mere appearances, collective varieties of organic forms, and the ego ("I") is only a collection of states of consciousness. The term personality is also used to express the continuance of a person's distinguishing qualities, of one's personal identity, in spite of bodily and mental changes. See Psychology.

Personal Property. Term peculiar to English law. It meant originally all property in respect of which a *real* action (i.e. an action for the *res* or thing) would not lie; but in respect of which only a personal action against the defendant would lie. It comprises all goods, chattels, choses in action, leaseholds; but not freeholds, or things thereunto annexed. The distinction is illogical, and the most logical division of property is into movable and immovable.

Personalty. Legal term used in wills, etc. See Net Personality.

Personation (Lat. *persona*, mask, person). In English law, pretending to be someone else. A person who does this in order to obtain property is guilty of a felony by the False Personation Act, 1874, passed in consequence of the Tichborne case. To personate a master so as to give a false character to a servant is a misdemeanour under an old statute of George III; and the Ballot Act, 1872, made it a criminal offence to personate a voter at an election.

Personification. Literary device by which human attributes are given to inanimate things or

more especially to abstract ideas. It was common in the age of Gray, in whose ode on Eton College we read of :

Disdainful Anger, pallid fear,
And Shame that skulks behind . . .
And Envy wan, and faded Care,
Grim-visaged comfortless Despair .

Perspective (Lat. *perspicere*, to look through). The principle governing the apparent size and shape of objects relative to their distance from the eye and their position above or below eye level ; also the application of the principle to the representation of such objects on a single plane surface. The principle is most easily grasped if one imagines a great vertical plane of transparent glass (the picture plane) set up between the eye and the objects within its range of vision. If one could then trace on the flat glass the positions and outlines of the objects as seen through the glass, certain laws of linear perspective would become evident. The most important are as follows :

(1) All horizontal lines receding from the eye appear to slope upwards or downwards towards the horizon level or eye level, those below the eye level appearing to slope upwards and those above the eye level downwards. (2) The farther below or above the eye level such horizontal lines lie, the steeper is the apparent slope upwards or downwards. (3) Parallel horizontal lines appear to come nearer together the further they recede from the eye. If extended they would meet on the eye (or horizon) level at a point called the vanishing point (V.P.). For horizontal lines at right angles to the picture plane the vanishing point is on the eye level immediately in front of the eye, known as the centre of vision (C.V.); the lines to the left of the centre of vision slope upwards or downwards to the right, those to the right slope to the left. Horizontal lines at any angle to the picture plane other than a right angle have their own vanishing point to the R. or L. of the centre of vision. (4) Vertical lines appear to remain vertical, but a series of vertical lines of the same height and at equal distances from each other, appear to become shorter and nearer together the farther distant they are from the eye.

These general laws, with others more complicated, e.g. those concerning lines neither vertical nor

horizontal, as well as those concerning reflections and cast shadows, may be worked out accurately on mathematical principles, but it must be remembered that they are concerned with a single fixed range of vision. If the vision is moved even minutely to left or right, a new picture plane is immediately set up. In practice the human eye will correct the apparent distortions which follow. For example, suppose the eye to be directly confronted by a wall,

Perspective. In the top fig. the receding horizontal lines, as projected on the picture plane, slope towards a vanishing point on the eye level, and the vertical lines, representing a receding series of poles of equal height and equal distance apart, become shorter and nearer together. The middle fig. shows how horizontal lines at right angles to the picture plane appear to converge towards a centre of vision on the eye level. The lowest fig. shows the effect when horizontal lines are at an angle to the picture plane other than a right-angle : note that the horizontal line which is actually on the eye level remains horizontal.

the horizontal top of which is above eye level, but that the wall is too close for the whole of it to be seen at one glance. By the laws of perspective, the top of the wall should appear to slope downwards towards the eye level on both sides of the centre of vision ; and as the eye turns to left or right, setting up new picture planes to which the line of the wall is no longer parallel, the eye will, in fact, follow the line downwards in a curve, but is scarcely conscious of doing so. The camera has made us familiar with the odd effect of uncorrected distortion when objects are too near. A moving or panoramic camera, as it moves to left or right altering its centre of vision, is likewise unable to correct the effect of curve ; hence when a photograph is required of a wide group of people they are arranged in a curve, and the camera then records them as arranged in a straight line ; but any building in the background is distorted into a curve.

For the artist who wishes to represent objects recognizably on a flat surface some appreciation of
